2020-22 ACCESSORIES & EQUIPMENT

Acoustic Vehicle Alerting Control Unit - Diagnostics - CR-V (Hybrid)

DTC TROUBLESHOOTING

DTC B2890-13

DTC B2890-13 : An open in the acoustic vehicle alerting speaker circuit

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	Confirmed DTC	Pending DTC
B2890-13 An open in the acoustic vehicle alerting speaker circuit	B	B

DTC (Acoustic Vehicle Alerting Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 20 seconds.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B2890-13 An open in the acoustic vehicle alerting speaker circuit	B	B

   Is DTC B2890-13 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. AUDIBLE SPKR+, AUDIBLE SPKR- lines output check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Acoustic vehicle alerting speaker 2P connector

   -3. Raise the vehicle on a lift.

   -4. Turn the vehicle to the READY TO DRIVE mode.

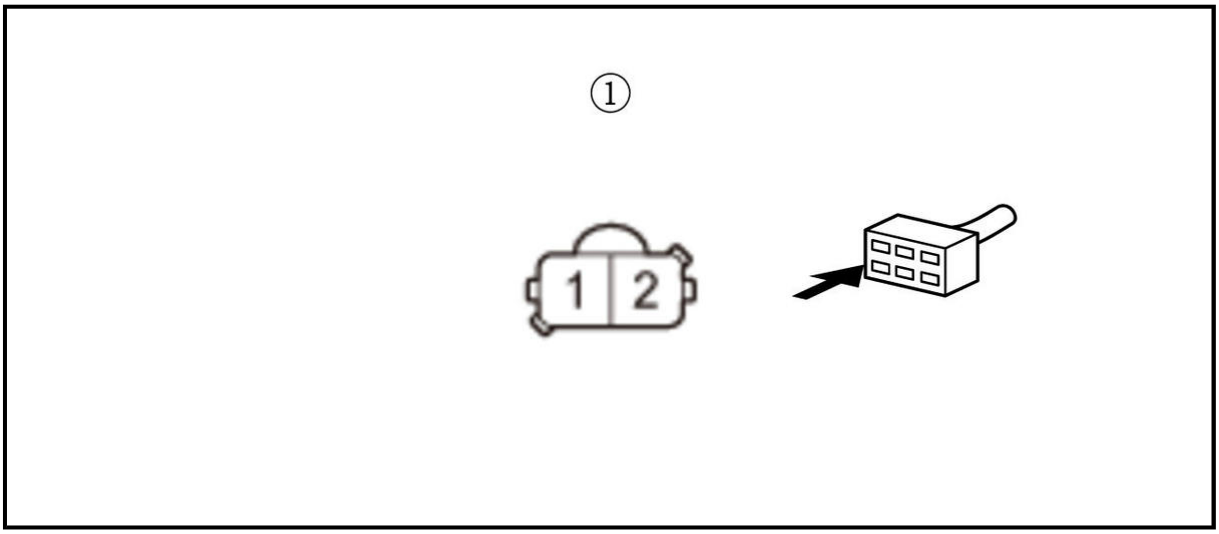
   -5. Shift the transmission to D position/mode, release the brake pedal but do not operate the accelerator pedal.

NOTICE: Do not put on the brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle READY TO DRIVE mode Acoustic vehicle alerting speaker 2P connector: disconnected
Test point 1	Acoustic vehicle alerting speaker 2P connector (female terminals) No. 1: ①
Test point 2	Acoustic vehicle alerting speaker 2P connector (female terminals) No. 2: ①

NOTE: The output voltage changes depending on vehicle speed.



Is there about 5 V?

YES

Replace the acoustic vehicle alerting speaker .

NO

Go to step 3.

3. Open wire check (AUDIBLE SPKR+, AUDIBLE SPKR- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

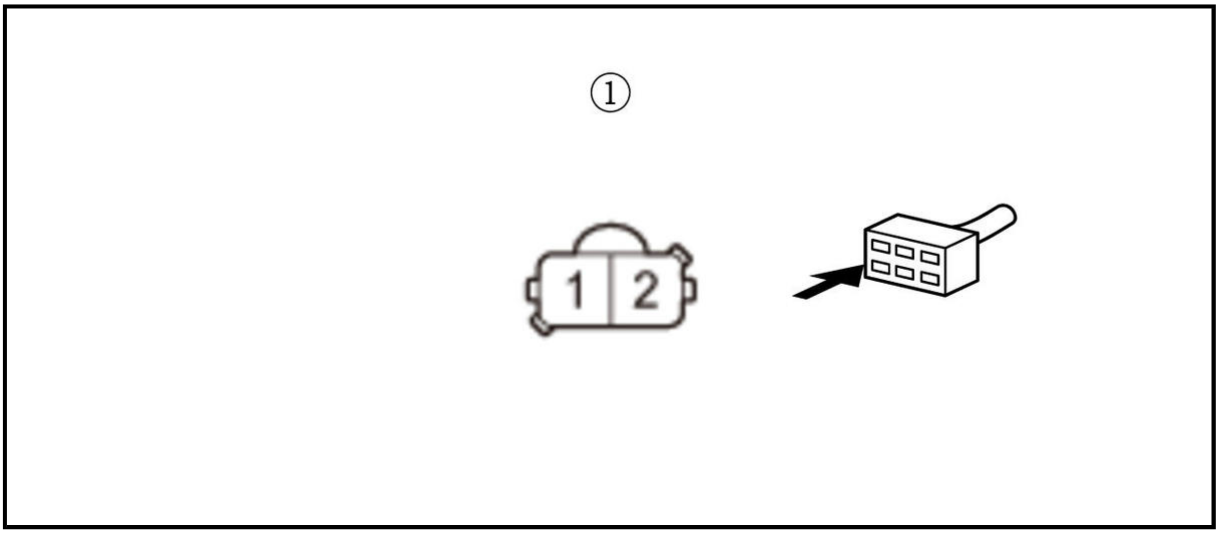
-2. Disconnect the following connector.

Acoustic vehicle alerting control unit 12P connector

-3. Measure the resistance between test points 1 and 2 respectively.

Test condition	Vehicle ON mode Acoustic vehicle alerting speaker 2P connector: disconnected Acoustic vehicle alerting control unit 12P connector: disconnected
Test point 1	Acoustic vehicle alerting speaker 2P connector (female terminals) No. 2: ①
Test point 2	**Acoustic vehicle alerting control unit 12P connector No. 3**

Test point 1	Acoustic vehicle alerting speaker 2P connector (female terminals) No. 1: ①
Test point 2	Acoustic vehicle alerting control unit 12P connector No. 4



Is there 1.0 Ω or less?

YES

Replace the acoustic vehicle alerting control unit .

NO

Repair an open or high resistance in the wire.

DTC U0029-00 (ACOUSTIC VEHICLE ALERTING CONTROL UNIT)

DTC U0029-00 : F-CAN communication line error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
U0029-00 F-CAN communication line error	B	B

DTC (Acoustic Vehicle Alerting Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0029-00 F-CAN communication line error	B	B

Is DTC U0029 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Intermittent failure, the system is OK at this time.

DTC U0100-00, U0101-00, U0122-00, U0128-00, U0129-00, U0155-00 (ACOUSTIC VEHICLE ALERTING CONTROL UNIT)

DTC U0100-00 : Acoustic vehicle alerting control unit lost communication with PCM

DTC U0101-00 : Acoustic vehicle alerting control unit lost communication with PCM/TCM

DTC U0122-00 : Acoustic vehicle alerting control unit lost communication with VSA modulator-control unit

DTC U0128-00 : Acoustic vehicle alerting control unit lost communication with Electric parking brake control unit

DTC U0129-00 : Acoustic vehicle alerting control unit lost communication with Electric servo brake control unit

DTC U0155-00 : Acoustic vehicle alerting control unit lost communication with Gauge control module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before you troubleshoot, record all freeze data and any on-board snapshot, and review the general troubleshooting information .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	Confirmed DTC	Pending DTC
U0100-00 Acoustic vehicle alerting control unit lost communication with PCM	B	B
U0101-00 Acoustic vehicle alerting control unit lost communication with PCM/TCM	B	B
U0122-00 Acoustic vehicle alerting control unit lost communication with VSA modulator-control unit	B	B
U0128-00 Acoustic vehicle alerting control unit lost communication with Electric parking brake control unit	B	B
U0129-00 Acoustic vehicle alerting control unit lost communication with Electric servo brake control unit	B	B
U0155-00 Acoustic vehicle alerting control unit lost communication with Gauge control module	B	B

DTC (Acoustic Vehicle Alerting Control Unit)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0100-00 Acoustic vehicle alerting control unit lost communication with PCM	B	B
U0101-00 Acoustic vehicle alerting control unit lost communication with PCM/TCM	B	B
U0122-00 Acoustic vehicle alerting control unit lost communication with VSA modulator-control unit	B	B
U0128-00 Acoustic vehicle alerting control unit lost communication with Electric parking brake control unit	B	B
U0129-00 Acoustic vehicle alerting control unit lost communication with Electric servo brake control unit	B	B
U0155-00 Acoustic vehicle alerting control unit lost communication with Gauge control module	B	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. CAN gateway system DTC check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U0056-00 CAN Gateway F-CAN ch C Bus Off	B
U0065-00 CAN Gateway F-CAN ch D Bus Off	B
U0038-00 CAN Gateway F-CAN ch E Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, U0056-00, U0038-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the acoustic vehicle alerting control unit detect the CAN gateway Bus channels B?

Bus B is Not Available

Go to step 4.

Bus B is Available

Go to step 5.

4. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

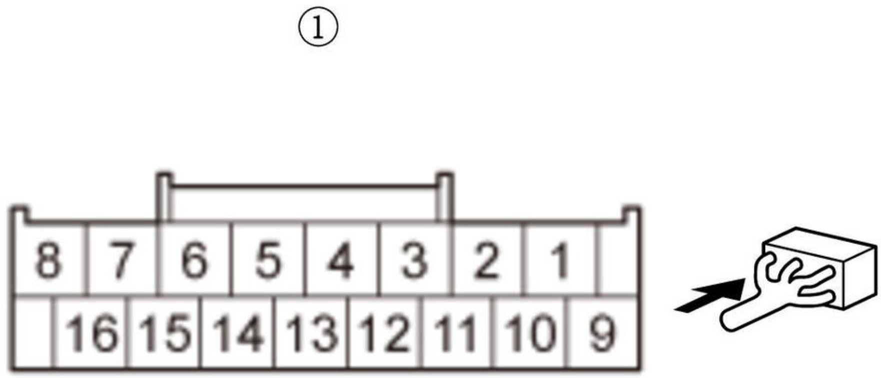
-2. Disconnect the following connectors.

CAN gateway 16P connector
Acoustic vehicle alerting control unit 12P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Acoustic vehicle alerting control unit 12P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**Acoustic vehicle alerting control unit 12P connector No. 5**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**Acoustic vehicle alerting control unit 12P connector No. 6**



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. **Replace the acoustic vehicle alerting control unit** .

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

5. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100-00	PCM	A, B, E
U0101-00	PCM	A, B, E
U0122-00	VSA modulator-control unit	B, C
U0128-00	VSA modulator-control unit	B, C
U0129-00	Electric servo brake control unit	B, C
U0155-00	Gauge control module	D

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-00: PCM is Not Available for Bus A

Go to step 6.

U0100-00: PCM is Not Available for Bus B

Go to step 7.

U0100-00: PCM is Not Available for Bus E

Go to step 10.

U0101-00: PCM is Not Available for Bus A

Go to step 6.

U0101-00: PCM is Not Available for Bus B

Go to step 7.

U0101-00: PCM is Not Available for Bus E

Go to step 10.

U0122-00: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0122-00: VSA modulator-control unit is Not Available for Bus C

Go to step 8.

U0128-00: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0128-00: VSA modulator-control unit is Not Available for Bus C

Go to step 8.

U0129-00: Electric servo brake control unit is Not Available for Bus B

Go to step 7.

U0129-00: Electric servo brake control unit is Not Available for Bus C

Go to step 8.

U0155-00: Gauge control module is Not Available for Bus D

Go to step 9.

6. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100-00, U0101-00: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

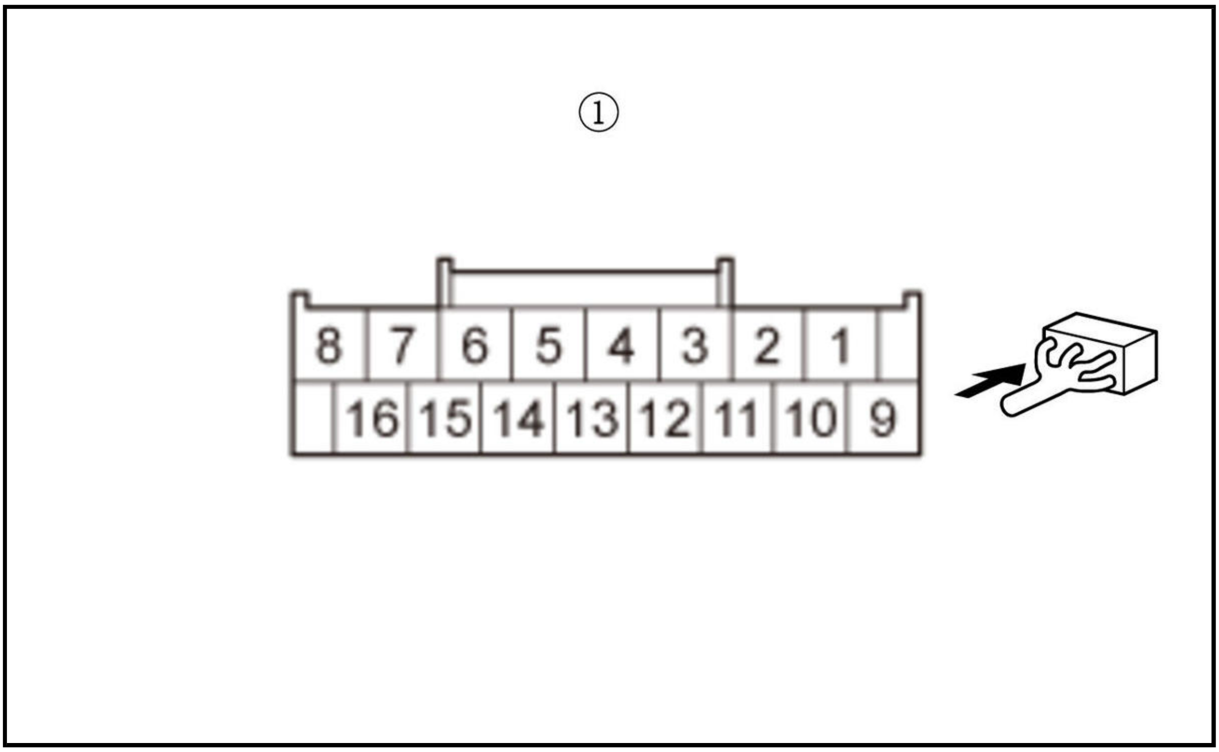
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36
U0101-00	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	**PCM**
U0101-00	**PCM**

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

7. Open wire check (F-CAN B lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. U0100-00, U0101-00: Jump the SCS line with the HDS, and wait more than 1 minute.

   SCS short

   -3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

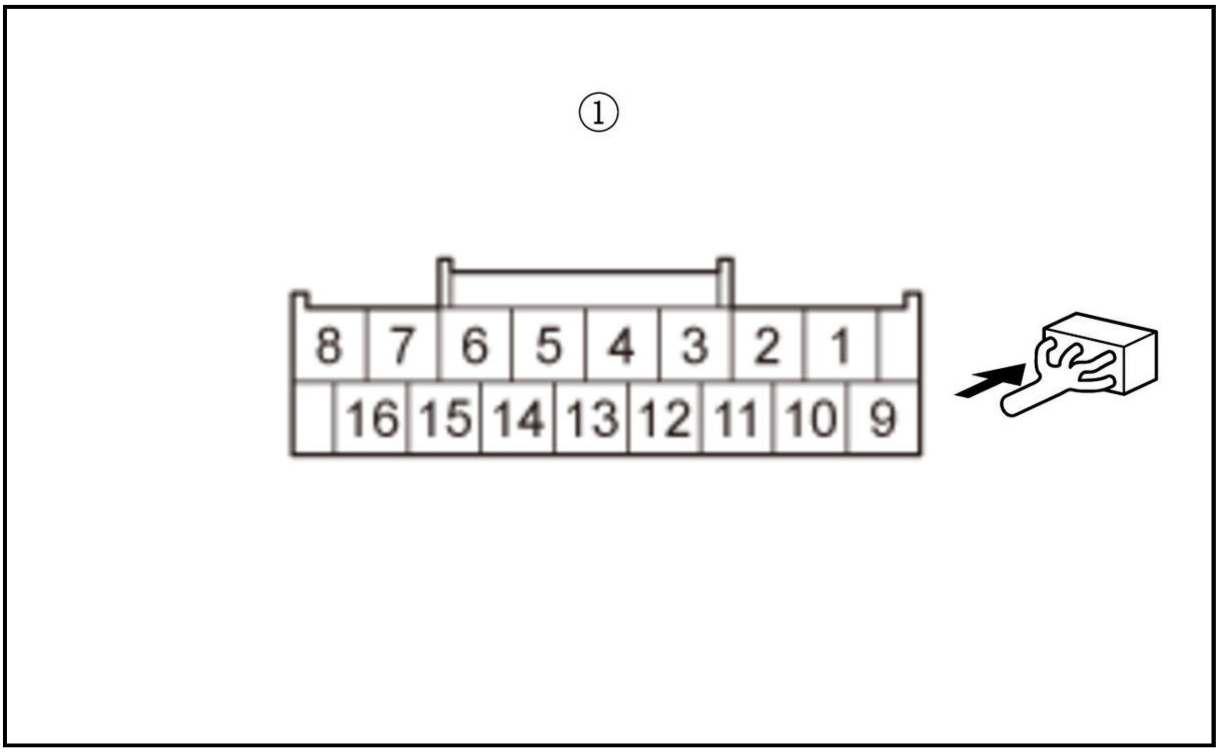
DTC	Connector
-	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector
U0128-00	VSA modulator-control unit 46P connector
U0129-00	Electric servo brake control unit 22P connector
U0155-00	Gauge control module connector A (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	**Circuit name**	**Test point 1 (Receiving control unit)**		**Test point 2 (Transmitting control unit)**	
		Connector	**Terminal**	**Connector**	**Terminal**
U0100-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38
U0101-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38
U0122-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN B_L		No. 14		No. 28

DTC	**Circuit name**	**Test point 1 (Receiving control unit)**		**Test point 2 (Transmitting control unit)**	
		Connector	**Terminal**	**Connector**	**Terminal**
U0128-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN B_L		No. 14		No. 28
U0129-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**Electric servo brake control unit 22P connector**	No. 15
	F-CAN B_L		No. 14		No. 14
U0155-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**Gauge control module connector A (32P)**	No. 5
	F-CAN B_L		No. 14		No. 6



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	**PCM**
U0101-00	**PCM**
U0122-00	**VSA modulator-control unit**
U0128-00	**VSA modulator-control unit**
U0129-00	**Electric servo brake control unit**
U0155-00	**Gauge control module**

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

8. Open wire check (F-CAN C lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

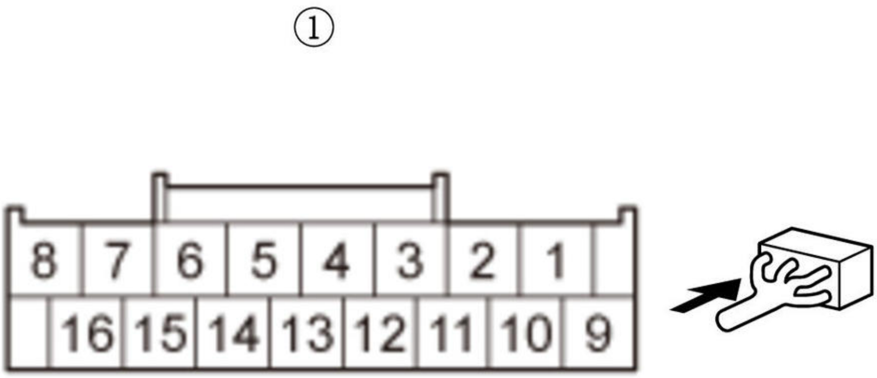
DTC	Connector
-	CAN gateway 16P connector
U0122-00	VSA modulator-control unit 46P connector
U0128-00	VSA modulator-control unit 46P connector
U0129-00	Electric servo brake control unit 22P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0122-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	VSA modulator-control unit 46P connector	No. 46
	F-CAN C_L		No. 13		No. 34

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0128-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	VSA modulator-control unit 46P connector	No. 46
	F-CAN C_L		No. 13		No. 34
U0129-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	Electric servo brake control unit 22P connector	No. 19
	F-CAN C_L		No. 13		No. 18



Is there 1.0 Ω or less?

YES

The F-CAN C_H wire and the F-CAN C_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0122-00	VSA modulator-control unit

DTC	Operation for transmitting control unit
U0128-00	**VSA modulator-control unit**
U0129-00	**Electric servo brake control unit**

NO

Repair an open in F-CAN C_H or F-CAN C_L wire.

9. Open wire check (F-CAN D lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

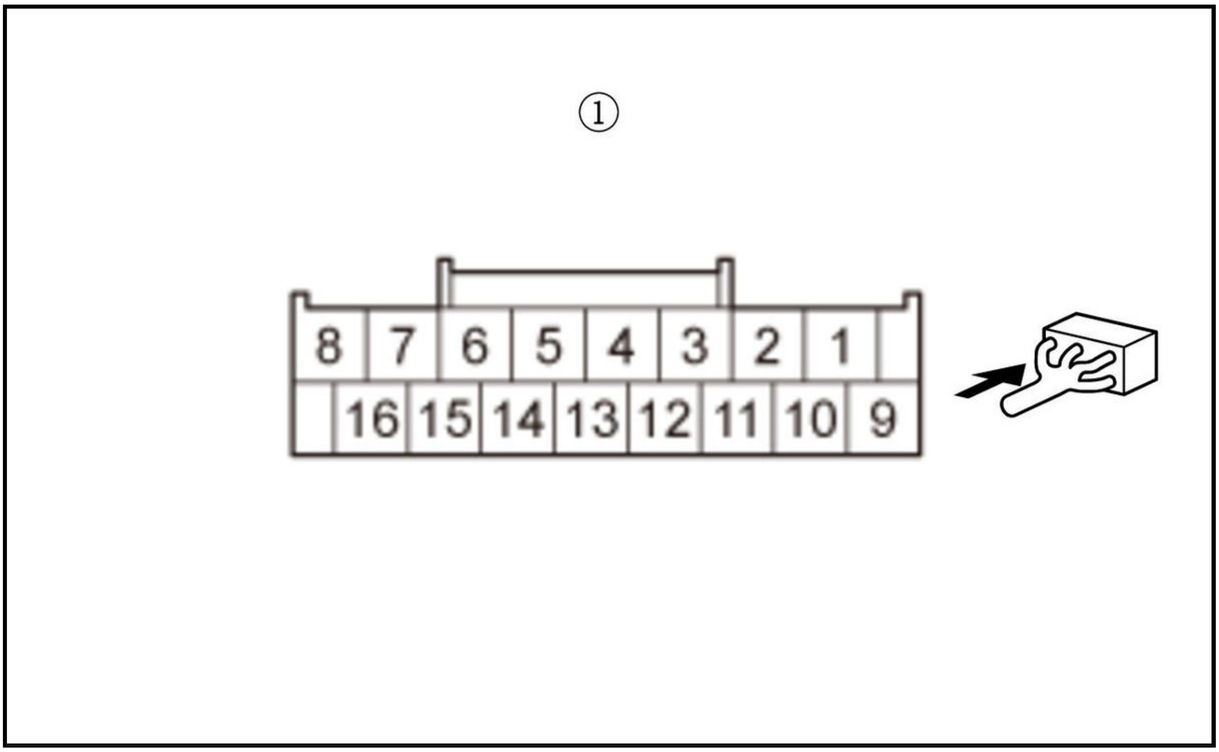
-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0155-00	Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0155-00	F-CAN D_H	CAN gateway 16P connector (female terminals): ①	No. 7	**Gauge control module connector A (32P)**	No. 19
	F-CAN D_L		No. 15		No. 20



Is there 1.0 Ω or less?

YES

The F-CAN D_H wire and the F-CAN D_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0155-00	Gauge control module

NO

Repair an open in F-CAN D_H or F-CAN D_L wire.

10. Open wire check (EP-CAN lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100-00, U0101-00: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

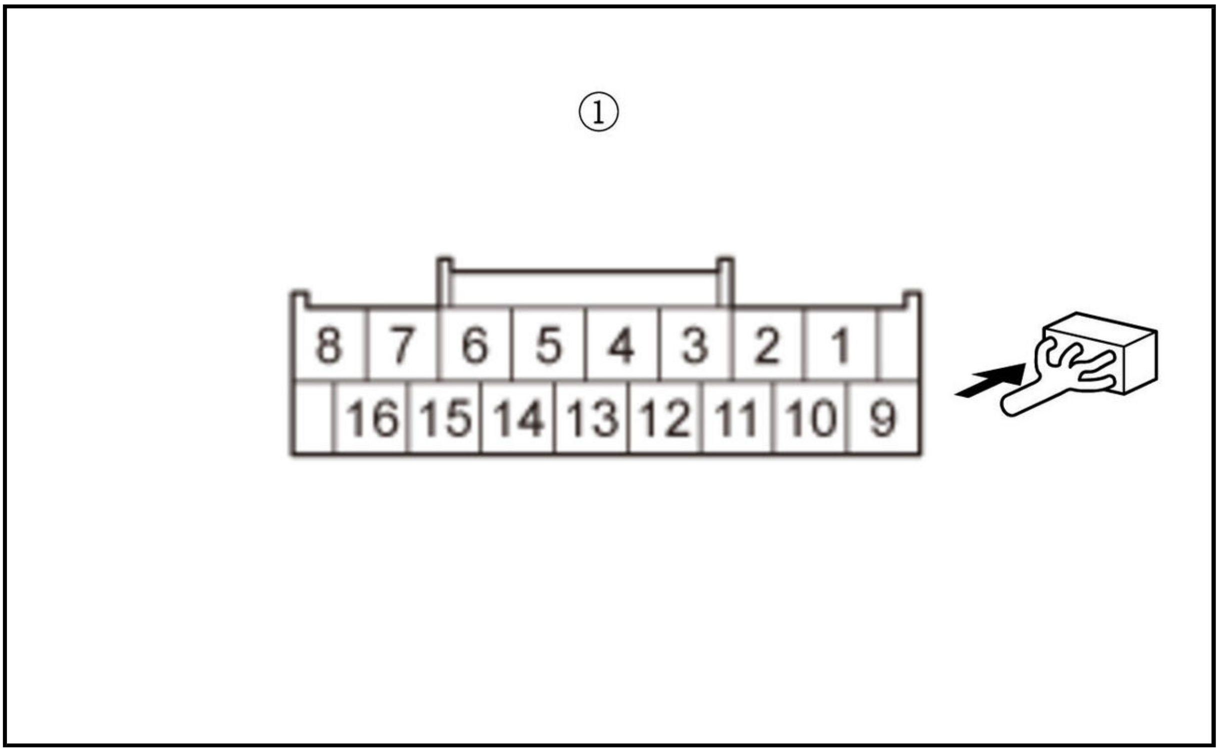
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	**Terminal**	**Connector**	**Terminal**
U0100-00	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	PCM connector A (50P)	No. 21
	EP-CAN A_L		No. 8		No. 20
U0101-00	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	PCM connector A (50P)	No. 21
	EP-CAN A_L		No. 8		No. 20



Is there 1.0 Ω or less?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	**PCM**
U0101-00	**PCM**

NO

Repair an open in EP-CAN A_H or EP-CAN A_L wire.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

ACC OFF IS DISPLAYED ON THE MID UNEXPECTEDLY

Diagnostic procedure

- Check the ACC system auto stop control history.

ACC INDICATOR (ON THE MID) DOES NOT COME ON

Diagnostic procedure

- Symptom troubleshooting.

ACC INDICATOR (ON THE MID) DOES NOT GO OFF, AND NO DTCS ARE STORED

Diagnostic procedure

NOTE: If any of the CAN communication failure DTC is indicated in another system, troubleshoot the DTC first.

- Check for an open or a short in the F-CAN circuit;
-
    - -

      Between the gauge control module and the CAN gateway (F-CAN D_H, F-CAN D_L)
    - -

      Between the millimeter wave radar and the CAN gateway (F-CAN C_H, F-CAN C_L)
- Check the millimeter wave radar power circuit (IG1_OPTION).
- Check the millimeter wave radar ground circuit (GND).
- Do to the gauge control module self-diagnostic function .

Also check for

Refer to the followings about the indicator operating condition;

- General troubleshooting information

Refer to the followings about the circuit troubleshooting;

- Gauge control Module connector for inputs and outputs
- Millimeter wave radar connector for inputs and outputs
- Adaptive cruise control (ACC) circuit diagram
- Fuse to components index
- Ground to components index

CMBS OFF SWITCH DOES NOT TURN ON/TURN OFF (CMBS INDICATOR DOES NOT CHANGE) (CMBS)

Diagnostic procedure

- Do the gauge control module self-diagnostic function .
- Test the CMBS OFF switch .

Also check for

- An open or increased resistance in the wire

- A short in the wire

CMBS INDICATOR (ON THE MID) DOES NOT COME ON (CMBS)

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

CMBS INDICATOR (ON THE MID) DOES NOT GO OFF (CMBS)

Diagnostic procedure

- Symptom troubleshooting.

DOES NOT SENSE THE VEHICLE DRIVING AHEAD

Diagnostic procedure

- Symptom troubleshooting.

Also check for

- Out of the performance limits
- Wheel alignment
- Undetectable environment

INTERMITTENTLY SENSES THE VEHICLE DRIVING AHEAD

Diagnostic procedure

- Symptom troubleshooting.

Also check for

- Incorrect millimeter wave radar installation
- Wheel alignment
- Undetectable environment

LKAS INDICATOR (ON THE MID) DOES NOT COME ON

Diagnostic procedure

- Symptom troubleshooting.

LKAS INDICATOR (ON THE MID) DOES NOT GO OFF, AND NO DTCS ARE STORED

Diagnostic procedure

NOTE: If any of the CAN communication failure DTC is indicated in another system, troubleshoot the DTC first.

- Check for an open or a short in the F-CAN circuit;
-
    - -

      Between the gauge control module and the CAN gateway (F-CAN D_H, F-CAN D_L)
    - -

      Between the millimeter wave radar and the CAN gateway (F-CAN C_H, F-CAN C_L)
- Check the millimeter wave radar power circuit (IG1_OPTION).
- Check the millimeter wave radar ground circuit (GND).
- Do to the gauge control module self-diagnostic function .

Also check for

Refer to the followings about the indicator operating condition;

- General troubleshooting information

Refer to the followings about the circuit troubleshooting;

- Gauge control Module connector for inputs and outputs
- Millimeter wave radar connector for inputs and outputs
- Lane Keeping Assist System (LKAS) Circuit Diagram
- Fuse to components index
- Ground to components index

SENSES A VEHICLE DRIVING IN ANOTHER LANE

Diagnostic procedure

- Symptom troubleshooting.

Also check for

- Incorrect millimeter wave radar installation
- Wheel alignment

SET DISTANCE CANNOT BE ADJUSTED WITH THE DISTANCE SWITCH

Diagnostic procedure

- Test the ACC combination switch .

SET SPEED DOES NOT CANCEL WHEN THE MAIN SWITCH IS TURNED OFF

Diagnostic procedure

- Test the ACC combination switch .

Also check for

An open in the wire

SET SPEED DOES NOT CANCEL WHEN THE BRAKE PEDAL IS PRESSED

Diagnostic procedure

- Test the brake pedal position switch .

Also check for

An open in the wire

THE CMBS DID NOT OPERATE (CMBS)

Diagnostic procedure

- Check the millimeter wave radar installation .
- Check the front grille for warpage.
- Check the wheel alignment .

Also check for

- Driving conditions, weather, environmental influences
- Undetectable environment

THE CMBS OPERATED WITHOUT DANGER OF COLLISION (CMBS)

Diagnostic procedure

- Check the millimeter wave radar installation .
- Check the front grille for warpage.
- Check the wheel alignment .

Also check for

Driving conditions, weather, environmental influence

THE CMBS OPERATES FREQUENTLY (CMBS)

Diagnostic procedure

- Check the millimeter wave radar installation .
- Check the front grille for warpage.
- Check the wheel alignment .

Also check for

Driving conditions, weather, environmental influence

THE MID DOES NOT INDICATE WHEN THE CMBS OFF SWITCH IS OPERATED (CMBS)

Diagnostic procedure

- Do the gauge control module self-diagnostic function .
- Test the CMBS OFF switch .

Also check for

- An open or increased resistance in the wire
- A short in the wire

THE MID DOES NOT INDICATE WITH THE CMBS OPERATING (CMBS)

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

THE BUZZER DOES NOT SOUND WHEN THE CMBS OFF SWITCH IS OPERATED (CMBS)

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

THE BUZZER DOES NOT SOUND (CMBS)

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

VEHICLE DOES NOT DECELERATE OR ACCELERATE ACCORDINGLY WHEN THE SET- OR RES+ SWITCH IS PRESSED

Diagnostic procedure

- Test the ACC combination switch .

Also check for

An open in the wire

VEHICLE SPEED CAN BE SET, BUT THERE IS NO ACC INDICATION ON THE MID

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

VEHICLE SPEED CAN BE SET, BUT VEHICLE DECELERATES

Diagnostic procedure

- Check for DTCs in the PGM-FI system with the HDS .

Also check for

Faulty ETCS

VEHICLE SPEED CANNOT BE SET WHEN THE SET SWITCH IS PRESSED BETWEEN 25 MPH (40 KM/H) AND 90 MPH (145 KM/H)

Diagnostic procedure

- Test the ACC combination switch .
- Test the brake pedal position switch .

Also check for

- An open in the wire
- A short in the wire
- The system is in service mode.

DESCRIPTION & OPERATION

ADAPTIVE CRUISE CONTROL (ACC) SYSTEM DESCRIPTION

Function

The ACC system with Low Speed Follow (LSF) uses the multipurpose camera unit and the millimeter wave radar to calculate and adjust the vehicle speed to maintain the appropriate following interval between your vehicle and the vehicle detected ahead based on your vehicle speed and driving conditions. When another vehicle cuts in between your vehicle and the vehicle detected, the system switches the target vehicle to a new vehicle using the image information (vehicle and lane information) from the multipurpose camera. When the vehicle detected changes the lane or goes out of the detection range, the vehicle drives at the preset vehicle speed until detecting a new target vehicle. ACC system works with the cruise control system to adjust the vehicle speed.

The cruise control mode can be entered by operating the distance switch while the ACC is working.

LSF Function

Operation Conditions

Control vehicle speed	Following function	0 - 90 mph (0 - 145 km/h)
	Set speed range	25 - 90 mph (40 - 145 km/h)
Left/right detection angle of millimeter wave radar		+/-42.6 degrees
Up/down detection angle of millimeter wave radar		-6 to +11.5 degrees
Road inclination		Less than 6%
Detection object		Vehicle only

Basic Controls of ACC and Low Speed Follow (LSF)

- The ACC system uses the millimeter wave radar to detect the vehicle ahead, determines the target vehicle and measures the distance to the target vehicle and its vehicle speed. (the system also uses the multipurpose camera as needed to determine the target vehicle based on the lane and vehicle position information)
- When there is no vehicle detected ahead, your vehicle drives at the preset speed. When there is a vehicle detected ahead, your vehicle follows the vehicle and drives within the preset speed.

Throttle Control

Tracks vehicle ahead

- Deceleration by controlling the throttle and braking to maintain the set distance
- Stop holding by controlling the braking

When the vehicle ahead starts to move, the MID will flash the stopped message. If you press the RES/+ or SET/– button, or depress the accelerator pedal, ACC/LSF operates again within the previously set speed.

- RES/+ or SET/- button operation
- Depressing accelerator pedal

*: If the driver presses the RES/+ or SET/- button on or the acceleration pedal before the leading vehicle restarting moving, your vehicle does not start moving except when the system detects that the leading vehicle restarts moving within a set period of time after the button or pedal is pressed.

Electric Parking Brake Control

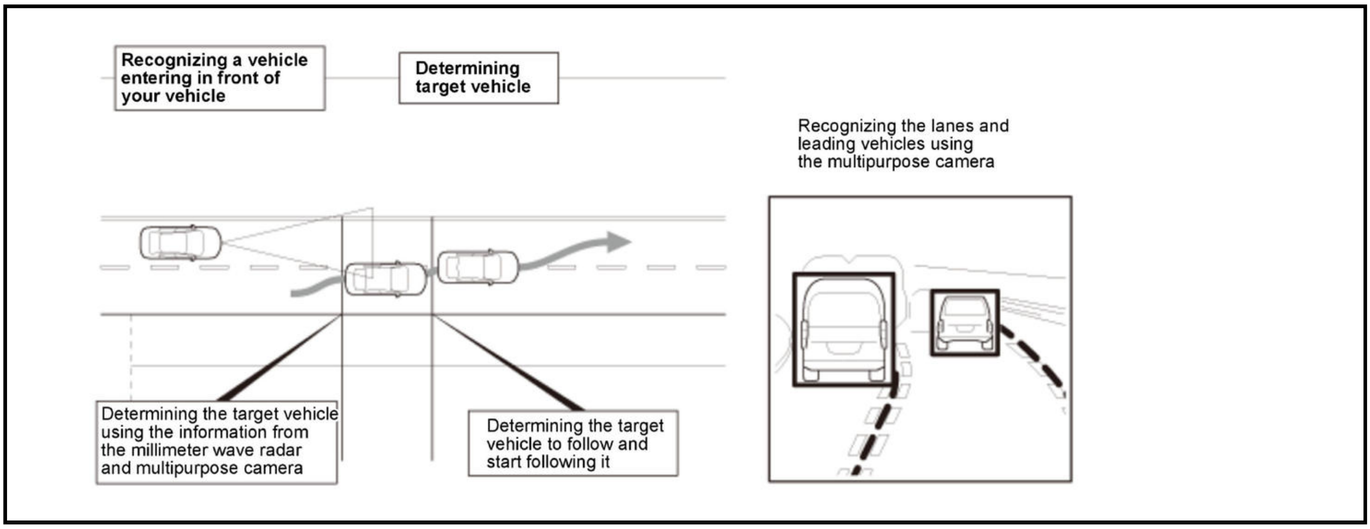
Tracks vehicle ahead

Deceleration by controlling the throttle and braking to maintain the set distance

When the vehicle being followed stops, your vehicle stops to maintain the set stopping distance.

The following conditions will trigger the ACC with LSF to cancel the stop holding status and apply the parking brake automatically.
- 10 minutes after a full stop
- The driver leaves the vehicle
- A brake system failure occurs
- A malfunction of the multipurpose camera unit
- The vehicle is turned to the OFF (LOCK) mode

Determination of the target vehicle



Recognizing a vehicle entering in front of your vehicle
Determining target vehicle

Recognizing the lanes and leading vehicles using the multipurpose camera

Determining the target vehicle using the information from the millimeter wave radar and multipurpose camera

Determining the target vehicle to follow and start following it

ADAPTIVE CRUISE CONTROL (ACC) SYSTEM DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the ACC system is shown below.

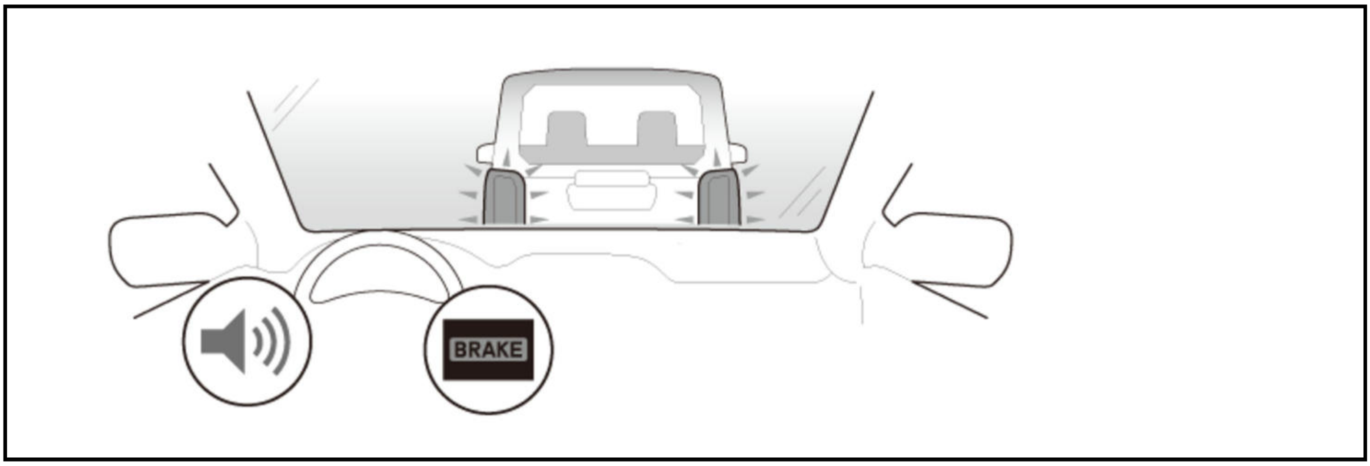
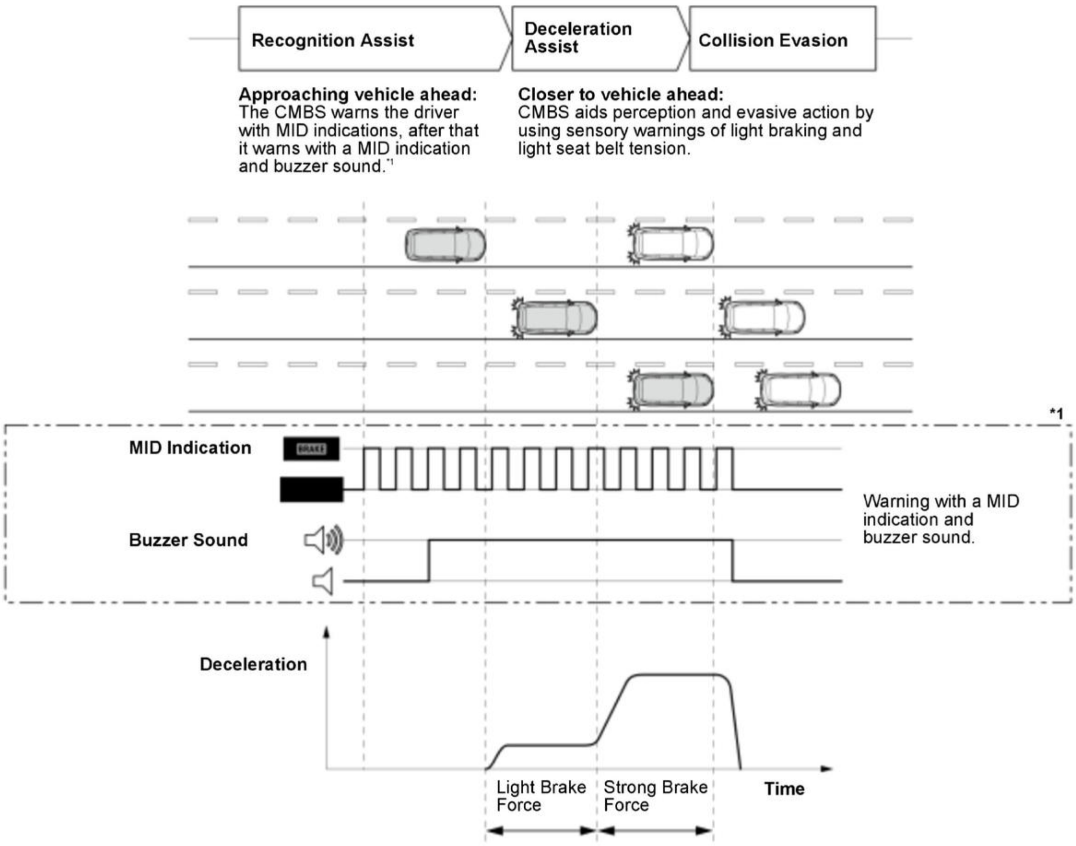
COLLISION MITIGATION BRAKING SYSTEM (CMBS) DESCRIPTION

The CMBS can detect a possible collision and assist brake operation to reduce the impact on the vehicle.



CMBS Operation Sequence

- When the speed difference between your vehicle and a vehicle or pedestrian detected ahead is greater than 3 mph (5 km/h) and the system detects a possible collision, the system issues a warning message on the Multi Information Display (MID) and sets an alarm off.
- When your vehicle is getting close to the vehicle or pedestrian detected ahead of your vehicle, the system issues a warning message on the MID and sets an alarm off to give the warning to the driver that there is a possible collision (First step).
- When your vehicle gets even closer to the vehicle or pedestrian detected ahead of your vehicle and the system anticipates a collision, CMBS applies light braking force while issuing the MID warning and setting an alarm off (Second step).
- When the system determines that a collision is inevitable, the CMBS applies strong brake force while issuing the MID warning and setting an alarm off (Third step).



Recognition Assist
Deceleration Assist
Collision Evasion
Approaching vehicle ahead:
The CMBS warns the driver with MID indications, after that it warns with a MID indication and buzzer sound.*1
Closer to vehicle ahead:
CMBS aids perception and evasive action by using sensory warnings of light braking and light seat belt tension.
*1
MID Indication
BRAKE
Buzzer Sound
Warning with a MID indication and buzzer sound.
Deceleration
Light Brake Force
Strong Brake Force
Time

*1: Normally the alarm buzzer goes off after the MID warning message appears but they may be issued at the same time due to driving and weather conditions.

- The multipurpose camera unit records the number of operations from vehicle ON mode to OFF (LOCK) mode. When the limit for the number of operations is exceeded, "excessive CMBS operation" is judged, the CMBS function is disabled, the warning indicator comes on and DTCs are stored. The limit for the number of operations differs according to the CMBS operation conditions.
- When the multipurpose camera is malfunctioning (including a temporary function stop), CMBS does not function.

Operation Conditions

B	Vehicle Ahead	Opposite Vehicle	Pedestrian
Conditions for the object	Passenger vehicles, subcompact, or large vehicle (The system may have difficulty recognizing two wheeled vehicles, like motorcycles, or other unusual body styles.		The system uses analysis method using preprogrammed human figure patterns to detect pedestrians. (heights need to be approximately 1 to 2 meters for

B		Vehicle Ahead	Opposite Vehicle	Pedestrian
		The system will function as designed if the vehicles are detected.)		the system to recognize figures as pedestrians) • Pedestrians behind the vehicle, and persons crossing the road. • • - In some cases, persons crossing the road may not be detected if they jump out onto the road or are running. • - Depending on shape and material, human shaped posters or signs along the road may be detected.
System operation conditions	Operation vehicle speed	About 3 mph (5 km/h) or more	Between about 3 mph (5 km/h) and 62 mph (100 km/h).	
	Relative velocity	About 3 mph (5 km/h) or more	About 9 mph (15 km/h) or more	About 3 mph (5 km/h) or more
	Environment conditions*	• There is sufficient visibility and light available for the multipurpose camera to recognize objects • In environments where millimeter wave transmission/reception is not blocked (Some weather conditions such as fog, snowfall may have impact on system operation)		

*: For more details on environmental conditions and objects that are hard to be recognized, refer to the owner's manual.

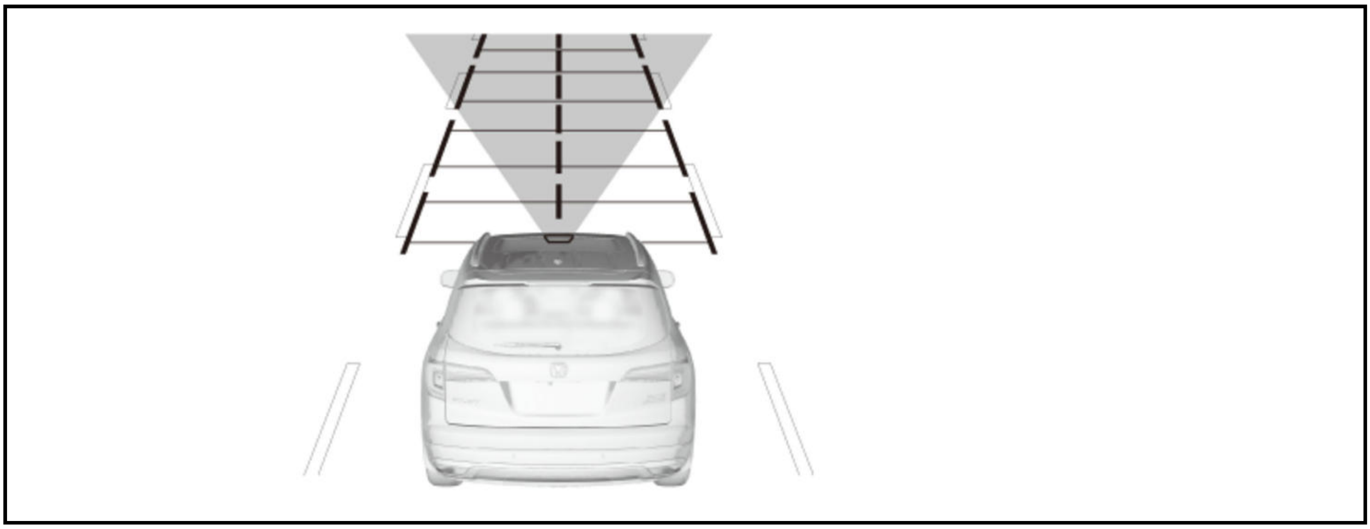
LANE KEEPING ASSIST SYSTEM (LKAS) DESCRIPTION

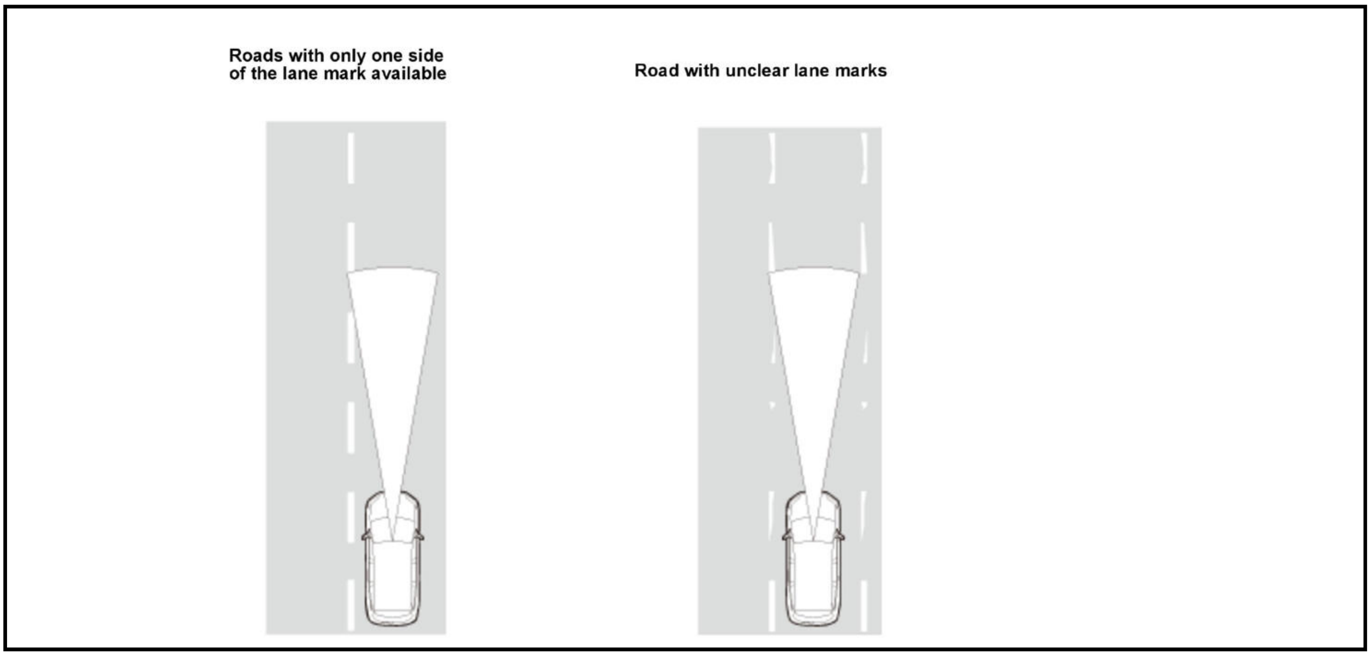
Lane Keeping Assist System (LKAS)

The LKAS uses the multipurpose camera to read the detected lane lines on both sides of the road. The multipurpose camera unit draws an imaginary line at the center between both lane lines, and lane keeping assist control is performed by assisting the steering so that the vehicle is guided along this imaginary line near the center of the lane. The system gets suspended when the system determines that the driver is not holding the steering wheel for a certain period of time while LKAS is in operation.



LKAS Inoperative Road Conditions

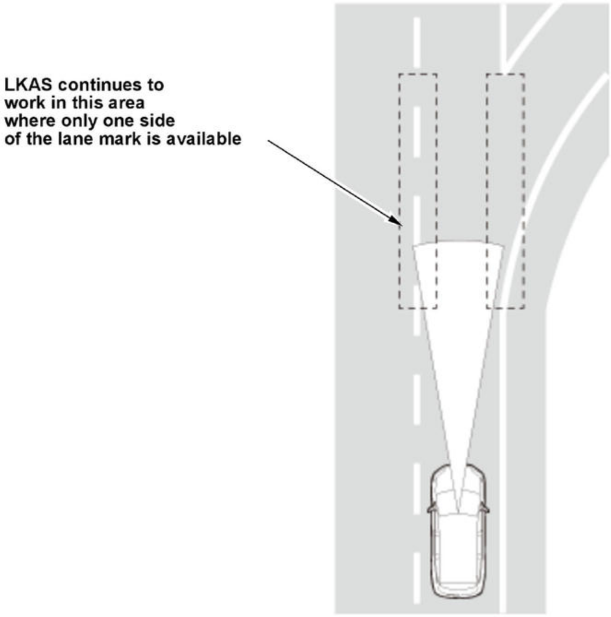
LKAS does not operate in the following road conditions (LKAS is inoperative while LDW continues to operate).



Roads with only one side of the lane mark available
Road with unclear lane marks

In case one side of lane mark is temporary missing (KA, KC models)

LKAS will continue to work even when one side of the lane mark is missing temporarily such as an intersection or a junction.



Operation Conditions

System Operation Conditions	Operation under conditions where lane line recognition is possible on both sides (Lane line recognition may not be possible in bad weather, snow-covered roads, or areas with backlight).	
	Operation vehicle speed	45 - 90 mph (72 - 145 km/h)
	Object lane line types	Broken lines or solid lines on the road (white and yellow)
	Driver operation	The LKAS is cancelled when the driver's intention to control the vehicle, such as intentional steering wheel operation, brake pedal operation, high speed wiper operation, and turn signal operation, is recognized.
LKAS Cancel Alarm	When the LKAS is canceled, a buzzer sounds ("beep") to warn the driver. The alarm can be set ON/OFF.	

LANE KEEPING ASSIST SYSTEM (LKAS) DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the LKAS is shown below.

For locations of each component on the vehicle, refer to Component Location Index:

- **Multipurpose camera unit**
- **Millimeter wave radar**
- **PCM**
- **EPS control unit**
- **SRS unit**
- **VSA modulator-control unit**
- **Gauge control module**

The LKAS for this vehicle uses the multipurpose camera unit to calculate camera image information, and sends the LKAS indicated value to the control unit via the millimeter wave radar.

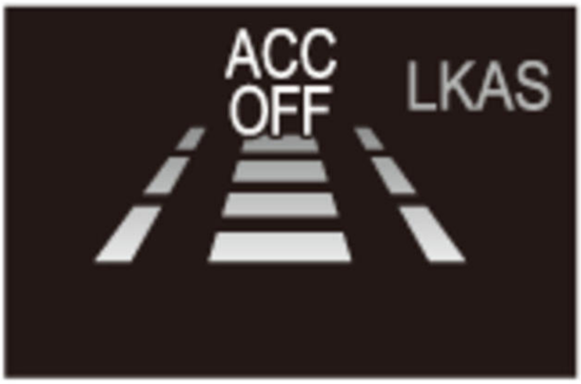
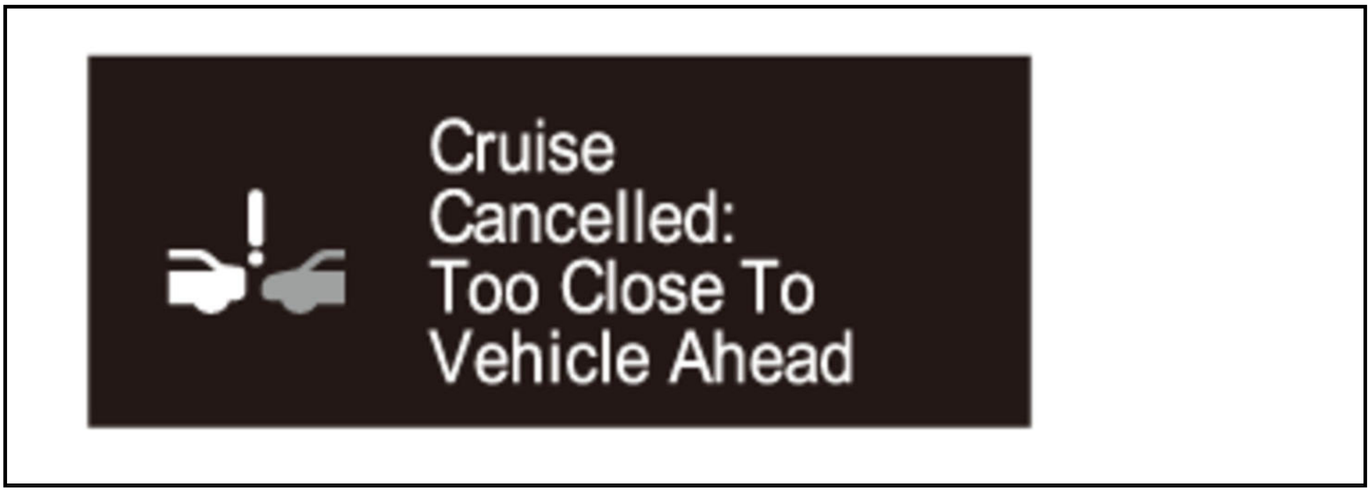
GENERAL INFORMATION

ACC SYSTEM AUTO STOP CONTROL HISTORY

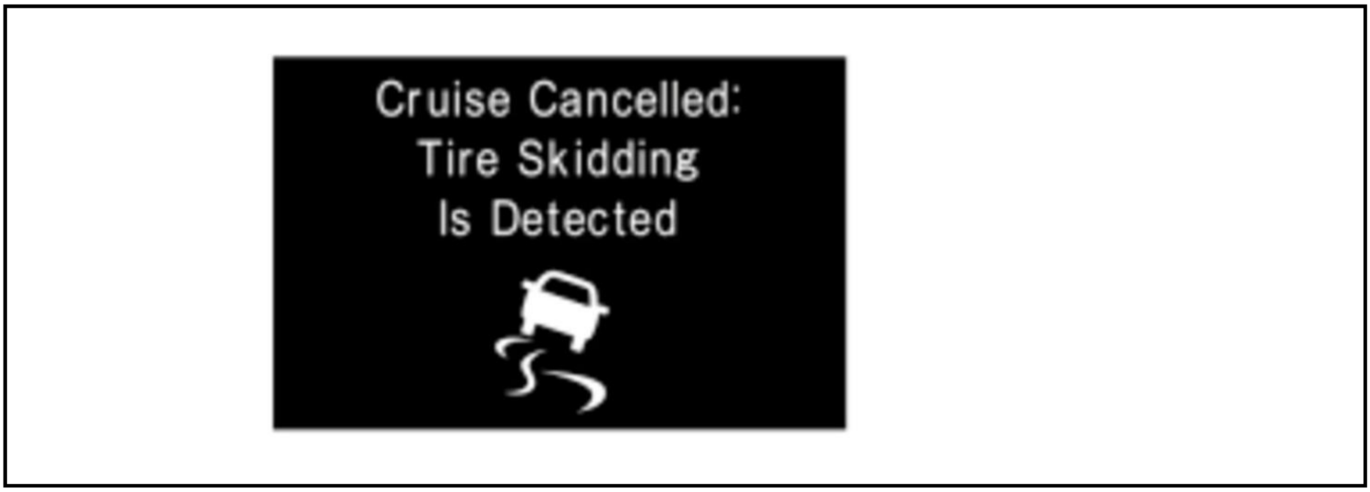
When the ACC is activated, if the millimeter wave radar determines that the ACC is unable to operate normally due to an environmental factors (such as weather or road surface condition and driving or vehicle condition) or other reasons even when the ACC system itself is normal, the millimeter wave radar automatically cancels the activation of the ACC and records the ACC system auto stop control code in it.

When the ACC is automatically cancelled, "ACC OFF" is displayed on the multi-information display (MID) to notify the driver of the cancellation. At this time, the ACC indicator (amber) does not come on.





Cruise Cancelled: Too Close To Vehicle Ahead



Cruise Cancelled: Tire Skidding Is Detected

Checking for ACC System Auto Stop Control Codes

The ACC system auto stop control codes recorded in the millimeter wave radar can be read out by the procedure below.

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. Connect the HDS .

2. In the Driving Support of the HDS, select Integrated Driver Support System, then select Data List on the HDS. Checking for ACC system auto stop control codes recorded in the Data List.

NOTE:

- **ACC system auto stop control history is recorded from 1. When automatic cancellation takes place 11 times or more, the past 10 records are held. In this case, history 10 is the latest record and the 10 latest records are held. When 0, no record is held.**
- **When DTCs are cleared with the HDS, the ACC system auto stop control history is cleared as well.**
- **Some of the following ACC system auto stop control codes may not be used for specific model specifications.**

ACC System Auto Stop Control Codes

Code	ACC System Auto Stops Operating	Examples	Detection Conditions	Restoration Conditions (Conditions under which ACC SET is possible)	Reasons for Control OFF
80	Engine Speed too high or too low	The vehicle decelerated because the leading vehicle decelerated, and	The driver did not operate the clutch pedal within 10	The engine speed returned to the	Prevention of engine stall while the vehicle is

Code	ACC System Auto Stops Operating	Examples	Detection Conditions	Restoration Conditions (Conditions under which ACC SET is possible)	Reasons for Control OFF
		the engine speed dropped below the mid-speed ranges.	seconds after the shift-down request was displayed.	specified speed or higher.	decelerating because the leading vehicle is decelerating.
84	Target vehicle comes closer than the radar detecting limits	- The leading vehicle slowed down rapidly. - Another vehicle suddenly cut in front of the own vehicle.	The distance between the leading vehicle and your vehicle is less than the minimum allowable vehicle-to-vehicle distance. - Models with the low speed follow (LSF) feature: 1.5 m (4.9 ft) - Models without the low speed follow (LSF) feature: 5 m (16 ft)	The system returns to normal when the distance between the leading vehicle and your vehicle reaches or exceeds the minimum allowable vehicle-to-vehicle distance + 0.5 m (1.6 ft).	The control is prohibited at a close distance to the leading vehicle where the ACC system is unavailable. If the leading vehicle is too close to your vehicle, the millimeter wave radar may fail to detect the leading vehicle.
89	Front wheel spin	- Driving on a slippery (low ') road - TCS control is executed.	A change in the wheel speed equivalent to 0.75 G occurs.	Other than those listed to the left	Prevention of use of ACC on a road where vehicle behavior is unstable

*: This value differs depending on whether or not the vehicle is equipped with Low Speed Follow (LSF).

Code	ACC System Auto Stops Operating	Examples	Detection Conditions	Restoration Conditions (Conditions under which ACC SET is possible)	Reasons for Control OFF
99	Acceleration/deceleration abnormality	- The inclination of the road changed significantly while the vehicle accelerates/decelerates at around the maximum acceleration/deceleration speed of the ACC system. - The powertrain or brake system is abnormal.	- While the ACC was operating, an acceleration of 0.4 G or more* continued for 1.0 second or more. - While the ACC was operating, a deceleration of -0.5 G or less*	Other than those listed to the left	Because the maximum acceleration/deceleration speed for the ACC system is exceeded.

Code	ACC System Auto Stops Operating	Examples	Detection Conditions	Restoration Conditions (Conditions under which ACC SET is possible)	Reasons for Control OFF
			continued for 1.5 seconds or more.		
101	Rear wheel locked	The parking brake is not released or the vehicle is driven on a frozen road surface.	A signal of 5 mph (8 km/h) or more is inputted to the front wheel sensor and a signal of 0 mph (0 km/h) is inputted to the rear wheel sensor.	The front and rear wheel sensors detect a wheel speed.	Prevention of unstable vehicle behavior
109	Movement distance too short after initiation	When the millimeter wave radar detects an object that turns on low speed follow (LSF) control immediately after vehicle ON mode.	When the distance the vehicle travels after vehicle ON mode, is less than 8 m (26 ft), which is calculated based on the vehicle speed.	When the distance the vehicle travels is 8 m (26 ft) or more.	This is because an object other than a vehicle may be recognized as the leading vehicle after vehicle ON mode in a parking lot etc.
110	Shift position 1st	• While driving in 1st gear. • Vehicle is driven at an extremely low speed.	1st gear shift position is detected.	Vehicle is driven in 2nd or higher gear (forward gear).	Inappropriate gear is selected for ACC system.

*: This value differs depending on whether or not the vehicle is equipped with Low Speed Follow (LSF).

Code	ACC System Auto Stops Operating	Examples	Detection Conditions	Restoration Conditions (Conditions under which ACC SET is possible)	Reasons for Control OFF
111	Brake pads temperature too high	• Driving down hill • Driving down hill on a long road • Excessive use of the footbrake • Turn the vehicle to the OFF (LOCK) mode when VSA system sets the brake pad high temperature information, then turn the vehicle to the ON mode again.	VSA system sets the brake pad high temperature information.	VSA system clears the brake pad high temperature information.	• Use of ACC while driving downhill on a long road cause the brake pads to increase in temperature which can result in change of the operation feeling of a brake pedal. In this case, driver may not be able to respond to changes in feeling of a brake pedal. • The driver may make a complaint about a nasty smell from high

Code	ACC System Auto Stops Operating	Examples	Detection Conditions	Restoration Conditions (Conditions under which ACC SET is possible)	Reasons for Control OFF
					temperature brake pads without noticing the ACC brake.

*: This value differs depending on whether or not the vehicle is equipped with Low Speed Follow (LSF).

SYMPTOM TROUBLESHOOTING INDEX

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING INDEX

NOTE: The ACC system is cancelled when the VSA system is activated.

Symptom	Diagnostic procedure	Also check for
Vehicle speed can be set, but there is no ACC indication on the MID	**Do the gauge control module self-diagnostic function** .	B
ACC OFF is displayed on the MID unexpectedly	**Check the ACC system auto stop control history**.	B
Vehicle speed cannot be set when the SET switch is pressed between 25 mph (40 km/h) and 90 mph (145 km/h)	- **Test the ACC combination switch** . - **Test the brake pedal position switch** .	- An open in the wire - A short in the wire - The system is in service mode.
Vehicle does not decelerate or accelerate accordingly when the SET- or RES+ switch is pressed	**Test the ACC combination switch** .	An open in the wire
Set speed does not cancel when the brake pedal is pressed	**Test the brake pedal position switch** .	An open in the wire
Set speed does not cancel when the MAIN switch is turned off	**Test the ACC combination switch** .	An open in the wire
Set distance cannot be adjusted with the distance switch	**Test the ACC combination switch** .	B
Vehicle speed can be set, but vehicle decelerates	**Check for DTCs in the PGM-FI system with the HDS** .	Faulty ETCS
ACC indicator (on the MID) does not come on	**Symptom troubleshooting**.	B
ACC indicator (on the MID) does not go off, and no DTCs are stored	**NOTE:** If any of the CAN communication failure DTC is indicated in another system, troubleshoot the DTC first. - Check for an open or a short in the F-CAN circuit; - - - Between the gauge control module and the CAN gateway (F-CAN D_H, F-CAN D_L) - -	Refer to the followings about the indicator operating condition; - **General troubleshooting information** Refer to the followings about the circuit troubleshooting; - **Gauge control Module connector for inputs and outputs** - **Millimeter wave radar connector for inputs and outputs** - **Adaptive cruise control (ACC) circuit diagram**

Symptom	Diagnostic procedure	Also check for
	Between the millimeter wave radar and the CAN gateway (F-CAN C_H, F-CAN C_L) - Check the millimeter wave radar power circuit (IG1_OPTION). - Check the millimeter wave radar ground circuit (GND). - **Do to the gauge control module self-diagnostic function** .	- **Fuse to components index** - **Ground to components index**
Senses a vehicle driving in another lane	**Symptom troubleshooting**.	- Incorrect millimeter wave radar installation - Wheel alignment

Symptom	Diagnostic procedure	Also check for
Does not sense the vehicle driving ahead	**Symptom troubleshooting**.	- Out of the performance limits - Wheel alignment - Undetectable environment
Intermittently senses the vehicle driving ahead	**Symptom troubleshooting**.	- Incorrect millimeter wave radar installation - Wheel alignment - Undetectable environment

SYMPTOM TROUBLESHOOTING

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - ACC INDICATOR (ON THE MID) DOES NOT COME ON

1. Gauge control module operation check

   -1. Turn the vehicle to the ON mode.

   Check the following indicators in the gauge control module:

- Malfunction indicator lamp (MIL)
- Brake system indicator
- 12 volt charging system indicator

Do the indicators come on?

YES

Go to the gauge control module self-diagnostic function .

NO

Go to step 2.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D7

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. Turn the vehicle to the ON mode, then the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D7 fuse circuit.

3. Open wire check (IG1_METER line)

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Gauge control module connector A (32P): disconnected
Test point 1	Gauge control module connector A (32P) No. 17
Test point 2	Body ground

Is there battery voltage?

YES

Replace the gauge control module .

NO

Repair an open in the IG1_METER wire between the under-dash fuse/relay box and the gauge control module.

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - DOES NOT SENSE THE VEHICLE DRIVING AHEAD

1. All condition check

-1. Find out if the detection problem occurs under all conditions.

Does it occur under all conditions?

YES

The millimeter wave radar vertical aiming is incorrect. **Aim the millimeter wave radar** .

NO

Go to step 2.

2. Road condition check

   -1. Find out if the detection problem occurs only on a particular road such as a winding road, an entrance of a corner, an exit of a corner, a tight corner, or a bad road.

   Does it occur only on a particular road?

   YES

   Explain to the customer that the system sometimes cannot detect under certain road conditions.

   NO

   Go to step 3.

3. Weather condition check

   -1. Find out if the detection problem occurs only under poor weather conditions such as fog, snow, heavy rain, or gusty winds.

   Does it occur only under poor weather conditions?

   YES

   Explain to the customer that the system sometimes cannot detect under poor weather conditions.

   NO

   Go to step 4.

4. Driving condition check:

   Find out if the detection problem occurs only when the vehicle ahead drives under these conditions:

   - Merged into the lane suddenly.
   - Closing on a vehicle within 4 m (13 ft).

   Does it occur only under certain driving conditions?

   YES

   Explain to the customer that the system sometimes cannot detect under certain driving conditions.

   NO

   Go to step 5.

5. Millimeter wave radar aiming check

   -1. Confirm if the radar detects vehicles driving in another lane.

   Does it detect vehicles in other lanes?

   YES

   The millimeter wave radar horizontal aiming is incorrect. **Aim the millimeter wave radar** .

NO

Go to step 6.

6. Other component check

   -1. Confirm if the detection problem is caused by instability.

   NOTE: If the cause of the misdetection or undetectable problems is unclear, it is possible that the problem was caused by environmental conditions. Explain to the customer that intermittent failures are sometimes caused by environmental conditions.

   Is the vehicle unstable? (Compare it to a known-good, like vehicle.)

   YES

   Check other components such as VSA modulator-control unit or wheel speed sensors, etc.

   NO

   Go to step 7.

7. Heavy load check

   -1. Check if there is a heavy load on the vehicle.

   Is there a heavy load on the vehicle?

   YES

   Remove the heavy load from the vehicle. Advise the customer that this problem may occur temporarily when hauling heavy loads.

   NO

   Go to step 8.

8. Millimeter wave radar and radar cover check

   -1. Check for dirt, dust, or snow on the surface of the millimeter wave radar and the radar cover.

   Are the millimeter wave radar and radar cover OK?

   YES

   Go to step 9.

   NO

   Clean the millimeter wave radar and the radar cover.

9. Vehicle ride height check

   -1. Measure the front and rear vehicle ride height.

   Is the vehicle ride height equal?

   YES

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

   NO

   Inspect the suspension for damage, and compare ride height to a known-good vehicle. **Adjust the wheel alignment as needed** .

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - INTERMITTENTLY SENSES THE VEHICLE DRIVING AHEAD

1. Road condition check

   -1. Find out if the detection problem occurs only on a particular road such as a winding road, an entrance of a corner, an exit of a corner, a tight corner, or a bad road.

   Does it occur only on a particular road?

   YES

   Explain to the customer that the system sometimes cannot detect under certain road conditions.

   NO

   Go to step 2.

2. Weather condition check

   -1. Find out if the detection problem occurs only under poor weather conditions such as fog, snow, heavy rain, or gusty winds.

   Does it occur only under poor weather conditions?

   YES

   Explain to the customer that the system sometimes cannot detect under poor weather conditions.

   NO

   Go to step 3.

3. Driving condition check:

   Find out if the detection problem occurs only when the vehicle ahead drives under these conditions:

   - Merged into the lane suddenly.
   - Closing on a vehicle within 4 m (13 ft).

   Does it occur only under certain driving conditions?

   YES

   Explain to the customer that the system sometimes cannot detect under certain driving conditions.

   NO

   Go to step 4.

4. Millimeter wave radar aiming check

   -1. Confirm if the radar detects vehicles driving in another lane.

   Does it detect vehicles in other lanes?

   YES

   The millimeter wave radar horizontal aiming is incorrect. **Aim the millimeter wave radar aiming** .

   NO

   Go to step 5.

5. All condition check

-1. Find out if the detection problem occurs under all conditions.

Does it occur under all conditions?

YES

The millimeter wave radar vertical aiming is incorrect. **Aim the millimeter wave radar aiming** .

NO

Go to step 6.

6. Other component check

   -1. Confirm if the detection problem is caused by instability.

   NOTE: If the cause of the misdetection or undetectable problems is unclear, it is possible that the problem was caused by environmental conditions. Explain to the customer that intermittent failures are sometimes caused by environmental conditions.

   Is the vehicle unstable? (Compare it to a known-good, like vehicle.)

   YES

   Check other components such as VSA modulator-control unit or wheel speed sensors, etc.

   NO

   Go to step 7.

7. Heavy load check

   -1. Check if there is a heavy load on the vehicle.

   Was there a heavy load on the vehicle?

   YES

   Remove the heavy load from the vehicle. Advise the customer that this problem may occur temporarily when hauling heavy loads.

   NO

   Go to step 8.

8. Millimeter wave radar and radar cover check

   -1. Check for dirt, dust, or snow on the surface of the millimeter wave radar and the radar cover.

   Are the millimeter wave radar and radar cover OK?

   YES

   Go to step 9.

   NO

   Clean the millimeter wave radar and the radar cover.

9. Vehicle's history check

   -1. Check the vehicle's history for front end collision repairs.

   Has the vehicle been in a collision and repaired?

   YES

Go to step 10.

NO

Go to step 12.

10. Millimeter wave radar installing check

    -1. Check if the millimeter wave radar and its bracket are installed correctly, and also check if the vehicle frame is straight.

    Are all parts installed correctly?

    YES

    Go to step 11.

    NO

    Reinstall the part correctly, or if damaged, replace the part, then **aim the millimeter wave radar** .

11. Vehicle ride height check

    -1. Measure the front and rear vehicle ride height.

    Is the vehicle ride height equal?

    YES

    Go to step 12.

    NO

    Inspect the suspension for damage, and compare ride height to a known-good vehicle. **Adjust the wheel alignment as needed** .

12. Wheel alignment check

    -1. **Check the wheel alignment** .

    Is the wheel alignment OK?

    YES

    Aim the millimeter wave radar .

    NO

    Adjust the wheel alignment .

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - SENSES A VEHICLE DRIVING IN ANOTHER LANE

1. Problem verification 1

    -1. Find out when and under what conditions the system has misdetections.

    Do they occur within 20 minutes or less?

    YES

    Go to step 2.

    NO

    Explain to the customer that system misdetections are sometimes caused by the environment (weather, road conditions, driving conditions, etc.).

2. Problem verification 2

   -1. Find out if the detection problem occurs only with certain types of vehicles (dirty vehicle, tall vehicle, motorcycle, or special vehicle).

   Does it occur only with certain types of vehicles?

   YES

   Explain to the customer that the system sometimes cannot detect certain vehicle types.

   NO

   Go to step 3.

3. Vehicle's history check

   -1. Check the vehicle's history for front end collision repairs.

   Has the vehicle been in a collision and repaired?

   YES

   Go to step 4.

   NO

   Go to step 5.

4. Millimeter wave radar installing check

   -1. Check if the millimeter wave radar and its bracket are installed correctly, and also check if the vehicle frame is straight.

   Are all parts installed correctly?

   YES

   Go to step 5.

   NO

   Reinstall the part correctly, or if damaged, replace the part, then **aim the millimeter wave radar** .

5. Wheel alignment check

   -1. **Check the wheel alignment** .

   Is the wheel alignment OK?

   YES

   Aim the millimeter wave radar .

   NO

   Adjust the wheel alignment .

COLLISION MITIGATION BRAKING SYSTEM (CMBS) SYMPTOM TROUBLESHOOTING - CMBS INDICATOR (ON THE MID) DOES NOT GO OFF

1. DTCs check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC (IDAS)

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 2.

2. VSA system DTCs check

   -1. Check for VSA system DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 3.

3. PGM-FI system DTCs check

   -1. Check for PGM-FI system DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 4.

4. Gauge control module operation check

   -1. **Do the gauge control module self-diagnostic function** .

Is the gauge control module OK?

YES

Go to step 5.

NO

Replace the gauge control module .

5. CMBS OFF switch check

-1. **Test the CMBS OFF switch** .

Is the switch OK?

YES

Check for loose terminals and poor connections in the millimeter wave radar 8P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace millimeter wave radar** .

NO

Replace the CMBS OFF switch .

LANE KEEPING ASSIST SYSTEM (LKAS) SYMPTOM TROUBLESHOOTING - LKAS INDICATOR (ON THE MID) DOES NOT COME ON

1. Gauge control module operation check

-1. Turn the vehicle to the ON mode.

Check the following indicators in the gauge control module:

- Malfunction indicator lamp (MIL)
- Brake system indicator
- 12 volt charging system indicator

Do the indicators come on?

YES

Go to the gauge control module self-diagnostic function .

NO

Go to step 2.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. D7**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. Turn the vehicle to the ON mode then the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D7 fuse circuit.

3. Open wire check (IG1_METER line)

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Gauge control module connector A (32P): disconnected
Test point 1	Gauge control module connector A (32P) No. 17
Test point 2	Body ground

Is there battery voltage?

YES

Replace the gauge control module .

NO

Repair an open in the wire between the under-dash fuse/relay box and the gauge control module.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

AM RADIO RECEPTION CHANGES AT NIGHT (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- This is a system characteristic. AM radio stations are required by the government (FCC) to lower their power at night

AM/FM RADIO DISPLAY IS BLANK OR NO STATION INFORMATION IS DISPLAYED (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

AM/FM RADIO PRESET MEMORY IS LOST (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Replace the audio unit**

Also Check for

Internal error

AM/FM RADIO PRESET MEMORY IS LOST (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Replace the tuner unit**

Also Check for

Internal error

AUDIO REMOTE-HFL SWITCH DOES NOT WORK PROPERLY (AUDIO UNIT BUTTONS WORK) (COLOR AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

AUDIO REMOTE-HFL SWITCH DOES NOT WORK PROPERLY (AUDIO UNIT BUTTONS WORK) (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

AUDIO SYSTEM SOUND IS WEAK OR DISTORTED (DISPLAY IS NORMAL) (COLOR AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

- Fader and balance positions
- Aftermarket amplifier or speakers

AUDIO SYSTEM SOUND IS WEAK OR DISTORTED (DISPLAY IS NORMAL) (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- Fader and balance positions
- Aftermarket amplifier or speakers

AUDIO UNIT BUTTON DOES NOT WORK (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Do the Knob Check in the System Diagnostic Mode**

Also Check for

Check the connector for poor connections or loose terminals between the audio unit and the audio panel

AUDIO UNIT BUTTON ILLUMINATION DOES NOT WORK (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

AUDIO UNIT DOES NOT EXIT ANTI-THEFT MODE (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Anti-Theft Feature**

AUDIO UNIT DOES NOT EXIT ANTI-THEFT MODE (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Anti-Theft Feature**

AUDIO UNIT WILL NOT TURN ON (NO INFORMATION DISPLAY) (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

AUDIO UNIT WILL NOT TURN ON (NO INFORMATION DISPLAY) (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

AUDIO-NAVIGATION UNIT POWER WILL NOT TURN ON (NO INFORMATION DISPLAY)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- Blown fuses
- Screen settings
- **Error Messages**
- Software not up to date

BLUETOOTH AUDIO DOES NOT WORK

Diagnostic Procedure

Check the Bluetooth module:

- With navigation: **Do the HFL/Mic in the System Diagnostic Mode**
- Display audio type without navigation: **Do the HFL/Mic in the System Diagnostic Mode**
- Color audio type: **Do the Version Display in the System Diagnostic Mode**

Also Check for

Bluetooth audio device compatibility (see the Owner's Manual)

BLUETOOTH AUDIO DOES NOT WORK (COLOR AUDIO TYPE)

Also Check for

Bluetooth phone compatibility (see the Owner's Manual)

BLUETOOTH AUDIO DOES NOT WORK (DISPLAY AUDIO TYPE)

Also Check for

Bluetooth phone compatibility (see the Owner's Manual)

BOOMING SOUND WHILE DRIVING WITH AUDIO SYSTEM ON OR OFF (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

BOOMING SOUND WHILE DRIVING WITH AUDIO SYSTEM ON OR OFF (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

Powertrain vibration or judder

CENTER DISPLAY UNIT BUTTON DOES NOT WORK (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Do the Hard Key in the System Diagnostic Mode**

Also Check for

Check the Touch Panel Sensitivity in the System Settings

CENTER DISPLAY UNIT DOES NOT DIM (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

CLOCK WILL NOT SET TO CORRECT TIME

Also Check for

Check the GPS signal

EXCESSIVE TRANSITION BETWEEN ANALOG BROADCAST AND DIGITAL HD RADIO (TM) BROADCAST (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Receiver is located near the edge of the digital HD Radio (TM) coverage area. Refer to www.hdradio.com to verify radio stations in your coverage area

HD RADIO (TM) CHANGES HD CHANNEL ON ITS OWN (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- This is intended behavior. HD Radio (TM) is set to revert to main channel after extended loss of HD2/HD3 broadcast

HFL DOES NOT WORK PROPERLY

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

Bluetooth phone compatibility (see the Owner's Manual)

NAVIGATION SYSTEM STAYS ON THE CSF SCREEN

Diagnostic Procedure

- Navigation DTCs

Also Check for

- GPS Initialization
- Aftermarket metallic window tint on the front window or electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit
- Disconnected or defective GPS antenna

NAVIGATION TOUCH PANEL DOES NOT WORK

Diagnostic Procedure

- Do the Touch Panel Check in the System Diagnostic Mode

Also Check for

Forced Rebooting of Audio-Navigation Unit

NO HD TRAFFIC INFORMATION

Diagnostic Procedure

- **Go to AM/FM radio display is blank or no station information is displayed troubleshooting**

Also Check for

Local outage or no local broadcast. Compare to a known-good vehicle of the same year and trim.

NO SOUND IS HEARD FROM ALL THE SPEAKERS (DISPLAY IS NORMAL) (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

Aftermarket amplifier or speakers

NO SOUND IS HEARD FROM ALL THE SPEAKERS (DISPLAY IS NORMAL) (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

Aftermarket amplifier or speakers

PANDORA IS NOT IS DISPLAYED AS AN AUDIO SOURCE (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Do the PANDORA in the System Diagnostic Mode to check the Pandora settings is abled**

POOR AM OR FM RADIO RECEPTION OR INTERFERENCE (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- Check radio reception: **Do the FM or AM in the System Diagnostic Mode**
- Aftermarket FM modulator
- Loose antenna amplifier mounting bolt

POOR GPS RECEPTION OR INTERFERENCE

Diagnostic Procedure

- **Do the GPS Information in the System Diagnostic Mode**

Also Check for

- **Global Positioning System (GPS) Limitations**
- Aftermarket metallic window tint on the front window or electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit

POOR OR NO SOUND WITH AM/FM RADIO (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- Check radio reception: **Do the Remote Tuner in the System Diagnostic Mode**
- Aftermarket FM modulator
- Loose antenna amplifier mounting bolt

REARVIEW CAMERA IMAGE DOES NOT CHANGE WHEN SELECTING DIFFERENT VIEWS (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

REARVIEW CAMERA IMAGE DOES NOT CHANGE WHEN SELECTING DIFFERENT VIEWS (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

REARVIEW CAMERA IMAGE DOES NOT COME ON (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

REARVIEW CAMERA IMAGE DOES NOT COME ON (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

SYSTEM ALWAYS COMES UP IN-LINE DIAGNOSTIC MODE

Diagnostic Procedure

- **Factory diagnostic screen In Line Diagnostic mode**

SYSTEM ALWAYS COMES UP IN-LINE DIAGNOSTIC MODE (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Factory diagnostic screen In Line Diag**

THE MID DOES NOT DISPLAY THE AUDIO UNIT INFORMATION (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

THE MID DOES NOT DISPLAY THE AUDIO-NAVIGATION UNIT INFORMATION

Diagnostic Procedure

- Symptom Troubleshooting

THE APPROVED BLUETOOTH CELL PHONE CANNOT USE ALL ITS FUNCTIONS

Diagnostic Procedure

- HFL System Troubleshooting

THE APPROVED BLUETOOTH CELL PHONE DOES NOT PLACE OR RECEIVE CALLS USING THE HFL SYSTEM

Diagnostic Procedure

- HFL System Troubleshooting

THE APPROVED BLUETOOTH CELL PHONE IS HAVING PROBLEMS PAIRING TO THE VEHICLE

Diagnostic Procedure

- HFL System Troubleshooting

USB CHARGER DOES NOT WORK (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

USB DEVICE DOES NOT FUNCTION (COLOR AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

- Error Messages
- USB device compatibility (see the Owner's Manual)

USB DEVICE DOES NOT FUNCTION (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

- Error messages
- USB device compatibility (see the Owner's Manual)

VEHICLE POSITION ICON WANDERS ACROSS THE MAP WHEN DRIVING (DOES NOT FOLLOW A DISPLAYED ROAD) OR MAP VEHICLE ICON SPINS

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- **Global Positioning System (GPS) Limitations**
- **Map Matching**
- **Sensor Calibration**
- VSP missing
- Poor or no GPS reception
- Check for any related service bulletin software updates

VOICE CONTROL DOES NOT WORK/RESPOND

Also Check for

Check for any related service bulletin software updates

VOICE GUIDANCE CANNOT BE HEARD, IS BROKEN UP, OR THERE IS STATIC

Also Check for

Volume or voice feedback setting (see the Navigation System Manual)

VOLUME DOES NOT INCREASE WITH SPEED (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

Speed-sensitive Volume Control settings (see the Owner's Manual)

VOLUME DOES NOT INCREASE WITH SPEED (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

Speed-sensitive Volume Control settings (see the Owner's Manual)

VOLUME IS TOO HIGH OR TOO LOW WHEN DRIVING AT FREEWAY SPEEDS (COLOR AUDIO TYPE)

Also Check for

Speed-sensitive Volume Control settings (see the Owner's Manual)

VOLUME IS TOO HIGH OR TOO LOW WHEN DRIVING AT FREEWAY SPEEDS (DISPLAY AUDIO TYPE)

Also Check for

Speed-sensitive Volume Control settings (see the Owner's Manual)

XM RADIO DISPLAY IS BLANK AND NO STATION INFORMATION IS DISPLAYED (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- With navigation: Navigation DTCs
- Without navigation: Audio DTCs

Also Check for

Error messages

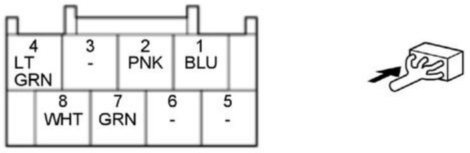
CONNECTOR VIEW

ANC/ACTIVE SOUND CONTROL MICROPHONE CONNECTOR FOR INPUTS AND OUTPUTS

Connector Index
Front ANC/Active Sound Control Microphone 8P Connector
Rear ANC/Active Sound Control Microphone 2P Connector

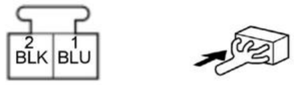
NOTE: The front HFL-navigation-ANC/active sound control microphone and the front HFL-ANC/active sound control microphone are the same parts.

Front ANC/Active Sound Control Microphone 8P Connector (female terminals)



Cavity	Terminal Name	Description
1	MIC_GND	Ground for microphone
2	MIC+	Outputs microphone signal
3	---	Not used
4	MIC_PWR	Microphone power source
5	---	Not used
6	---	Not used
7	HFT_MUTE	Inputs HFL microphone directivity switching signal
8	ANC_F_MIC+8V	Outputs signal for front ANC/active sound control microphone

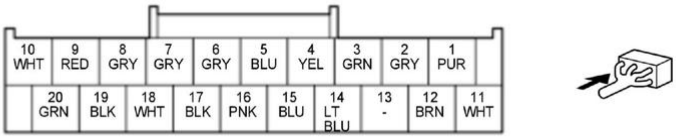
Rear ANC/Active Sound Control Microphone 2P Connector (female terminals)



Cavity	Terminal Name	Description
1	ANC_R_MIC+8V	Outputs signal for rear ANC/active sound control microphone
2	SH_ANC_R_MIC	Shield for terminal No. 1

ANC/ACTIVE SOUND CONTROL UNIT CONNECTOR FOR INPUTS AND OUTPUTS

ANC/Active Sound Control Unit 20P Connector (female terminals)

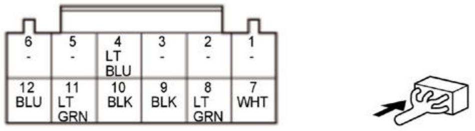


Cavity	Terminal Name	Description
1	GND	ANC/active sound control unit ground
2	AUD_F_MIX_SH	Shield for terminals No. 15 and No. 16
3	SWD+B	Inputs signal for ANC/active sound control unit switching ON/OFF
4	F-CAN B_H	Communication signal
5	F-CAN B_L	Communication signal
6	SH_ANC_R_MIC	Shield for terminal No. 17
7	SH_ANC_F_MIC	Shield for terminal No. 18
8	ANC_SH	Shield for terminals No. 9, No. 10, No. 19, and No. 20
9	ANC_R-	Outputs noise cancelling signal to related units
10	ANC_F-	Outputs noise cancelling signal to related units
11	+B_BACK_UP	+B power source
12	IG1_METER	IG1 power source
13	---	Not used
14	K-LINE	Communication signal
15	AUD_F_MIX_GND	Basis ground for terminals No. 16
16	AUD_F_MIX	Outputs noise cancelling mixing signal from related units
17	ANC_R_MIC+8V	Inputs signal for rear ANC/active sound control microphone
18	ANC_F_MIC+8V	Inputs signal for front ANC/active sound control microphone

Cavity	Terminal Name	Description
19	ANC_R+	Outputs noise cancelling signal to related units
20	ANC_F+	Outputs noise cancelling signal to related units

AUDIO REMOTE-HFL SWITCH CONNECTOR FOR INPUTS AND OUTPUTS

Audio Remote-HFL Switch 12P Connector (female terminals)



Cavity	Terminal Name	Description
1	---	Not used
2	---	Not used
3	---	Not used
4	ILL-(LED)	Outputs illumination control signal for related units
5	---	Not used
6	---	Not used
7	+B	+B power source
8	ILLUMI+	Outputs illumination signal
9*	STRG_GND	Ground for related units
10	STRG_GND	Audio remote-HFL switch ground
11*	HSW_LIN	Communication signal
12	STRG_SW_LIN	Communication signal

*: With heated steering wheel

AUDIO UNIT CONNECTOR FOR INPUTS AND OUTPUTS (COLOR AUDIO TYPE)

Connector Index
Audio Unit Connector A (24P)
Audio Unit Connector C (32P)
Audio Unit Connector E (3P)
Audio Unit Connector F (5P)

Cavity	Terminal Name	Description
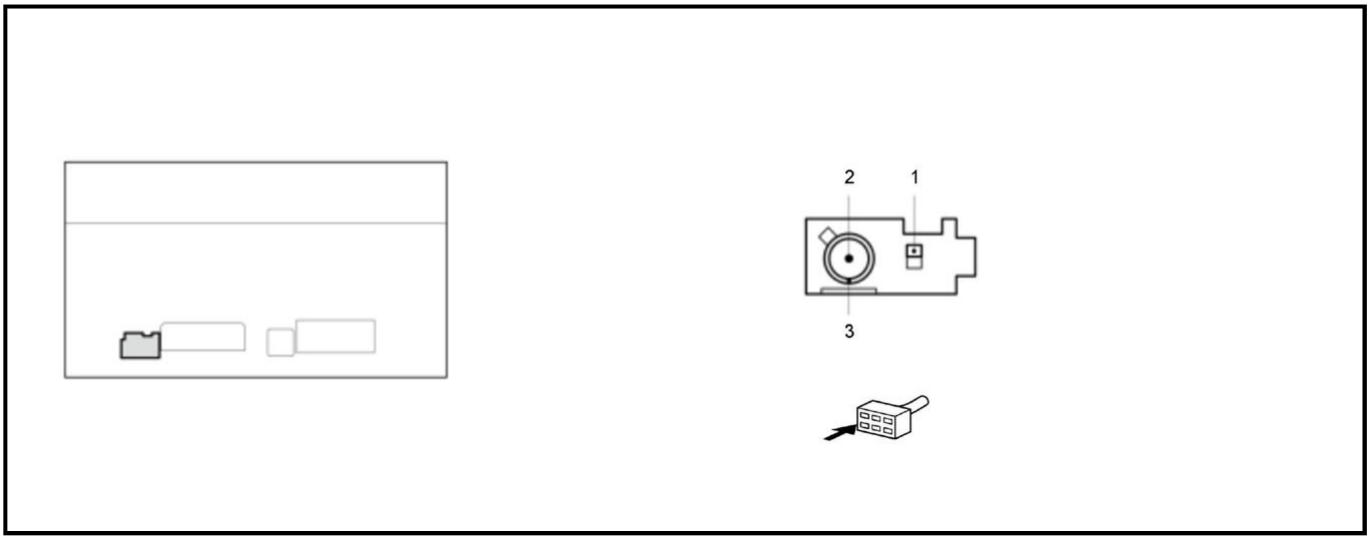
C1	ANC_R+	Inputs noise cancelling signal from ANC/active sound control unit
C2	ANC_R-	Inputs noise cancelling signal from ANC/active sound control unit
C3	COMPASS_1	Communication signal
C4	COMPASS_2	Communication signal
C5	HFT_MUTE	Outputs HFL microphone directivity switching signal
C6	SH_MIC	Shield for terminals No. 22 and No. 23
C7	MIC_PWR	Power source for HFL microphone
C8	---	Not used
C9	---	Not used
C10	---	Not used
C11	COMPASS_3	Communication signal
C12	COMPASS_4	Communication signal
C13	CAMERA_VCC	Power source for rearview camera
C14	CAMERA_GND	Ground for rearview camera
C15	---	Not used
C16	CAMERA_ADPT	Detects connection for rearview camera
C17	ANC_F+	Inputs noise cancelling signal from ANC/active sound control unit
C18	ANC_F-	Inputs noise cancelling signal from ANC/active sound control unit
C19	AUD_F_MIX	Inputs noise cancelling mixing signal from ANC/active sound control unit
C20	AUD_F_MIX_GND	Basis ground for terminals No. 19
C21	---	Not used
C22	MIC+	Inputs sound signal from HFL microphone
C23	MIC_GND	Ground for HFL microphone
C24	---	Not used
C25	---	Not used

Cavity	Terminal Name	Description
C26	---	Not used
C27	---	Not used
C28	SH_CAMERA	Shield for terminals No. 13, No. 14, No. 29, and No. 30
C29	CAMERA_V	Inputs NTSC video signal from rearview camera

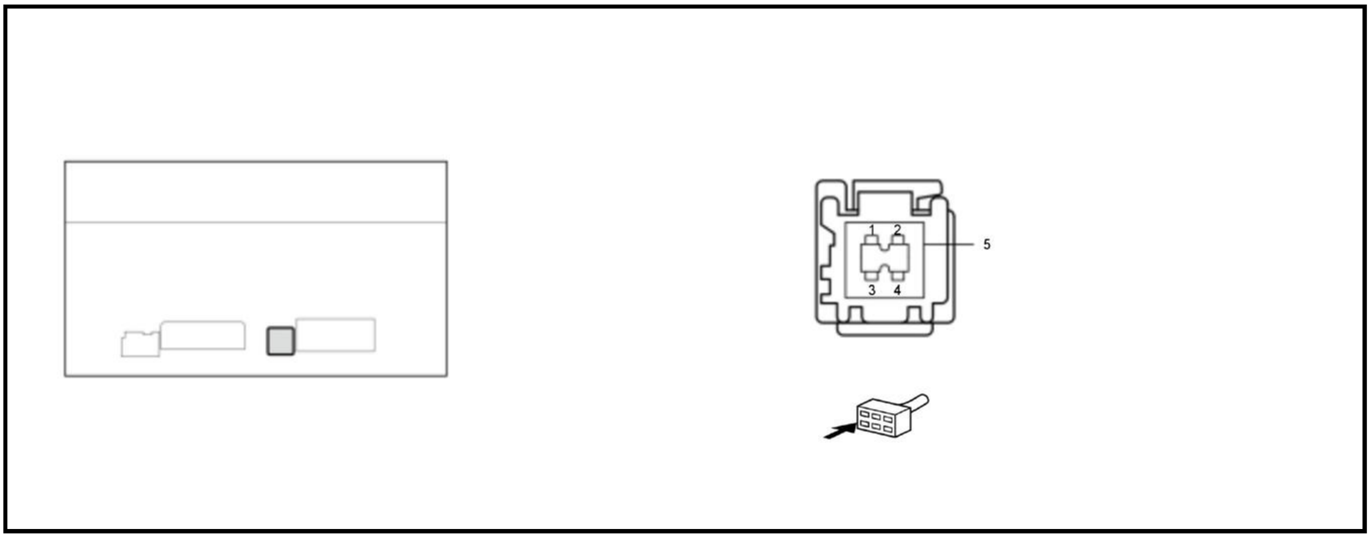
Cavity	Terminal Name	Description
C30	CAMERA_V_GND	Ground for NTSC video signal from rearview camera
C31	CAMERA_BIT0	Outputs mode select signal for rearview camera
C32	CAMERA_BIT1	Outputs mode select signal for rearview camera

Audio Unit Connector E (3P) (female terminals)



Cavity	Terminal Name	Description
E1	ANT+B	Power source for AM/FM antenna amplifier
E2	RF IN	Inputs AM/FM signal
E3	SH(RF IN)	Shield for terminal No. 2

Audio Unit Connector F (5P) (female terminals)



Cavity	Terminal Name	Description
F1	USB1 GND	Ground for USB port
F2	USB1 VBUS	Outputs power source for USB port
F3	USB1 DATA+	Communication signal
F4	USB1 DATA-	Communication signal
F5	USB1 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

Cavity	Terminal Name	Description
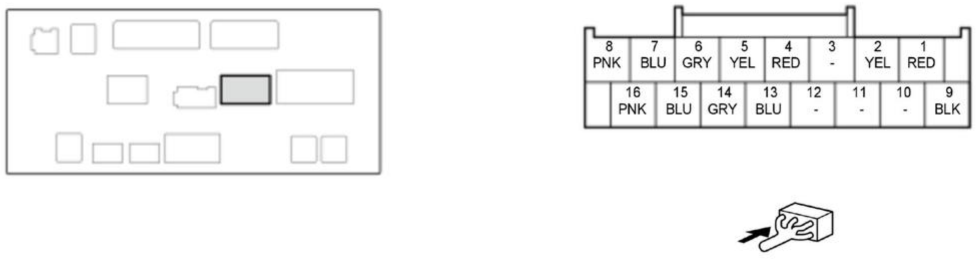
C22	MIC+	Inputs sound signal from HFL microphone
C23	MIC_GND	Ground for HFL microphone
C24	---	Not used
C25	---	Not used
C26	---	Not used
C27	---	Not used
C28	SH_CAMERA	Shield for terminals No. 13, No. 14, No. 29, and No. 30
C29	CAMERA_V	Inputs NTSC video signal from rearview camera
C30	CAMERA_V_GND	Ground for NTSC video signal from rearview camera
C31	CAMERA_BIT0	Outputs mode select signal for rearview camera
C32	CAMERA_BIT1	Outputs mode select signal for rearview camera

*: Without stereo amplifier

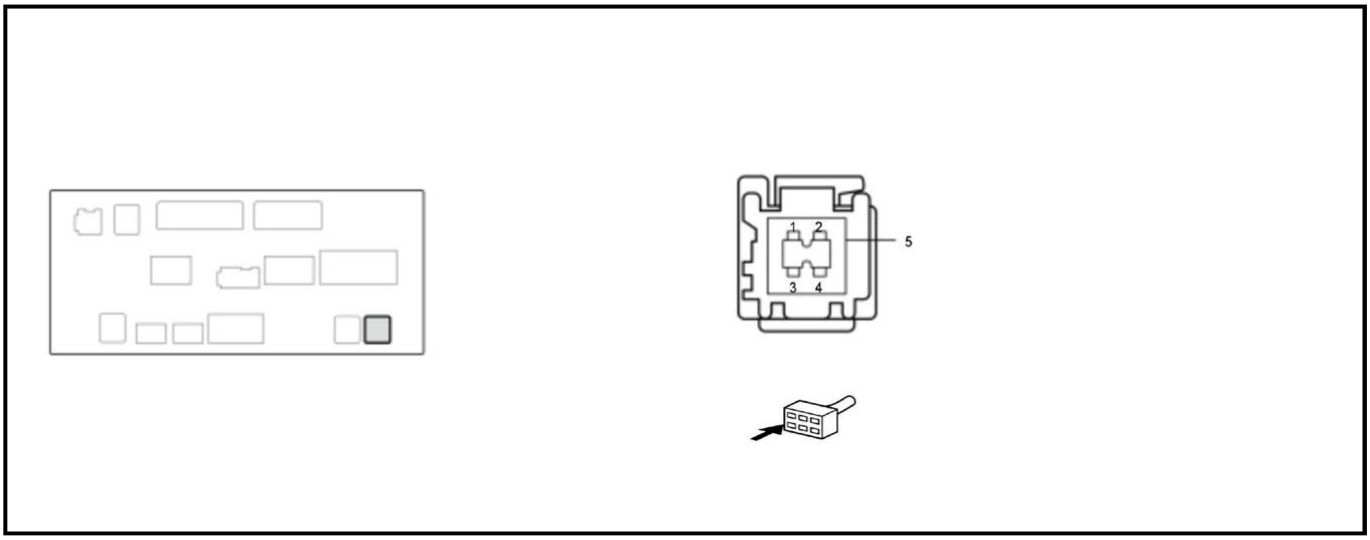
Audio Unit Connector E (16P) (female terminals)



Cavity	Terminal Name	Description
E1	TUNER_6V	Power source for tuner unit
E2	TUNER_9V	Power source for tuner unit
E3	---	Not used
E4	DISP_CONT	Outputs signal for center display unit switching on/off
E5	F-CAN B_H	Communication signal
E6	AMP_RS485_SH	Shield for terminals No. 7 and No. 8
E7	RS485+	Communication signal
E8	RS485-	Communication signal
E9	TUNER_GND	Ground for tuner unit
E10	---	Not used
E11	---	Not used
E12	---	Not used

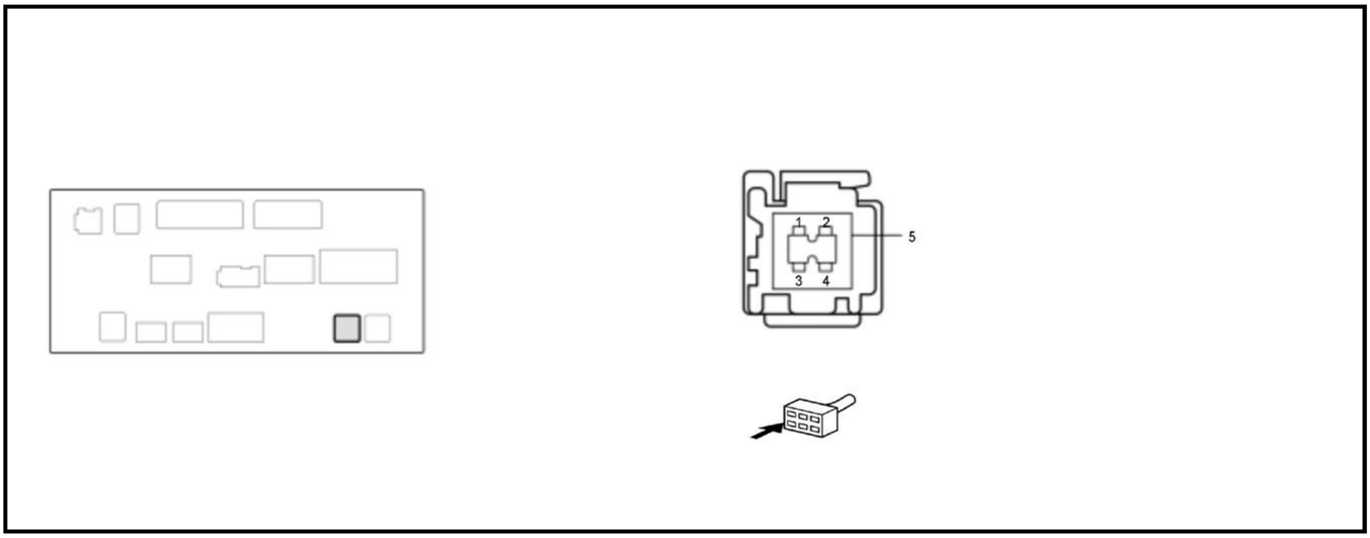
Cavity	Terminal Name	Description
E13	F-CAN B_L	Communication signal
E14	TUNER_RS485_SH	Shield for terminals No. 15 and No. 16
E15	TUNER_RS485+	Communication signal
E16	TUNER_RS485-	Communication signal

Audio Unit Connector F (5P) (female terminals)



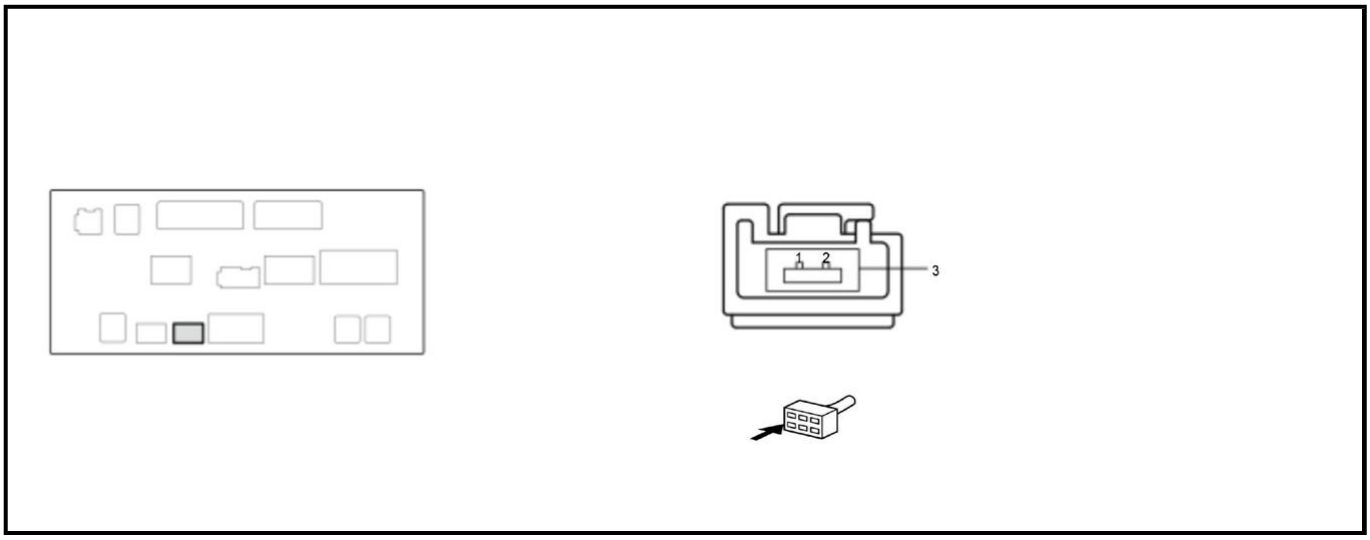
Cavity	Terminal Name	Description
F1	USB1 GND	Ground for USB port A
F2	USB1 VBUS	Outputs power source for USB port A
F3	USB1 DATA+	Communication signal
F4	USB1 DATA-	Communication signal
F5	USB1 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

Audio Unit Connector G (5P) (female terminals)



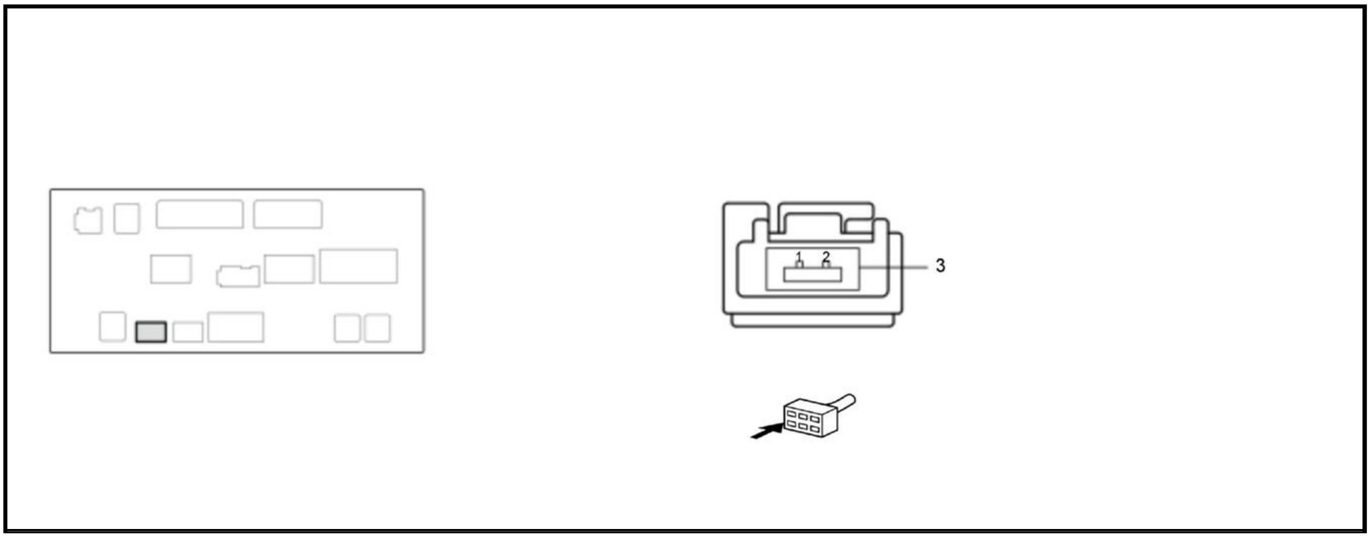
Cavity	Terminal Name	Description
G1	USB2 GND	Ground for USB port B
G2	USB2 VBUS	Outputs power source for USB port B
G3	USB2 DATA+	Communication signal
G4	USB2 DATA-	Communication signal
G5	USB2 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

Audio Unit Connector H (3P) (female terminals)



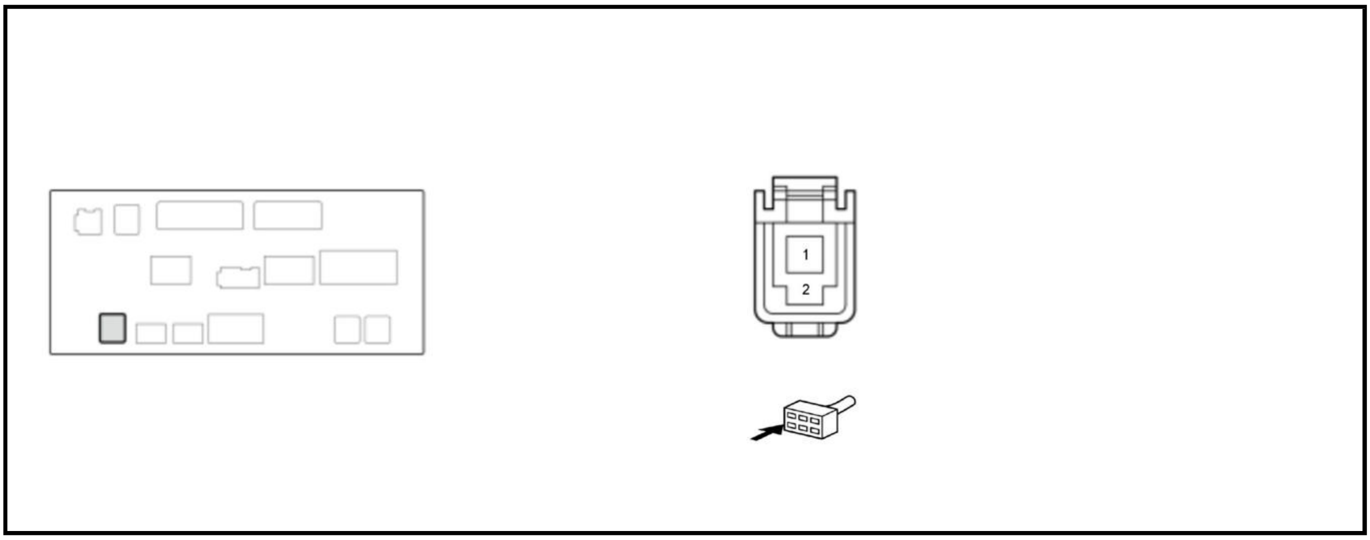
Cavity	Terminal Name	Description
H1	LVDS1+	Communication signal
H2	LVDS1-	Communication signal
H3	LVDS1 SH	Shield for terminals No. 1 and No. 2

Audio Unit Connector J (3P) (female terminals)



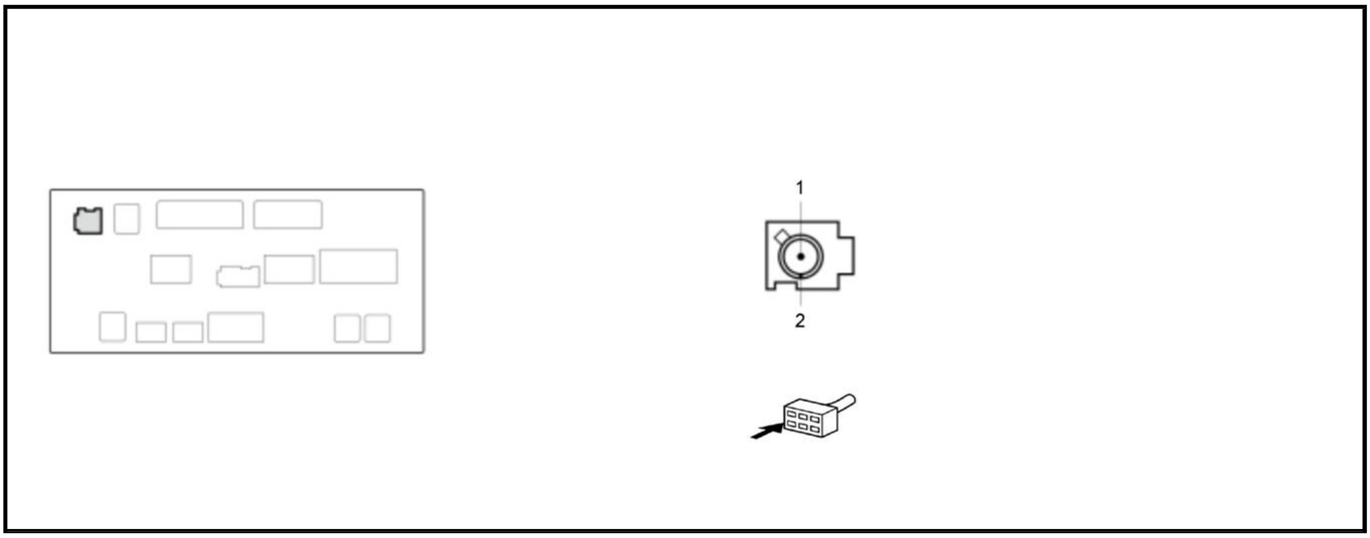
Cavity	Terminal Name	Description
J1	LVDS2+	Communication signal
J2	LVDS2-	Communication signal
J3	LVDS2 SH	Shield for terminals No. 1 and No. 2

Audio Unit Connector K (2P) (female terminals)



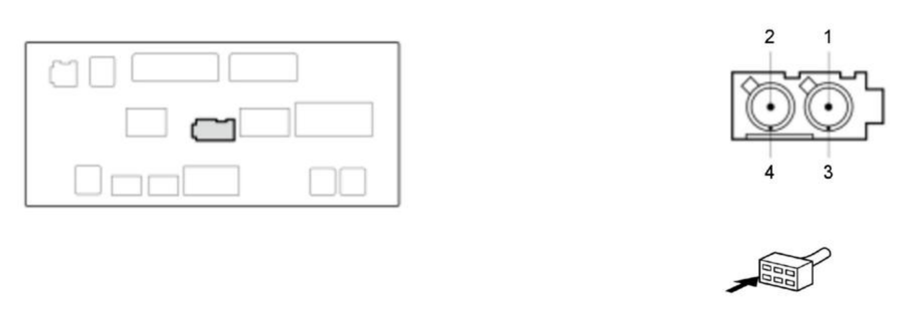
Cavity	Terminal Name	Description
K1	GPS ANT	Inputs GPS signal
K2	GPS SH	Shield for terminal No. 1

Audio Unit Connector L (2P) (female terminals)



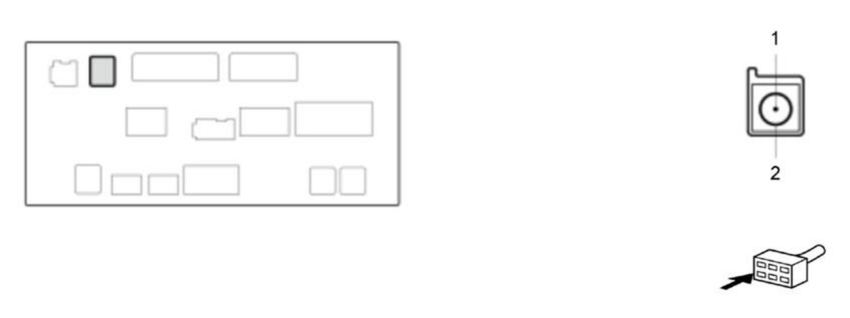
Cavity	Terminal Name	Description
L1	SPDIF1 SIG	Communication signal for tuner unit
L2	SPDIF1 SH	Shield for terminal No. 1

Audio Unit Connector M (4P) (female terminals) (with stereo amplifier)



Cavity	Terminal Name	Description
M1	SPDIF2 SIG	Communication signal
M2	---	Not used
M3	SPDIF2 SH	Shield for terminal No. 1
M4	---	Not used

Audio Unit Connector N (2P) (female terminals)



Cavity	Terminal Name	Description
N1	SAT/TER	Inputs satellite/terrestrial signal
N2	SH (SAT/TER)	Shield for terminal No. 1

AUDIO-NAVIGATION UNIT CONNECTOR FOR INPUTS AND OUTPUTS

Connector Index
Audio-Navigation Unit Connector A (24P)
Audio-Navigation Unit Connector B (24P)
Audio-Navigation Unit Connector C (32P)

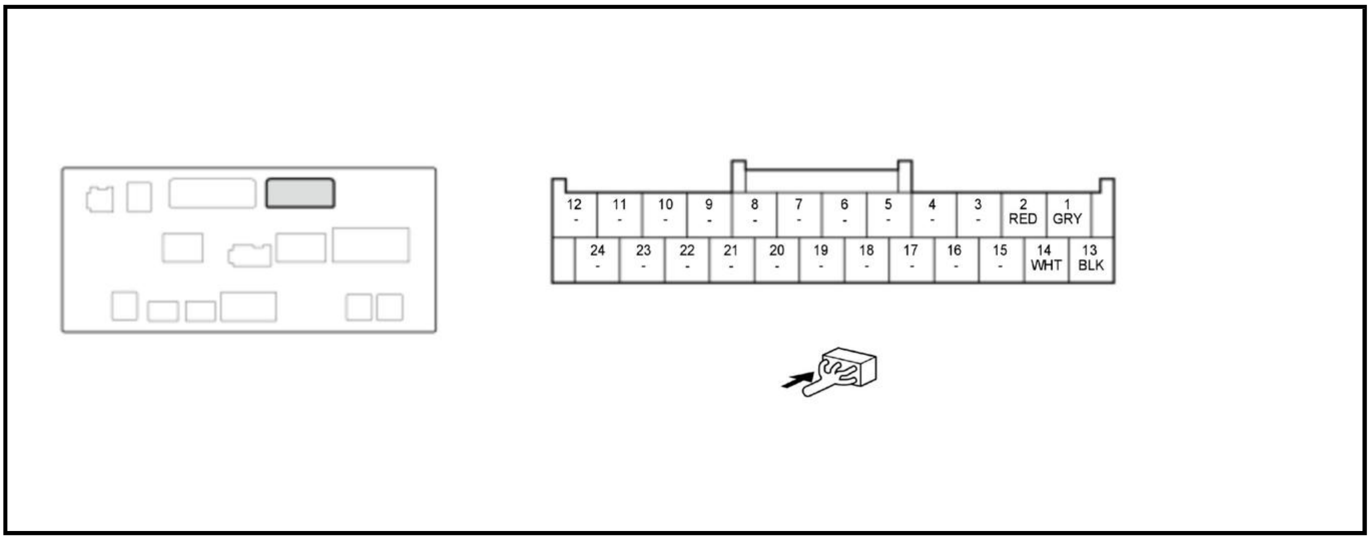
A12	K-LINE	Communication signal
A13	---	Not used
A14	B-CAN_H	Communication signal
A15	---	Not used
A16	---	Not used

Cavity	Terminal Name	Description
A17	---	Not used
A18	---	Not used
A19	---	Not used
A20	---	Not used
A21	SWD+B	Outputs signal for related unit switching on/off
A22	VSP	Inputs vehicle speed pulse
A23	ACC	ACCESSORY power source
A24	B-CAN_L	Communication signal

Audio-Navigation Unit Connector B (24P) (female terminals)



Cavity	Terminal Name	Description
B1	AUX_NAVI_SH	Shield for terminals No. 2, No. 13, and No. 14
B2	AUX BEEP	Outputs system beep signal
B3	---	Not used
B4	---	Not used
B5	---	Not used
B6	---	Not used

Cavity	Terminal Name	Description
C1	---	Not used
C2	---	Not used
C3	---	Not used
C4	---	Not used
C5	HFT_MUTE	Outputs HFL microphone directivity switching signal
C6	SH_MIC	Shield for terminals No. 22 and No. 23
C7	MIC_PWR	Power source for HFL microphone
C8	---	Not used
C9	---	Not used
C10	IG1_METER	IG1 power source
C11	---	Not used
C12	---	Not used
C13	CAMERA_VCC	Power source for rearview camera
C14	CAMERA_GND	Ground for rearview camera
C15	BACK_LT	Detects reverse signal
C16	CAMERA_ADPT	Detects connection for rearview camera
C17	---	Not used
C18	---	Not used
C19	---	Not used
C20	---	Not used
C21	---	Not used
C22	MIC+	Inputs sound signal from HFL microphone
C23	MIC_GND	Ground for HFL microphone
C24	---	Not used
C25	---	Not used
C26	---	Not used
C27	---	Not used
C28	SH_CAMERA	Shield for terminals No. 13, No. 14, No. 29, and No. 30
C29	CAMERA_V	Inputs NTSC video signal from rearview camera
C30	CAMERA_V_GND	Ground for NTSC video signal from rearview camera
C31	CAMERA_BIT0	Outputs mode select signal for rearview camera
C32	CAMERA_BIT1	Outputs mode select signal for rearview camera

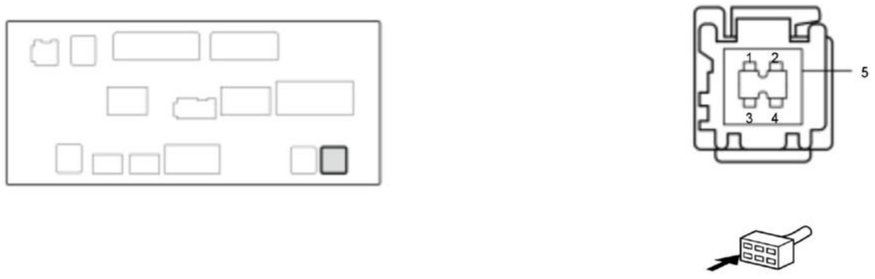
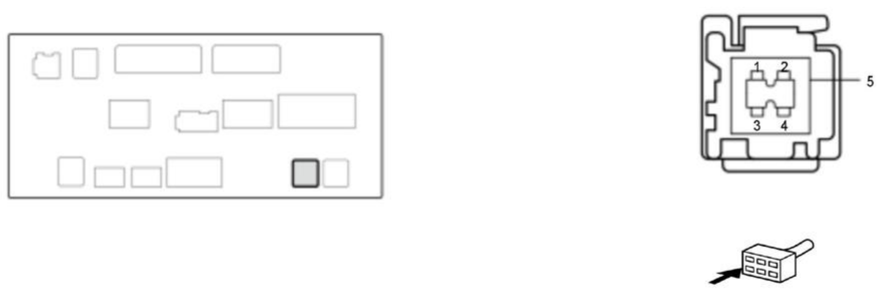
Cavity	Terminal Name	Description
E1	TUNER_6V	Power source for tuner unit
E2	TUNER_9V	Power source for tuner unit
E3	---	Not used
E4	DISP_CONT	Outputs signal for center display unit switching on/off
E5	F-CAN B_H	Communication signal
E6	AMP_RS485_SH	Shield for terminals No. 7 and No. 8
E7	RS485+	Communication signal
E8	RS485-	Communication signal
E9	TUNER_GND	Ground for tuner unit
E10	---	Not used
E11	---	Not used
E12	---	Not used
E13	F-CAN B_L	Communication signal
E14	TUNER_RS485_SH	Shield for terminals No. 15 and No. 16
E15	TUNER_RS485+	Communication signal
E16	TUNER_RS485-	Communication signal

Audio-Navigation Unit Connector F (5P) (female terminals)



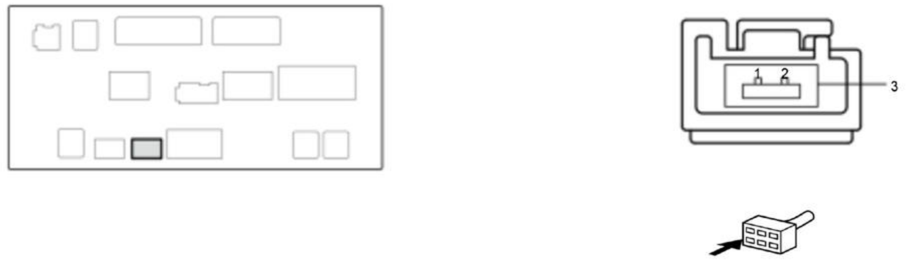
Cavity	Terminal Name	Description
F1	USB1 GND	Ground for USB port A
F2	USB1 VBUS	Outputs power source for USB port A
F3	USB1 DATA+	Communication signal
F4	USB1 DATA-	Communication signal
F5	USB1 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

Audio-Navigation Unit Connector G (5P) (female terminals)



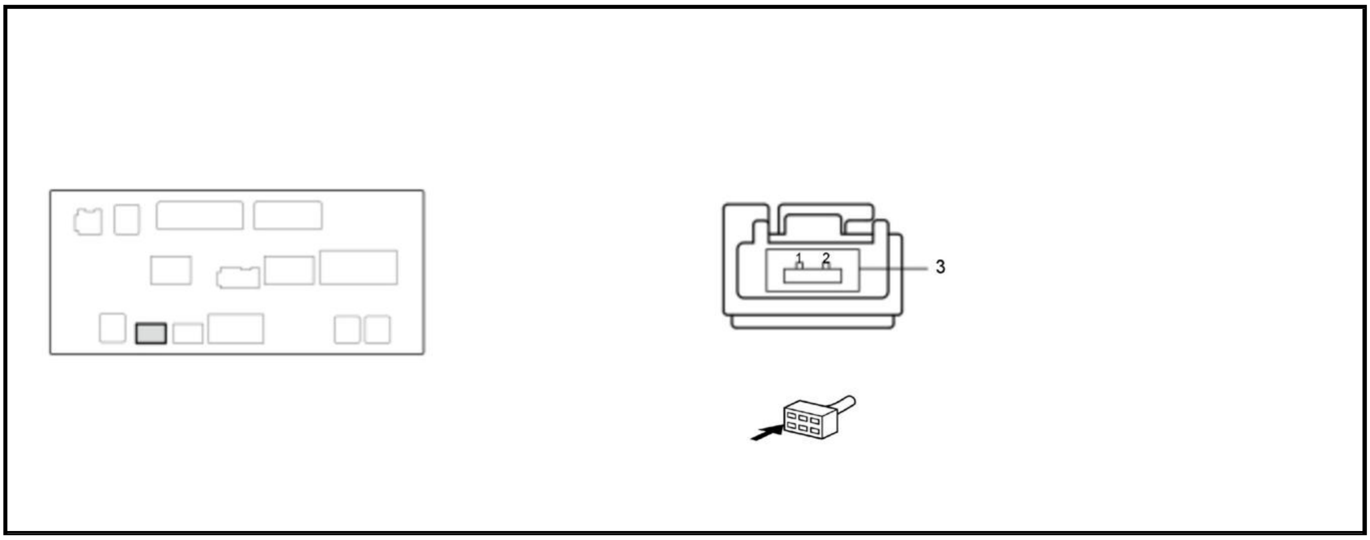
Cavity	Terminal Name	Description
G1	USB2 GND	Ground for USB port B
G2	USB2 VBUS	Outputs power source for USB port B
G3	USB2 DATA+	Communication signal
G4	USB2 DATA-	Communication signal
G5	USB2 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

Audio-Navigation Unit Connector H (3P) (female terminals)



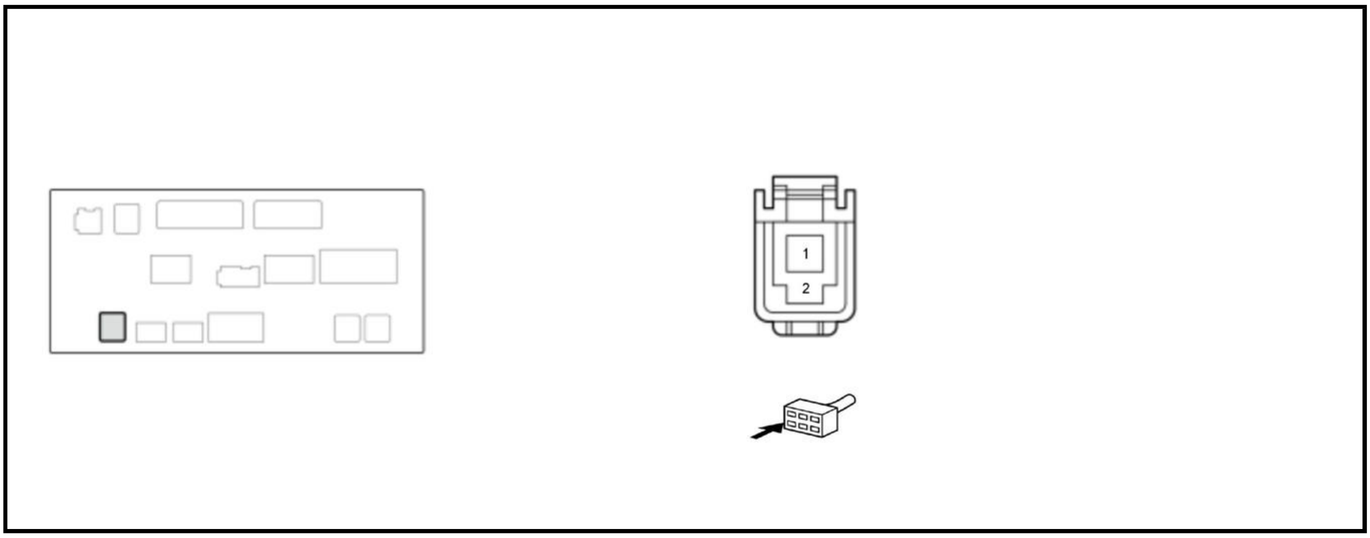
Cavity	Terminal Name	Description
H1	LVDS1+	Communication signal
H2	LVDS1-	Communication signal
H3	LVDS1 SH	Shield for terminals No. 1 and No. 2

Audio-Navigation Unit Connector J (3P) (female terminals)



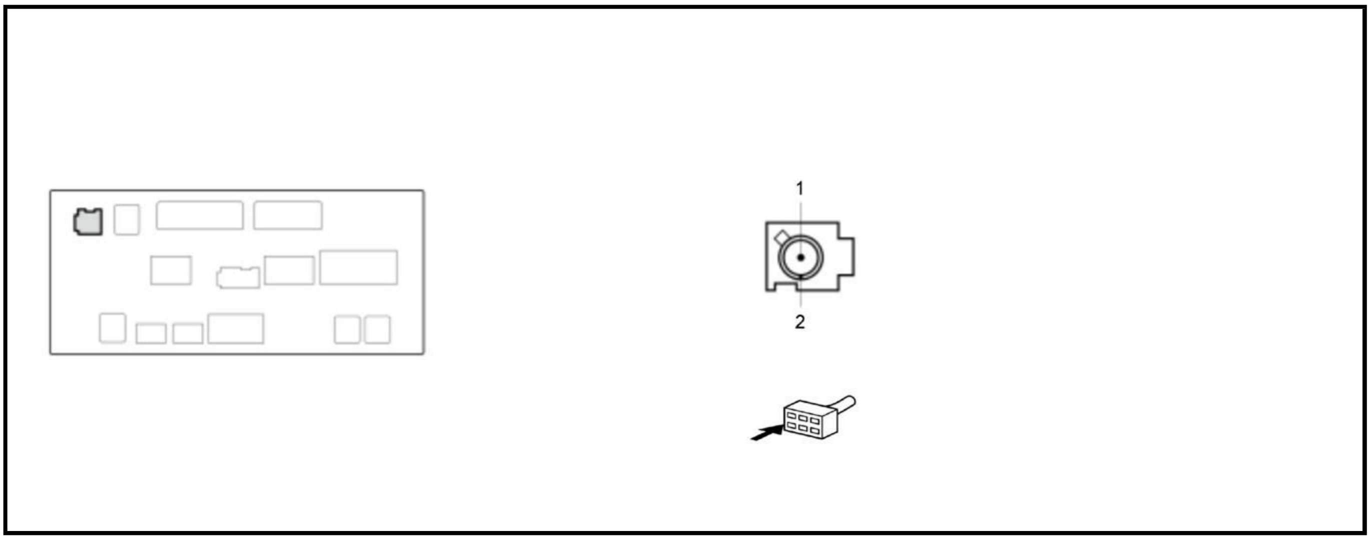
Cavity	Terminal Name	Description
J1	LVDS2+	Communication signal
J2	LVDS2-	Communication signal
J3	LVDS2 SH	Shield for terminals No. 1 and No. 2

Audio-Navigation Unit Connector K (2P) (female terminals)



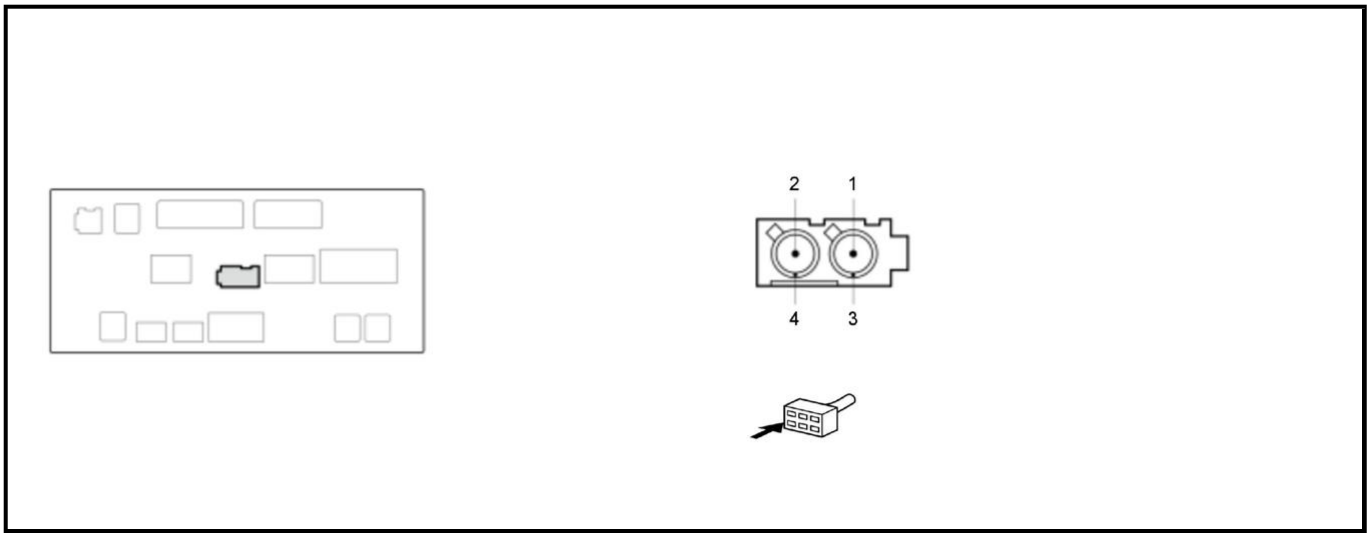
Cavity	Terminal Name	Description
K1	GPS ANT	Inputs GPS signal
K2	GPS SH	Shield for terminal No. 1

Audio-Navigation Unit Connector L (2P) (female terminals)



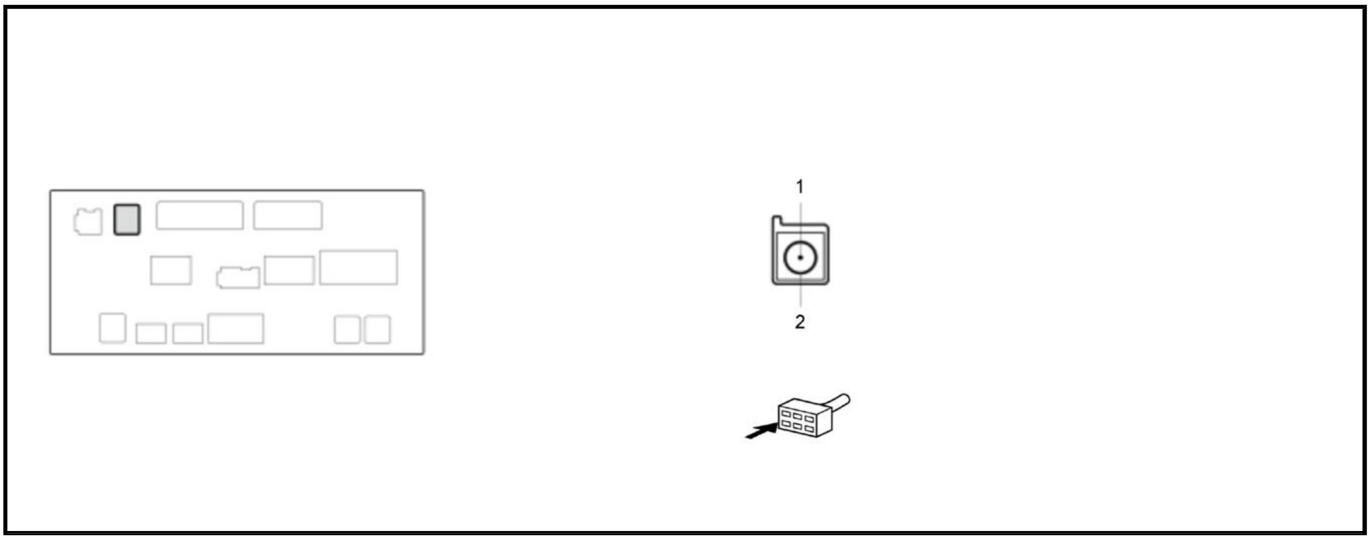
Cavity	Terminal Name	Description
L1	SPDIF1 SIG	Communication signal for tuner unit
L2	SPDIF1 SH	Shield for terminal No. 1

Audio-Navigation Unit Connector M (4P) (female terminals)



Cavity	Terminal Name	Description
M1	SPDIF2 SIG	Communication signal
M2	---	Not used
M3	SPDIF2 SH	Shield for terminal No. 1
M4	---	Not used

Audio-Navigation Unit Connector N (2P) (female terminals)

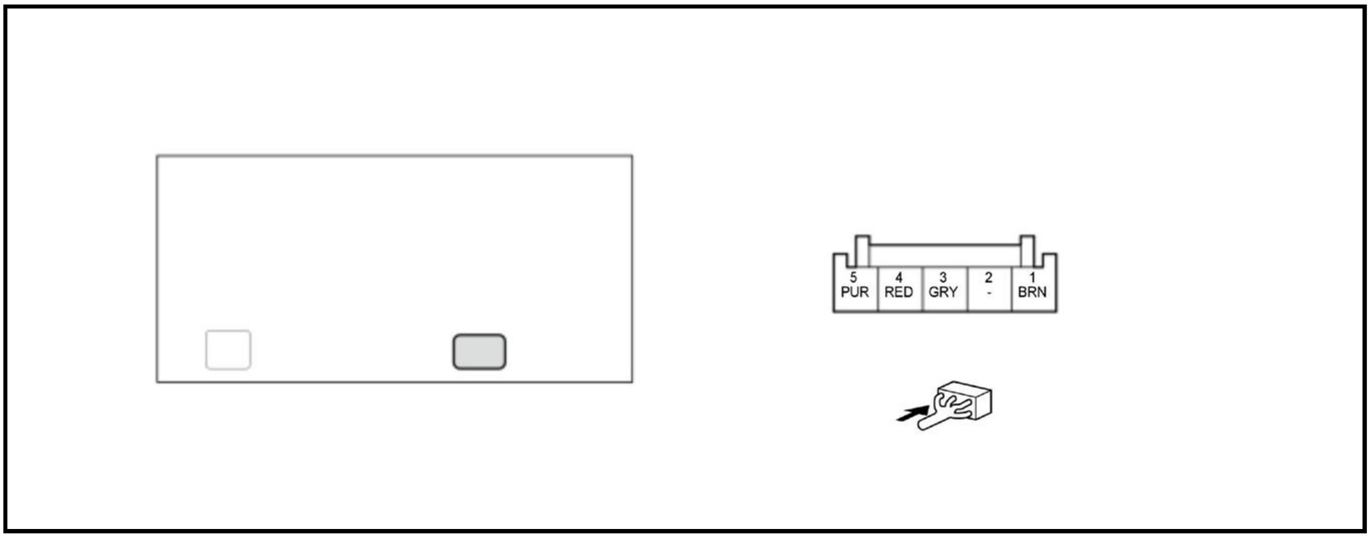


Cavity	Terminal Name	Description
N1	SAT/TER	Inputs satellite/terrestrial signal
N2	SH (SAT/TER)	Shield for terminal No. 1

CENTER DISPLAY UNIT CONNECTOR FOR INPUTS AND OUTPUTS

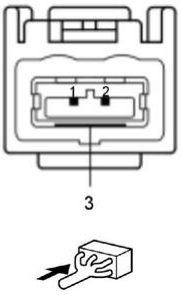
Connector Index
Center Display Unit Connector A (5P)
Center Display Unit Connector B (3P)

Center Display Unit Connector A (5P) (female terminals)



Cavity	Terminal Name	Description
A1	+B_AUDIO	+B power source
A2	---	Not used
A3	ILLUMI+	Detects illumination on signal
A4	DISP_CONT	Inputs signal for center display unit switching ON/OFF
A5	GND	Ground for center display unit

Center Display Unit Connector B (3P) (female terminals)

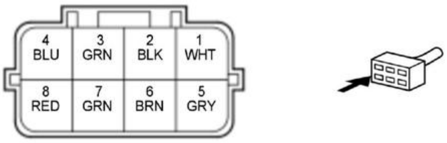


Cavity	Terminal Name	Description
B1	LVDS1+	Communication signal

Cavity	Terminal Name	Description
B2	LVDS1-	Communication signal
B3	LVDS1 SH	Shield for terminals No. 1 and No. 2

REARVIEW CAMERA CONNECTOR FOR INPUTS AND OUTPUTS

Rearview Camera 8P Connector (male terminals)



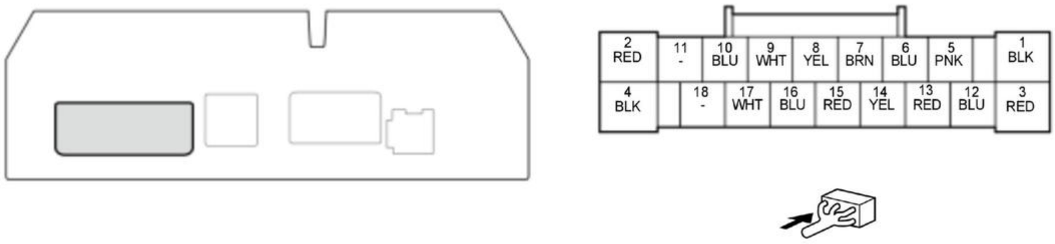
Cavity	Terminal Name	Description
1	CAMERA_V_GND	Ground for NTSC video signal
2	CAMERA_VCC	Power source for rearview camera
3	CAMERA_BIT0	Inputs mode select signal for rearview camera
4	CAMERA_BIT1	Inputs mode select signal for rearview camera
5	SH_CAMERA	Shield for terminals No. 1, No. 2, No. 7, and No. 8
6	CAMERA_ADPT	Detects connection for rearview camera
7	CAMERA_V	Outputs NTSC video signal
8	CAMERA_GND	Rearview camera ground

STEREO AMPLIFIER CONNECTOR FOR INPUTS AND OUTPUTS

Connector Index
Stereo Amplifier Connector A (18P)
Stereo Amplifier Connector B (8P) (Not used)

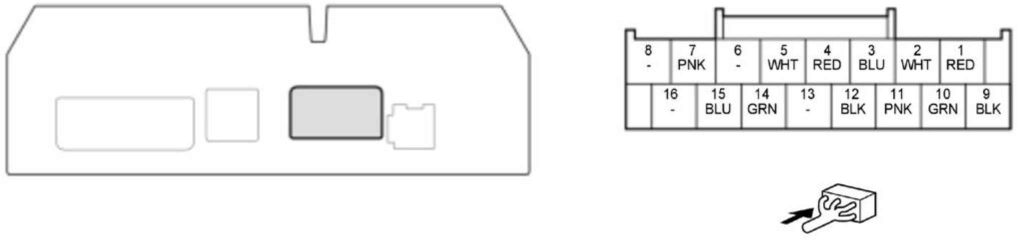
Connector Index
Stereo Amplifier Connector C (16P)
Stereo Amplifier Connector D (2P)

Stereo Amplifier Connector A (18P) (female terminals)



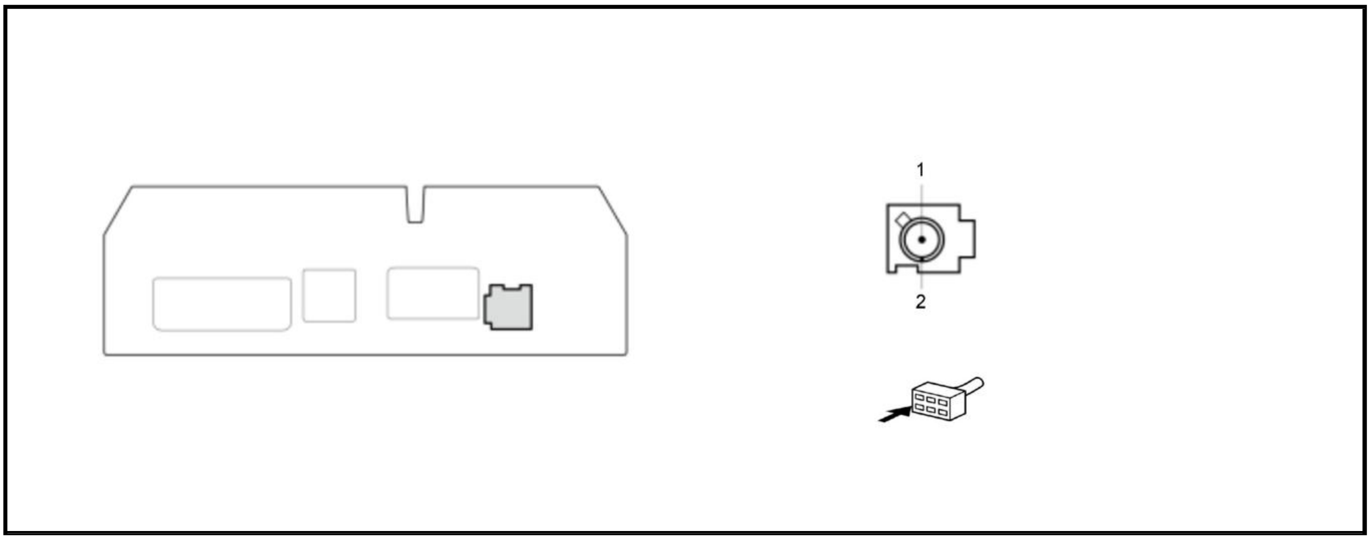
Cavity	Terminal Name	Description
A1	GND	Ground for stereo amplifier
A2	SUB_WOOFER+	Outputs sound signal for subwoofer
A3	+B_AUDIO_AMP	+B power source
A4	SUB_WOOFER-	Outputs sound signal for subwoofer
A5	FL_SPKR+	Outputs sound signal for left front door speaker
A6	FL_SPKR-	Outputs sound signal for left front door speaker
A7	RR_SPKR-	Outputs sound signal for right rear speakers
A8	RR_SPKR+	Outputs sound signal for right rear speakers
A9	RL_SPKR-	Outputs sound signal for left rear speakers
A10	RL_SPKR+	Outputs sound signal for left rear speaker
A11	---	Not used
A12	FR_SPKR-	Outputs sound signal for right front door speaker
A13	FR_SPKR+	Outputs sound signal for right front door speaker
A14	FL_TWEETER+	Outputs sound signal for left front tweeter
A15	FL_TWEETER-	Outputs sound signal for left front tweeter
A16	FR_TWEETER+	Outputs sound signal for right front tweeter
A17	FR_TWEETER-	Outputs sound signal for right front tweeter
A18	---	Not used

Stereo Amplifier Connector C (16P) (female terminals)



Cavity	Terminal Name	Description
C1	ANC_R-	Inputs noise cancelling signal from ANC/active sound control unit
C2	ANC_F-	Inputs noise cancelling signal from ANC/active sound control unit
C3	AUD_F_MIX_GND	Basis ground for terminals No. 11
C4	AUX BEEP	Inputs system beep signal
C5	AUX NAVI GND	Basis ground for terminals No. 4 and No. 12
C6	---	Not used
C7	RS485-	Communication signal
C8	---	Not used
C9	ANC_R+	Inputs noise cancelling signal from ANC/active sound control unit
C10	ANC_F+	Inputs noise cancelling signal from ANC/active sound control unit
C11	AUD_F_MIX	Inputs noise cancelling mixing signal from ANC/active sound control unit
C12	AUX NAVI	Inputs sound signal for voice guidance and Voice Recognition (VR) prompts
C13	---	Not used
C14	SWD+B	Inputs signal for stereo amplifier switching on/off
C15	RS485+	Communication signal
C16	---	Not used

Stereo Amplifier Connector D (2P) (female terminals)

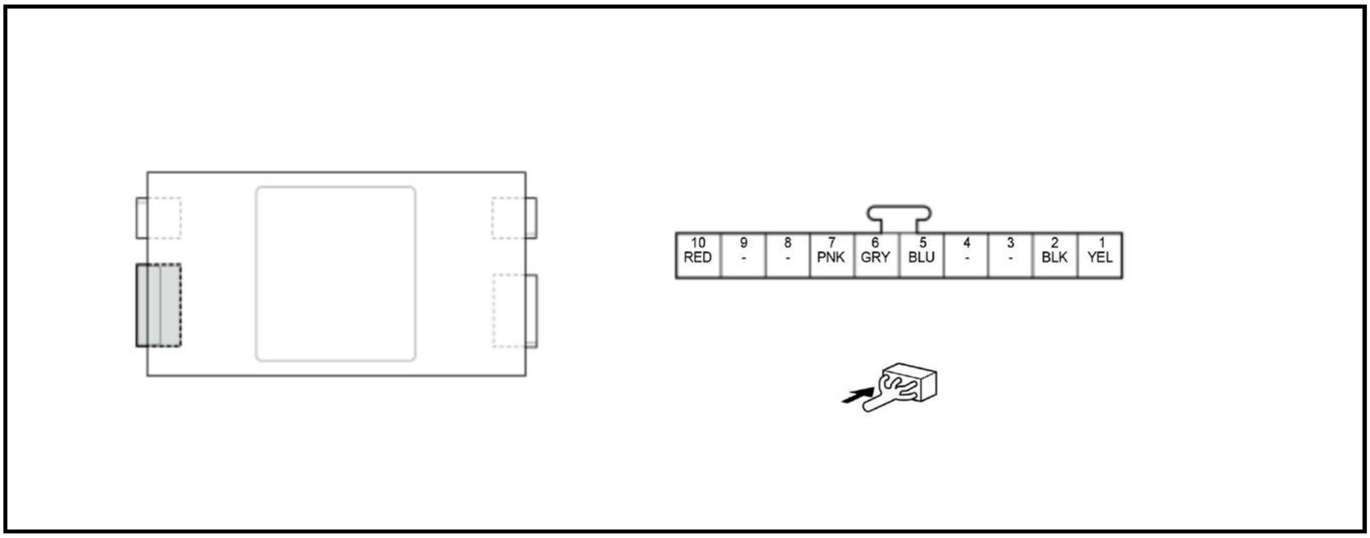


Cavity	Terminal Name	Description
D1	SPDIF2 SIG	Communication signal
D2	SPDIF2 SH	Shield for terminal No. 1

TUNER UNIT CONNECTOR FOR INPUTS AND OUTPUTS

Connector Index
Tuner Unit Connector A (10P)
Tuner Unit Connector B (2P)
Tuner Unit Connector C (5P)
Tuner Unit Connector D (2P) (Not used)

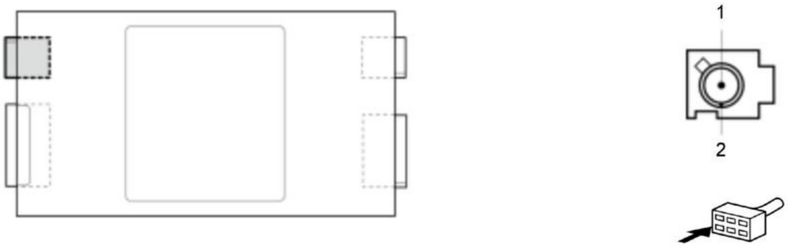
Tuner Unit Connector A (10P) (female terminals)



Cavity	Terminal Name	Description
A1	TUNER_9V	Power source for tuner unit
A2	TUNER_GND	Tuner unit ground
A3	---	Not used
A4	---	Not used
A5	TUNER_RS485+	Communication signal
A6	TUNER_RS485_SH	Shield for terminals No. 5 and No. 7
A7	TUNER_RS485-	Communication signal
A8	---	Not used

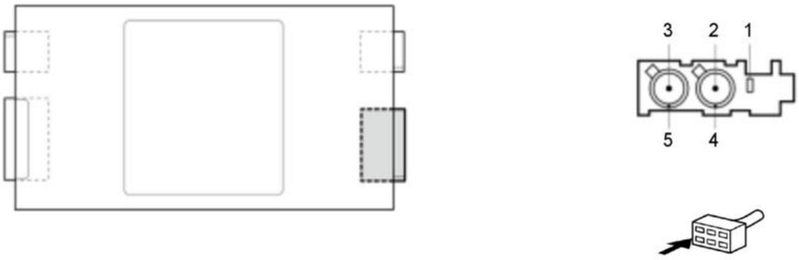
Cavity	Terminal Name	Description
A9	---	Not used
A10	TUNER_6V	Power source for tuner unit

Tuner Unit Connector B (2P) (female terminals)



Cavity	Terminal Name	Description
B1	SPDIF1 SIG	Communication signal
B2	SPDIF1 SH	Shield for terminal No. 1

Tuner Unit Connector C (5P) (female terminals)

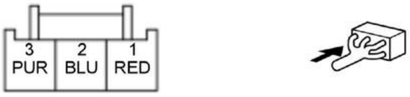


Cavity	Terminal Name	Description
C1	ANT+B	Power source for AM/FM antenna amplifier
C2	RF IN	Inputs AM/FM signal
C3	---	Not used
C4	SH(RF IN)	Shield for terminal No. 2
C5	---	Not used

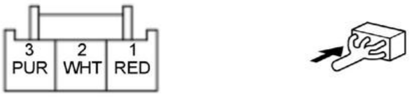
USB CHARGER UNIT CONNECTOR FOR INPUTS AND OUTPUTS

Connector Index
USB Charger Unit 3P Connector (with wireless charger)
USB Charger Unit 3P Connector (without wireless charger)

USB Charger Unit 3P Connector (female terminals) (with wireless charger)



USB Charger Unit 3P Connector (female terminals) (without wireless charger)



Cavity	Terminal Name	Description
1	ACC	ACCESSORY power source
2	+B_USB_CHARGER* 1+B_BACK_UP* 2	+B power source
3	GND	USB charger unit ground

*1: With wireless charger*2: Without wireless charger

REMOVAL AND INSTALLATION

ANC/ACTIVE SOUND CONTROL MICROPHONE REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE: The front HFL-ANC/active sound control microphone and the front HFL-navigation-ANC/active sound control microphone are the same parts.

Front (With roof console module)

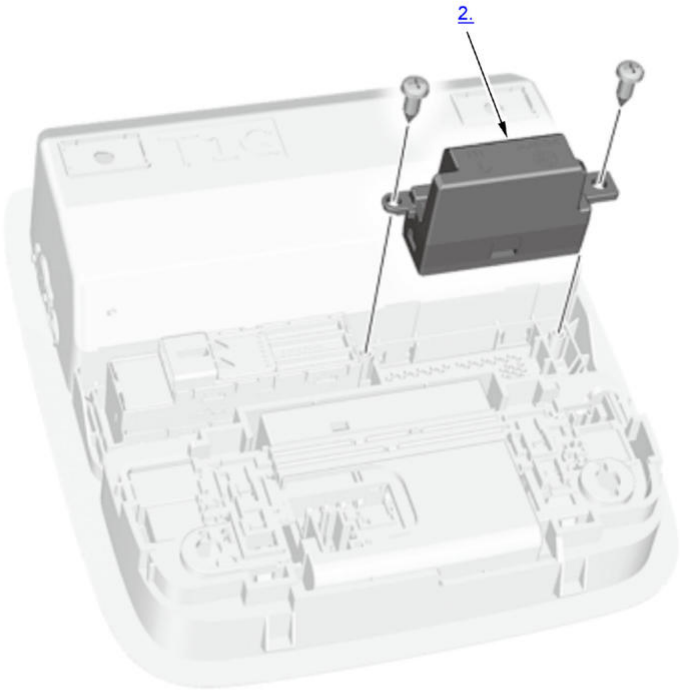

Fig. 1: Front ANC/Active Sound Control Microphone Components (With Roof Console Module)

☐	Torque: N.m (kgf.m, lbf.ft)

1. Glove box - Remove
2. ANC/Active Sound Control Unit - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

AUDIO REMOTE-HFL SWITCH REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. Driver's Airbag - Remove
2. Audio Remote-HFL Switch - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

AUDIO UNIT REMOVAL AND INSTALLATION (COLOR AUDIO TYPE)

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- 📖 Where icon is shown, for further information see below.
- When working on electronic components, make sure the work area is clean and dust free.
- Make sure your hands are clean and free of oils and grease.
- If you are replacing the audio unit, write down the audio presets (if possible), and enter them into a new audio unit.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

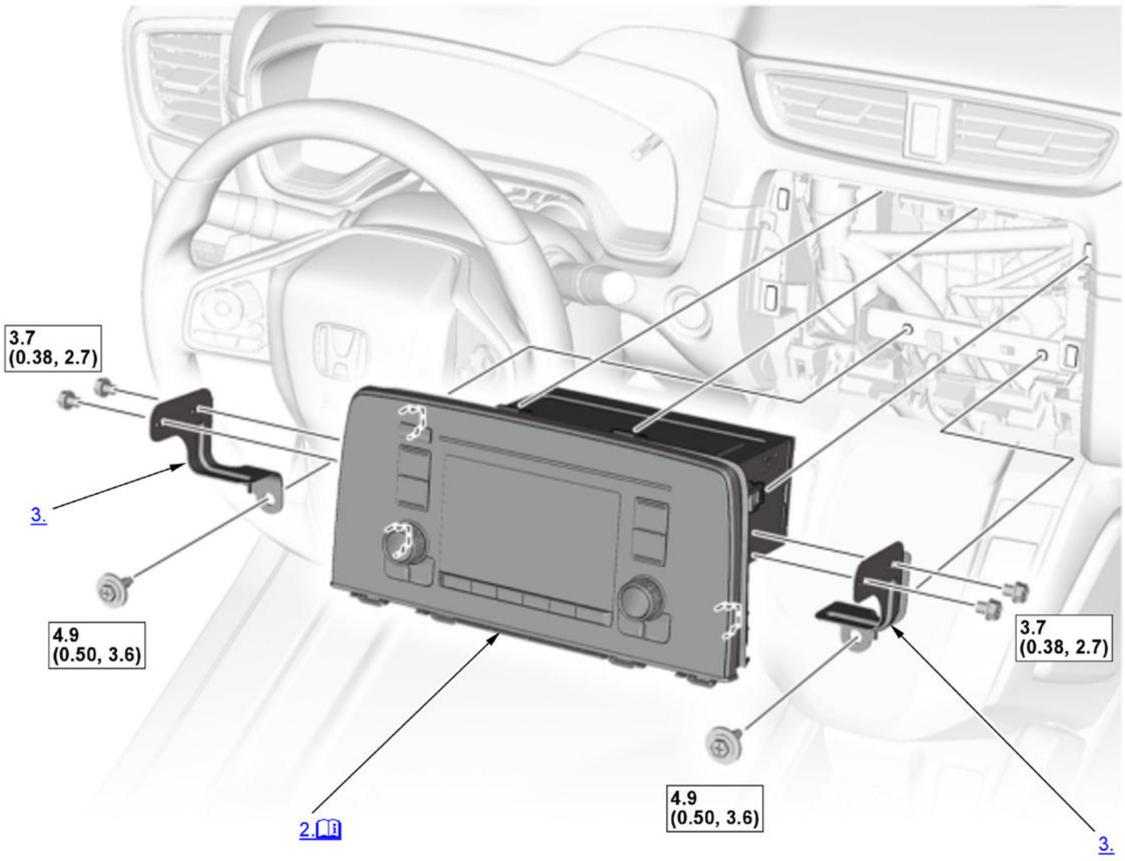

Fig. 5: Exploded View Of Audio Unit Components (Color Audio Type - 1 Of 2)
Courtesy of HONDA, U.S.A., INC.

📖	Detailed information, notes, and precautions

☐	Torque: N.m (kgf.m, lbf.ft)

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

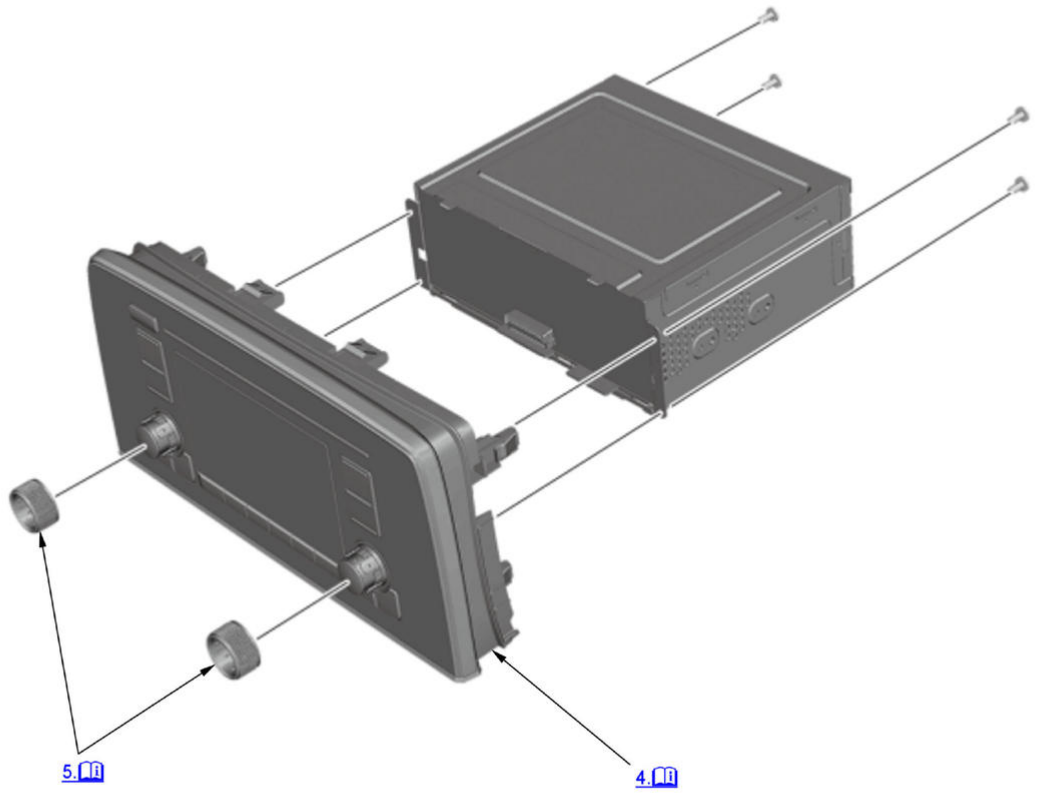

Fig. 6: Exploded View Of Audio Unit Components (Color Audio Type - 2 Of 2)
Courtesy of HONDA, U.S.A., INC.

📖i	Detailed information, notes, and precautions

1. Climate Control Panel - Remove
2. Audio Unit Assembly - Remove

   Note for installation

   - When installing, make sure all the connectors are secure.
   - After Installation, do the System Links in the System Diagnostic Mode to confirm that there are no problems in the system.
3. Audio Unit Bracket - Remove
4. Audio Panel - Remove

   NOTE:

   - Discharge static electricity from your body before and during the work.
   - Do not touch the circuit board(s) with your bare hands.
5. Volume/List Knob - Remove

   If necessary, remove the knob(s).

6. All Removed Parts - Install

Install the parts in the reverse order of removal.

AUDIO UNIT REMOVAL AND INSTALLATION (DISPLAY AUDIO TYPE)

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- ℹ Where icon is shown, for further information see below.
- When working on electronic components, make sure the work area is clean and dust free.
- Make sure your hands are clean and free of oils and grease.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

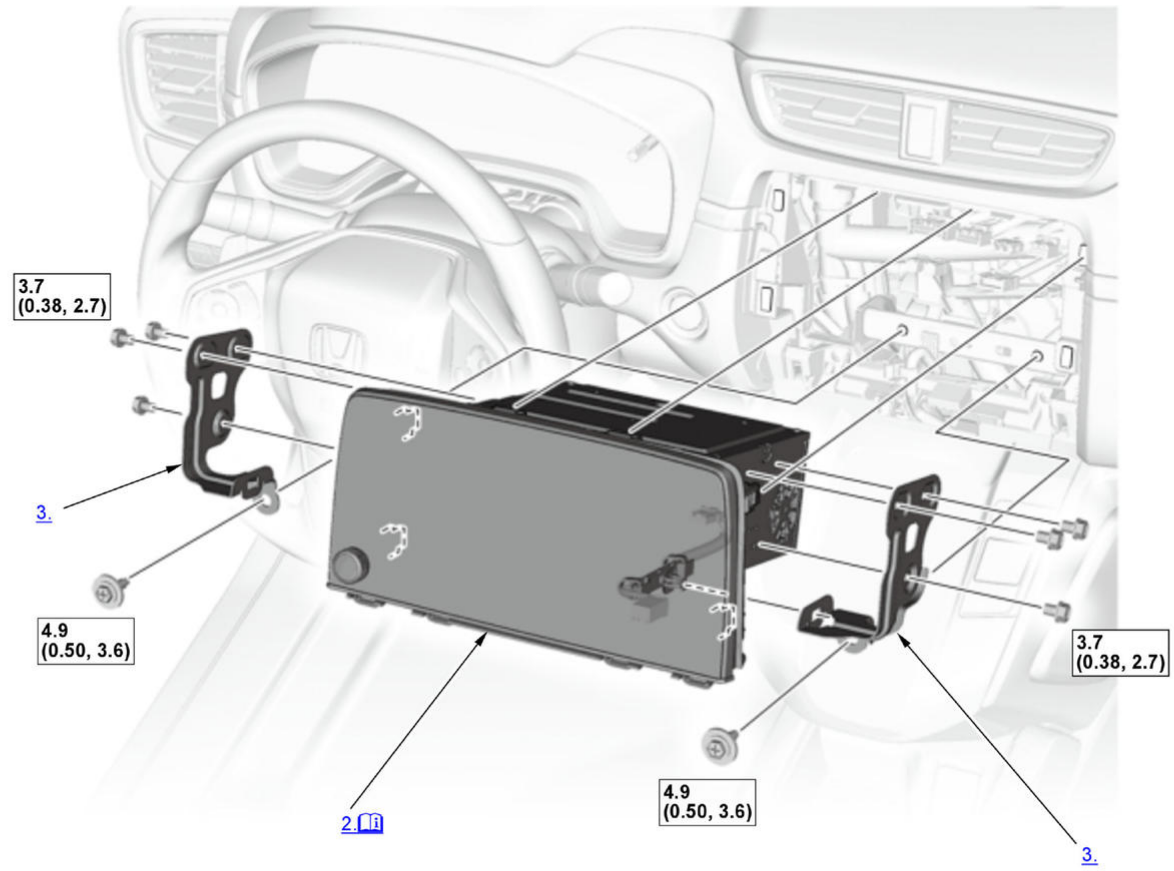

Fig. 7: Exploded View Of Audio Unit Components (Display Audio Type)
Courtesy of HONDA, U.S.A., INC.

ℹ	Detailed information, notes, and precautions
▭	Torque: N.m (kgf.m, lbf.ft)

1. Climate Control Panel - Remove
2. Audio Unit Assembly - Remove

   Note for installation

   - When installing, make sure all the connectors are secure.
   - After Installation, do the System Links in the System Diagnostic Mode to confirm that there are no problems in the system.
3. Audio Unit Bracket - Remove
4. Center Display Unit - Remove
5. Volume Knob - Remove

   If necessary, remove the knob.

6. All Removed Parts - Install

   Install the parts in the reverse order of removal.

AUDIO-NAVIGATION UNIT REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

- ℹ Where icon is shown, for further information see below.
- When working on electronic components, make sure the work area is clean and dust free.
- Make sure your hands are clean and free of oils and grease.
- When the audio-navigation unit is replaced or disconnected, do the Map Matching. This part of the initialization matches the GPS coordinates with a road on the map screen. To do this part of the procedure, make sure that the navigation system displays a map, and drive the vehicle on a mapped road shown on the map screen. Do not enter a destination at this time. When the name of the current road you are driving on appears at the bottom of the screen, the entire procedure is complete.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

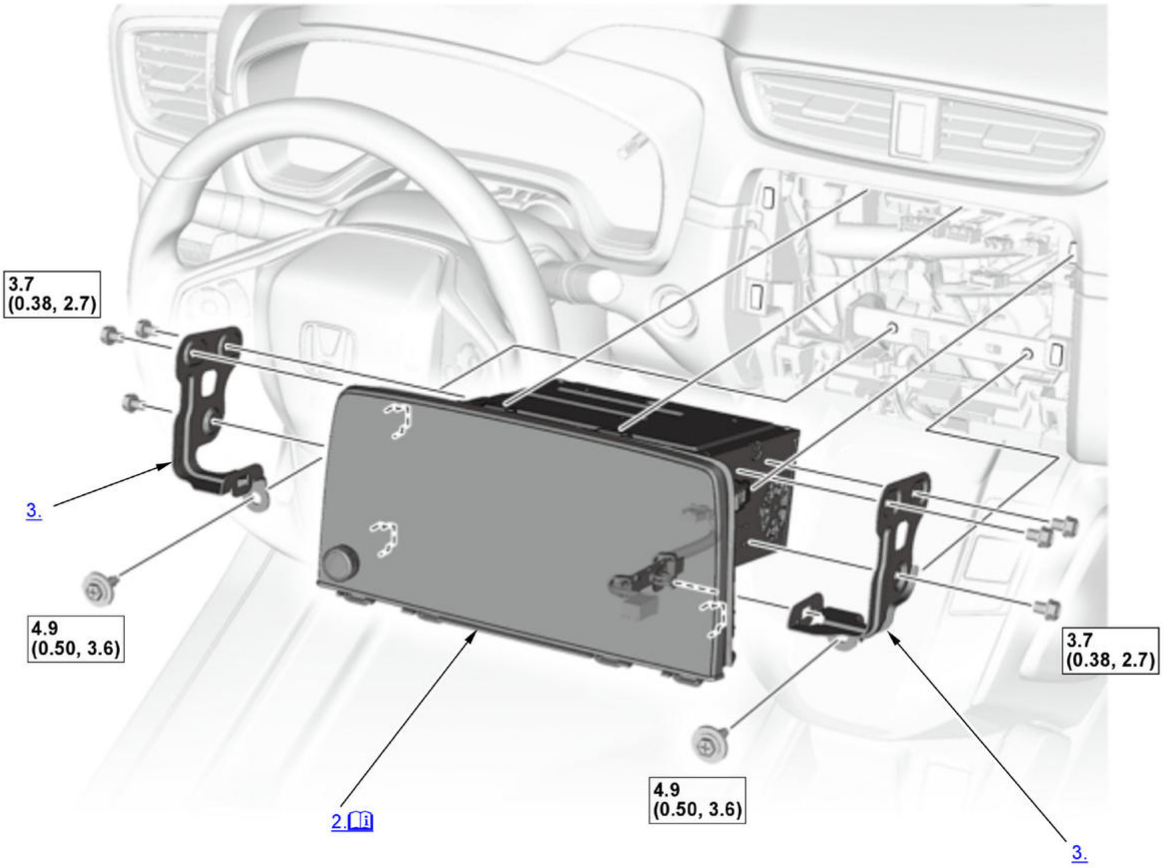

Fig. 8: Exploded View Of Audio-Navigation Unit Components
Courtesy of HONDA, U.S.A., INC.

ℹ	Detailed information, notes, and precautions
▭	Torque: N.m (kgf.m, lbf.ft)

1. **Climate Control Panel - Remove**
2. Audio-Navigation Unit Assembly - Remove

   Note for installation

   - When installing, make sure all the connectors are secure.
   - If the audio-navigation was replaced, it may take up to 30 minutes for the navigation system to calibrate and operate correctly.
   - After Installation, **do the System Links in the System Diagnostic Mode** to confirm that there are no problems in the system, then park the vehicle outside, and do the GPS initialization.
3. Audio-Navigation Unit Bracket - Remove
4. **Center Display Unit - Remove**
5. Volume Knob - Remove

   If necessary, remove the knob.
6. All Removed Parts - Install

Install the parts in the reverse order of removal.

CENTER DISPLAY UNIT REMOVAL AND INSTALLATION

Removal and Installation

NOTE: ℹ Where icon is shown, for further information see below.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

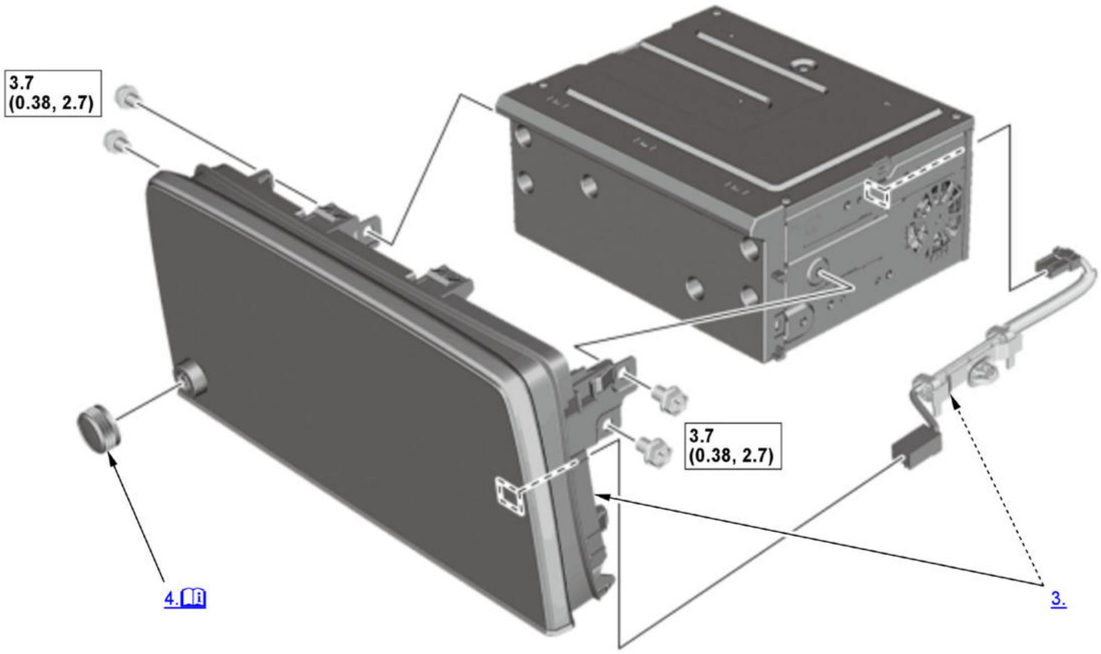

Fig. 9: Exploded View Of Center Display Unit Components
Courtesy of HONDA, U.S.A., INC.

ℹ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)

1. Audio-Navigation Unit Assembly - Remove (With Navigation)
2. Audio Unit Assembly - Remove (Without Navigation)
3. Center Display Unit - Remove
4. Volume Knob - Remove

   If necessary, remove the knob.

5. All Removed Parts - Install

   Install the parts in the reverse order of removal.

GPS ANTENNA REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

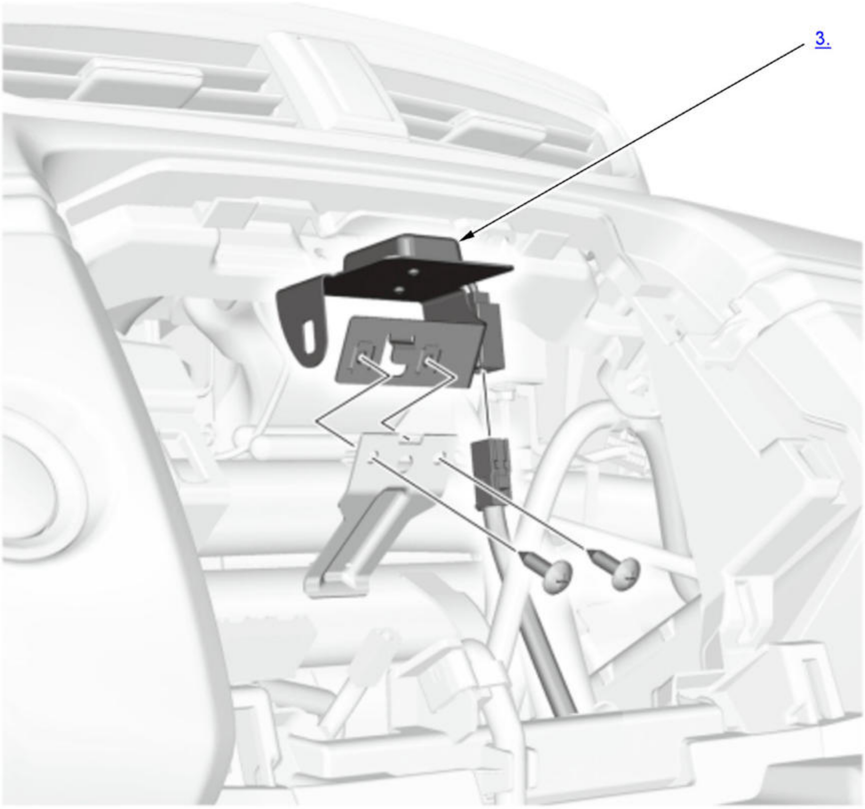

Fig. 10: GPS Antenna Components
Courtesy of HONDA, U.S.A., INC.

1. Audio-Navigation Unit Assembly - Remove (With Navigation)
2. Audio Unit Assembly - Remove (Without Navigation)
3. GPS Antenna - Remove
4. All Removed Parts - Install

   Install the parts in the reverse order of removal.

REARVIEW CAMERA REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

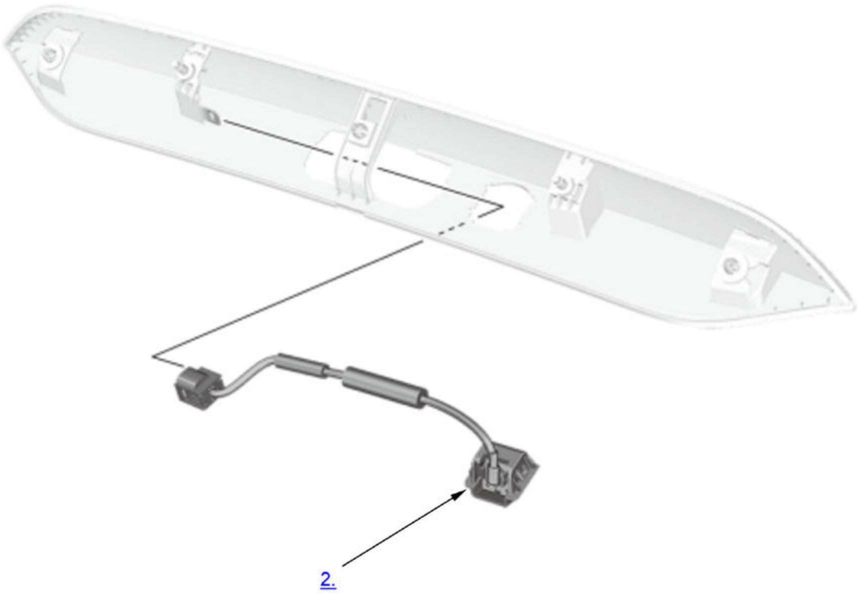

Fig. 11: Rearview Camera Components
Courtesy of HONDA, U.S.A., INC.

1. **Rear License Trim - Remove**
2. Rearview Camera - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

ROOF ANTENNA REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: 📖 Where icon is shown, for further information see below.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

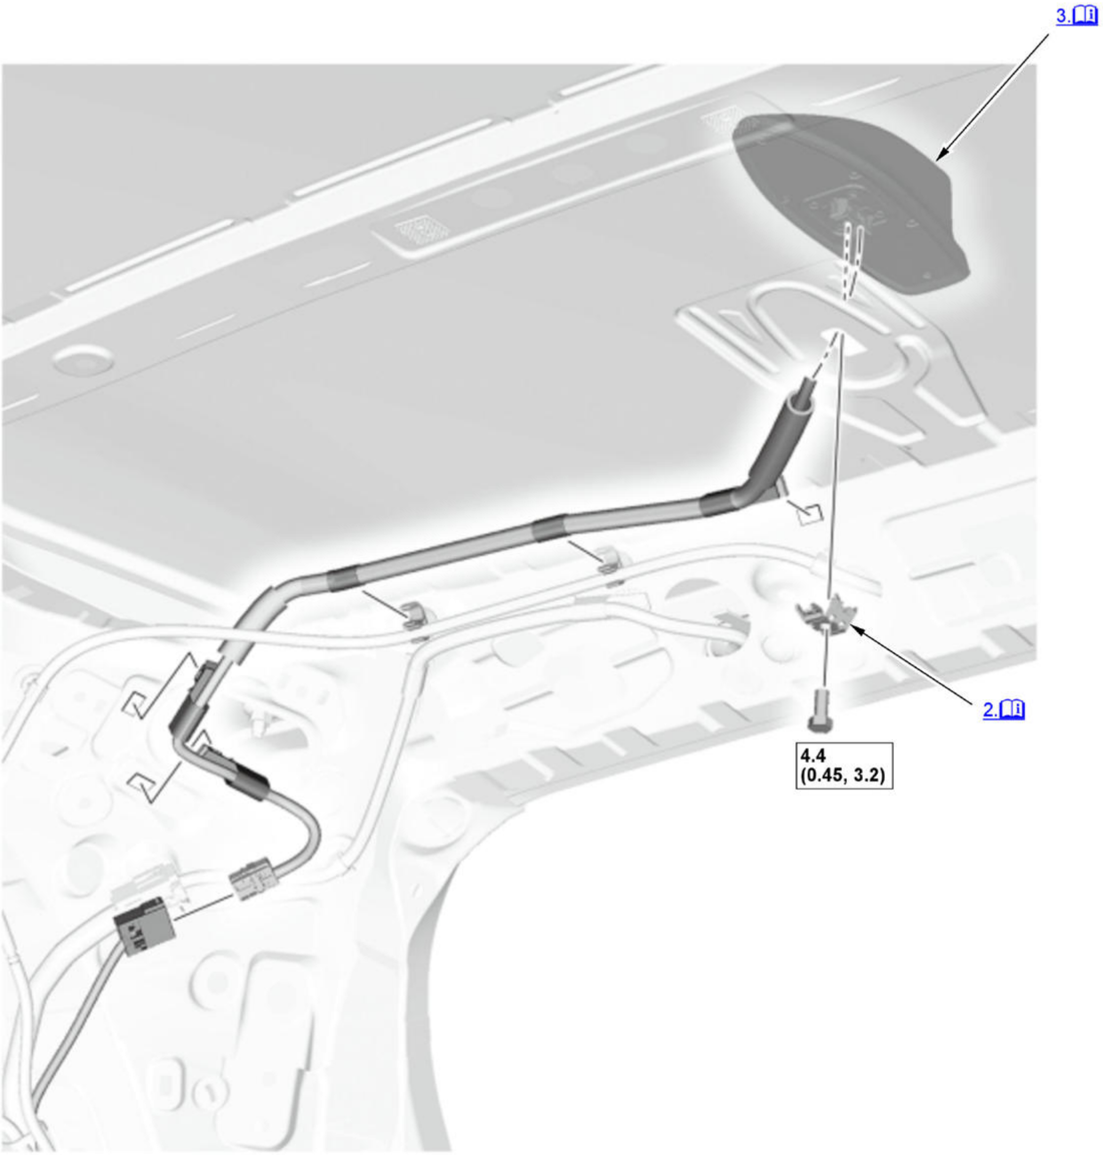

Fig. 12: Roof Antenna Components
Courtesy of HONDA, U.S.A., INC.

📖	Detailed information, notes, and precautions

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Headliner - Remove**
2. Capture Washer - Remove

   Note for installation

   - When removing the capture washer, replacing with a new one is recommended.
   - In case of reusing the capture washer, perform the shower test to confirm that there is no water leakage.
3. Roof Antenna - Remove

   NOTE: Take care not to damage the washer tube.

4. All Removed Parts - Install

Install the parts in the reverse order of removal.

STEREO AMPLIFIER REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

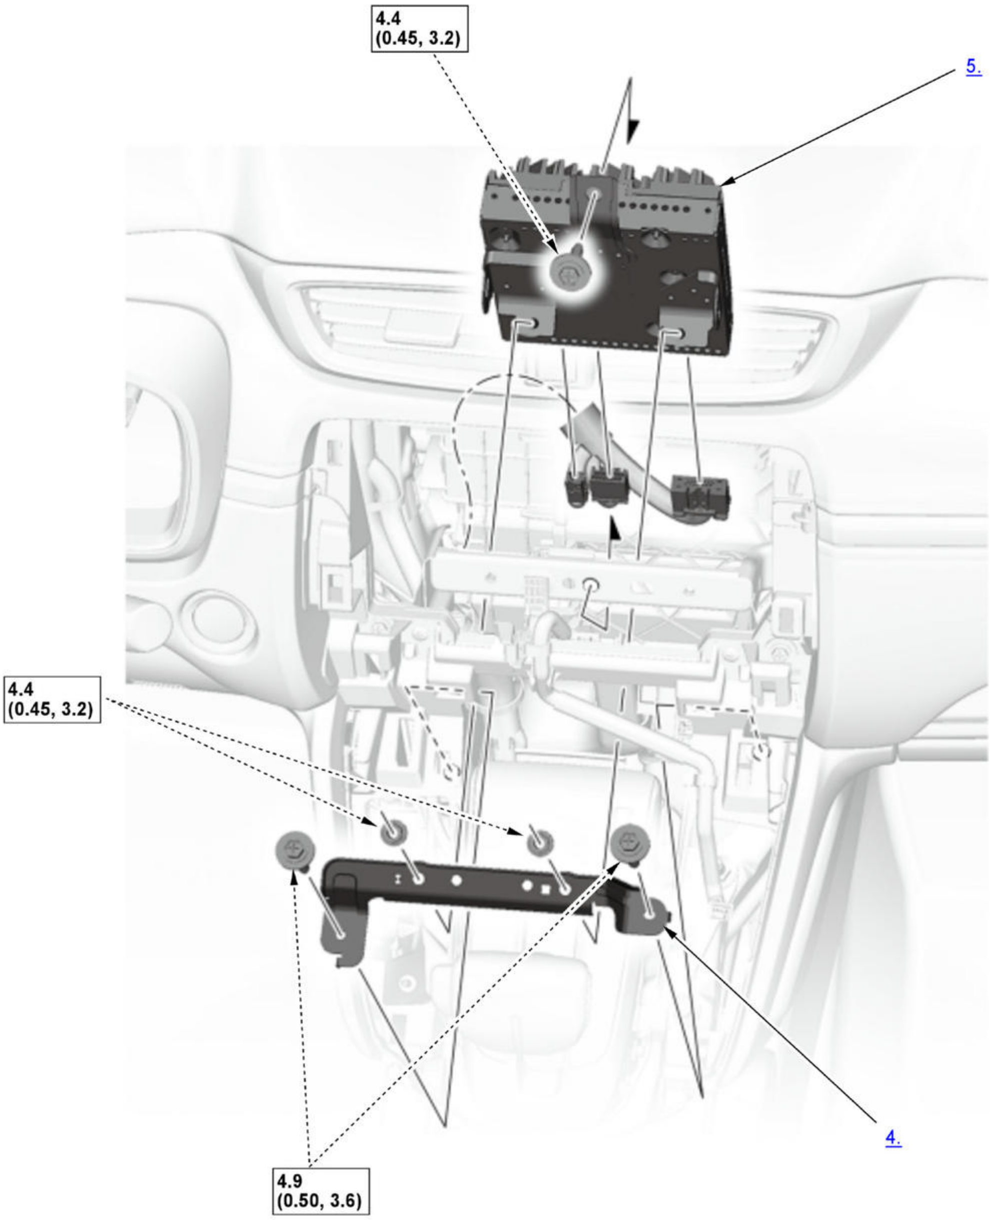

Fig. 13: Exploded View Of Stereo Amplifier Components
Courtesy of HONDA, U.S.A., INC.

	Torque: N.m (kgf.m, lbf.ft)

1. Audio-Navigation Unit Assembly - Remove (With Navigation)
2. Audio Unit Assembly - Remove (Without Navigation)
3. Escutcheon Panel - Remove
4. Stereo Amplifier Bracket - Remove
5. Stereo Amplifier - Remove
6. All Removed Parts - Install

   Install the parts in the reverse order of removal.

TUNER UNIT REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE: If you are replacing the tuner unit, write down the AM/FM radio presets (if possible), and enter them into the new audio-navigation unit or the new audio unit.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

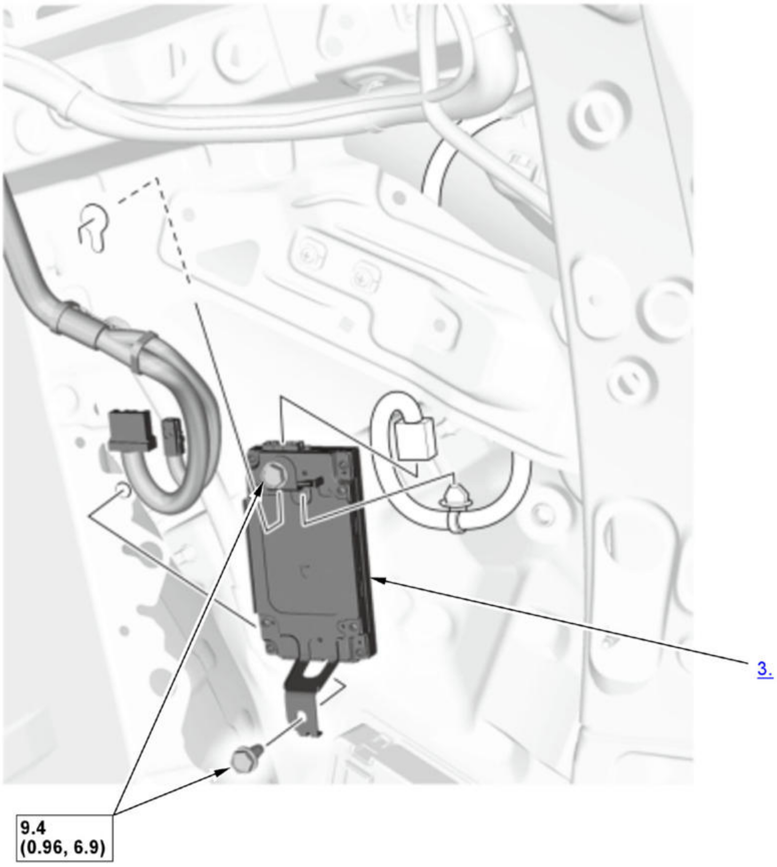

Fig. 14: Tuner Unit Components
Courtesy of HONDA, U.S.A., INC.

	Torque: N.m (kgf.m, lbf.ft)

1. Rear Side Trim Panel (Right Side) - Remove
2. Subwoofer - Remove (With subwoofer)
3. Tuner Unit - Remove
4. All Removed Parts - Install

   Install the parts in the reverse order of removal.

USB ADAPTER HOLDER REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

USB Adapter Holder (USB Port A / B)

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

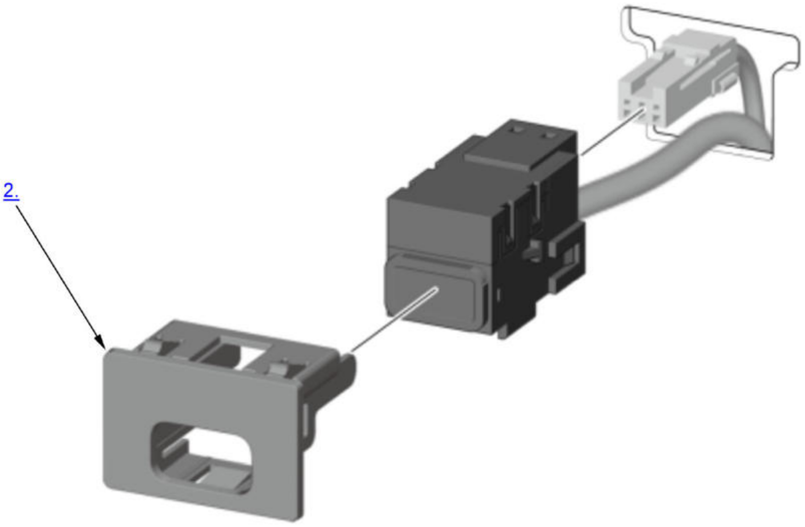

Fig. 15: USB Adapter Holder Components
Courtesy of HONDA, U.S.A., INC.

1. Dashboard Center Lower Panel - Remove
2. USB Adapter Holder - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

USB CHARGER UNIT REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

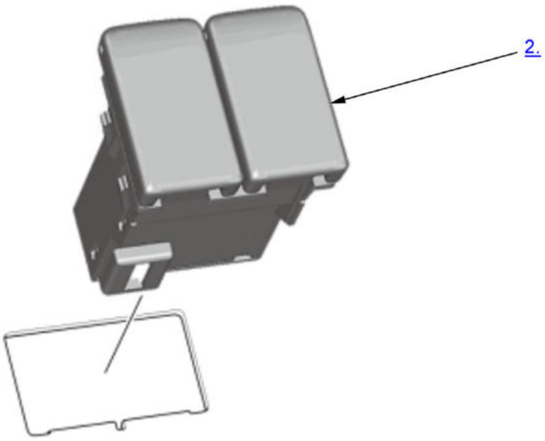

Fig. 16: USB Charger Unit Components
Courtesy of HONDA, U.S.A., INC.

1. Center Console Rear Trim - Remove
2. USB Charger Unit - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

REMOVAL, INSTALLATION & TEST

SPEAKER REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: How to read the torque specifications .

Door Speaker

1. Door Panel - Remove
   - Front door
   - Rear door
2. Door Speaker - Remove

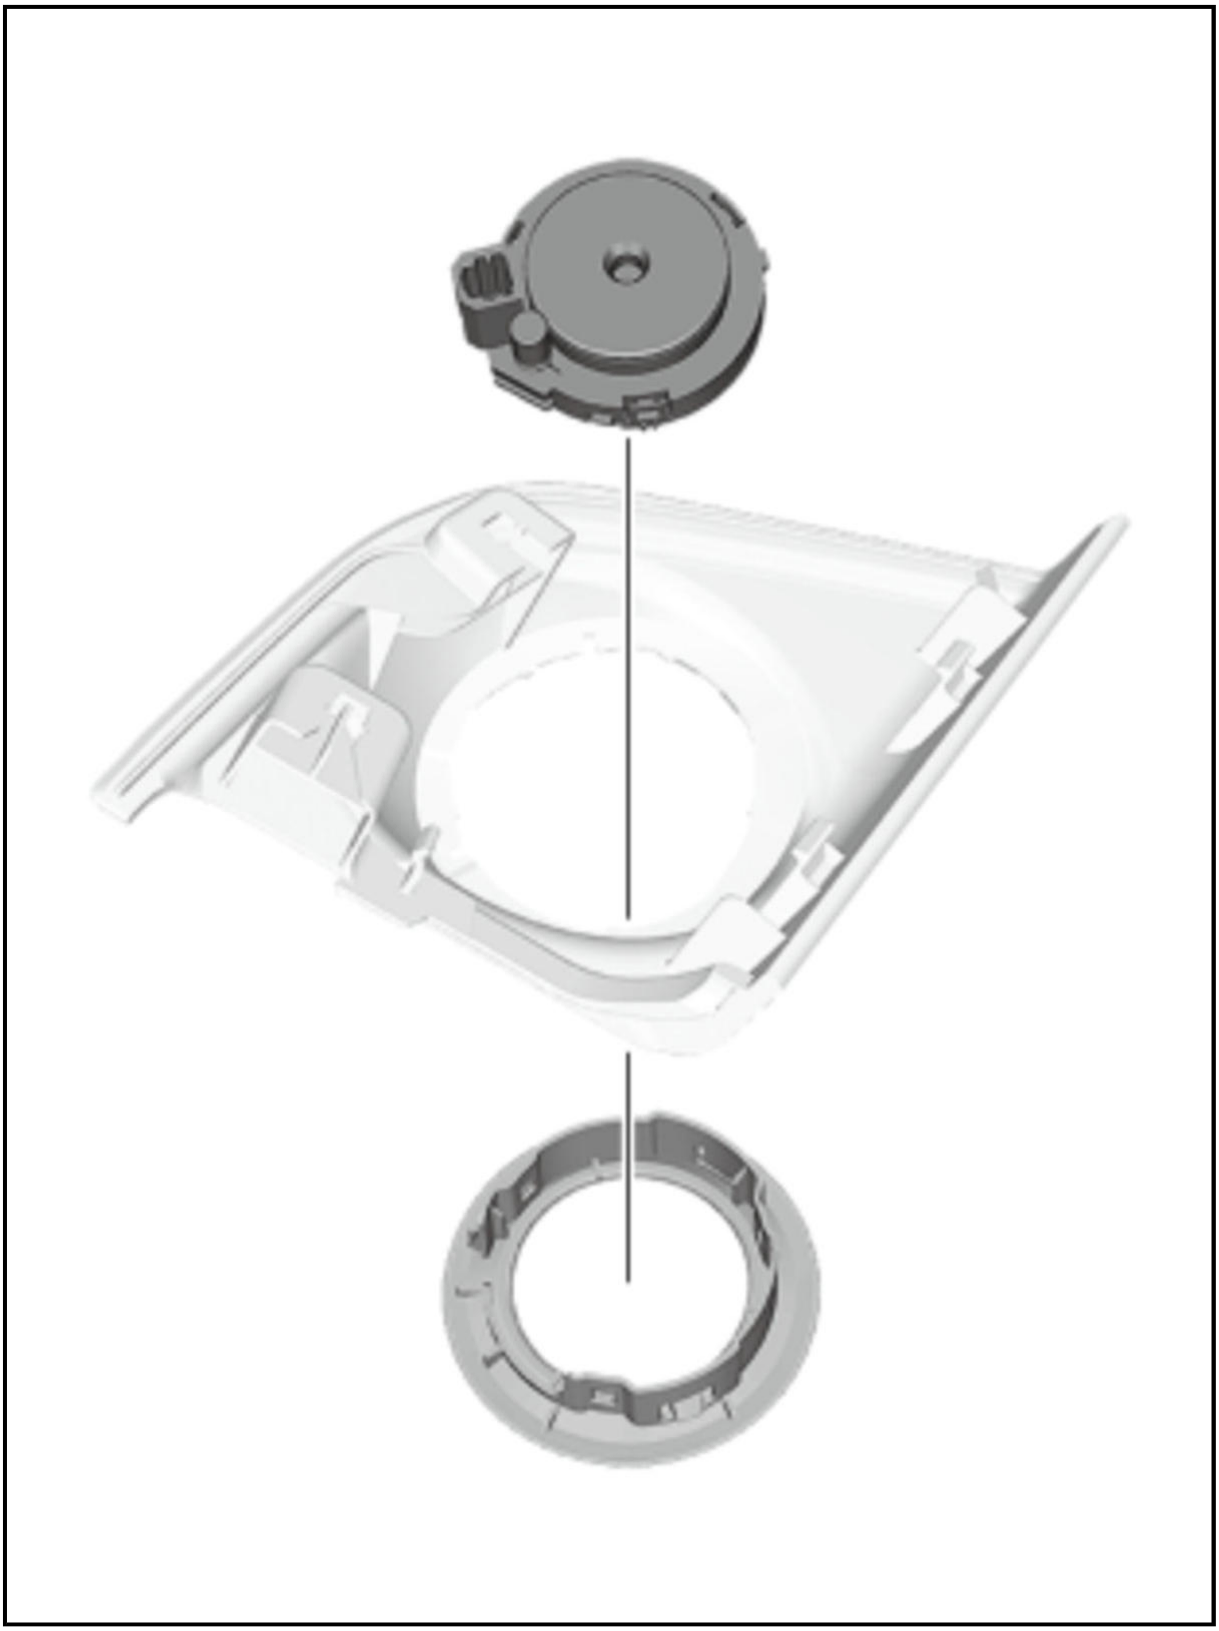
	1. Remove the bolt, then lift the door speaker (A) straight up to release the lower clips (B). 2. Disconnect the connector.

3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

Front Tweeter

1. **Mirror Trim - Remove**
2. Front Tweeter - Remove

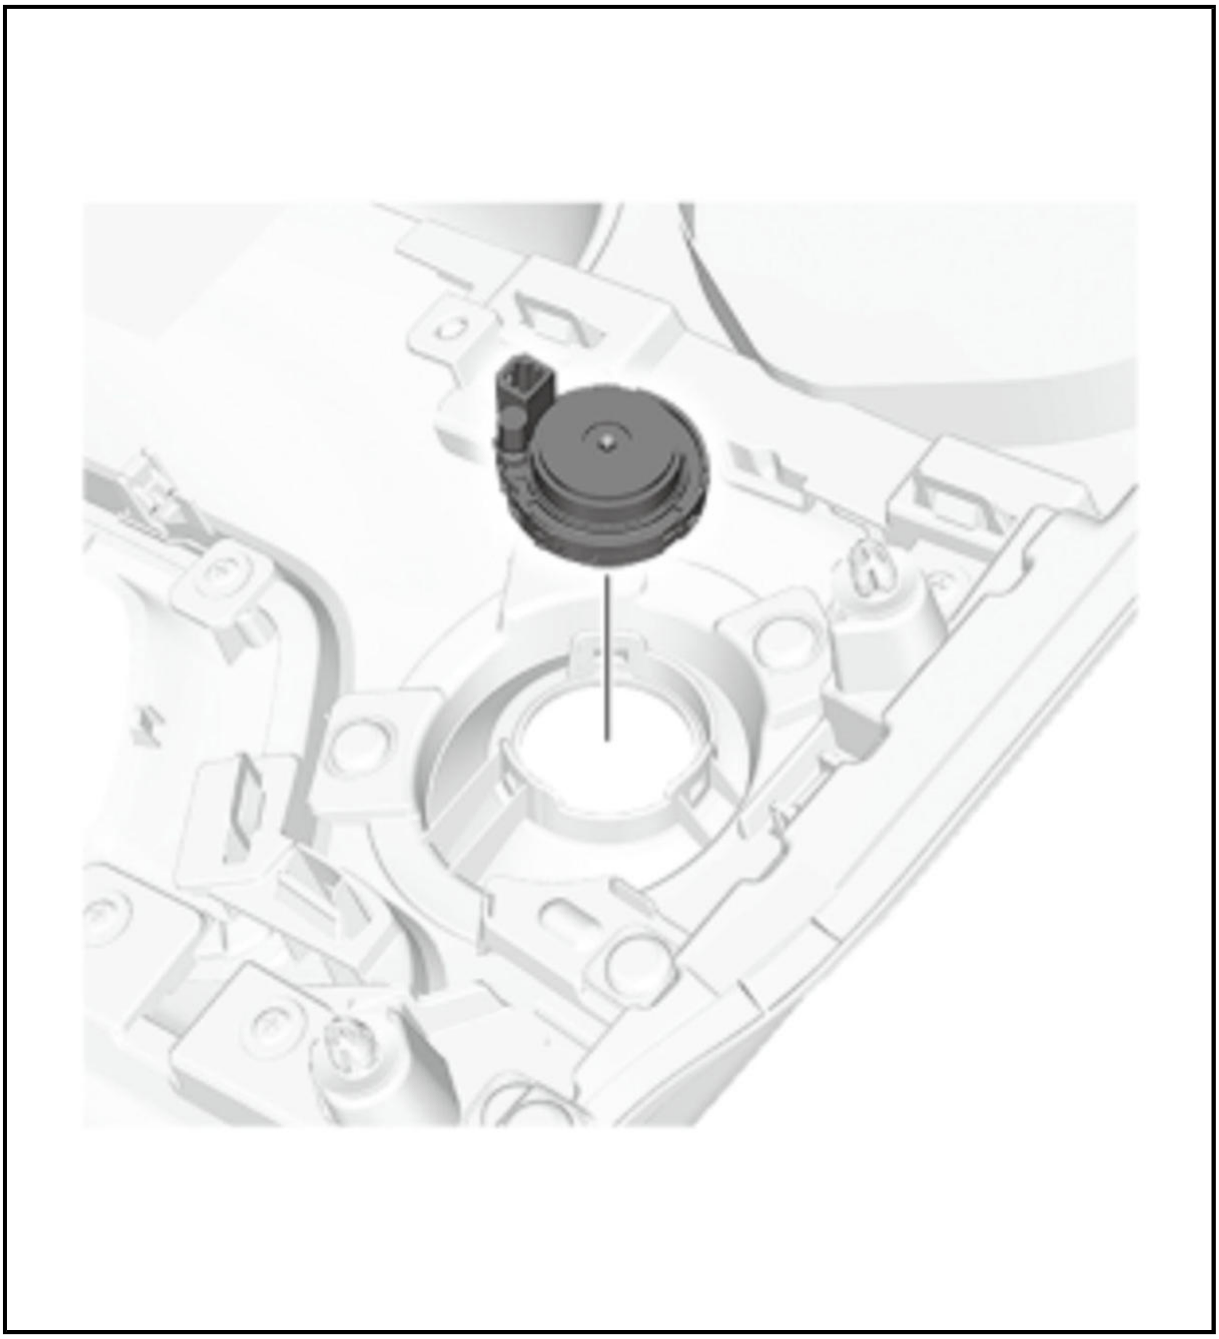


3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

Rear Tweeter

1. **Rear Door Panel - Remove**
2. Rear Tweeter - Remove

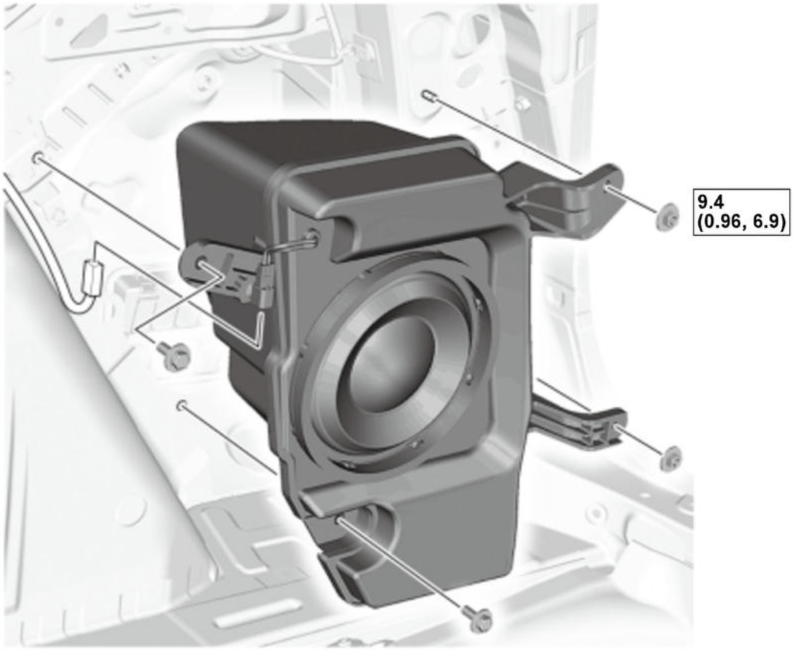


3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

Subwoofer

1. **Rear Side Trim Panel (Right Side) - Remove**
2. Subwoofer - Remove



3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

Test

Door Speaker, Rear Speaker

1. Door Speaker, Rear Speaker - Test

	1. Measure the resistance between terminals No. 1 and No. 2. There should be about 4 Ω. 2. If the resistance is not as specified, replace the door speaker.

Tweeter

1. Tweeter - Test

	1. Measure the resistance between terminal No. 1 and the outside terminal of the capacitor (A). There should be about 4 Ω. Also visually check the capacitor for damage. 2. If the resistance is not as specified, replace the tweeter.

Subwoofer

1. Subwoofer - Test

	1. Measure the resistance between the terminals No. 1 and No. 2. There should be about 2 Ω. 2. If the resistance is not as specified, replace the subwoofer.

DESCRIPTION & OPERATION

AUDIO SYSTEM DESCRIPTION

Basic Configuration

The Audio and Visual system consists of a digital audio/video playback function, communication to the customer's device, and displaying the driver's support information.

Audio Unit

The audio unit acts as a processor which includes playback functions of the USB, BluetoothB® audio, iPod for music, and an internal radio tuner or an external radio tuner that is controlled with digital communication. Select audio functions from audio unit buttons, touch screen (touch the display directly to select items on the screen), or the audio remote switch (on the steering wheel).

There are two kinds of audio units according to a vehicle model:

B	Display Audio type	Color Audio type
With Navigation	o	x
Without Navigation	o	o

Display Audio type

The audio unit acts as a head unit that controls external audio/visual system related devices which do not have an audio disc player and a control module. The center display unit acts as an user interface and is located on the front of the audio unit. An antenna for BluetoothB® communication, and an antenna for wireless LAN communication are built into the audio unit. Each function regarding the system is installed in the audio unit as applications. As an advanced feature, a smartphone linkage and video playback functions are available.

An audio unit with navigation function is referred to as an audio-navigation unit. This unit has a built-in gyro sensor and a navigation map data (**refer to the Navigation System Description**).

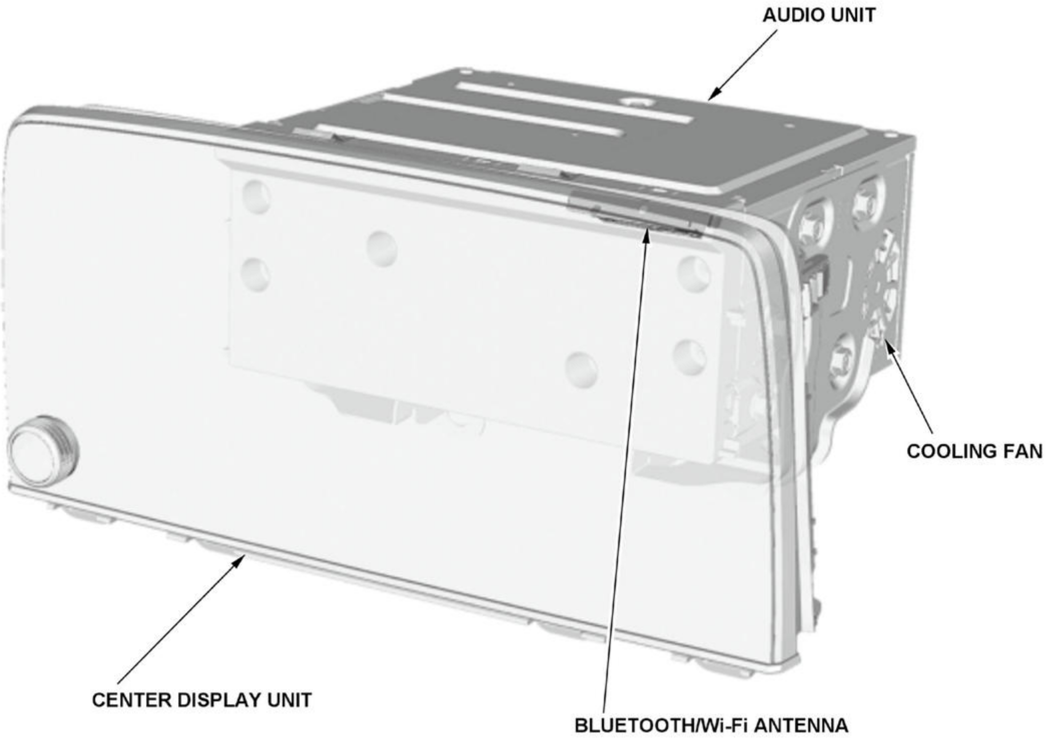
The SD card is a storage media that saves the navigation map data. The audio-navigation unit and the SD card cannot be substituted separately because the SD card module is not a removable type.

Both the audio-navigation unit and the audio unit have a GPS antenna circuit. The GPS information is used for a function that needs vehicle location other than the navigation function.

For vehicles with Sirius XMB® radio, the XM receiver circuit is built into the audio unit circuit. The XM satellite/terrestrial signal is received by the XM antenna built-in the roof antenna. The audio unit holds XM presets and settings even when the 12 volt battery is disconnected (AM/FM presets are stored in the tuner unit).

There are two audio systems available for the display audio type:

- The system with stereo amplifier: An external stereo amplifier (10 channels output) and 10 speakers are equipped. The audio unit outputs a digital audio signal to the stereo amplifier.
- The system without stereo amplifier: 8 speakers are equipped. In this case, a power amplifier is built into the audio unit.



Fail-Safe Function

The audio unit performs a fail-safe control when the system detects an abnormal high temperature in the unit:

Built-in cooling fan on/off control: When the audio unit temperature is too high, the audio unit turns the cooling fan on until the temperature cools down.

Self-Diagnostic Function

The audio unit has a self-diagnostic function to check the failure of the audio unit or its connection. Additionally, the audio unit has original hard error codes that can be displayed on the diagnostic screen to identify the failure part.

Forced Rebooting Function

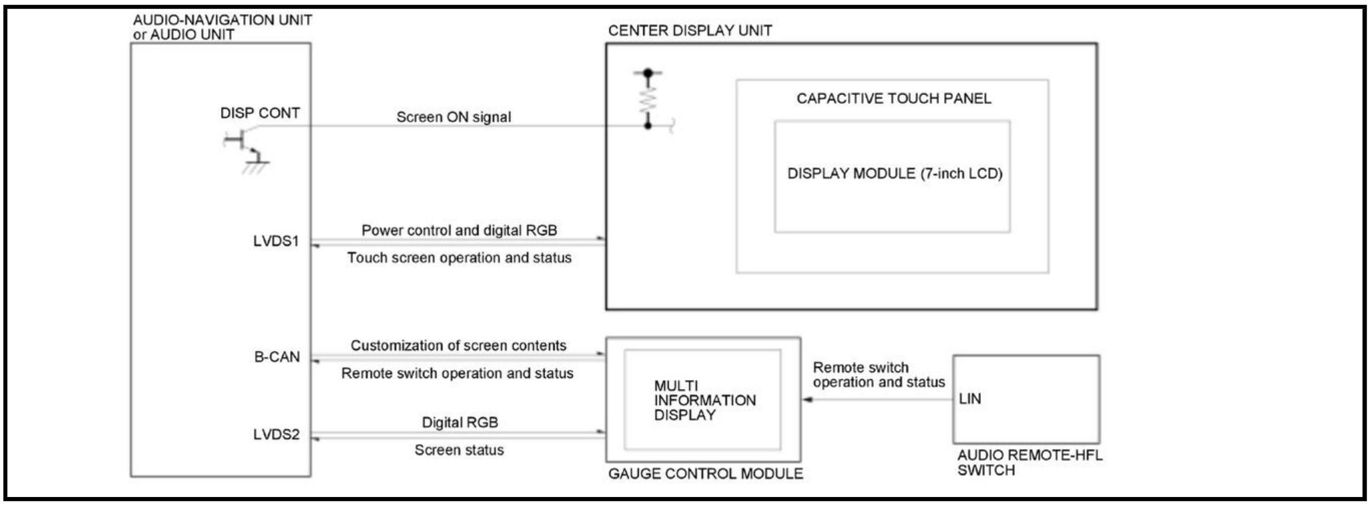
If the system is frozen, and the screen does not respond, you can attempt rebooting the audio unit by pressing and holding the AUDIO POWER (⏻) button for 5 seconds.

Center Display Unit (Display Audio type)

The center display unit has a 7-inch WVGA color TFT LCD that is driven by IPS (In-plane Switching) system with an electrostatic capacitive touch panel. The surface of the display is given an anti-glare coating. This unit displays the navigation map, vehicle information, various menu screens, and a rearview image, and can operate the audio, navigation, and HFL systems by touching the display. The HVAC information is displayed if the audio unit receives a feedback signal from the climate control unit via the B-CAN.

Controls

The center display unit turns on when the DISP CONT signal changes from OFF to ON.



AUDIO-NAVIGATION UNIT or AUDIO UNIT
CENTER DISPLAY UNIT

B-CAN
Customization of screen contents
Remote switch operation and status
MULTI INFORMATION DISPLAY
Remote switch operation and status
LIN
LVDS2
Digital RGB
Screen status
GAUGE CONTROL MODULE
AUDIO REMOTE-HFL SWITCH

Fail-Safe Function

The center display unit performs a fail-safe control when the system detects an abnormal high temperature in the unit:

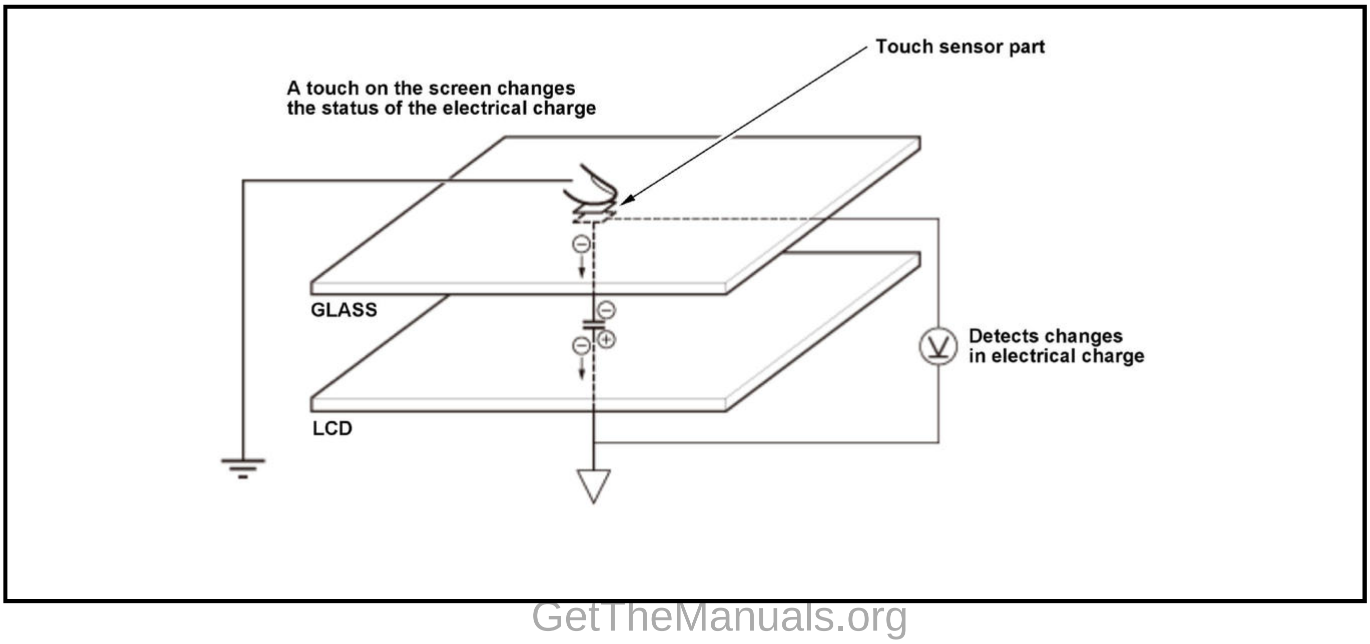
- When the center display unit temperature rises over about 86B°F (30B°C), the display brightness dims gradually.
- When the center display unit temperature rises 158B°F (70B°C), the display brightness dims to 75% of normal brightness.
- When the center display unit temperature rises over 176B°F (80B°C) for 8 minutes, the center display unit sends the error status to the audio unit, and the center display unit displays the error message and then turns off (the background system stays on).
- When the center display unit temperature drops to below 167B°F (75B°C), the display back light turns on, and the display brightness returns gradually as the temperature drops.

Self-Diagnostic Function

The audio unit can check the center display unit status by performing the System Diagnostic Mode.

Electrostatic Capacitive Touch Panel

To use the touch screen, bring your finger close to the screen or gently touch it with your finger. The touch sensor senses the change of the electrical charge when your finger is close to the screen and detects the position of the electrical charge. Use only a gentle touch to select or move the screen image. A hard finger press is not necessary. The screen cannot sense your touch if you wear heavy gloves, use a fingernail, or a pen.

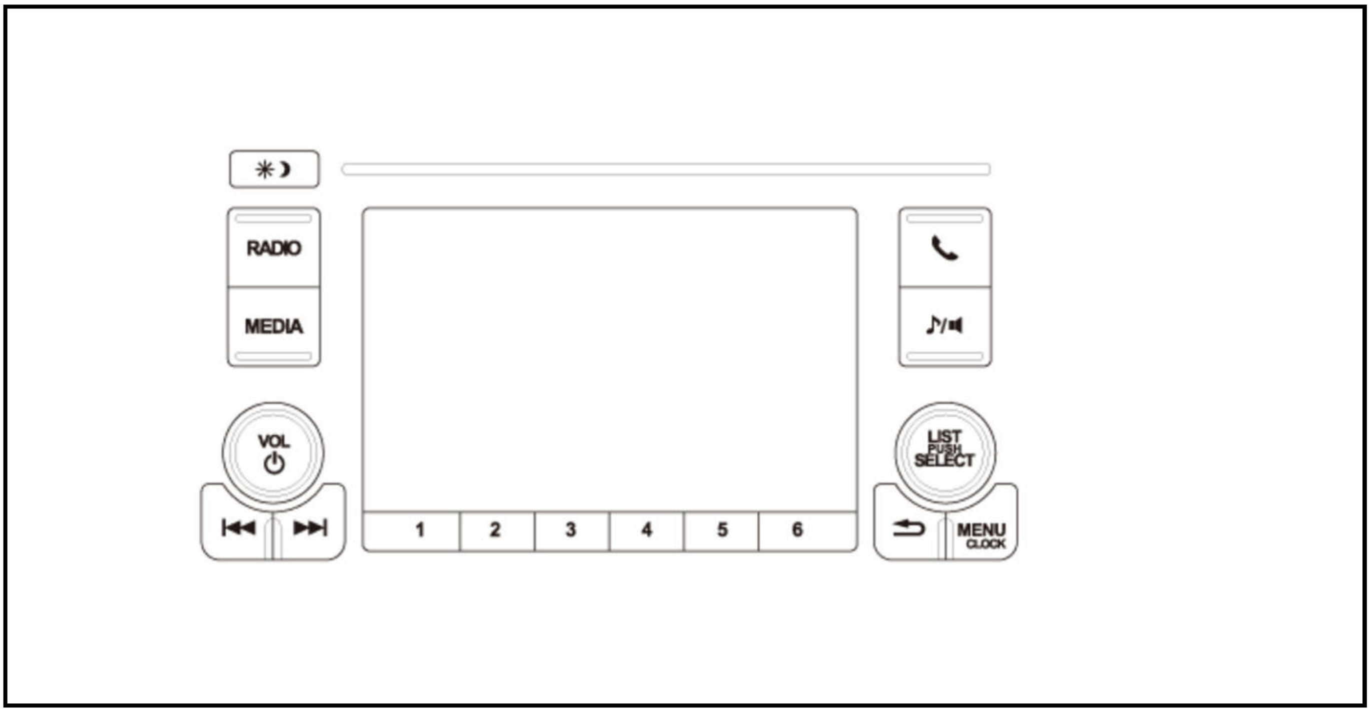


Touch sensor part
A touch on the screen changes the status of the electrical charge
GLASS
Detects changes in electrical charge
LCD

Color Audio type

The audio unit is a simple component which does not have an audio disc player, and has a 5-inch VGA color TFT LCD panel. The screen is not a touch sensitive and displays audio and HandsFreeLink (HFL) information. Additionally, the screen shows the rearview image when the transmission is shifted to the R position/mode. The audio panel has an illumination dimming function that is controlled by the B-CAN information. An antenna for BluetoothB® communication is built in the audio unit. As an advanced feature, the HFL function includes an external microphone that located in the roof console.

The AM/FM (RBDS) radio tuner is built into the audio unit. This unit holds AM/FM presets even when the 12 volt battery is disconnected.



Fail-Safe Function

The audio unit performs the fail-safe control when the system detects an abnormal high temperature in the unit:

- When the surface of the LCD temperature rises over 194B°F (90B°C), the display back light turns off.
- When the surface of the LCD temperature drops to below 189B°F (87B°C), the display back light turns on.

Self-Diagnostic Function

The audio unit has the self-diagnostic function to check the failure of the audio unit or its connection.

Audio System Functions

Anti-Theft Function (With Audio System Theft Protection)

The audio unit has an anti-theft protection function separate from the security system of the vehicle. If the audio unit is removed from the vehicle, the audio unit requires a procedure to unlock the security system in order to use it again after the audio unit is reconnected.

There are two kinds of anti-theft mode release procedures:

- While displaying the security code entry screen or the conformation screen of the anti-theft system, press and hold the AUDIO POWER (⏻) button for at least 2 seconds. The audio unit automatically exits the anti-theft mode.

- While displaying the security code entry screen, enter the 5-digit anti-theft code.

The System Diagnostic Mode (includes checking hard error codes) can be used even if the audio unit is in the anti-theft mode.

If you substitute the audio unit into another vehicle, you must either enter the anti-theft code or perform the anti-theft skip mode in the System Diagnostic mode (This mode will release the anti-theft code for 150 seconds).

Muting Logic

The outline of the audio interruption function is shown in the following table.

With Stereo Amplifier

Contents	Audio Output			
	Front CH (driver's side)	Front CH (passenger's side)	Rear CH	Subwoofer CH
System beep	Beep and audio	Beep and audio	Audio	Audio
Pressing TALK/BACK buttons	Feedback output	Muted	Muted	Muted
Guidance	Guidance output and attenuated audio	Attenuated audio	Attenuated audio	Attenuated audio
HFL	HFL output	HFL output	Muted	Muted
HFL and Guidance	Guidance output	HFL output	Muted	Muted

Without Stereo Amplifier

Contents	Audio Output		
	Front CH (driver's side)	Front CH (passenger's side)	Rear CH
System beep	Beep and audio	Beep and audio	Audio
Pressing TALK/BACK buttons	Feedback output	Muted	Muted
Guidance	Guidance output and attenuated audio	Attenuated audio	Attenuated audio
HFL	HFL output	HFL output	Muted
HFL and Guidance	Guidance output	HFL output	Muted

Speed-Sensitive Volume Compensation (SVC)

All audio systems are equipped with speed-sensitive volume compensation (SVC). The audio unit receives the vehicle speed pulse (VSP) from the gauge control module (B-CAN). The system processes the speed input and increases the audio system volume level as the vehicle speed increases to compensate for the interior noise that occurs at higher speeds. When the vehicle slows down, the volume returns to its normal level. For vehicles with a stereo amplifier, SVC function is controlled by the stereo amplifier. The SVC has four settings: SVC OFF, SVC LOW, SVC MID, and SVC HIGH that can be adjusted using the audio unit.

Operation Restriction

The audio unit has a function that restricts certain operations of audio and visual systems that may affects safe driving.

Clock Function

The audio unit has a real time clock circuit that operates the clock even if the vehicle is in the OFF (LOCK) mode. Also, the audio unit (display audio type) can adjust the internal clock by linking a smartphone. Additionally, the audio unit with a GPS antenna can display clock information by receiving the GPS signal.

USB Connection

For vehicles with an audio unit (display audio type), two USB ports are equipped for an external device input and a smartphone connection. The USB port A is based on the specification of USB Battery Charging 1.2 (BC 1.2) that supports high-speed charging of the USB device. The audio unit can detect the USB device type (BC 1.2 or not), and change the charging mode automatically. The USB port B supports charging to USB devices by a 1.0 A electric supply.

For vehicles with an audio unit (color audio type), a USB port is equipped for an external device input. The USB port supports charging to USB devices by a 1.0 A electric supply.

USB Audio

The audio system can play digital music from portable audio players, a USB drive, etc. When the device is plugged into the vehicle's USB port, and the vehicle is turned to the ACCESSORY mode, the audio unit begins to communicate with the connected USB device, and to supply the VBUS power. The audio unit controls the device when searching and playing the files. Not all players and player functions work with the USB adapter. Please see the Owner's Manual for more information.

Supported Devices

- Supports for USB Mass storage class/Bulk-only transport.
- USB 2.0 Full-speed capable.
- At least 256 MB storage capacity.
- USB formatted to be compatible with Windows-based operating systems.
- If the USB has a security feature, like write protection, it must be turned off.

There are many different USB devices, manufacturers, and configurations with new devices being released every day, which makes it impossible to test all USB devices with the audio system. Even if the USB device has all these requirements, it may not be compatible.

Hard drives do not support overwriting the data for the track order, which is why they are not recommended.

When you disconnect a USB device, the data for the track order remains in the audio unit's memory so when you reconnect the same USB device, the audio unit continues playing from the location where it was disconnected. If a new USB device is connected, the data for the track order is rewritten and you need to select the album or music file.

BluetoothB® Connection

The audio unit can be paired with a compatible cell phone or a device for BluetoothB® communication. Pairing procedures vary by the connection history and BluetoothB® version of the cell phone or the device. Refer to the Owner's Manual.

The audio unit supports BluetoothB® Ver 4.0+EDR (Ver 2.1+EDR*). BluetoothB® enables audio streaming, wireless play back on an audio device, hands-free calling with a cell phone, data communication, and phone book loading.

*: Color audio type

BluetoothB® Audio

BluetoothB® audio allows approved BluetoothB® cell phones equipped with music function to play music via the vehicle's audio system using a BluetoothB® technology. You can control the cell phone's music player remotely using the wireless connection.

- You can play music stored in your cell phone using the wireless connection.
- You can choose the next song, a previous song and resume/pause via the wireless connection.

NOTE: Not all cell phones support the BluetoothB® audio function.

Supported Devices

- BluetoothB® music phones that support A2DP 1.2 and AVRCP 1.0, 1.3, and 1.4.
- BluetoothB® adapters for portable music devices including iPod are not supported.

NOTE: Availability of the functions depends on the connected cell phone.

Wireless LAN Connection (Display Audio type)

The audio unit supports wireless LAN connection based on the IEEE 802.11 a/b/g/n standard. The audio unit can connect the device that has a function as a Wi-Fi access point.

Video Playback Function (Display Audio type)

The audio system can play digital compressed video from a HDMI device or a USB device (MP4 is supported).

HD Radio (TM) (Display Audio Type)

HD Radio (TM) is a crystal clear digital audio broadcast by local radio stations. There is no charge for HD radio. Simply tune to your favorite station, and if the station is broadcasting with HD Radio (TM) technology, then the audio unit will automatically pick up the digital signal, and begin playing the crystal clear, subscription free audio. Refer to your Owner's Manual to determine how your particular receiver indicates HD Radio (TM) reception and how to transition from the main program to the multicast program(s).

- The HD1 channel acquires the analog station first and then blends with the digital signal. Therefore, the digital audio may have a short delay.
- There is no analog signal available on the HD2/HD3 channels. Therefore, there is a short delay while decoding the digital audio. Audio will begin playing when available.
- Go to www.hdradio.com for stations in the area to verify correct operation on the station.

Song By Voice (TM) (Display Audio Type)

A customer can use the Song By Voice (TM) feature to select and play the audio files in an iPod or a USB device with voice commands.

When an iPod or a USB device is connected to the audio unit, the unit makes a dictionary from the album name, folder name, artist name, track name, and the file name.

If a different device is connected, or the customer updates the files on the connected device, a new dictionary is created.

Smartphone Linkage Function (Display Audio type)

This function helps ensure the safe use of a smartphone while driving. Connect a smartphone to the audio unit to use it. Connection methods vary depending on carriers.

When using the navigation function via a smartphone, the audio unit can display the navigation map screen that is in the connected smartphone. In this case, the GPS signal is received by the audio unit, and the vehicle signals are received from the F-CAN and the B-CAN as information of vehicle position tuning.

When using the voice recognition function via a smartphone, the HFL microphone in the roof console picks up the driver's voice, and sends the voice signal to the smartphone via the audio unit using BluetoothB®.

When the voice recognition is in use, the audio unit sends the fan mute signal to the climate control unit via the B-CAN. The blower fan operating voltage may be reduced depending on the current fan speed.

HondaLink Assist (Display Audio Type)

HondaLink delivers remote services to the vehicle using the customer's compatible BluetoothB® cell phone.

If the SRS airbag is deployed, the SRS unit sends a signal to the audio unit via the F-CAN. Then, the audio unit calls a Public Safety Answering Point (PSAP) automatically using the customer's compatible BluetoothB® cell phone, and sends the vehicle location using Dual-Tone Multi-Frequency (DTMF). The audio unit uses the GPS antenna for tracking the vehicle location.

Tuner Unit

The tuner unit is a separate digital radio tuner interface. Received AM/FM radio waves are processed on the digital signal processor (DSP) and sent to the audio unit via the dedicated digital audio line (SPDIF1). At this time, HD radio (TM) sound signal is separated from normal AM radio sound signal. All of the information about AM/FM reception (includes RBDS information) are sent from the tuner unit via the dedicated serial bus (RS485). This unit holds AM/FM radio frequency presets even when the 12 volt battery is disconnected.

For vehicles with Sirius XMB® radio, the antenna for receiving AM/FM radio waves and satellite/terrestrial (XM) signal uses a roof antenna type. AM/FM radio wave is amplified by the AM/FM antenna amplifier. The sensitivity of the FM wave is raised by the auto gain control. The XM antenna receives satellite signal and terrestrial signal by using the high-gain antenna. Signals are sent to the audio unit via the dedicated single line (SAT/TER).

Self-Diagnostic Function

The audio unit can check the tuner unit status by performing the System Diagnostic Mode.

Stereo Amplifier

The stereo amplifier is a separated power amplifier interface. Digital audio signal (SPDIF2) that is received from the audio unit is processed on the DSP, and sent to each speaker after amplified by the AMP IC.

The stereo amplifier communicates with the audio-navigation unit or the audio unit using the dedicated serial bus (RS485). This communication includes the vehicle speed (for SVC) information, audio settings, and the MUTE commands. The stereo amplifier adjusts the speaker outputs by oneself which is based on the received information.

The stereo amplifier receives the noise cancelling signal (ANC), guidance signal, and system beep signal via independent lines, and mixes them to the applicable audio lines.

Fail-Safe Function

The stereo amplifier performs a fail-safe control when the stereo amplifier detects an abnormal high temperature. The stereo amplifier then sends the error status to the audio unit, and the center display unit displays an error message which then the stereo amplifier inhibits sound output.

When the temperature cools down, the stereo amplifier outputs the sound again.

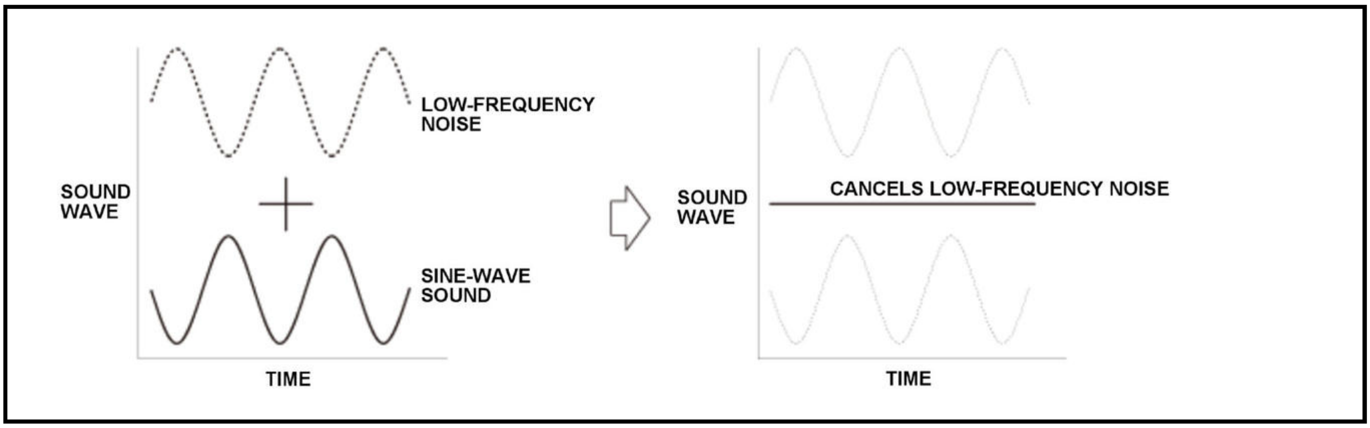
Active Noise Cancellation (ANC)/Active Sound Control

Both the active noise cancellation (ANC) and the active sound control are built into the ANC/active sound control unit. Both systems eliminate unwanted sound entering the passenger compartment. There are two microphones mounted in the headliner; one is just behind the front overhead roof console and the other is just ahead of the rear map lights. The microphones capture low frequencies entering the passenger compartment and send a signal to the ANC/active sound control unit. The ANC/active sound control unit then creates the sound wave that is sent out through the speakers to eliminate the unwanted sound.

Active Noise Cancellation (ANC)

The ANC system works to cancel the engine booming sound up to about 2000 RPM (min -1). The ANC/active sound control unit receives the engine speed pulse (NEP) from the PCM and outputs a sine-wave-sound through the audio speakers to cancel the low-frequency noise from the engine. The ANC system also uses two microphones to detect and monitor the low frequency noise in the passenger compartment. The microphones feedback the noise information to the audio unit or the audio-navigation unit which adjusts the speaker output to reduce the noise. The ANC also receives the output of the door open/close signal from the MICU. Whenever any door is opened, the ANC system temporarily stops working. Each signal is sent to the ANC/active sound control unit via F-CAN.

The ANC/Active sound control unit monitors the stereo amplifier output signals to the subwoofer, and if the subwoofer gives a sound more than the rated value, the ANC/Active sound control unit stops ANC control. This control is not for deleting bass of an audio output.



Active Sound Control

The active sound control is the next generation control of eliminating the unwanted sound in the passenger compartment. The active sound control has a much broader range than the ANC system. In addition to the microphones in the headliner, the active sound control also receives the output from the engine speed pulse (NEP) to provide various levels of the sound cancelling depending on changes in the engine RPM.

Front ANC/Active Sound Control Microphone

Receives a voice command, and transmits them to the audio unit or the audio-navigation unit. The microphone unit consists of two microphones. One of the microphones is combined with the ANC/active sound control microphone. It detects the driver's voice and the passenger's voice separately (**refer to the HandsFreeLink System Description for the HFL Microphone functions** .)

Audio Remote-HFL Switch

The audio remote switch and the HFL switch are integrated into the audio remote-HFL switch that uses a digital communication (LIN).

The audio remote-HFL switch has an electrostatic capacitance touch sensor (see Center Display Unit) for specific button operation.

When using any button or the touch switch on the audio remote-HFL switch, the control signal is sent to the audio unit via the gauge control module. The gauge control module reflects the control information of the audio remote-HFL switch as indication to the multi-information display (MID).

If the LIN circuit is open or shorted between the gauge control module and the audio remote-HFL switch, the gauge control module triggers the related DTC.

Multi-View Rearview Camera

The multi-view rearview camera is a function that provides three different view images to the driver by the camera that is installed in the vehicle's rear end. The view images can be changed by the user. The rearview guide lines change according to the selected view. The rearview camera is connected directly to the audio unit.

- Normal View Mode

  The display shows the standard view.

- Wide View Mode

  The display shows wider visibility than the normal view, which helps the driver confirm any objects approaching from right and left.

- Top Down View Mode

  The display shows the view from the top angle of the vehicle, which helps the driver confirm the distance from any object behind.

Basic Control

The audio unit outputs the power source (CAMERA VCC) to the rearview camera under some conditions:

- Turn the vehicle to the ACCESSORY mode.
-

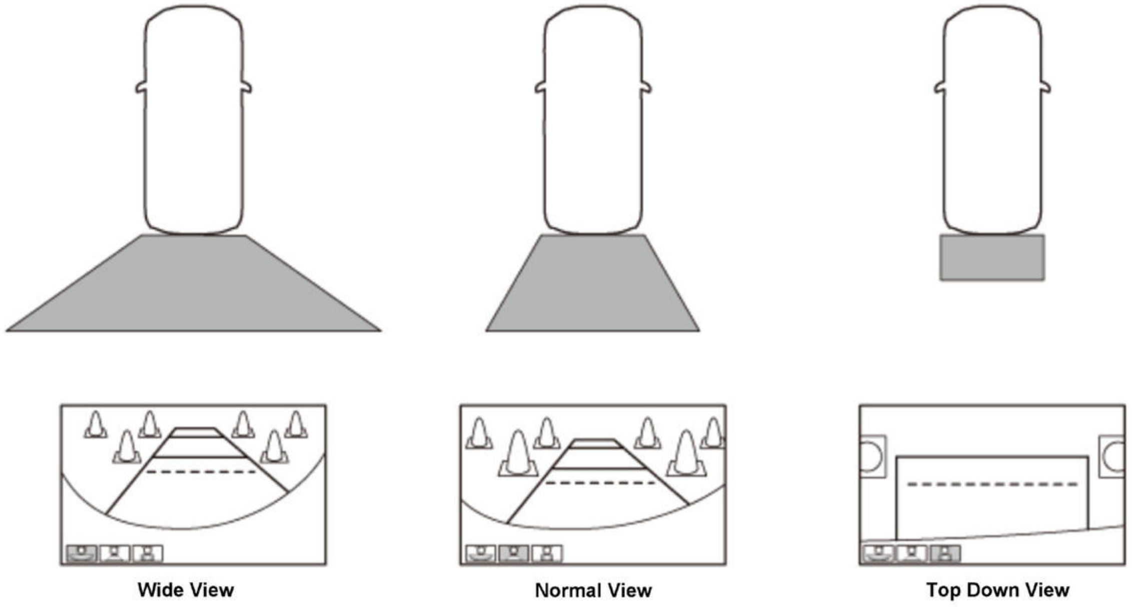
  - If the audio unit does not detect the BACK LT signal for 5 minutes, the audio unit cancels outputting the power source to the rearview camera.
- Detecting the BACK LT signal (when the transmission is shifted to R position/mode).
-
  - If the audio unit does not detect the BACK LT signal for 5 minutes after cancelling the rearview mode, the audio unit cancels outputting the power source to the rearview camera.
- When using the Rear Camera diagnosis in the System Diagnostic Mode.
-
  - If the audio unit does not detect the BACK LT signal for 5 minutes after exiting the System Diagnostic Mode, the audio unit cancels outputting the power source to the rearview camera.

When the audio unit detects the BACK LT signal for at least 0.5 seconds, the audio unit display turns on the rearview camera image. The display delays for 0.5 seconds to prevent changing the screen image too frequently because of incorrect shift position/mode selection. You can change the view mode by touching the mode icon* 1 or by pressing the SELECTOR knob* 2.

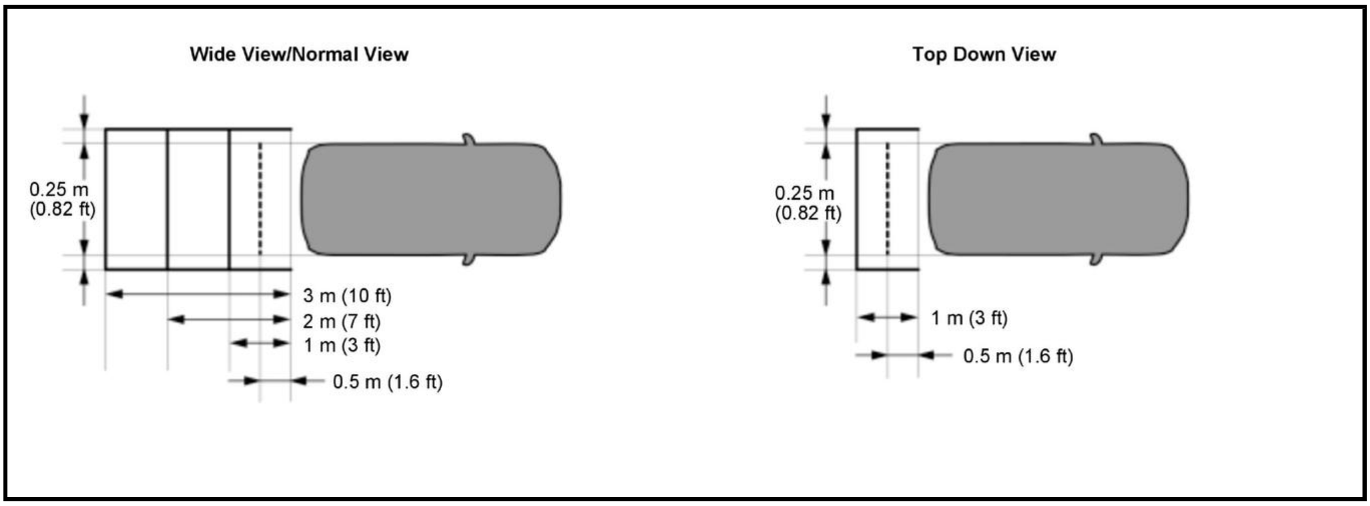
*1: Display audio type

*2: Color audio type

While displaying the rearview image, the LaneWatch function cannot be used because the LaneWatch image can be misunderstood as the rearview image.



Guidelines type A



Wide View/Normal View
0.25 m (0.82 ft)
3 m (10 ft)
2 m (7 ft)
1 m (3 ft)
0.5 m (1.6 ft)
Top Down View

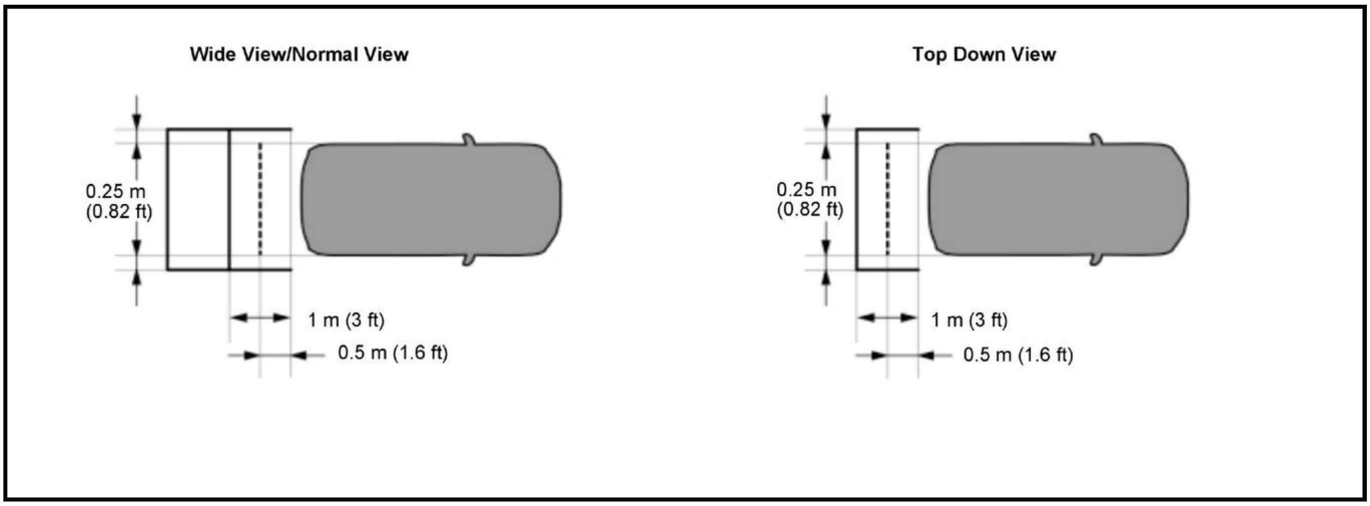
1 m (3 ft)
0.5 m (1.6 ft)

Guidelines type B



Wide View/Normal View
0.25 m (0.82 ft)
1 m (3 ft)
0.5 m (1.6 ft)
Top Down View
0.25 m (0.82 ft)
1 m (3 ft)
0.5 m (1.6 ft)

Changing Camera Views

When the rearview camera image is displayed, touching the mode icon sends a signal from the audio unit to the rearview camera using the CAMERA BIT0 and CAMERA BIT1 signal lines to change the rearview camera view.

B	Wide	Normal	Top Down
CAMERA BIT0 Signal	OFF (0 V)	ON (5 V - 8 V)	OFF (0 V)
CAMERA BIT1 Signal	OFF (0 V)	OFF (0 V)	ON (5 V - 8 V)

View Mode Memorization

Any time the audio unit loses power (battery disconnected, audio unit disconnected, etc.) the rearview camera defaults to the normal angle view. The rearview camera will also default to this angle if you had the top down angle selected when you turn the vehicle to the OFF (LOCK) mode. If you change the rearview camera to the wide view, the rearview camera will remember this view when you turn the vehicle to the ON mode.

Dynamic Guideline (Display Audio type)

When the rearview image is displayed with the guide line, the guide line changes according to the steering angle input (When the steering rotates 90 degrees or more). The steering angle information is received from the gauge control module via the B-CAN as vehicle signals.

USB Charger Unit

The USB charger unit controls an output current for charging of a USB device. The USB port C and D (CHARGE ONLY) located on the center console are a dedicated USB charging port. The USB charger unit is based on the specification of the USB Battery Charging 1.2 (BC 1.2) that supports high-speed charging of the USB device. The USB charger unit can detect the USB device type (BC 1.2 or not), and change the charging mode automatically.

The USB charger unit is launched by turning the vehicle to the ACCESSORY mode. When you connect the USB device to the USB port C and D (CHARGE ONLY), the USB charger unit supplies the appropriate current (1.0 A - 2.1 A) to the USB device via the USB VBUS. In this case, the USB charger unit detects the electrical characteristics from the USB DATA lines. No data communication occurs between the USB charger unit and the USB device. Also, there is no connection between the USB charger unit and the audio-navigation unit or the audio unit.

DIAGNOSIS

AUDIO SYSTEM DIAGNOSTIC MODE (COLOR AUDIO TYPE)

Start-Up Procedure and Diagnostic Menu

NOTE:

- Check the vehicle 12 volt battery condition first .
- The screens detail indicated may change depending on equipment or specification.

1. Turn the vehicle to the ON mode. If needed, start the engine.

2. Press the POWER (⏻) button to turn off the audio unit.

3. Press and hold the preset No. 1 button, then preset No. 6 button and then the VOLUME/POWER (⏻) knob. The display screen goes directly to the Manual Diag menu shown.

NOTE: Do not press preset No. 1 and No. 6 buttons simultaneously.

- Preset No. 2 button: AUDIO
- Preset No. 3 button: Display
- Preset No. 4 button: Camera
- Preset No. 5 button: Connection
- Preset No. 6 button: Vehicle information

5. To end the system diagnostic mode, press the VOLUME/POWER knob, or turn the vehicle to the OFF (LOCK) mode.

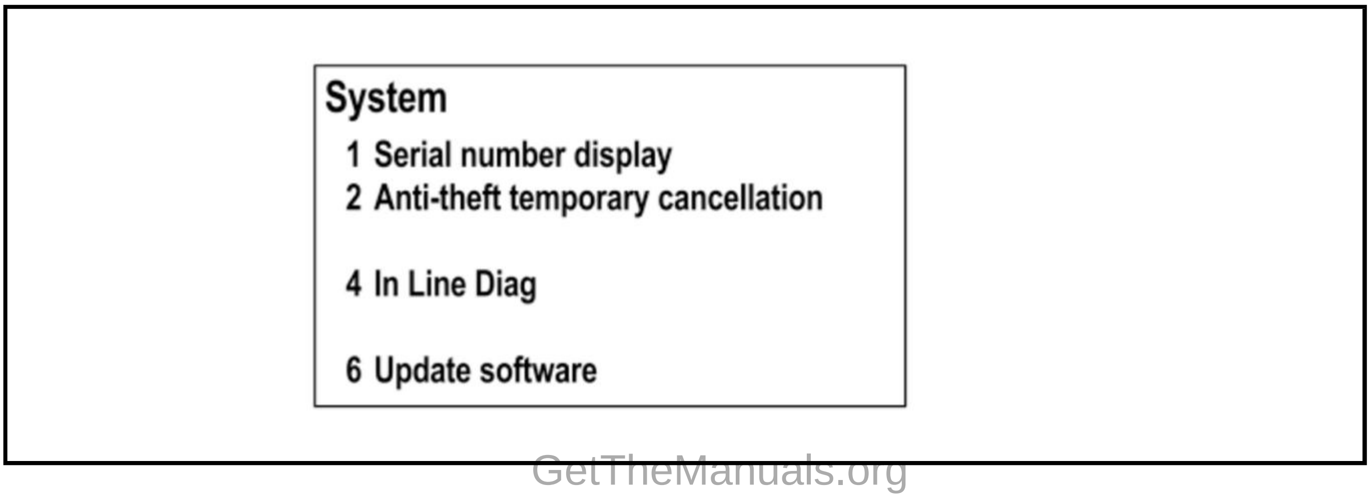
How to Obtain the Audio Unit Serial Number (With Audio System Theft Protection)

NOTE: This procedure can be done only before anti-theft mode is cancelled.

1. Turn the vehicle to the ON mode. Make sure the audio unit is in the anti-theft mode.

2. Go into the System Diagnostic Mode, and select the System diagnosis, then press the preset No. 1 button.

3. The screen displays an 8-digit audio unit serial number.



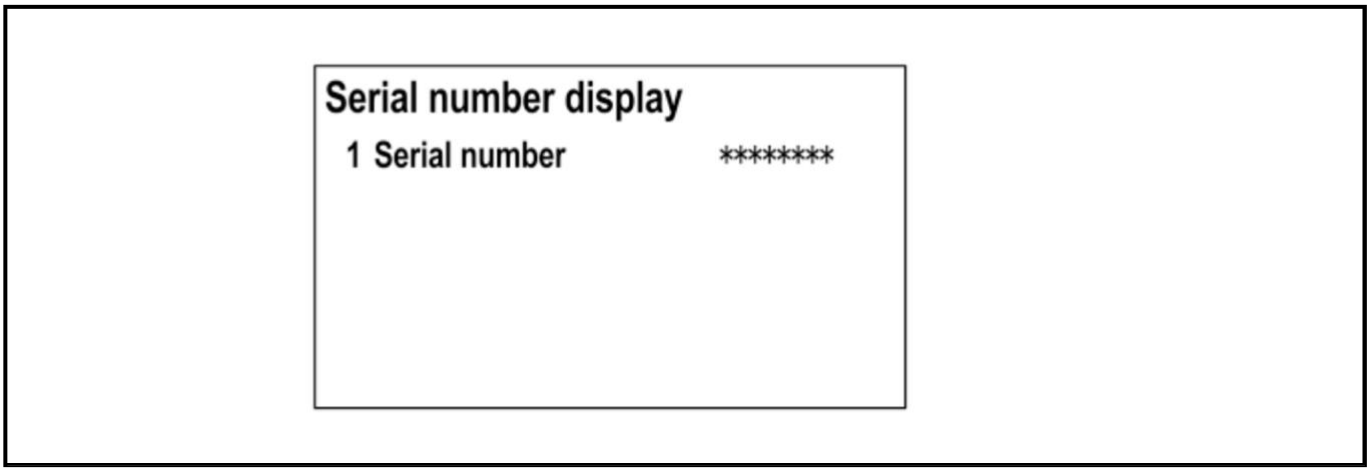
System

1 Serial number display

2 Anti-theft temporary cancellation

4 In Line Diag

6 Update software



Serial number display

1 Serial number ********

4. Use all 8 numbers as the serial number when using the Interactive Network (iN) to retrieve the 5-digit anti-theft code.

Anti-Theft Temporary Cancellation

5. Return to the System diagnosis, when preset No. 2 button is pressed, the anti-theft mode is cancelled temporarily, and the system returns to the normal audio screen automatically.

System

This diagnosis displays the current version information about each module in the audio unit, and result of the In Line Diag, and detects the hard keys.

To start the diagnosis, press the preset button to select the diagnosis number you want to check.

NOTE: Items not listed are not available in this model.

- Preset No. 1 button: Driver distraction prevention
- Preset No. 3 button: Knob check
- Preset No. 4 button: In Line Diag
- Preset No. 5 button: Knob illumination check
- Preset No. 6 button: Update software (factory use only)

5 Knob illumination check

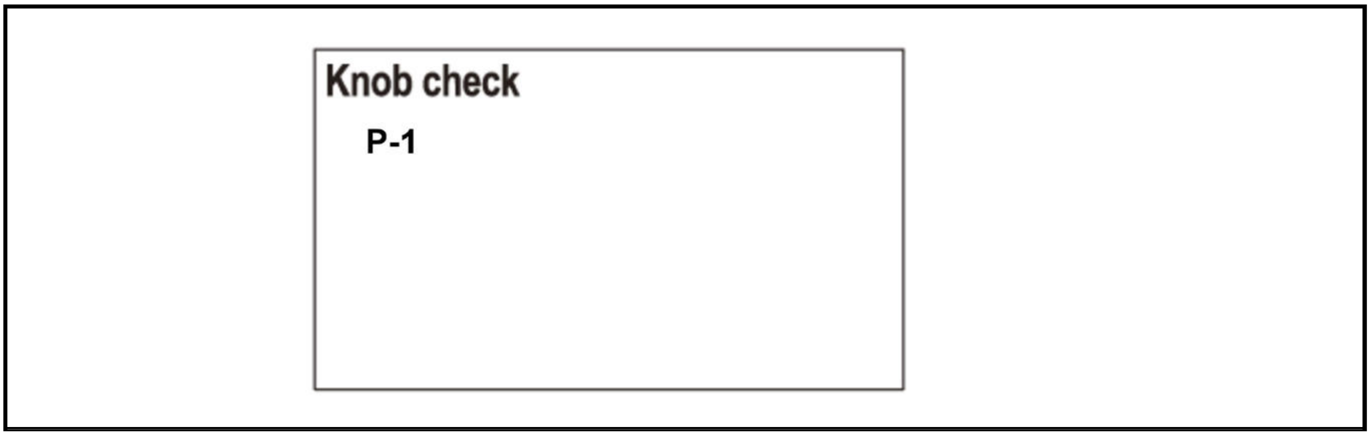
6 Update software

Knob Check

This diagnosis checks the audio unit hard buttons and the audio remote-HFL switch.

As each function is tested, the corresponding button name should be displayed.

- If any button of the audio unit does not respond, **replace the audio panel or the audio unit** .
- If any button of the audio remote-HFL switch does not respond, **do the audio remote-HFL switch test** .
- If all buttons of the audio remote-HFL switch do not respond, go to **Audio remote-HFL switch does not work properly (audio unit buttons work) troubleshooting**.

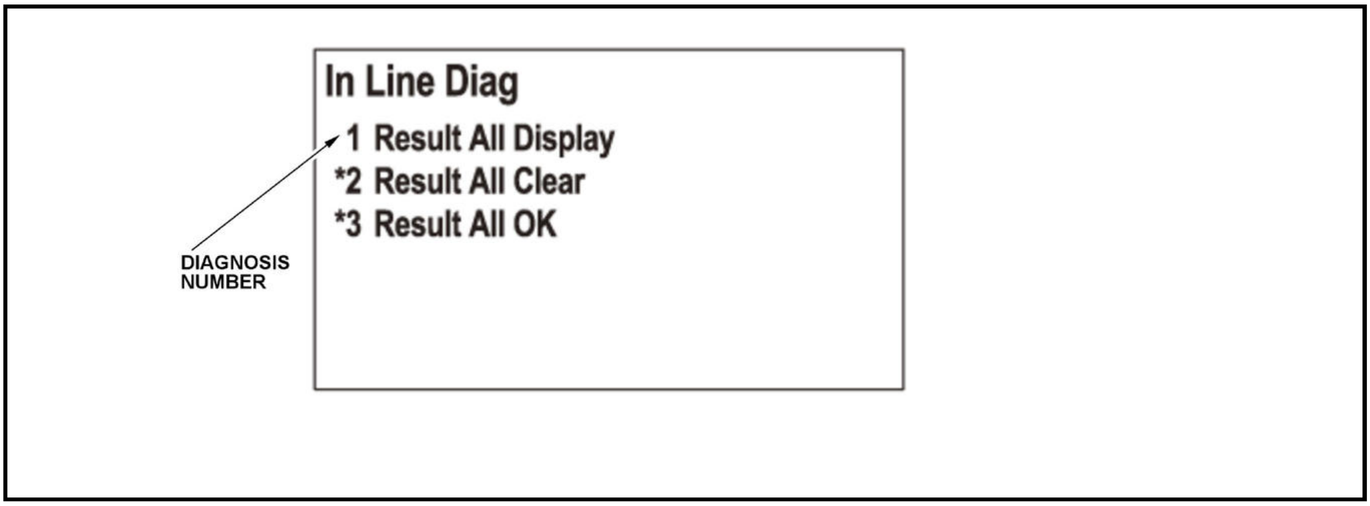


In Line Diag

This diagnosis checks whether the audio unit is receiving each unit signal properly, and clear the result(s).

To start the diagnosis, press the preset button to select the diagnosis number you want to check.

- Preset No. 1 button: Result All Display
- Preset No. 2 button: Result All Clear
- Preset No. 3 button: Result All OK



Result All Display

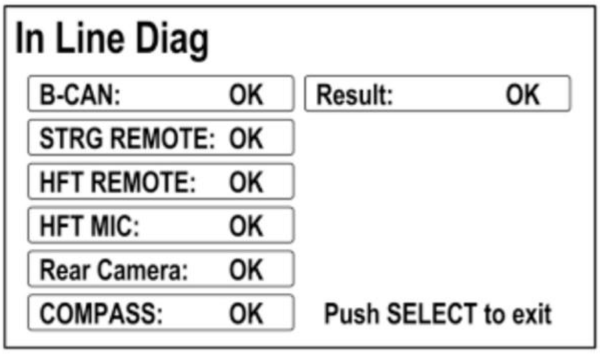
You can check the result of the In Line Diag.

The In Line Diag function runs automatically. When the diagnosis finishes, the icons turn different colors based on their test status (OK or NG).

NOTE: The STRG REMOTE and the HFL REMOTE indicates NG until the audio remote switch button and the HFL switch button are pressed.

Icon Colors	Description
Green	The system ran a diagnosis and the results are OK.
Red	Errors that require replacement of hardware or harness.

Icon Colors	Description
Yellow	Errors that do not require hardware replacement, such as a missing optional systems (rearview camera), or the connection check is in the state which is not done.



In Line Diag

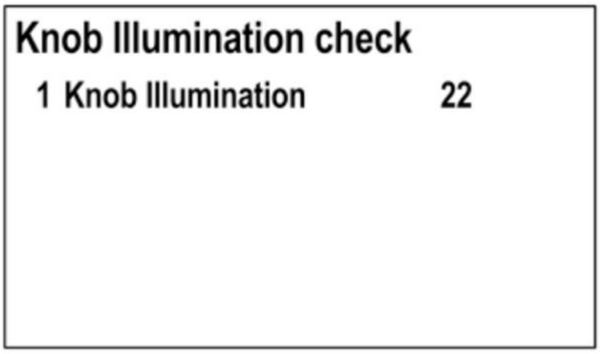
Result: OK

Push SELECT to exit

Knob Illumination Check

This diagnosis checks the dimming circuit of the audio unit buttons.

When rotating the LIST/SELECT knob, you should see the value change from 1 (max low) to 22 (max high).



Knob Illumination check

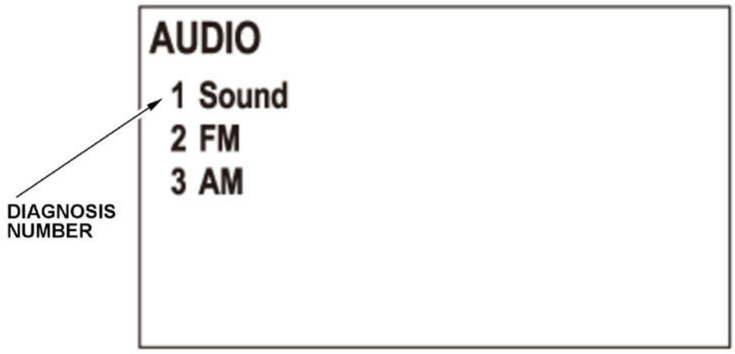
1 Knob Illumination 22

AUDIO

This diagnosis checks the audio unit sound system.

To start the diagnosis, press the preset button to select the diagnosis number you want to check.

- Preset No. 1 button: Sound
- Preset No. 2 button: FM
- Preset No. 3 button: AM



Sound (Speaker Check)

This diagnosis checks the audio speakers individually. The EQ (diagnosis No. 2) and the Loudness (diagnosis No. 3) are not supported in this diagnosis.

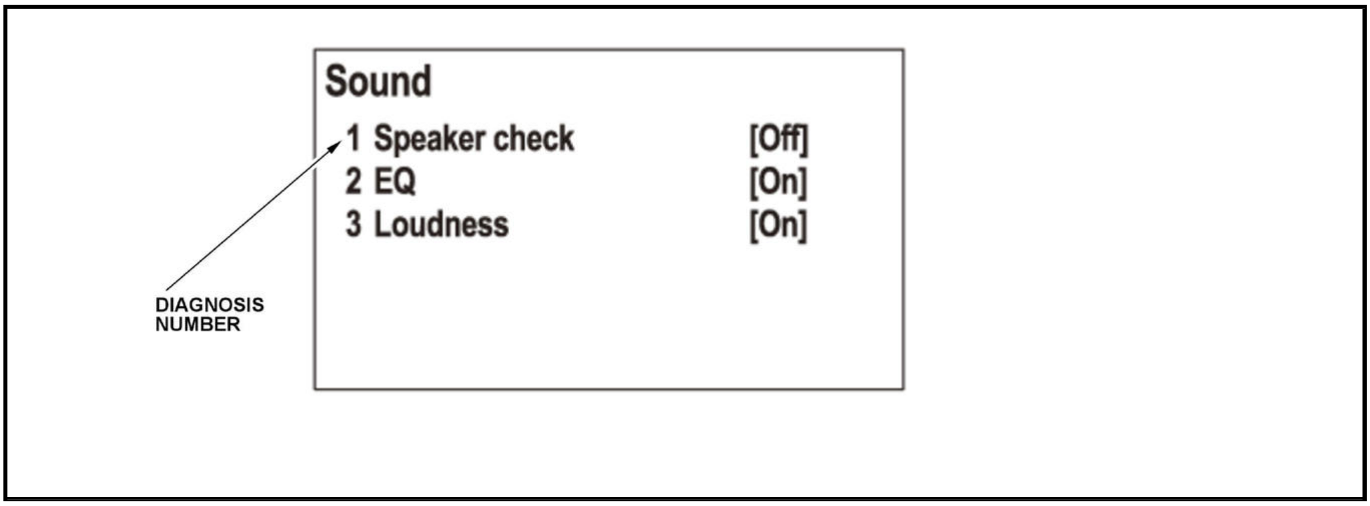
Press the preset No. 1 button to check speakers. A tone should sound from the speaker.

Each time you press the preset No. 1 button, the system checks the speakers in this order: ① -> ② -> ③ -> ④ -> ⑤ -> ⑥ -> ①

NOTE: If the audio system is not equipped with tweeter, the audio unit outputs a tone from each front door speaker when the FLTW or the FRTW is selected.

B	Display Message	Vehicle Test Condition
①	Off	Speaker check mode is OFF.
②	FL	You should hear a tone from the left front door speaker and the left front tweeter*.
③	FR	You should hear a tone from the right front door speaker and the right front tweeter*.
④	RR	You should hear a tone from the right rear door speaker and the right rear tweeter*.
⑤	RL	You should hear a tone from the left rear door speaker and the left rear tweeter*.
⑥	All	You should hear a tone from all speakers.

*: With tweeter



Sound

1 Speaker check [Off]
2 EQ [On]
3 Loudness [On]

FM

This diagnosis checks the FM reception level in the electric field strength (dB). This level then can be used in the diagnosis of audio unit reception quality.

Reception Level Check

Preparation:

- Park the vehicle outside in a good location away from tall buildings, mountains, high-voltage power line or any other object that may interfere with reception.
- Tune to a powerful local FM radio station then write down the radio station number.

Tune to the FM radio station you wrote down in preparation using the SEEK/DOWN (⏮) or SEEK/UP (⏭) button, and note the reception level of that station.

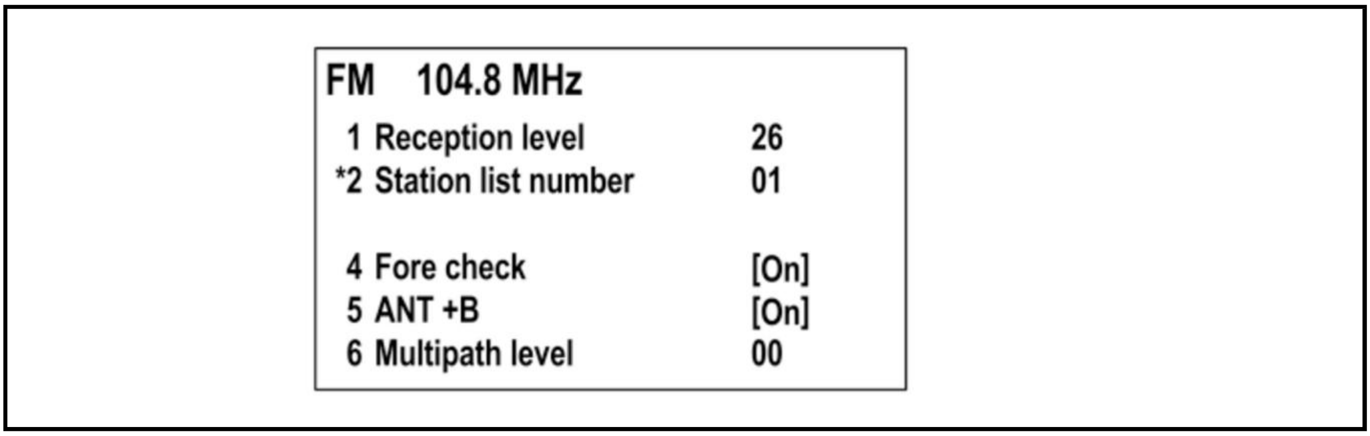
Press the preset No. 6 button to turn the AM/FM antenna power (ANT +B) off.

Note the decibel level of that station with the AM/FM antenna power off.

Press the preset No. 6 button to turn the AM/FM antenna power (ANT +B) on.

Compare your results to a known-good, (make sure it is the same year and trim level) in the same location and direction, and under the same environmental conditions.

- If the reception level is within 10% of the known-good vehicle, no repair is needed at this time.
- If the reception level is at least 10% less than the known good vehicle, go to Poor AM or FM radio reception or interference troubleshooting.



FM 104.8 MHz

1 Reception level 26
*2 Station list number 01

4 Fore check [On]

AM

This diagnostic screen checks the AM reception level in the electric field strength (dB). This level then can be used in the diagnosis of audio unit reception quality.

Reception Level Check

Preparation:

- Park the vehicle outside in a good location away from tall buildings, mountains, high-voltage power line or any other object that may interfere with reception.
- Tune to a powerful local AM radio station then write down the radio station number.

Tune to the AM radio station you wrote down in preparation using the SEEK/DOWN (⏮) or SEEK/UP (⏭) button, and note the reception level of that station.

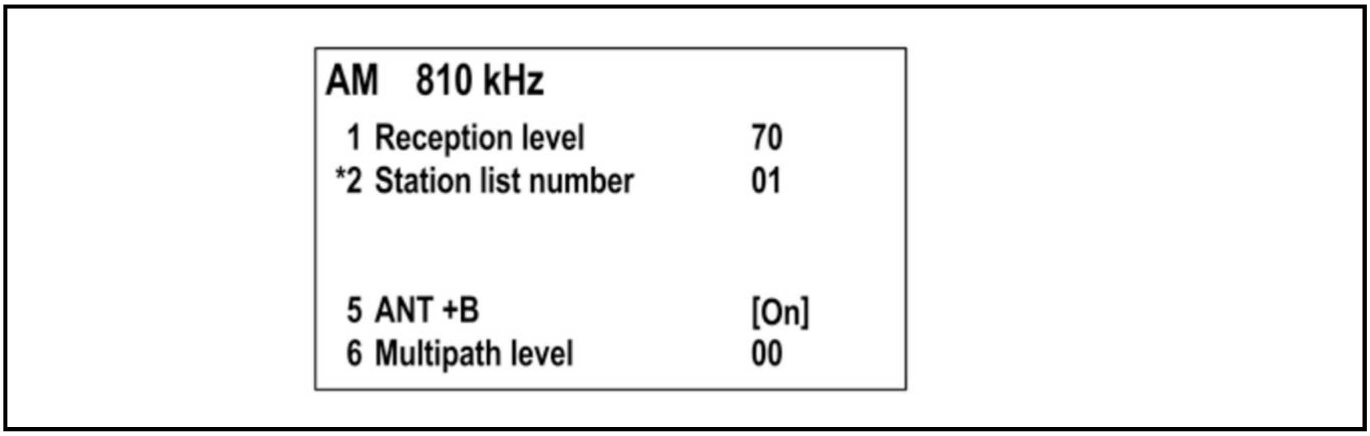
Press the preset No. 5 button to turn the AM/FM antenna power (ANT +B) off.

Note the decibel level of that station with the AM/FM antenna power off.

Press the preset No. 5 button to turn the AM/FM antenna power (ANT +B) on.

Compare your results to a known-good, (make sure it is the same year and trim level) in the same location and direction, and under the same environmental conditions.

- If the reception level is within 10% of the known-good vehicle, no repair is needed at this time.
- If the reception level is at least 10% less than the known good vehicle, **go to Poor AM or FM radio reception or interference troubleshooting**.



```
AM   810 kHz
  1 Reception level          70

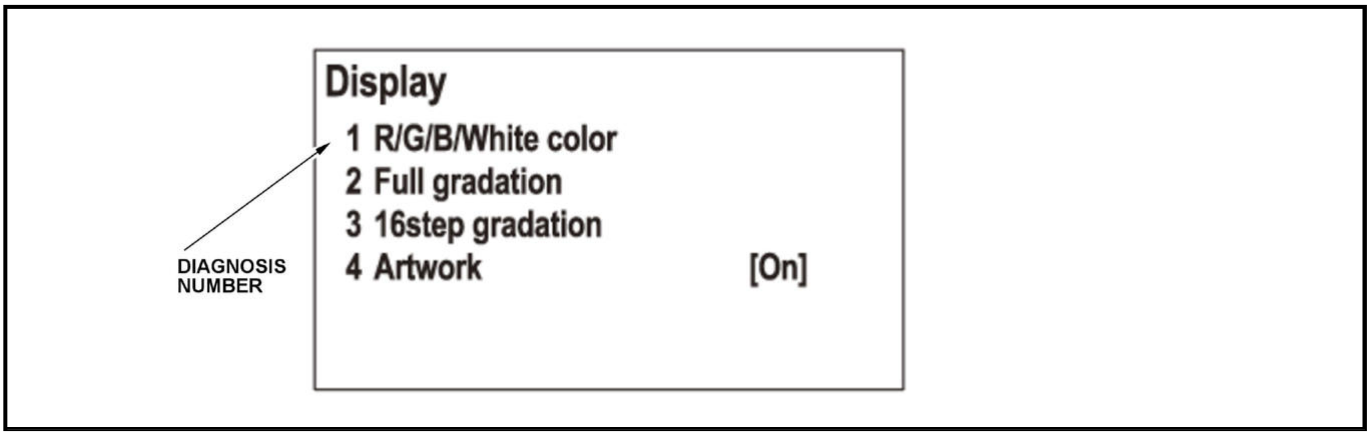
Display

These screens allow you to troubleshoot the LCD display built into the audio unit. Select the item you want to check, and follow the diagnostic instructions.

To start the diagnosis, press the preset button to select the diagnosis number you want to check. The Artwork (diagnosis No. 4) is not supported in this diagnosis.

- Preset No. 1 button: R/G/B/White color
- Preset No. 2 button: Full gradation
- Preset No. 3 button: 16 step gradation



Display

1 R/G/B/White color

2 Full gradation

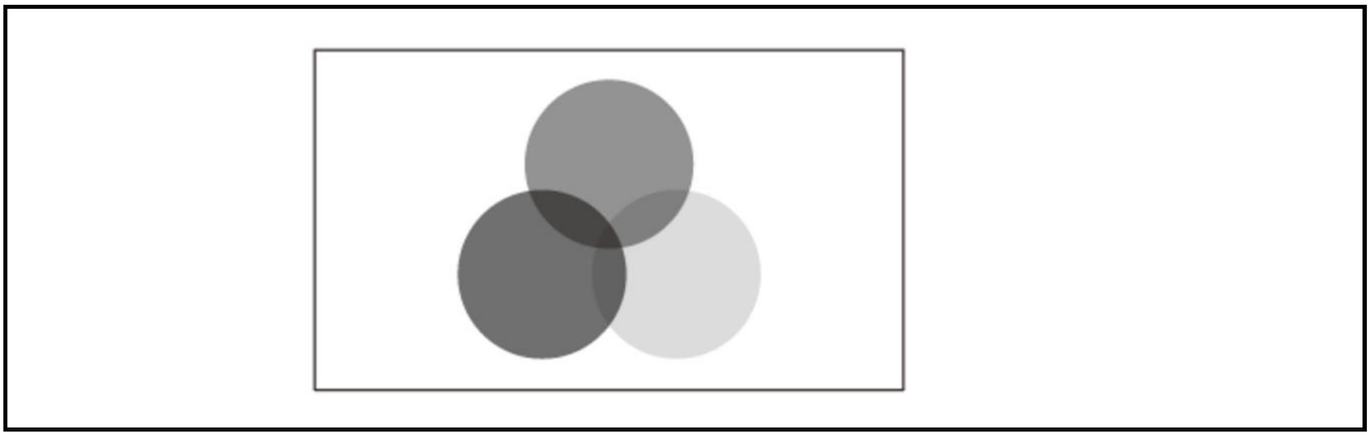
3 16step gradation

4 Artwork [On]

R/G/B/White Color

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

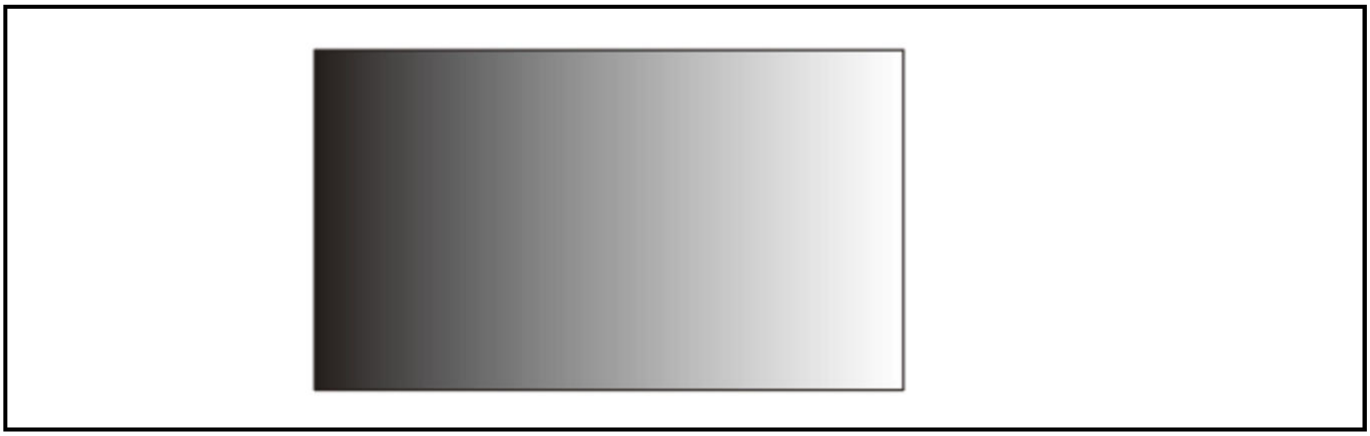
This screen verifies that the audio unit is displaying the RGB (Red, Green, and Blue) components properly. The three primary colors should all appear without distortion. The combination of all three should produce a central white section.



Full Gradation

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

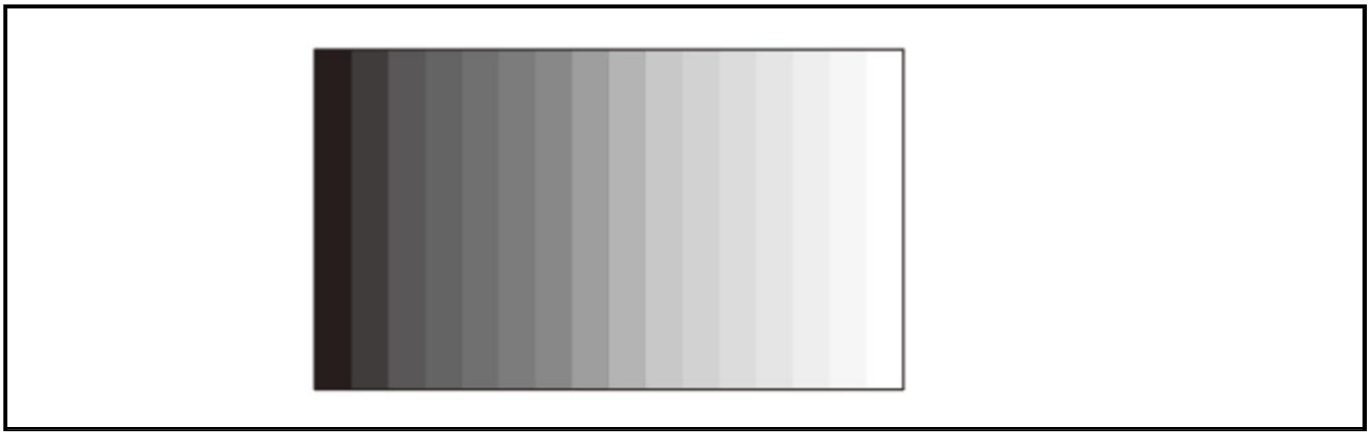
This screen checks problems with contrast. You should be able to see the changes in the smooth across the scale.



16 Step Gradation

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks problems with contrast. You should be able to see the changes from bar to bar across the scale. It is normal for the two bars on either side to appear the same.

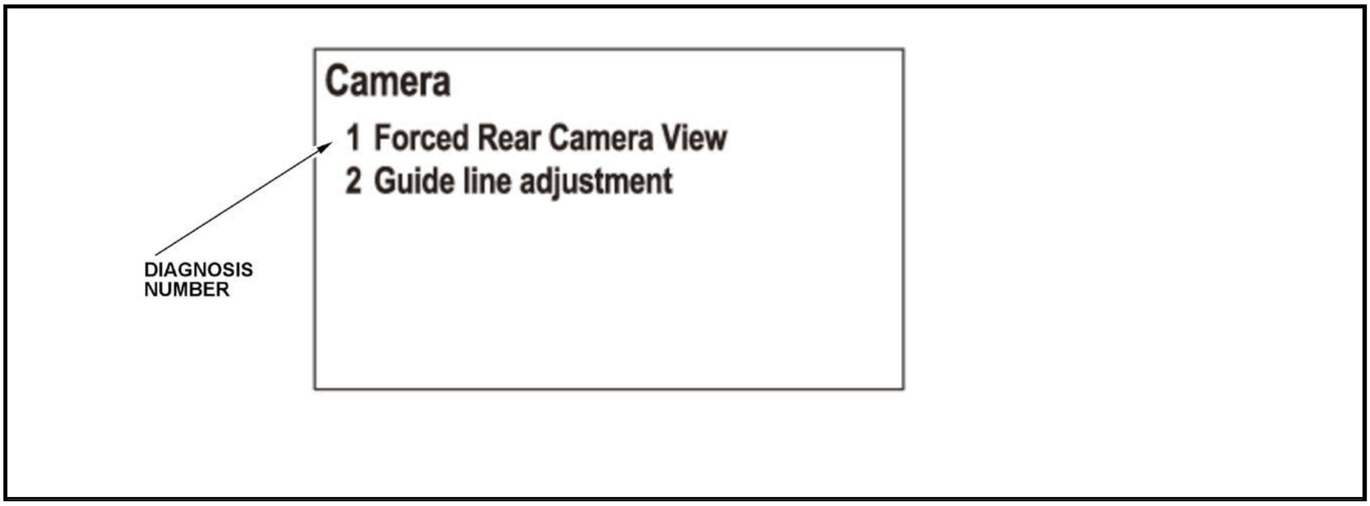


Camera

This screen checks the rearview camera image, and adjusts the guideline.

To start the diagnosis, press the preset button to select the diagnosis number you want to check.

- Preset No. 1 button: Forced Rear Camera View
- Preset No. 2 button: Guideline adjustment



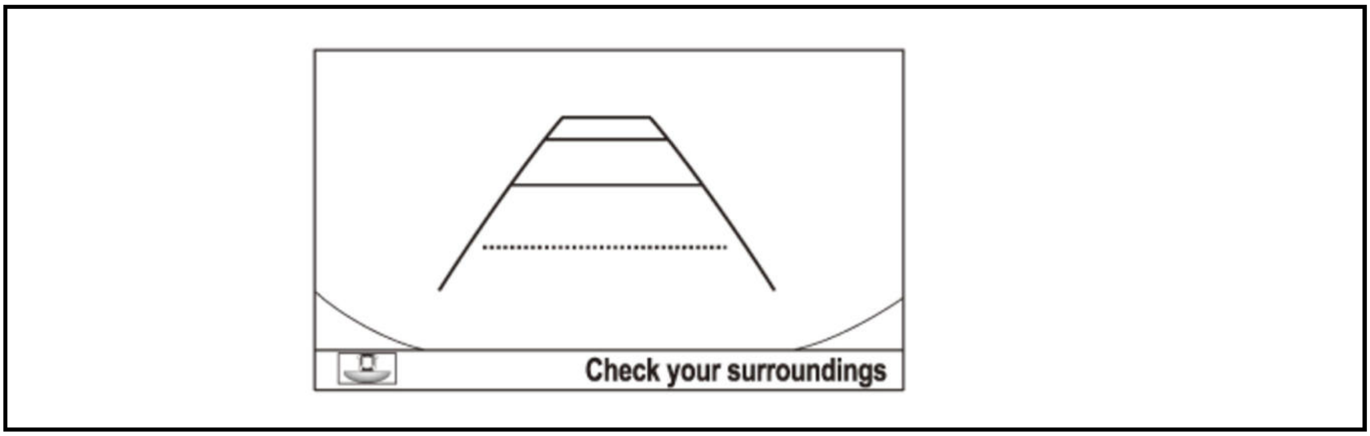
Camera

1 Forced Rear Camera View

2 Guide line adjustment

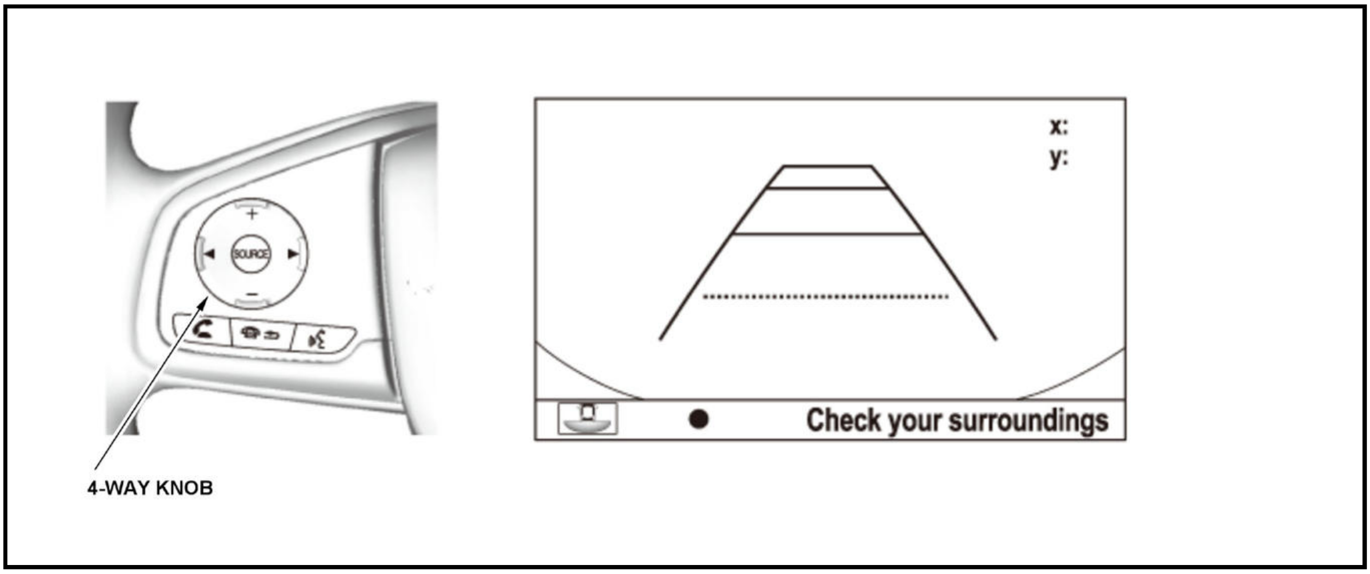
Forced Rear Camera View

This diagnosis displays the rearview camera image forcibly.



Guide Line Adjustment

This diagnostic adjusts the rearview camera image guide lines. If you need to adjust a guide line, refer to the following procedures.



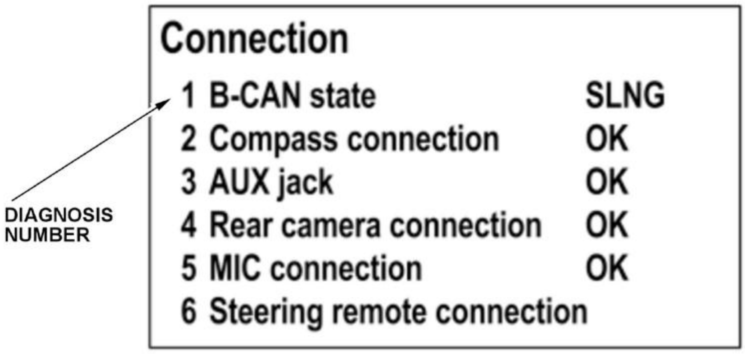
Title	Procedures	
Guide Line Adjustment	1	Press and hold the point up or down use the 4-WAY knob on the audio remote switch and select the view mode (Wide View, Normal View, Top Down View) for the rearview camera you want to adjust.
	2	You will move to the camera guideline adjustment mode by pressing the MENU button on the audio panel.
	3	Use LIST/SELECT knob on the audio panel and select the camera guide line you want to adjust. **NOTE:** After selecting the camera guide line, you will move to the point adjustment mode on the selected camera guide line by pressing the MENU button. By using the LIST/SELECT knob, you can select the point on the camera guide line you want to adjust.
	4	Use the 4-WAY knob on the audio remote switch and adjust the camera guide line or the point of the camera guide line.
	5	By pressing the RETURN button on the audio panel, the adjusted guide line data is saved.

If you need to reset the guide line to the factory settings, refer to the following procedures.

Title	Procedures	
Factory Settings	1	You will move to the camera guideline adjustment mode by pressing the MENU button on the audio panel.
	2	Press and hold the No. 2 button for more than 5 seconds, the guideline is reset to the factory default.

Connection

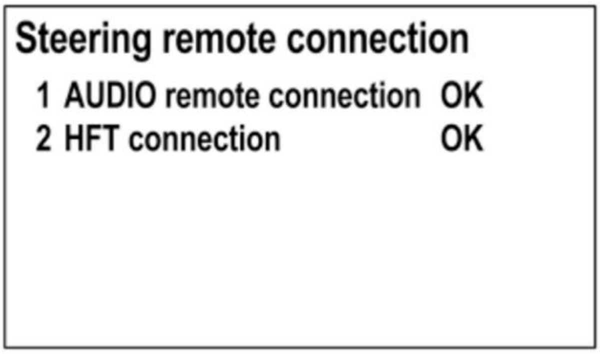
This diagnosis checks the connection between each component connected to the audio unit.



Connection

1 B-CAN state SLNG
2 Compass connection OK
3 AUX jack OK
4 Rear camera connection OK
5 MIC connection OK
6 Steering remote connection

To diagnose the Steering remote connection, press the preset No. 6 button.



Steering remote connection

1 AUDIO remote connection OK
2 HFT connection OK

Diagnosis Number	Item	Description
1	B-CAN state	This diagnosis checks whether the audio unit is receiving B-CAN data properly. If the B-CAN state shows NG, check for B-CAN DTCs with the HDS. If no DTCs are detected, check for continuity in the B-CAN lines between the audio unit and the gauge control module.
2	Compass connection	The diagnosis check whether the audio unit is connecting the electric compass.
3	AUX jack (if equipped)	The diagnosis check whether the audio unit is connecting the auxiliary jack assembly.
4	Rear camera connection	The diagnosis check whether the audio unit is connecting the rearview camera.
5	MIC connection	This diagnosis checks whether the audio unit is connecting the HFL microphone properly.
6	Steering remote connection	This diagnosis checks whether the audio unit is connecting the audio remote-HFL switch properly. Press any audio remote-HFL switch button to check the connection.

Vehicle Information

Use this screen to confirm that the audio unit is properly receiving input signals. The displayed value changes each time according to the state of input signal.

To start the diagnosis, press the preset button to select the diagnosis number you want to check.

DIAGNOSIS NUMBER

AUDIO SYSTEM DIAGNOSTIC MODE (DISPLAY AUDIO TYPE)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This diagnosis is applied to the audio unit (without navigation) only. **Refer to the navigation system section for audio-navigation unit System Diagnostic Mode** .
- The screens detail indicated may change depending on equipment or specification.

Start-Up Procedure and Diagnostic Menu

1. Turn the vehicle to the ON mode. If needed, start the engine.

2. Press and hold the PHONE button, the DISPLAY MODE (☼ ☽) button, and the AUDIO POWER (⏻) button until the Select Diagnosis Items menu screen is displayed:

NOTE: The buttons needs to be pressed together simultaneously.

- Self-Diagnosis Mode (runs the automatic diagnosis of the audio system)
- Detail Information and Setting (allows you to manually diagnose the audio system)

Press any icon if you want to see details

2. The diagnosis tests the following:

- Most of the wires connecting the external audio components shown in the block diagram.
- The results from the various components shown in the block diagram.
- The audio unit checks the microphone by listening to the "Pi Pi Pon" sound produced by the audio unit from the speakers when the diagnosis is started. This requires that the audio system be operating normally.

3. When the diagnosis finishes, the icons turn different colors based on their test status.

NOTE: By selecting the Help icon, you can see a description for each color.

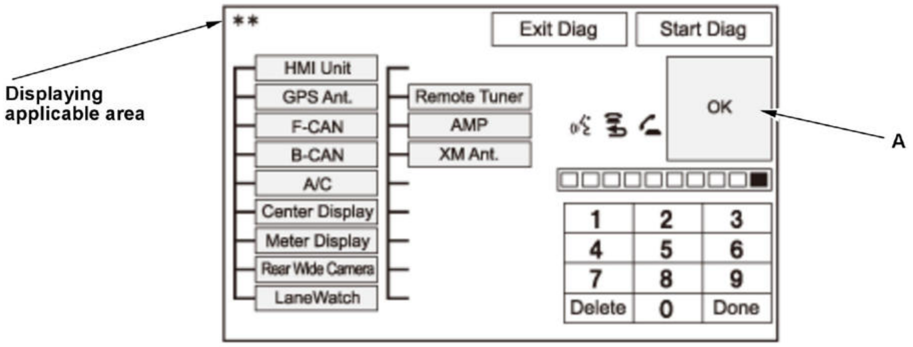
Icon Colors	Description
Green	The system ran a diagnosis and the results are OK.
Red*	Errors that require replacement of hardware or harness. Examples are connection error or memory diagnosis errors. Select the red icon and check each diagnostic screen (refer to the description for diagnostic screens in the Unit Check).
Yellow	• Errors that do not require hardware replacement, or the connection check is in the state which is not done. Such as leaving the vehicle in the ACCESSORY mode or because of a missing accessory. • When the audio unit detects a failure, and stores DTC, the Error History icon turns yellow.
White	The diagnosis is running. The screen functions are locked out while the diagnosis runs.
Gray	• The system cannot automatically check this function. You have to select the diagnosis item and manually do additional testing, like checking the audio unit buttons in the Hard Key test. When you complete the Hard Key test and return to the System Links screen, the gray icon turns green. • The Vehicle Status icon anytime shows gray. • When the audio unit does not store DTCs, the Error History icon shows gray.

*: The F-CAN icon and the B-CAN icon turns red when the vehicle is in the ACCESSORY mode. Check the System Links with the engine running, and if the F-CAN icon and the B-CAN icon turns green, the system is OK at this time.

4. Select the icon to see the details of that diagnostic function. The icon colors on the screen may not change until you exit and reenter the Self-Diagnosis mode. In some cases, you may have to restart the engine for the indication to change. After you repair the affected component or harness, repeat this diagnosis.

Factory Diagnostic Screen In Line Diag and Linking

If the vehicle left the factory in the factory diagnostic mode, you will see this screen every time you turn the vehicle to the ON mode. Sometimes this screen also appears after you replace the audio unit with a new or remanufactured unit. Normally the factory does the steps necessary to verify proper operation and terminate the factory diagnosis. Until the proper confirmation sequence is done, the screen appears every time you turn the vehicle to the ON mode.



NOTE: The system cannot complete a full diagnosis unless vehicle is in the ON mode.

1. Select the Start Diag icon to check the connection between the audio unit and related components. When the connection diagnosis is in progress, the icon (A) indicates Detecting..., and each icon turns white. If the connection is OK, the icon turns green. If the connection is NG, the icon turns red. Check for connection between the audio unit and related unit on the failure connection line.

NOTE: When the item is a variation equipment, the icon shows yellow, and it is not reflected in diagnosis.

2. If the connection diagnosis is finished, press the steering commander switch buttons (the TALK button, PICK-UP button, and the HANG-UP/BACK button) to check the HFL switch. As each button is pressed, the corresponding icon on the display should turn green.

3. Press the TALK button, and within 5 seconds in a normal voice say "testing". The Mic Level indicator on the screen should momentarily turn green.

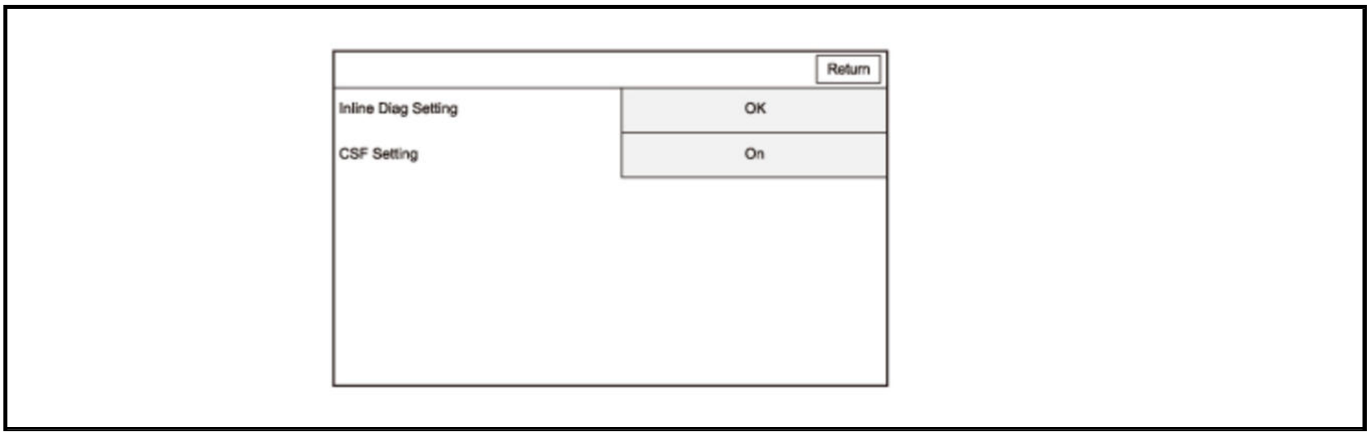
4. If all the diagnosis are OK, the icon (A) indicates OK. Select the Exit Diag icon to exit the diagnostic mode. The In Line Diag should not appear again.

Forced Completing of In Line Diag and Linking

Follow these steps to prevent the screen from appearing in the future:

1. While displaying the In Line Diag screen, press and hold the PHONE button, the DISPLAY MODE (☀ ☽) button, and the AUDIO POWER (⏻) button until the Select Diagnosis Items menu screen is displayed.

2. While displaying the Select Diagnosis Items menu screen, press and hold the HOME button until the In Line Diag setting screen is displayed.



Inline Diag Setting	OK
CSF Setting	On

3. Set the Inline Diag Setting to OK (complete). The system restarts and a normal start-up process occurs. The In Line Diag should not appear again.

Detail Information and Setting

This section allows you to run a specific diagnosis and allows additional setting choices for some screens that are not shown when touching an icon from the System Links screen.

Select the item you want to check, and the test begins. To return to the previous screen, select the Return icon.

RGB Color

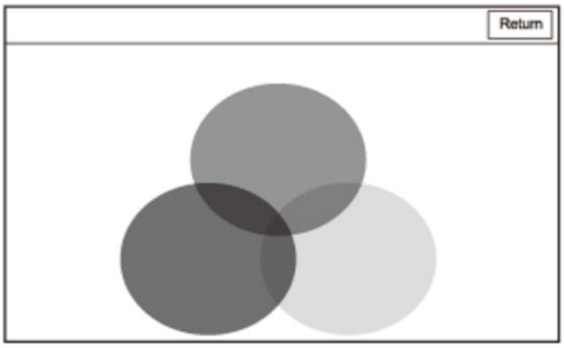
NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen verifies that the display is receiving the video (R, G, B, and Composite sync) signals properly. The three primary colors should all appear without distortion. The combination of all three should produce a central white section. If any of the color circles are missing, **replace the center display unit** .

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

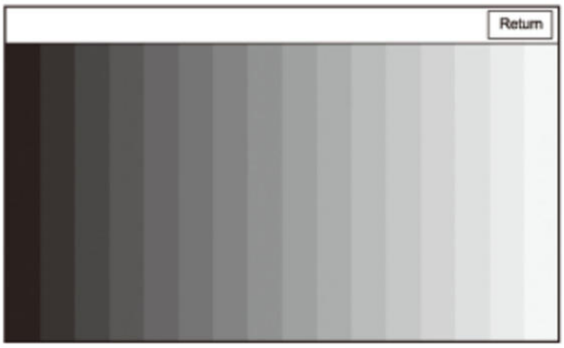


Gray Tone

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks problems with contrast in 16 gradations. You should be able to see the changes from bar to bar across the scale. It is normal for the two bars on either side to appear the same.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

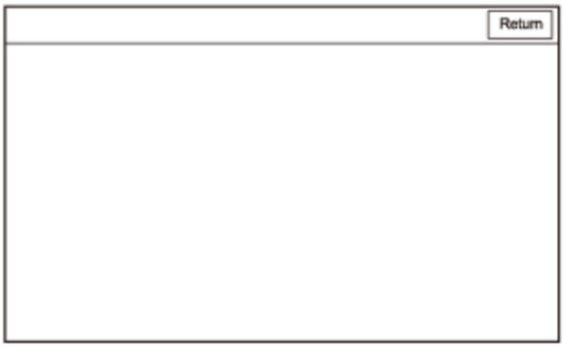


White Raster

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks for pixels that may be dead (off). The entire display must be white.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

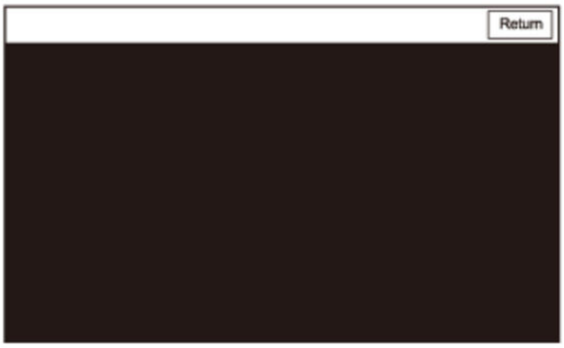


Black Raster

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks for pixels that may be stuck on. The entire display must be black.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

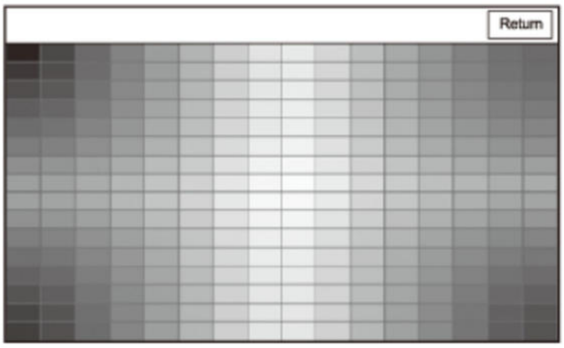


Color Pattern

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

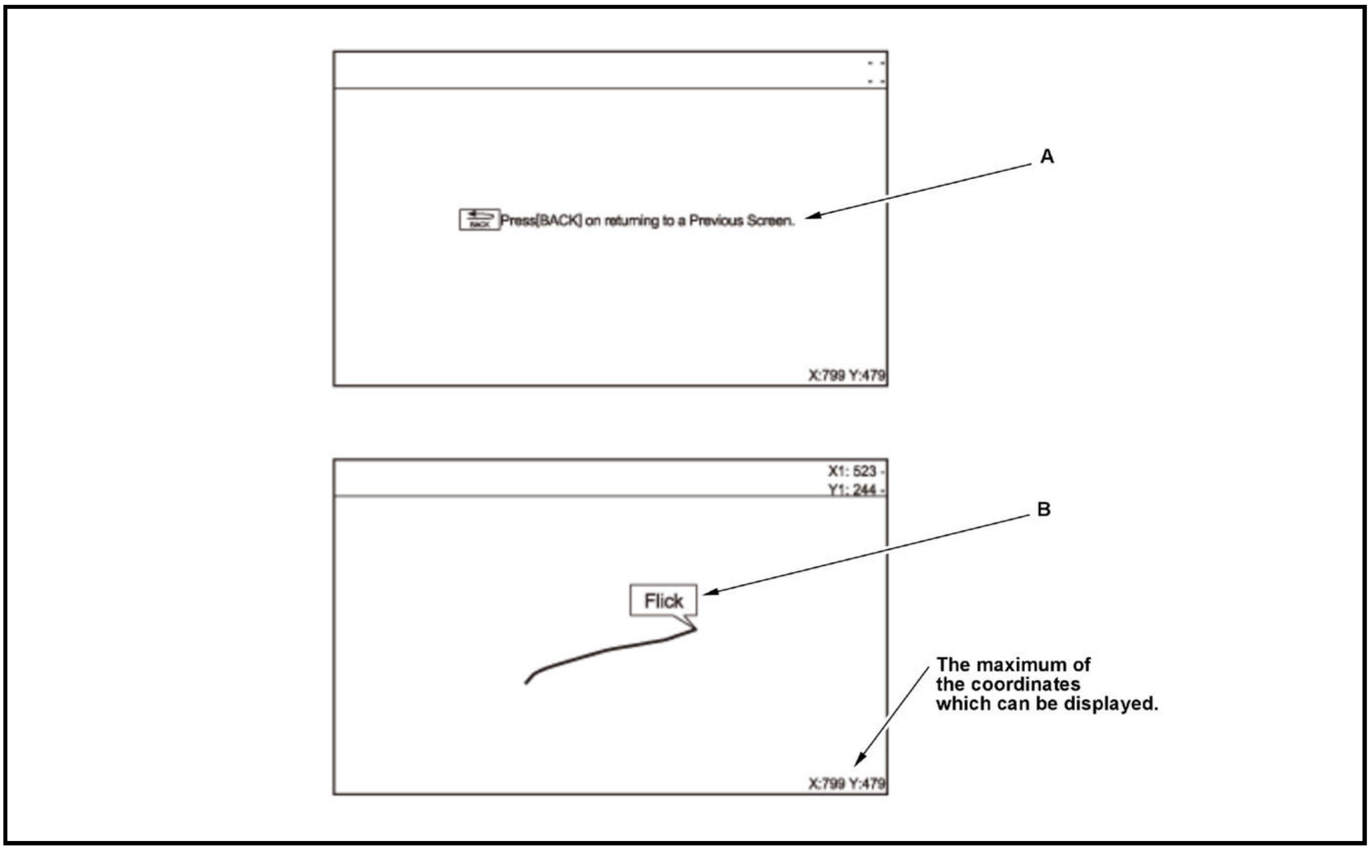
The screen shows the colors being used for the map and menu screens. This is for factory use only. To check the color signal, use the RGB Color diagnosis.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.



Touch Panel Check

This check allows you to check the sensitivity of touch panel. If the screen is operated in the state while the telop (A) is displayed, the track changes to black, and the action name (Tap, Double tap, Pinch, Slide, and Flick) appears on the caption (B) for 5 seconds. The screen displays the coordinates of where the screen was touched. If the BACK button is pressed, the screen returns to the Monitor Check menu. If another location other than the location pressed responds, do the Touch Panel Adjustment.



Press[BACK] on returning to a Previous Screen.

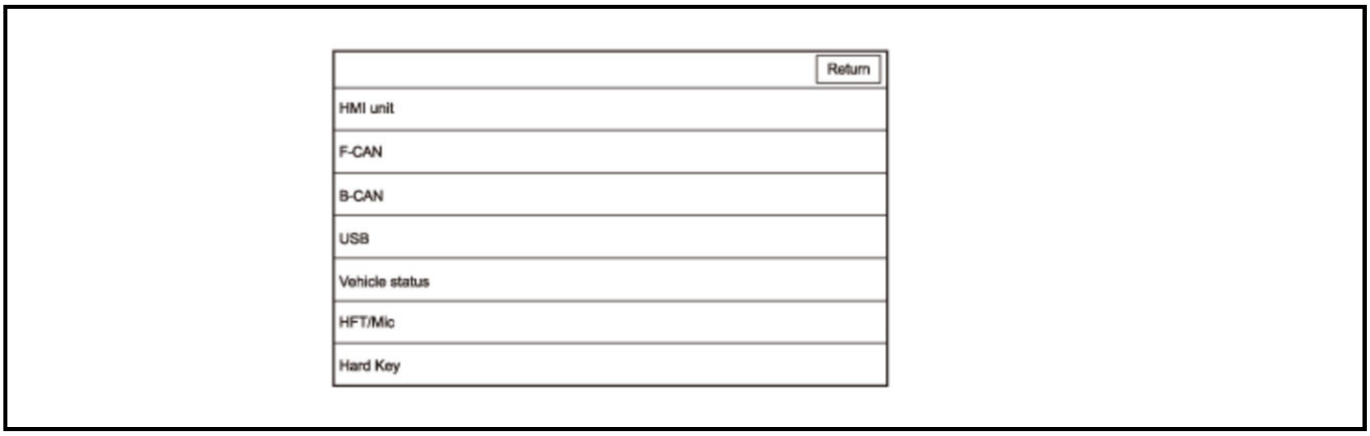
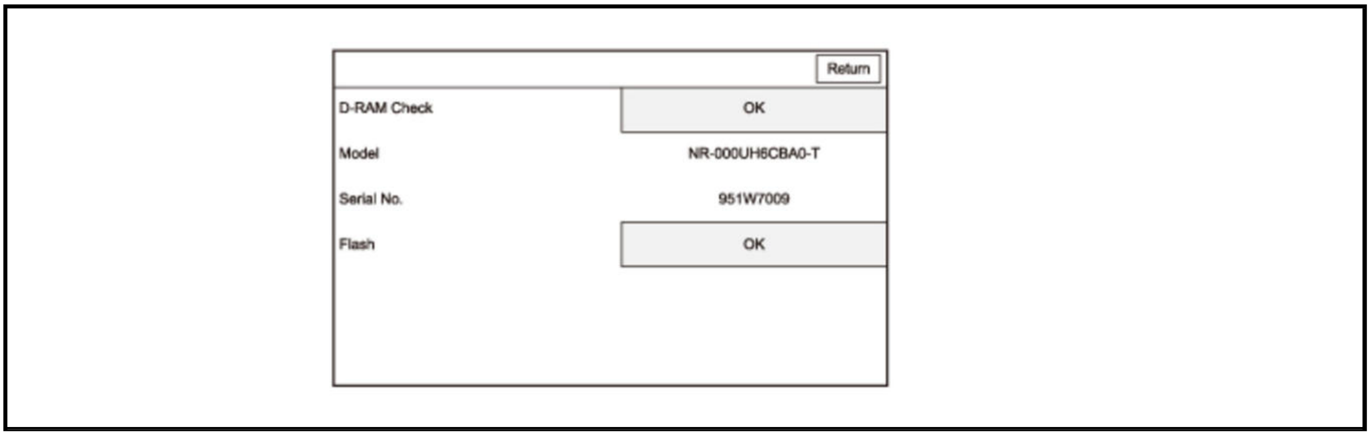
- Telematics Diag (not supported)



HMI Unit

This diagnosis checks for problems in the audio unit processor. When you start this diagnosis, the audio unit may freeze or delay up to a minute while the diagnosis runs.

- D-RAM: Displays the result of the access to the D-RAM (OK/NG). If NG, **check for hard error codes**.
- Model: Displays the audio unit manufacture's model number.
- Serial No. : Displays the audio unit serial number. That should be the same as the serial number found on the upper side of the audio unit.
- Flash: Displays the result of the access to the flash memory (OK/NG). If NG, **replace the audio unit** .



D-RAM Check	OK
Model	NR-000UH6CBA0-T
Serial No.	951W7009
Flash	OK

F-CAN

NOTE:

- This diagnosis must have the engine running.
- Swipe the screen to check the next items.

This diagnosis checks whether the audio unit has received specific F-CAN data. If F-CAN shows NO ERROR, an error is not detected between the F-CAN bus and the audio unit.

- If F-CAN shows RX ERROR, **replace the audio unit** .
- If F-CAN shows TIME OUT, There is a possibility that some items are NG (red icon). When all the items from each transmitting unit is NG, check for F-CAN DTCs with the HDS. If DTCs not detected, check for continuity in the F-CAN lines between the audio unit and the transmitting unit.

HFL/Mic

This diagnosis allows you to independently test the Bluetooth module and the microphone. The Bluetooth module is built into the audio unit. To properly check the microphones, make sure you are sitting in the driver's seat.

NOTE: Before this diagnosis, check the response of the TALK button on the audio remote-HFL switch by the Hard Key diagnosis.

- If the Bluetooth Connection Diagnosis shows NG, replace the audio unit .
- Press the TALK button, and within 5 seconds in a normal voice say "testing" toward the microphone in the roof console. The Mic Level indicator on the screen should momentarily turn green. The test is set to OK by indicating green more than 6 steps. If there is no Mic Level movement when you speak, go to HFL does not work properly troubleshooting .

Remote Tuner

NOTE:

- For factory use only. Do not alter any settings unless directed.
- These items describe in indication order. Swipe the screen to check the next items.

This diagnosis displays the external AM/FM radio tuner (tuner unit) status.

- System µcom version display: Displays the tuner unit processor version.
- Serial number display: Displays the tuner unit serial number. That should be the same as the serial number found on the upper side of the tuner unit.
- Frequency: Displays frequency of the radio station which is being received. Frequency can be changed by selecting each icon (A).
- Source can be changed in this order: Radio sources by selecting the Band Change icon.
- Radio reception level display: Displays radio reception level (dB). The AM/FM antenna power status can be changed to on or off by selecting the Ant +B OFF icon.

- Target Area: Displays the destination of the tuner unit at 2 digits.
- Operating status display*: If the vehicle has diversity antenna, you can select the radio antenna function from M (Main), S (Sub), or P (Diversity).
- RBDS BER display: Displays the RBDS bit error ratio.
- SNR display: Displays the Sound/Noise ratio about the AM or FM.
- Total preset number: Displays number of radio station preset about the AM or FM.
- HD functions ON/OFF: Displays the HD function is available (YES) or not available (NO).
- VOL: Displays the current volume level.
- Split Mode: Displays the split mode on or off. That can be changed by selecting the Split Mode icon.
- Blend Mode: Displays the blend mode which is being received. The blend mode can be changed to AUTO/ANALOG/DIGITAL by selecting the Blend Mode icon.
- HD Mode: Displays the HD mode status (ON: HD, OFF: analog) at frequency of the radio station which is being received. That can be changed by selecting the HD Mode icon.

Backup Data Clear

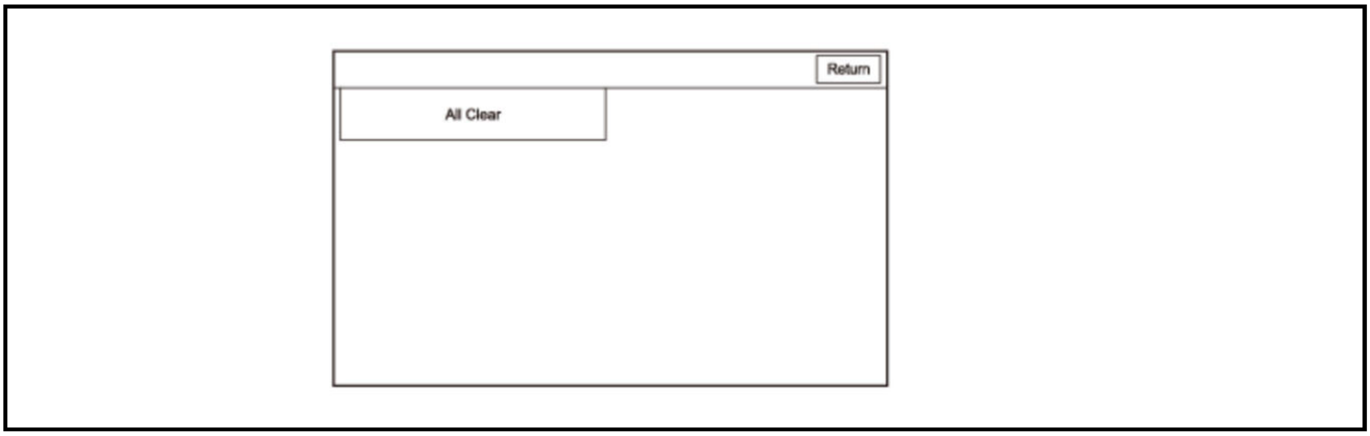
This screen initializes the back-up data in the audio unit. Select the All Clear icon.

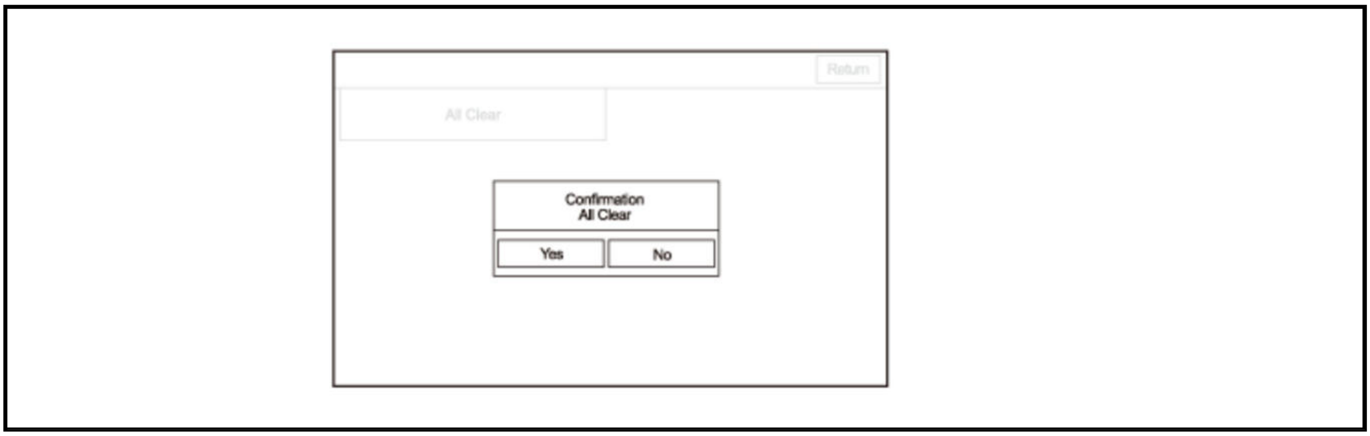


Return
All Clear

All Clear

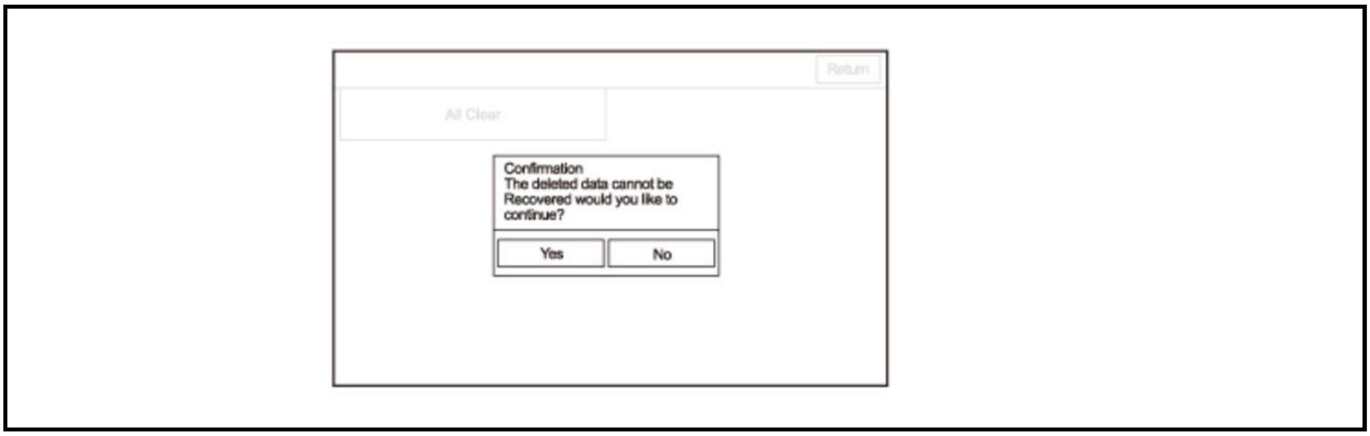
The all clear function deletes the data in the audio unit, and restores it to the factory defaults. This function is equivalent to Memory Refresh in the System Settings Menu.

When selecting the All Clear icon, the confirmation screen appears.



Confirmation
All Clear

When selecting the Yes icon, the second confirmation screen appears.



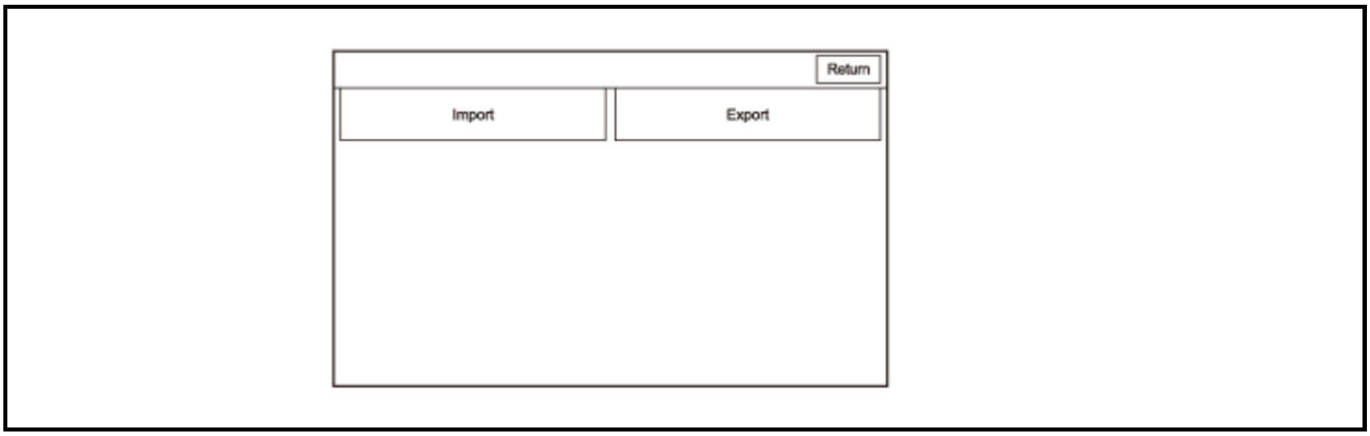
Confirmation
The deleted data cannot be Recovered would you like to continue?

When selecting the Yes icon, the system restarts after performing the All Clear process. After the restart, a normal start-up process occurs.

Save User's Memory

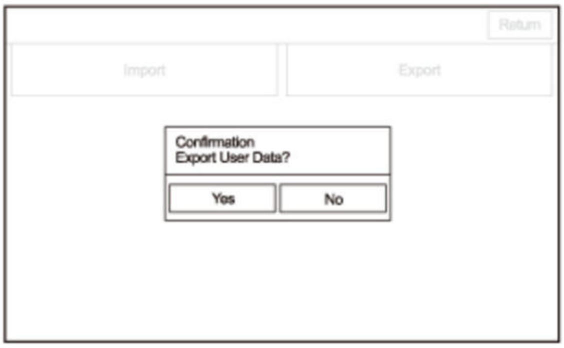
When replacing the audio unit, this function allows the technician to transfer the customer's personal data to the new audio unit. The transferred information includes their setup settings and personal addresses. The dealer inserts a USB device into the USB port A or B, and then selects the Save Users Memory function. The two functions in this diagnostic screen are Export and Import. Export saves the customer's data to the USB device, and Import moves the USB device files to the new audio unit.

This function does not start until you connect a USB device to the USB port.



1. Select the Export icon to move the customer's data from the original audio unit to the USB device. Select the Yes icon on the Export User Data Confirmation screen. The process takes only a couple of seconds. The system stores.DAT files on the USB device.

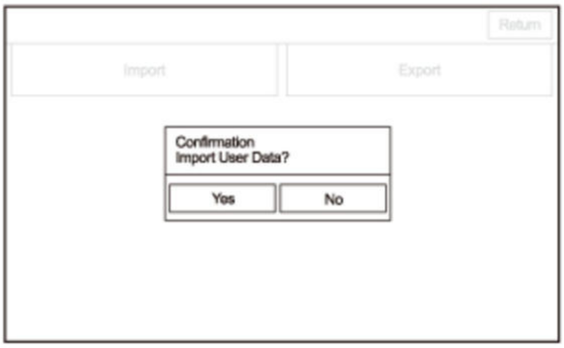
NOTE: If the Export icon is grayed out, check the USB port.



Confirmation
Export User Data?

2. After replacing the new audio unit, allow the system to boot up. Insert the USB device into the USB port A or B and enter the Save Users Memory in the System Diagnostic Mode.

3. Select the Import icon to move the two files stored by the Export process from the USB device to the new audio unit. Select the Yes icon on the Import User Data Confirmation screen. When the transfer is finished (a few seconds) the system automatically reboots. After the system reboots, remove the USB device from the USB port.

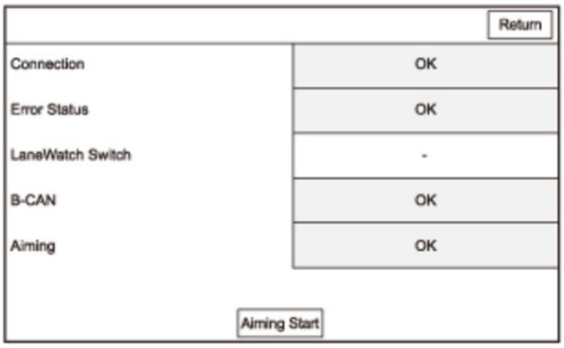


Confirmation
Import User Data?

LaneWatch

This diagnosis checks the LaneWatch status.

- If Connection shows hyphen (-), **check for hard error codes**.
- Error Status: Indicates LaneWatch camera status OK or NG. If Error Status shows NG, replace the LaneWatch camera. When the LaneWatch camera is disconnected, the status shows hyphen (-).
- If Error Status shows OK, press the HOME button to display the LaneWatch camera image. To return to the previous screen, press the HOME button again.
- LaneWatch Switch: LaneWatch switch status on or off. When the LaneWatch switch is pressing, the status shows ON. When the LaneWatch switch is released, the status shows hyphen (-).
- B-CAN: Checks whether the audio unit has received specific B-CAN data from the body control module. If B-CAN shows NG, check for B-CAN DTCs with the HDS. If DTCs are not detected, check for B-CAN lines continuity between the audio unit and the body control module.
- If Connection, Error Status, LaneWatch Switch, and B-CAN shows OK, the LaneWatch camera aiming procedure is available. If the LaneWatch camera need to aiming, refer to the How to Start LaneWatch Camera Aiming. When the aiming fails, Aiming shows NG.

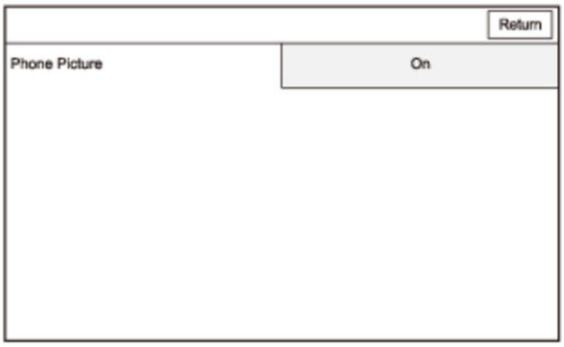


Return
Aiming Start

Connection	OK
Error Status	OK
LaneWatch Switch	-
B-CAN	OK
Aiming	OK

Phone Picture

This screen allows you to enable or disable the Show Contact Picture with On/Off.



Phone Picture On

Anti-Theft Skip

This selection can cancel the anti-theft mode temporarily (for 150 seconds).

The Anti-Theft Skip icon is grayed out when the anti-theft mode is already canceled.

Other

Select the item you want to check.

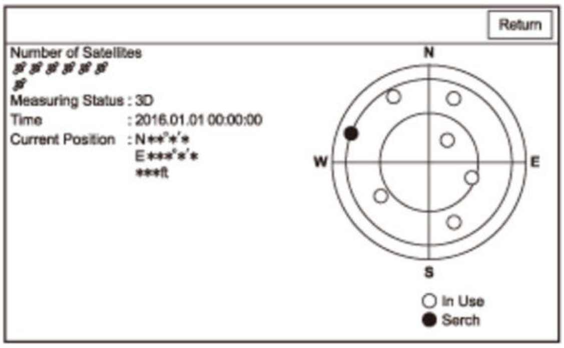
GPS Information

This screen shows the current status of GPS reception. The circular diagram shows the current location of the GPS satellites (yellow numbers) as they would appear in the sky. The outer circle represents the horizon (0 degrees elevation). The middle and inner circles represents 30 and 60 degrees respectively. The very center of the diagram (90 degrees elevation) is directly overhead. Nearby obstructions, like tall buildings will block satellites in that direction. That is why it is necessary to be in an open area to effectively troubleshoot GPS reception issues. The satellite numbers shown on the diagram while pressing the HOME button that correspond to the PRN (satellite ID number). There are always at least 24 active GPS satellites in orbit. Because satellites fail, and have to be removed from service, spares are always parked in orbit, ready to be activated. This is why the PRN can be greater than 24.

NOTE: When you use this screen for troubleshooting, park the vehicle outside, away from buildings, tall trees, and high tension wires for at least 10 minutes with the engine running.

- The Number of Satellites box shows the number of acquired satellites (maximum of 12). It should contain three or more icons.
- The Current Position shows latitude, longitude, and elevation (in feet). If there are less than four satellites, the elevation can be grossly inaccurate.
- The date/time field shows the current date and time that is received from the GPS satellite.



Number of Satellites

Measuring Status : 3D

Time : 2016.01.01 00:00:00

Current Position : N**°*'*

GENERAL INFORMATION

AUDIO SYSTEM ERROR CODES

NOTE: The audio system can display a few error codes when some problems are detected with the audio unit and the USB. This is not a complete list of audio error codes. Refer to symptom troubleshooting.

Audio Unit Error Messages (Display audio type)

Error Message Displayed	Possible Cause	Solution
The system is unable to start due to excessive heat. The system will start after the system cools.	This message appears when the display temperature is too high.	Park the vehicle in a cooler place for a while. If the high temperature status is cancelled, the audio unit turns on the display.
Sounds are restricted because the AMP is in protection mode.	This message appears when the stereo amplifier temperature is too high, and the stereo amplifier inhibits sound output.	Park the vehicle in a cooler place for a while. If the high temperature status is cancelled, the stereo amplifier outputs the sound again.

USB Error Messages

Error Message Displayed	Possible Cause	Solution
The connected USB device has a problem. See Owner's Manual* 1	Faulty power supply to USB device.	Check for hard error code: - **With navigation** - **Without navigation**
Bad USB Device Please Check Owner's Manual* 2	Faulty power supply to USB device.	Disconnect the USB device, and turn the vehicle to the OFF (LOCK) mode then the ON mode. Then connect a known-good USB device to the USB port. If the error message appears on the screen, **replace the audio unit** .
Connect Retry	The audio unit failed to synchronize with the iPod.	Appears when the system does not acknowledge the iPod. Reconnect the iPod.
No Data	No music file(s) can be found in a USB device.	Check the music files in the USB device.
USB Error	There is an internal problem with the audio unit.	**Replace the audio-navigation unit** or **the audio unit** .
Unplayable File	The audio unit cannot read the file(s).	- Check the files in the USB device. There is a possibility

Error Message Displayed	Possible Cause	Solution
		that the files have been damaged - The WMA files or the AAC file cannot be read with the (DRM) copy protection rights
Unsupported	- Unsupported USB device is connected - Unsupported file system - USB device communication error	Connect the applicable USB device (see the Owner's Manual).
Unsupported Version	Unsupported version iPod is connected.	Connect the applicable iPod (see the Owner's Manual).

*1: Display audio type

*2: Color audio type

XM Error Messages

NOTE: Do these checks with the vehicle parked outside with a clear view of the southern horizon.

Error Message Displayed	Possible Cause	Solution
Channel Not Subscribed	Selected XM channel is not subscribed.	Check the XM channel subscription status.

Error Message Displayed	Possible Cause	Solution
Channel Not Available	Selected XM channel is not in service.	Try another XM channel.
No Signal	Loss of signal.	Both terrestrial and satellite antennas have lost the signal. Park the vehicle outside with a clear view of the southern horizon.
Antenna Disconnected	XM antenna/antenna lead error.	Check for hard error code: - **With navigation** - **Without navigation**

SYMPTOM TROUBLESHOOTING INDEX

AUDIO SYSTEM SYMPTOM TROUBLESHOOTING INDEX (COLOR AUDIO TYPE)

Symptom	Diagnostic Procedure	Also Check for
Poor AM or FM radio reception or interference	**Symptom Troubleshooting**	- Check radio reception: **Do the FM or AM in the System Diagnostic Mode** - Aftermarket FM modulator - Loose antenna amplifier mounting bolt

Symptom	Diagnostic Procedure	Also Check for
Audio unit will not turn on (No information display)	**Symptom Troubleshooting**	B
No sound is heard from all the speakers (display is normal)	**Symptom Troubleshooting**	Aftermarket amplifier or speakers
Audio system sound is weak or distorted (display is normal)	**Symptom Troubleshooting**	• Fader and balance positions • Aftermarket amplifier or speakers
AM/FM radio preset memory is lost	**Replace the audio unit**	Internal error
Audio unit button does not work	**Do the Knob Check in the System Diagnostic Mode**	Check the connector for poor connections or loose terminals between the audio unit and the audio panel
Volume does not increase with speed	**Symptom Troubleshooting**	Speed-sensitive Volume Control settings (see the Owner's Manual)
Volume is too high or too low when driving at freeway speeds	B	Speed-sensitive Volume Control settings (see the Owner's Manual)
Audio remote-HFL switch does not work properly (audio unit buttons work)	**Symptom Troubleshooting**	B
Audio unit does not exit anti-theft mode	**Anti-Theft Feature**	B
USB device does not function	**Symptom Troubleshooting**	• **Error Messages** • USB device compatibility (see the Owner's Manual)
Bluetooth audio does not work	B	Bluetooth phone compatibility (see the Owner's Manual)
Rearview camera image does not come on	**Symptom Troubleshooting**	B
Rearview camera image does not change when selecting different views	**Symptom Troubleshooting**	B
Audio unit button illumination does not work	**Symptom Troubleshooting**	B
Booming sound while driving with audio system on or off	**Symptom Troubleshooting**	B

AUDIO SYSTEM SYMPTOM TROUBLESHOOTING INDEX (DISPLAY AUDIO TYPE)

NOTE: **Refer to Navigation System Symptom Troubleshooting for information about the symptom of audio-navigation unit which is not in the following table** .

Symptom	Diagnostic Procedure	Also Check for
Poor or no sound with AM/FM radio	**Symptom Troubleshooting**	• Check radio reception: **Do the Remote Tuner in the System Diagnostic Mode** • Aftermarket FM modulator • Loose antenna amplifier mounting bolt

Symptom	Diagnostic Procedure	Also Check for
AM/FM radio display is blank or no station information is displayed	**Symptom Troubleshooting**	B
Excessive transition between analog broadcast and digital HD Radio (TM) broadcast	Receiver is located near the edge of the digital HD Radio (TM) coverage area. Refer to www.hdradio.com to verify radio stations in your coverage area	B
HD Radio (TM) changes HD channel on its own	This is intended behavior. HD Radio (TM) is set to revert to main channel after extended loss of HD2/HD3 broadcast	B
AM radio reception changes at night	This is a system characteristic. AM radio stations are required by the government (FCC) to lower their power at night	B
Audio unit will not turn on (No information display)	**Symptom Troubleshooting**	B
No sound is heard from all the speakers (display is normal)	**Symptom Troubleshooting**	Aftermarket amplifier or speakers
Audio system sound is weak or distorted (display is normal)	**Symptom Troubleshooting**	• Fader and balance positions • Aftermarket amplifier or speakers
AM/FM radio preset memory is lost	**Replace the tuner unit**	Internal error
Volume does not increase with speed	**Symptom Troubleshooting**	Speed-sensitive Volume Control settings (see the Owner's Manual)
Volume is too high or too low when driving at freeway speeds	B	Speed-sensitive Volume Control settings (see the Owner's Manual)
Center display unit button does not work	**Do the Hard Key in the System Diagnostic Mode**	Check the Touch Panel Sensitivity in the System Settings
Center display unit does not dim	**Symptom Troubleshooting**	B
The MID does not display the audio unit information	**Symptom Troubleshooting**	B
Audio remote-HFL switch does not work properly (audio unit buttons work)	**Symptom Troubleshooting**	B
Audio unit does not exit anti-theft mode	**Anti-Theft Feature**	B
USB device does not function	**Symptom Troubleshooting**	• **Error messages** • USB device compatibility (see the Owner's Manual)
Bluetooth audio does not work	B	Bluetooth phone compatibility (see the Owner's Manual)

Symptom	Diagnostic Procedure	Also Check for
Pandora is not is displayed as an audio source	**Do the PANDORA in the System Diagnostic Mode to check the Pandora settings is abled**	B

Symptom	Diagnostic Procedure	Also Check for
Rearview camera image does not come on	Symptom Troubleshooting	B
Rearview camera image does not change when selecting different views	Symptom Troubleshooting	B
USB charger does not work	Symptom Troubleshooting	B
Booming sound while driving with audio system on or off	Symptom Troubleshooting	Powertrain vibration or judder
XM radio display is blank and no station information is displayed	• With navigation: Navigation DTCs • Without navigation: Audio DTCs	Error messages
System always comes up in-line diagnostic mode	Factory diagnostic screen In Line Diag	B

DTC TROUBLESHOOTING INDEX

AUDIO SYSTEM DTC TROUBLESHOOTING INDEX

NOTE: These DTCs cannot be read with the HDS. To view them, refer to How to Check for Error History (Audio DTCs).

DTC	Description	Circuit
1102	USB Diag	USB
1301	GPS Antenna Error	GPS antenna
1302	GPS Receiver Error 1	GPS receiver
1306	Vehicle Speed Pulse	PCM or TCM
1702	XM Antenna Error	XM antenna
2608	R-Camera Diag	Rearview camera
2610	DRAM Diag	Audio unit DRAM
2701	GPS Diag: Antenna	GPS antenna
2703	Aircon Diag	Climate control unit

AUDIO SYSTEM SYMPTOM TROUBLESHOOTING

AM/FM RADIO DISPLAY IS BLANK OR NO STATION INFORMATION IS DISPLAYED

NOTE:

- Check the vehicle 12 volt battery condition first .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Turn on the audio system, and select AM or FM.

Does the AM or FM radio station information display blankΩ

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time. If the AM or FM sound is not heard, **go to Poor or no sound with AM/FM radio troubleshooting**.

2. Determine possible failure area (TUNER_6V line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Tuner unit connector A (10P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Tuner unit connector A (10P) No. 10**
Test point 2	Body ground

Is there about 6.0 V?

YES

The TUNER_6V wire is OK. Go to step 5.

NO

Go to step 3.

3. Open wire check (TUNER_6V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 1**
B	**Audio unit connector E (16P) (without navigation) No. 1**
Test point 2	Body ground

Is there about 6.0 V?

YES

Repair an open in the wire.

NO

The TUNER_6V wire is not open. Go to step 4.

4. Shorted wire check (TUNER_6V line)

-1. Disconnect the following connector.

Audio-navigation unit connector E (16P) (with navigation) Audio unit connector E (16P) (without navigation)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 1**
B	**Audio unit connector E (16P) (without navigation) No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair a short to body ground in the wire.

5. Determine possible failure area (TUNER_GND line, others)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Tuner unit connector A (10P) No. 2**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The TUNER_GND wire is OK. Go to step 7.

NO

Go to step 6.

6. Open wire check (TUNER_GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 9**
B	**Audio unit connector E (16P) (without navigation) No. 9**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair an open in the wire.

7. Determine possible failure area (TUNER_9V line, others)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Tuner unit connector A (10P): disconnected
Test point 1	Tuner unit connector A (10P) No. 1
Test point 2	Body ground

Is there about 9.0 V?

YES

The TUNER_9V wire is OK. Go to step 10.

NO

Go to step 8.

8. Open wire check (TUNER_9V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Tuner unit connector A (10P): disconnected
Test point 1	Audio-navigation unit connector E (16P) (with navigation) No. 2
B	Audio unit connector E (16P) (without navigation) No. 2
Test point 2	Body ground

Is there about 9.0 V?

YES

Repair an open in the wire.

NO

The TUNER_9V wire is not open. Go to step 9.

9. Shorted wire check (TUNER_9V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector E (16P) (with navigation) Audio unit connector E (16P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 2**
B	**Audio unit connector E (16P) (without navigation) No. 2**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair a short to body ground in the wire.

10. Shorted wire check (TUNER_RS485+ line, TUNER_RS485- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector E (16P) (with navigation) Audio unit connector E (16P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected

Test point 1	**Tuner unit connector A (10P) No. 5**
Test point 2	Body ground

Test point 1	**Tuner unit connector A (10P) No. 7**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The TUNER_RS485+ and the TUNER_RS485- wires are not shorted to ground. Go to step 11.

NO

There is a short to body ground in the wire(s). Replace the affected shielded harness.

11. Shorted wire check (TUNER_RS485+ line to TUNER_RS485- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Tuner unit connector A (10P) No. 5**
Test point 2	**Tuner unit connector A (10P) No. 7**

Is there 1.0 MΩ or more?

YES

The TUNER_RS485+ wire and the TUNER_RS485- wire are not shorted. Go to step 12.

NO

There is a short in the wires. Replace the affected shielded harness.

12. Shorted wire check (TUNER_RS485_SH line to another lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Tuner unit connector A (10P) No. 5**
Test point 2	**Tuner unit connector A (10P) No. 6**

Test point 1	**Tuner unit connector A (10P) No. 6**
Test point 2	**Tuner unit connector A (10P) No. 7**

Is there 1.0 MΩ or more?

YES

The TUNER_RS485_SH wire is not shorted. Go to step 13.

NO

There is a short in the wires. Replace the affected shielded harness.

13. Open wire check (TUNER_RS485+ line, TUNER_RS485- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Tuner unit connector A (10P) No. 5**
Test point 2	**Audio-navigation unit connector E (16P) (with navigation) No. 15**

B	**Audio unit connector E (16P) (without navigation) No. 15**

Test point 1	**Tuner unit connector A (10P) No. 7**
Test point 2	**Audio-navigation unit connector E (16P) (with navigation) No. 16**
B	**Audio unit connector E (16P) (without navigation) No. 16**

Is there 1.0 Ω or less?

YES

The TUNER_RS485+ and the TUNER_RS485- wires are OK. Go to step 14.

NO

There is an open in the wire(s). Replace the affected shielded harness.

14. Tuner unit check (substitution)

    -1. Substitute a known-good tuner unit.

    -2. Reconnect all the connectors, and recheck.

    Does the symptom go away?

    YES

    Replace the original tuner unit .

    NO: With navigation

    Replace the audio-navigation unit .

    NO: Without navigation

    Replace the audio unit .

AUDIO REMOTE-HFL SWITCH DOES NOT WORK PROPERLY (AUDIO UNIT BUTTONS WORK)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Using the audio remote-HFL switch buttons, check if the audio system and the HFL system operates properly.

   Are the audio system and the HFL system operation OK?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   The failure is duplicated, go to step 2.

2. Determine possible failure area (audio remote-HFL switch, others):

   Go into the System Diagnostic Mode;

   - With navigation: **Use the Hard Key test under the Unit Check menu** .
   - Display audio type without navigation: **Use the Hard Key test under the Unit Check menu**.
   - Color audio type: **Use the Knob Check test under the Version/System menu**.

-2. Check the audio remote-HFL switch status.

Do all of the buttons fail to respond?

YES

Go to step 3.

NO

Replace the audio remote-HFL switch .

3. Gauge control module DTCs check

-1. Check for gauge control module DTCs with the HDS.

DTC Description	DTC
B1195 Gauge control module lost communication with Audio Remote Switch (LIN bus connected)	B

DTC (Gauge Control Module)

Is DTC B1195 indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 4.

4. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Gauge control module connector A (32P)
Audio-navigation unit connector A (24P) (with navigation)
Audio unit connector A (24P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	Audio-navigation unit connector A (24P) (with navigation): disconnected
B	Audio unit connector A (24P) (without navigation): disconnected
Test point 1	**Gauge control module connector A (32P) No. 30**
Test point 2	**Audio-navigation unit connector A (24P) No. 14**
	Audio unit connector A (24P) No. 14

Test point 1	**Gauge control module connector A (32P) No. 31**
Test point 2	**Audio-navigation unit connector A (24P) No. 24**
	Audio unit connector A (24P) No. 24

Is there 1.0 Ω or less?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair an open in the wire(s).

AUDIO SYSTEM SOUND IS WEAK OR DISTORTED (DISPLAY IS NORMAL)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Turn the vehicle to the ON mode.

Go into the System Diagnostic Mode, and use the speaker check mode.

- **With navigation**
- **Without navigation**

Is there tone from the speakers, and is the tone quality normal in each channel?

YES

Intermittent failure, the system is OK at this time.

NO: With stereo amplifier

The failure is duplicated, go to step 2.

NO: Without stereo amplifier

The failure is duplicated, go to step 5.

2. Determine possible failure area (speaker lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Stereo amplifier connector A (18P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Stereo amplifier connector A (18P): disconnected

Test point 1:Stereo amplifier connector A (18P)	Test point 2:Stereo amplifier connector A (18P)	Resistance
No. 2	No. 4	About 2 Ω
No. 5	No. 6	About 4 Ω

Test point 1:Stereo amplifier connector A (18P)	Test point 2:Stereo amplifier connector A (18P)	Resistance
No. 7	No. 8	About 4 Ω* 1 About 3.2 Ω* 2
No. 9	No. 10	About 4 Ω* 1 About 3.2 Ω* 2
No. 12	No. 13	About 4 Ω
No. 14	No. 15	About 3.2 Ω
No. 16	No. 17	About 3.2 Ω

*1: Connect rear door speaker connector and disconnect rear tweeter connector.

*2: Disconnect rear door speaker connector and connect rear tweeter connector.

Is the resistance OK?

YES

Go to step 4.

NO

Go to step 3.

3. Speaker check

-1. **Test the speaker on the faulty speaker lines** .

Is the speaker OK?

YES

Repair a faulty speaker wire(s).

NO

Replace the speaker .

4. Speaker visual check

-1. **Remove the speaker** that is duplicating the failure, and check the speaker for any damage.

Is there any damage?

YES

Replace the speaker .

NO

Replace the stereo amplifier .

5. Determine possible failure area (speaker lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)

Left front tweeter 2P connector
Right front tweeter 2P connector
Left rear tweeter 2P connector
Right rear tweeter 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected
B	Left front tweeter 2P connector: disconnected
B	Right front tweeter 2P connector: disconnected
B	Left rear tweeter 2P connector: disconnected
B	Right rear tweeter 2P connector: disconnected

Test point 1:Audio-navigation unit connector A (24P) (with navigation) **Audio unit connector A (24P) (without navigation)**	**Test point 2:Audio-navigation unit connector A (24P) (with navigation)** **Audio unit connector A (24P) (without navigation)**	**Resistance**
No. 5	No. 6	About 4 Ω* 1 About 3.2 Ω* 2
No. 7	No. 8	About 4 Ω* 1 About 3.2 Ω* 2
No. 15	No. 16	About 4 Ω* 1 About 3.2 Ω* 2
No. 17	No. 18	About 4 Ω* 1 About 3.2 Ω* 2

*1: Connect door speaker connector and disconnect tweeter connector.

*2: Disconnect door speaker connector and connect tweeter connector.

Is the resistance OK?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Go to step 6.

6. Speaker check

-1. **Test the speaker on the faulty speaker lines** .

Is the speaker OK?

YES

Repair an open in the wire.

NO

Replace the speaker .

AUDIO UNIT BUTTON ILLUMINATION DOES NOT WORK

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check for B-CAN DTCs and resolve them before troubleshooting.
- Check the connectors for poor connections or loose terminals.

1. Relay control module DTCs check

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

-3. Wait for at least 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC (Relay Control Module)

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 2.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Turn the combination light switch to the PARKING ( ) position.

-3. Check the illumination of the audio unit buttons.

Are the buttons illuminated?

YES

Intermittent failure, the audio unit is OK at this time.

NO

The failure is duplicated, go to step 3.

3. Determine possible failure area (interior lights circuit, others)

-1. Check the illumination of several other buttons not related to the audio system.

Are the buttons illuminated?

YES

Go to step 4.

NO

Troubleshoot the interior lights.

4. Determine possible failure area (audio unit, others)

-1. **Go into the System Diagnostic Mode, and use the ILLUMI in the Vehicle Information to check the ILLUMI signal**.

Does the METER_ILL STATUS signal change from [0] to [1] when the combination light switch is turned to the parking light position?

YES

Replace the audio unit .

NO

Go to step 5.

5. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the combination light switch off.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connectors.

Gauge control module connector A (32P)
Audio unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	Audio unit connector A (24P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 30**
Test point 2	**Audio unit connector A (24P) No. 14**

Test point 1	**Gauge control module connector A (32P) No. 31**

Test point 2	**Audio unit connector A (24P) No. 24**

Is there 1.0 Ω or less?

YES

Replace the audio unit .

NO

Repair an open in the wire(s).

AUDIO UNIT POWER WILL NOT TURN ON (NO INFORMATION DISPLAY)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check if the Display Mode (☼ ☽) button has been pressed, and turned off the display (see the Owner's Manual for more information).
- Check the connectors for poor connections or loose terminals.
- Check the fuses and **relays** associated with the system, and check for a short in the related lines.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check if the display indicates any information.

Is any information displayed?

YES

Intermittent failure, the system is OK at this time.

NO: Display audio type

The failure is duplicated, go to step 2.

NO: Color audio type

The failure is duplicated, go to step 8.

2. Determine possible failure area (LVDS1 circuit, others)

-1. Shield the center display unit from the sun with your hand, and check that the display is back lit (only the back light is on).

Can you see the back light?

YES

Go to step 11.

NO

Go to step 3.

3. Open wire check (+B_AUDIO line)

-1. Disconnect the following connector.

Center display unit connector A (5P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_AUDIO wire is OK. Go to step 4.

NO

Repair an open in the wire.

4. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 5**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 5.

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

5. Determine possible failure area (DISP_CONT line, others)

-1. Reconnect center display unit connector A (5P).

-2. Disconnect the following connector.

Audio unit connector E (16P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Audio unit connector E (16P): disconnected
Test point 1	**Audio unit connector E (16P) No. 4**
Test point 2	Body ground

Is there about 3.3 V?

YES

The DISP_CONT wire is OK. Go to step 7.

NO

Go to step 6.

6. Open wire check (DISP_CONT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Audio unit connector E (16P): disconnected
Test point 1	**Center display unit connector A (5P) No. 4**
Test point 2	Body ground

Is there about 3.3 V?

YES

Repair an open in the wire.

NO

Replace the center display unit .

7. Determine possible failure area (center display unit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect audio unit connector E (16P).

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio unit connector E (16P) No. 4**
Test point 2	Body ground

Is there less than 0.2 V?

Yes

Replace the center display unit .

No

Go to step 8.

8. Open wire check (+B_AUDIO line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector A (24P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_AUDIO wire is OK. Go to step 9.

NO

Repair an open in the wire.

9. Open wire check (ACC line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 23**
Test point 2	Body ground

Is there battery voltage?

YES

The ACC wire is OK. Go to step 10.

NO

Repair an open in the wire.

10. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect audio unit connector A (24P).

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio unit connector A (24P) No. 1**
Test point 2	Body ground

Is there less than 0.2 V?

YES: Display audio type

Replace the audio unit .

YES: Color audio type

Substitute the known good audio panel then recheck. If the symptom does not go away, replace the audio unit .

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

11. Shorted wire check (LVDS1+ line to LVDS1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio unit connector H (3P)
Center display unit connector B (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector H (3P): disconnected
B	Center display unit connector B (3P): disconnected
Test point 1	**Center display unit connector B (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 2**

Is there 1.0 MΩ or more?

YES

The LVDS1+ wire and the LVDS1- wire are not shorted. Go to step 12.

NO

There is a short in the wires. Replace the affected shielded harness.

12. Shorted wire check (LVDS1 SH line to another lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector H (3P): disconnected
B	Center display unit connector B (3P): disconnected
Test point 1	**Center display unit connector B (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 3**

Test point 1	**Center display unit connector B (3P) No. 2**
Test point 2	**Center display unit connector B (3P) No. 3**

Is there 1.0 MΩ or more?

YES

The LVDS1 SH wire is not shorted. Go to step 13.

NO

There is a short in the wires. Replace the affected shielded harness.

13. Open wire check (LVDS1+ line, LVDS1- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector H (3P): disconnected
B	Center display unit connector B (3P): disconnected
Test point 1	**Audio unit connector H (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 1**

Test point 1	**Audio unit connector H (3P) No. 2**
Test point 2	**Center display unit connector B (3P) No. 2**

Is there 1.0 Ω or less?

YES

The LVDS1+ and the LVDS1- wires are OK. Go to step 14.

NO

There is an open in the wire(s). Replace the affected shielded harness.

14. Center display unit check (substitution)

    -1. Substitute a known-good center display unit.

    -2. Reconnect all the connectors, and recheck.

    Does the symptom go away?

    YES

    Replace the original center display unit .

    NO

    Replace the audio unit .

BOOMING SOUND WHILE DRIVING WITH AUDIO SYSTEM ON OR OFF

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check for F-CAN and B-CAN DTCs and resolve them before troubleshooting.
- Check the connectors for poor connections or loose terminals.
- Check the fuses and **relays** associated with the system, and check for a short in the related lines.
- The front ANC/active sound control microphone is the same parts as the front HFL-navigation-ANC/active sound control microphone and the front HFL-ANC/active sound control microphone.

1. Problem verification

   -1. Make sure all doors, hood, and the tailgate are closed.

   -2. Start the engine.

   Is a booming sound or a low-frequency hum heard from speakers?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Determine possible failure area (speaker output circuit, others)

   -1. **Go into the System Diagnostic Mode, and use the speaker check mode**.

Is the sound quality normal at each speaker?

YES

Go to step 3.

NO

Go to No sound is heard from all the speakers (display is normal) troubleshooting.

3. Open wire check (+B_BACK_UP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ANC/active sound control unit 20P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 11**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_BACK_UP wire is OK. Go to step 4.

NO

Repair an open in the wire.

4. Open wire check (IG1_METER line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

B	ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1_METER wire is OK. Go to step 5.

NO

Repair an open in the wire.

5. Determine possible failure area (SWD+B line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The SWD+B wire is OK. Go to step 8.

NO

Go to step 6.

6. Open wire check (SWD+B line)

-1. Disconnect the following connector.

Stereo amplifier connector C (16P) (with stereo amplifier)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected
Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 21**
B	**Audio unit connector A (24P) (without navigation) No. 21**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open in the wire.

NO

The SWD+B wire is not open. Go to step 7.

7. Shorted wire check (SWD+B line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected

Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 21**

B	**Audio unit connector A (24P) (without navigation) No. 21**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair a short to body ground in the wire.

8. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect the following connector.

ANC/active sound control unit 20P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**ANC/active sound control unit 20P connector No. 1**
Test point 2	Body ground

Is there less than 0.2 V?

YES

The GND wire is OK. Go to step 9.

NO

Repair an open or high resistance in the wire or poor ground (G402).

9. Determine possible failure area (MIC_PWR line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front ANC/active sound control microphone 8P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**Front ANC/active sound control microphone 8P connector No. 4**

Test point 2	Body ground

Is there about 8.0 V?

YES

The MIC_PWR wire is OK. Go to step 12.

NO

Go to step 10.

10. Open wire check (MIC_PWR line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (36P) (with navigation) No. 7**
B	**Audio unit connector C (36P) (without navigation) No. 7**

Test point 2	Body ground

Is there about 8.0 V?

YES

Repair an open in the wire.

NO

The MIC_PWR wire is not open. Go to step 11.

11. Shorted wire check (MIC_PWR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector C (36P) (with navigation) Audio unit connector C (36P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Front ANC/active sound control microphone 8P connector: disconnected Audio-navigation unit connector C (36P) (with navigation): disconnected Audio unit connector C (36P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector C (36P) (with navigation) No. 7**
B	**Audio unit connector C (36P) (without navigation) No. 7**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES: With navigation

Replace the audio-navigation unit .

YES: without navigation

Replace the audio unit .

NO

Repair a short to body ground in the wire.

12. Determine possible failure area (ANC_F_MIC+8V line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**Front ANC/active sound control microphone 8P connector No. 8**
Test point 2	Body ground

Is there about 8.0 V?

YES

The ANC_F_MIC+8V wire is OK. Go to step 16.

NO

Go to step 13.

13. Open wire check (ANC_F_MIC+8V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 18**
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

The ANC_F_MIC+8V wire is not open. Go to step 14.

14. Shorted wire check (ANC_F_MIC+8V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ANC/active sound control unit 20P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Front ANC/active sound control microphone 8P connector: disconnected ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 18**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The ANC_F_MIC+8V wire is not shorted to ground. Go to step 15.

NO

There is a short to body ground in the wire. Replace the affected shielded harness.

15. Shorted wire check (SH_ANC_F_MIC line to ANC_F_MIC+8V line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Front ANC/active sound control microphone 8P connector: disconnected ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 7**
Test point 2	**ANC/active sound control unit 20P connector No. 18**

Is there 1.0 MΩ or more?

YES

Replace the ANC/active sound control unit .

NO

There is a short in the wires. Replace the affected shielded harness.

16. Open wire check (MIC_GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**Front ANC/active sound control microphone 8P connector No. 1**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The MIC_GND wire is OK. Go to step 17.

NO

There is an open in the wire. Replace the affected shielded harness.

17. Determine possible failure area (front ANC/active sound control microphone, others)

-1. Reconnect the following connector.

Front ANC/active sound control microphone 8P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

NOTE: Use the voltmeter in AC range.

Test condition	Vehicle ON mode, make a loud noise like clapping your hands in front of the front ANC/active sound control microphone.
Test point 1	**ANC/active sound control unit 20P connector No. 18**
Test point 2	**ANC/active sound control unit 20P connector No. 7**

Does the voltage change when making a loud noise in front of the microphone?

YES

Go to step 18.

NO

Replace the front ANC/active sound control microphone .

18. Determine possible failure area (ANC_R_MIC circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear ANC/active sound control microphone 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear ANC/active sound control microphone 2P connector: disconnected
Test point 1	**Rear ANC/active sound control microphone 2P connector No. 1**
Test point 2	**Rear ANC/active sound control microphone 2P connector No. 2**

Is there about 8.0 V?

YES

Go to step 23.

NO

Go to step 19.

19. Open wire check (SH_ANC_R_MIC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear ANC/active sound control microphone 2P connector: disconnected
Test point 1	Rear ANC/active sound control microphone 2P connector No. 2
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SH_ANC_R_MIC wire is not open. Go to step 20.

NO

There is an open in the wire. Replace the affected shielded harness.

20. Open wire check (ANC_R_MIC+8V line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear ANC/active sound control microphone 2P connector: disconnected
Test point 1	ANC/active sound control unit 20P connector No. 17
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

The ANC_R_MIC+8V wire is not open. Go to step 21.

21. Shorted wire check (ANC_R_MIC+8V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ANC/active sound control unit 20P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear ANC/active sound control microphone 2P connector: disconnected ANC/active sound control unit 20P connector: disconnected
Test point 1	ANC/active sound control unit 20P connector No. 17
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The ANC_R_MIC+8V wire is not shorted to ground. Go to step 22.

NO

There is a short to body ground in the wire. Replace the affected shielded harness.

22. Shorted wire check (SH_ANC_R_MIC line to ANC_R_MIC+8V line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear ANC/active sound control microphone 2P connector: disconnected ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 6**
Test point 2	**ANC/active sound control unit 20P connector No. 17**

Is there 1.0 MΩ or more?

YES

Replace the ANC/active sound control unit .

NO

There is a short in the wires. Replace the affected shielded harness.

23. Determine possible failure area (rear ANC/active sound control microphone, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect the following connector.

Rear ANC/active sound control microphone 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

NOTE: Use the voltmeter in AC range.

Test condition	Vehicle ON mode, make a loud noise like clapping your hands in front of the rear ANC/active sound control microphone.
Test point 1	**ANC/active sound control unit 20P connector No. 17**
Test point 2	**ANC/active sound control unit 20P connector No. 6**

Does the voltage change when making a loud noise in front of the microphone?

YES

Go to step 24.

NO

Replace the rear ANC/active sound control microphone .

24. Shorted wire check (ANC lines) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

ANC/active sound control unit 20P connector Stereo amplifier connector C (16P) (with stereo amplifier) Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation) Audio unit connector C (32P) (without stereo amplifier and without navigation)

-3. Measure the resistance between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation): disconnected Audio unit connector C (32P) (without stereo amplifier and without navigation): disconnected

Connector	Terminal
ANC/active sound control unit 20P connector	No. 9
	No. 10
	No. 19
	No. 20

Is there 1.0 MΩ or more?

YES

The ANC wires are not shorted to ground. Go to step 25.

NO

There is a short in the wires. Replace the affected shielded harness.

25. Shorted wire check (ANC lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation): disconnected Audio unit connector C (32P) (without stereo amplifier and without navigation): disconnected

Test point 1:ANC/active sound control unit 20P connector	Test points 2:ANC/active sound control unit 20P connector
No. 8	No. 9, No. 10, No. 19, No. 20
No. 9	No. 10, No. 19, No. 20
No. 10	No. 19, No. 20
No. 19	No. 20

Is there 1.0 MΩ or more between any of the terminals?

YES

The ANC wires are not shorted in the wires. Go to step 26.

NO

There is a short in the wires. Replace the affected shielded harness.

26. Open wire check (ANC lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation): disconnected Audio unit connector C (32P) (without stereo amplifier and without navigation): disconnected

With stereo amplifier

Test point 1:ANC/active sound control unit 20P connector	Test point 2:Audio-navigation unit connector C (36P)
No. 9	No. 2
No. 10	No. 18
No. 19	No. 1
No. 20	No. 17

Without stereo amplifier and without navigation

Test point 1:ANC/active sound control unit 20P connector	Test point 2:Audio unit connector C (32P)
No. 9	No. 2
No. 10	No. 18
No. 19	No. 1

Test point 1:ANC/active sound control unit 20P connector	Test point 2:Audio unit connector C (32P)
No. 20	No. 17

Is there 1.0 Ω or less?

YES

The ANC wires are OK. Go to step 27.

NO

There is an open in the wire(s). Replace the affected shielded harness.

27. Open wire check (F-CAN lines)

-1. Disconnect the following connector.

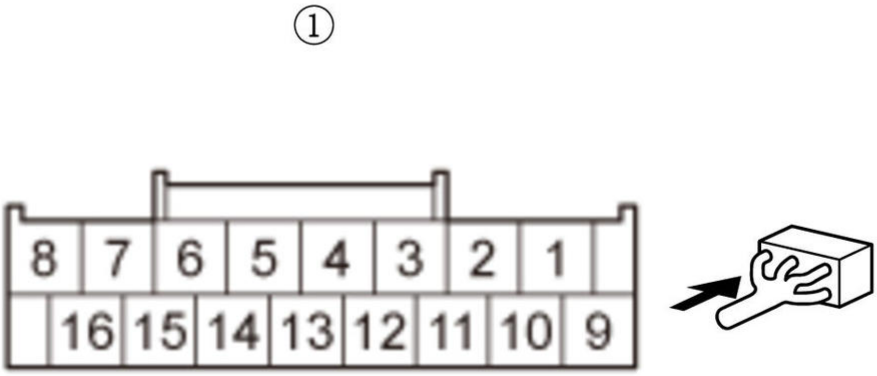
CAN gateway 16P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation): disconnected Audio unit connector C (32P) (without stereo amplifier and without navigation): disconnected CAN gateway 16P connector: disconnected

Test point 1	CAN gateway 16P connector No. 6 (female terminals): ①
Test point 2	**ANC/active sound control unit 20P connector No. 4**

Test point 1	CAN gateway 16P connector No. 14 (female terminals): ①
Test point 2	**ANC/active sound control unit 20P connector No. 5**



Is there 1.0 Ω or less?

YES

The F-CAN wires are OK. Go to step 28.

NO

Repair an open in the wire(s).

28. ANC/active sound control unit check (substitution)

-1. **Substitute a known-good ANC/active sound control unit** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original ANC/active sound control unit .

NO: with stereo amplifier

Replace the stereo amplifier .

NO: without stereo amplifier and with navigation

Replace the audio-navigation unit .

NO: without stereo amplifier and without navigation

Replace the audio unit .

CENTER DISPLAY UNIT DOES NOT DIM

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Turn the headlight on, and check that the dash brightness setting is not set to high.
- Check the connectors for poor connections or loose terminals.

1. Relay control module DTCs check

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

-3. Wait for at least 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC (Relay Control Module)

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 2.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Turn the combination light switch to the PARKING ( ) position.

-3. Check the illumination of the center display unit screen and buttons.

Does the center display brightness change?

YES

Intermittent failure, the audio unit is OK at this time.

NO

The failure is duplicated, go to step 3.

3. Determine possible failure area (interior lights circuit, others)

-1. Check the illumination of several other buttons not related to the audio/navigation system.

Are the buttons illuminated?

YES

Go to step 4.

NO

Troubleshoot the interior lights.

4. Open wire check (ILLUMI+ line)

-1. Turn the combination light switch off.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connector.

Center display unit connector A (5P)

-4. Turn the combination lighting switch to the PARKING ( ) position.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the center display unit .

NO

Repair an open in the wire.

NO SOUND IS HEARD FROM ALL THE SPEAKERS (DISPLAY IS NORMAL)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Display audio type: **If the center display unit displays an error message, follow the instructions**.
- Before doing this troubleshooting, **go to Audio-navigation unit power will not turn on (No information display) troubleshooting**.
- Check the connectors for poor connections or loose terminals.
- Check the fuses associated with the system, and check for a short in the related lines.

1. Operation check

   -1. Turn the vehicle to the ON mode.

   -2. Check that the volume level is not set to the MIN level.

   Is it at the MIN level?

   YES

   Raise the volume level, and recheck the function.

   NO: Display audio type

   Go to step 2.

   NO: Color audio type

   Go to step 4.

2. Audio system check

   -1. Check if the center display unit keeps indicating audio mute indication.

   Is audio mute indication displayed?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Open wire check (ACC line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 23**
B	**Audio unit connector A (24P) (without navigation) No. 23**
Test point 2	Body ground

Is there battery voltage?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair an open in the wire.

4. Problem verification:

   Go into the System Diagnostic Mode, and use the speaker check mode.

   - **With navigation**
   - **Without navigation**

   Did all speakers produce a tone?

   YES

   Intermittent failure, the system is OK at this time. Check for loose connections. If the tone is weak or distorted, **go to Audio system sound is weak or distorted (display is normal) troubleshooting**.

   NO: With stereo amplifier

   The failure is duplicated, go to step 5.

   NO: Without stereo amplifier

   The failure is duplicated, go to step 19.

5. System Diagnostic Mode check:

   Go into the System Diagnostic Mode, and use the System Links to check the AMP icon status.

   - **With navigation**
   - **Without navigation**

   Is the AMP icon green?

   YES

   Go to step 15.

   NO

   Go to step 6.

6. Open wire check (+B_AUDIO_AMP line)

-1. Disconnect the following connector.

Stereo amplifier connector A (18P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Stereo amplifier connector A (18P): disconnected
Test point 1	**Stereo amplifier connector A (18P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_AUDIO_AMP wire is OK. Go to step 7.

NO

Repair an open in the wire.

7. Determine possible failure area (SWD+B line, others)

-1. Disconnect the following connector.

Stereo amplifier connector C (16P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Stereo amplifier connector A (18P): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	**Stereo amplifier connector C (16P) No. 14**
Test point 2	Body ground

Is there battery voltage?

YES

The SWD+B wire is OK. Go to step 10.

NO

Go to step 8.

8. Open wire check (SWD+B line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Stereo amplifier connector A (18P): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 21**
B	**Audio unit connector A (24P) (without navigation) No. 21**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open in the wire.

NO

The SWD+B wire is not open. Go to step 9.

9. Shorted wire check (SWD+B line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Stereo amplifier connector A (18P): disconnected
B	Stereo amplifier connector C (16P): disconnected
B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 21**
B	**Audio unit connector A (24P) (without navigation) No. 21**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair a short to body ground in the wire.

10. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect the following connectors.

Stereo amplifier connector A (18P) Stereo amplifier connector C (16P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

Test point 1	Stereo amplifier connector A (18P) No. 1
Test point 2	Body ground

Is there less than 0.2 V?

YES

The GND wire is OK. Go to step 11.

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

11. Shorted wire check (RS485+ line, RS485- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector E (16P) (with navigation) Audio unit connector E (16P) (without navigation)
Stereo amplifier connector C (16P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	Audio-navigation unit connector E (16P) (with navigation) No. 7
B	Audio unit connector E (16P) (without navigation) No. 7
Test point 2	Body ground

Test point 1	Audio-navigation unit connector E (16P) (with navigation) No. 8
B	Audio unit connector E (16P) (without navigation) No. 8
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RS485+ and the RS485- wires are not shorted to ground. Go to step 12.

NO

There is a short to body ground in the wire(s). Replace the affected shielded harness.

12. Shorted wire check (RS485+ line to RS485- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	Audio-navigation unit connector E (16P) (with navigation) No. 7
B	Audio unit connector E (16P) (without navigation) No. 7

Test point 2	**Audio-navigation unit connector E (16P) (with navigation) No. 8**
B	**Audio unit connector E (16P) (without navigation) No. 8**

Is there 1.0 MΩ or more?

YES

The RS485+ and the RS485- wires are not shorted. Go to step 13.

NO

There is a short in the wires. Replace the affected shielded harness.

13. Shorted wire check (AMP_RS485_SH line to another lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 6**
B	**Audio unit connector E (16P) (without navigation) No. 6**
Test point 2	**Audio-navigation unit connector E (16P) (with navigation) No. 7**
B	**Audio unit connector E (16P) (without navigation) No. 7**

Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 6**
B	**Audio unit connector E (16P) (without navigation) No. 6**
Test point 2	**Audio-navigation unit connector E (16P) (with navigation) No. 8**
B	**Audio unit connector E (16P) (without navigation) No. 8**

Is there 1.0 MΩ or more?

YES

The AMP_RS485_SH wire is OK. Go to step 14.

NO

There is a short in the wires. Replace the affected shielded harness.

14. Open wire check (RS485+ line, RS485- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 7**
B	**Audio unit connector E (16P) (without navigation) No. 7**
Test point 2	**Stereo amplifier connector C (16P) No. 15**

Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 8**
B	**Audio unit connector E (16P) (without navigation) No. 8**
Test point 2	**Stereo amplifier connector C (16P) No. 7**

Is there 1.0 Ω or less?

YES

The RS485+ and the RS485- wires are OK. Go to step 18.

NO

There is an open in the wire(s). Replace the affected shielded harness.

15. Shorted wire check (SPDIF2 SIG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector M (4P) (with navigation) Audio unit connector M (4P) (without navigation)
Stereo amplifier connector D (2P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector M (4P) (with navigation): disconnected Audio unit connector M (4P) (without navigation): disconnected
B	Stereo amplifier connector D (2P): disconnected
Test point 1	**Audio-navigation unit connector M (4P) (with navigation) No. 1**
B	**Audio unit connector M (4P) (without navigation) No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The SPDIF2 SIG wire is not shorted to ground. Go to step 16.

NO

There is a short to body ground in the wire(s). Replace the affected shielded harness.

16. Shorted wire check (SPDIF2 SIG line to SPDIF2 SH line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector M (4P) (with navigation): disconnected Audio unit connector M (4P) (without navigation): disconnected
B	Stereo amplifier connector D (2P): disconnected
Test point 1	**Audio-navigation unit connector M (4P) (with navigation) No. 1**
B	**Audio unit connector M (4P) (without navigation) No. 1**
Test point 2	**Audio-navigation unit connector M (4P) (with navigation) No. 3**
B	**Audio unit connector M (4P) (without navigation) No. 3**

Is there 1.0 MΩ or more?

YES

The SPDIF2 SIG and the SPDIF2 SH wires are not shorted. Go to step 17.

NO

There is a short in the wires. Replace the affected shielded harness.

17. Open wire check (SPDIF2 SIG line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector M (4P) (with navigation): disconnected Audio unit connector M (4P) (without navigation): disconnected
B	Stereo amplifier connector D (2P): disconnected
Test point 1	**Audio-navigation unit connector M (4P) (with navigation) No. 1**
B	**Audio unit connector M (4P) (without navigation) No. 1**
Test point 2	**Stereo amplifier connector D (2P) No. 1**

Is there 1.0 Ω or less?

YES

The SPDIF2 SIG wire is OK. Go to step 18.

NO

There is an open in the wire(s). Replace the affected shielded harness.

18. Stereo amplifier check (substitution)

-1. **Substitute a known-good stereo amplifier** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original stereo amplifier .

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

19. Shorted wire check (SPKR lines) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)

-3. Measure the resistance between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode

B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected

Connector	Terminal
Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)	No. 5
	No. 6
	No. 7
	No. 8
	No. 15
	No. 16
	No. 17
	No. 18

Is there 1.0 MΩ or more?

YES

The SPKR wires are not shorted to ground. Go to step 20.

NO

Repair a short to body ground in the wire(s).

20. Shorted wire check (SPKR lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected

Test point 1: Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)	**Test point 2:** Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)	**Resistance**
No. 5	No. 6	About 4 Ω
No. 7	No. 8	About 4 Ω
No. 15	No. 16	About 4 Ω

Test point 1: Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)	**Test point 2:** Audio-navigation unit connector A (24P) (with navigation) Audio unit connector A (24P) (without navigation)	**Resistance**
No. 17	No. 18	About 4 Ω

Is the resistance OK?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair a short in the wires.

POOR AM OR FM RADIO RECEPTION OR INTERFERENCE

NOTE:

- Check the vehicle 12 volt battery condition first .
- Check for aftermarket accessories plugged into the vehicle accessory power sockets.
- Check for any radio frequency modulators that are plugged into the FM antenna lead. These modulators allow customers to play audio from accessories like CD players or game consoles using the audio system, but they can create interference issues.
- Check the radio reception in an open area. Compare it to a known-good vehicle whenever possible. Poor reception/interference can be caused by the following:
-
    - The radio station is far away
    - Atmospheric conditions are unfavorable
    - Tall buildings, mountains, or high-voltage power lines are nearby
    - Electrical loads like the rear window defroster, seat heaters, game consoles, etc.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Park the vehicle in an open area.

   -2. Turn the vehicle to the ON mode.

   -3. Turn on the audio system, and select AM or FM radio station.

   Is the sound quality normal?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   The failure is duplicated, go to step 2.

2. Reception/interference check

   -1. Check if the radio reception/interference is the same as the known-good vehicle in several locations.

   Is the AM or FM sound quality the same?

   YES

   Multipath interference or weak station. Operation is normal.

   NO

   Go to step 3.

3. Determine possible failure area (ANT +B line, others)

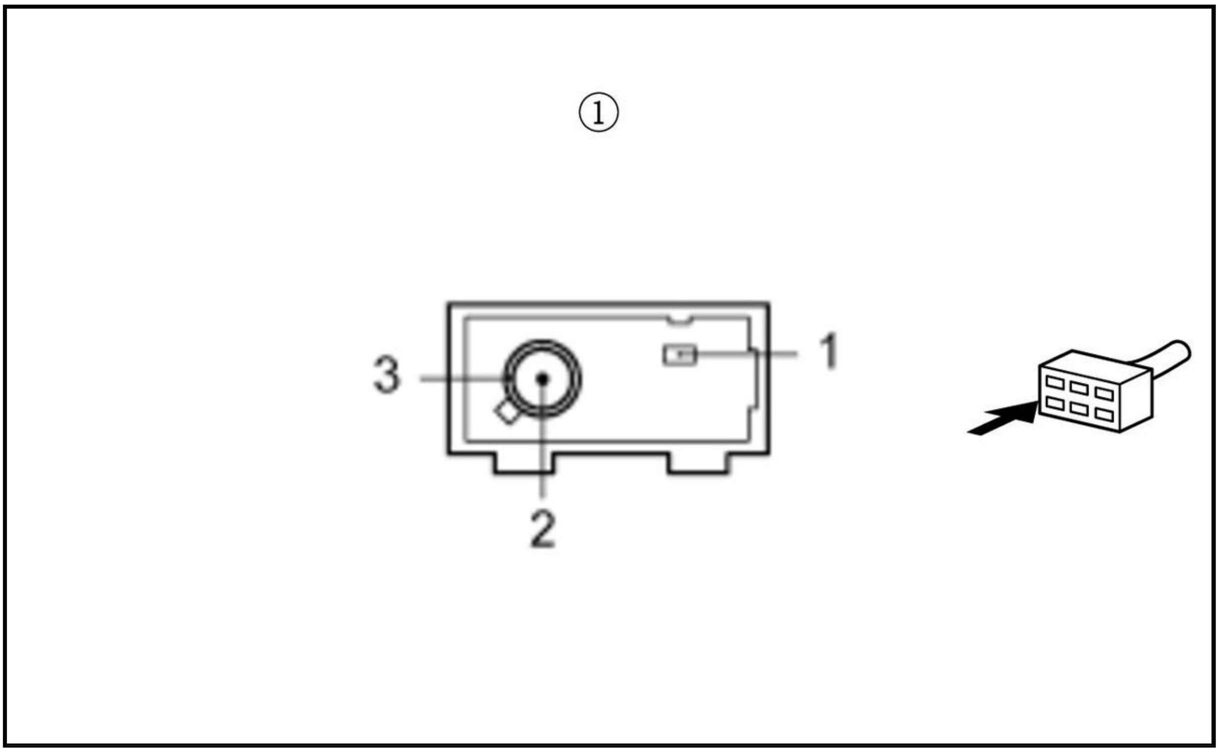
   -1. Disconnect the following connector.

Roof antenna connector A (3P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Roof antenna connector A (3P): disconnected
Test point 1	Roof antenna connector A (3P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The ANT +B wire is OK. Go to step 6.

NO

Go to step 4.

4. Shorted wire check (ANT +B line)

-1. Turn the vehicle to the OFF (LOCK) mode.

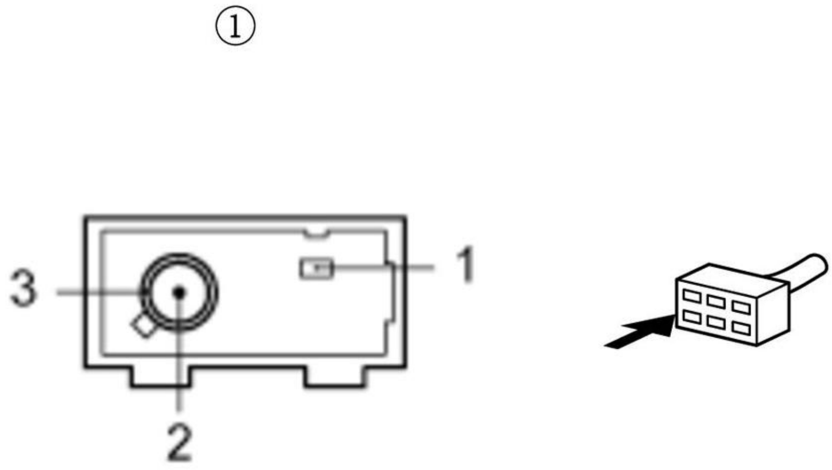
-2. Disconnect the following connector.

Audio unit connector E (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Audio unit connector E (3P): disconnected

Test point 1	Roof antenna connector A (3P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The ANT +B wire is not shorted to ground. Go to step 5.

NO

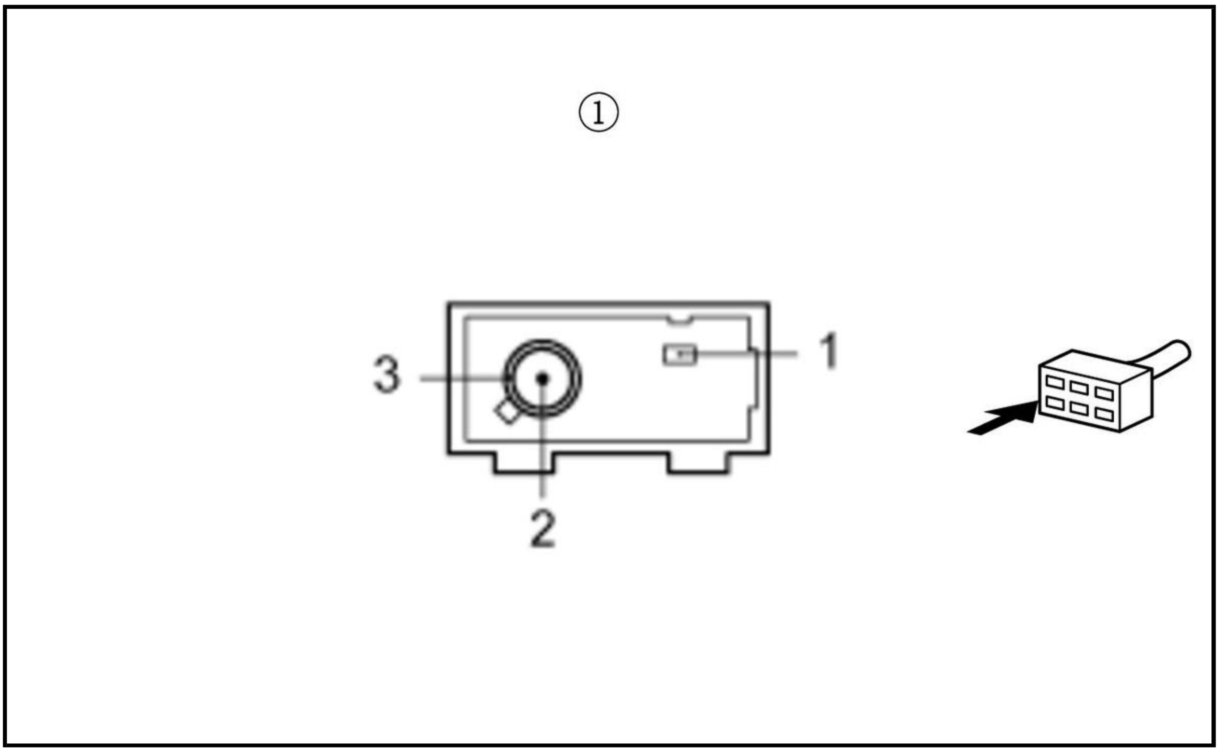
Repair a short to body ground in the wire.

5. Open wire check (ANT +B line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Audio unit connector E (3P): disconnected

Test point 1	**Audio unit connector E (3P) No. 1**
Test point 2	Roof antenna connector A (3P) (male terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Replace the audio unit .

NO

Repair an open in the wire.

6. Shorted wire check (RF IN line)

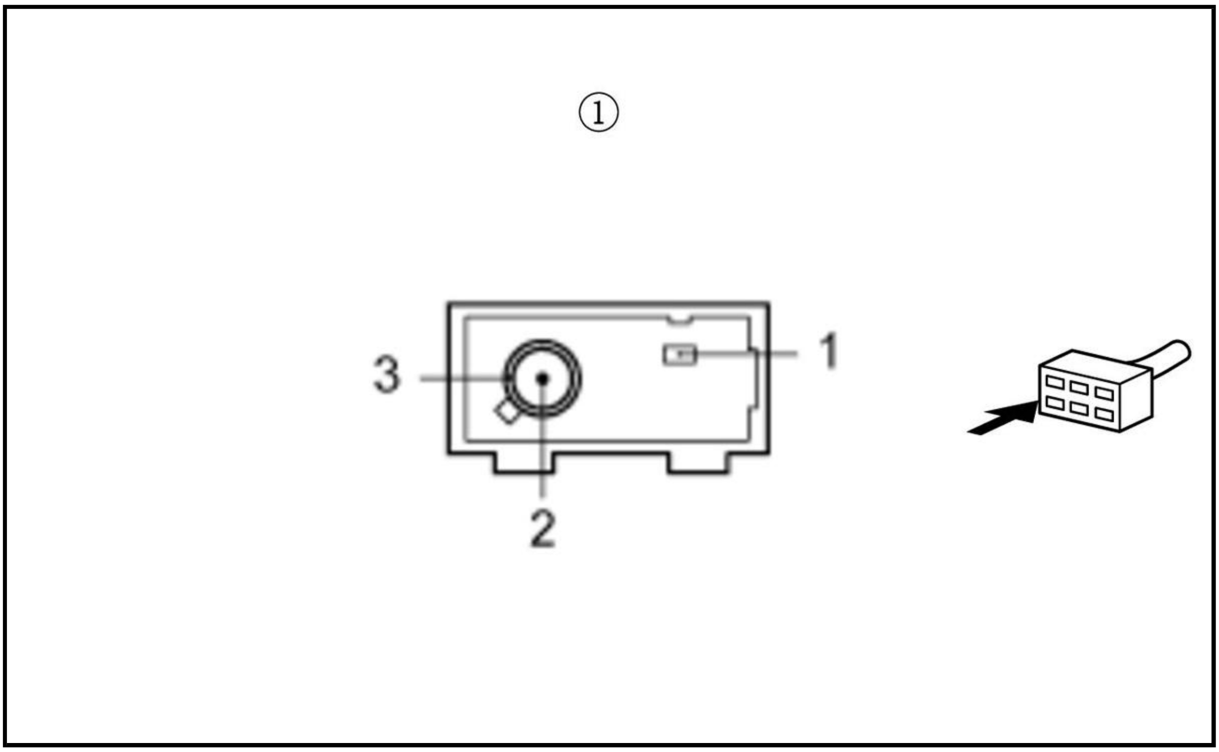
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector E (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Audio unit connector E (3P): disconnected
Test point 1	Roof antenna connector A (3P) (male terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The RF IN wire is not shorted to ground. Go to step 7.

NO

There is a short to body ground in the wire. Replace the affected antenna lead.

7. Shorted wire check (RF IN line to SH (RF IN) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected

B	Audio unit connector E (3P): disconnected
Test point 1	**Audio unit connector E (3P) No. 2**
Test point 2	**Audio unit connector E (3P) No. 3**

Is there 1.0 MΩ or more?

YES

The RF IN wire is not shorted to SH (RF IN) wire. Go to step 8.

NO

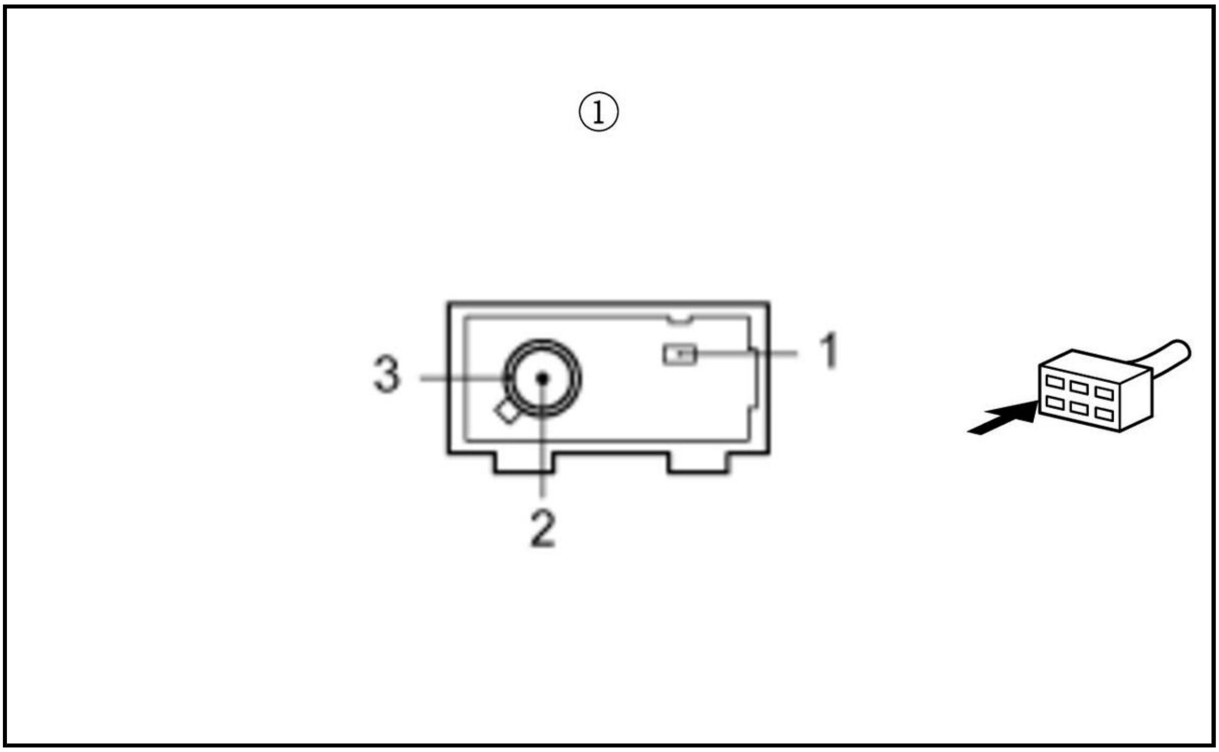
There is a short in the wire. Replace the affected antenna lead.

8. Open wire check (RF IN line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected

B	Audio unit connector E (3P): disconnected
Test point 1	Roof antenna connector A (3P) (male terminals) No. 2: ①
Test point 2	**Audio unit connector E (3P) No. 2**



Is there 1.0 Ω or less?

YES

The RF IN wire is OK. Go to step 9.

NO

There is an open in the wire. Replace the affected antenna lead.

9. Roof antenna check (substitution)

-1. **Substitute a known-good roof antenna** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original roof antenna .

NO

Replace the audio unit .

POOR OR NO SOUND WITH AM/FM RADIO

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check for aftermarket accessories plugged into the vehicle accessory power sockets.

- Check for any radio frequency modulators that are plugged into the FM antenna lead. These modulators allow customers to play audio from accessories like CD players or game consoles using the audio system, but they can create interference issues.
- Check the radio reception in an open area. Compare it to a known-good vehicle whenever possible. Poor reception/interference can be caused by the following:
-
    - The radio station is far away
    - Atmospheric conditions are unfavorable
    - Tall buildings, mountains, or high-voltage power lines are nearby
    - Electrical loads like the rear window defroster, seat heaters, game consoles, etc.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Park the vehicle in an open area.

   -2. Turn the vehicle to the ON mode.

   -3. Turn on the audio system, and select AM or FM radio station.

   Is the sound quality normal?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   The failure is duplicated, go to step 2.

2. Reception/interference check

   -1. Check if the radio reception/interference is the same as the known-good vehicle in several locations.

   Is the AM or FM sound quality the same?

   YES

   Multipath interference or weak station. Operation is normal.

   NO

   Go to step 3.

3. Seek stop test

   -1. Select the SCAN to check if the number of received radio station are the same as the known-good vehicle.

   Are the number of radio station the same?

   YES

   Go to step 11.

   NO

   Go to step 4.

4. Determine possible failure area (ANT +B line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

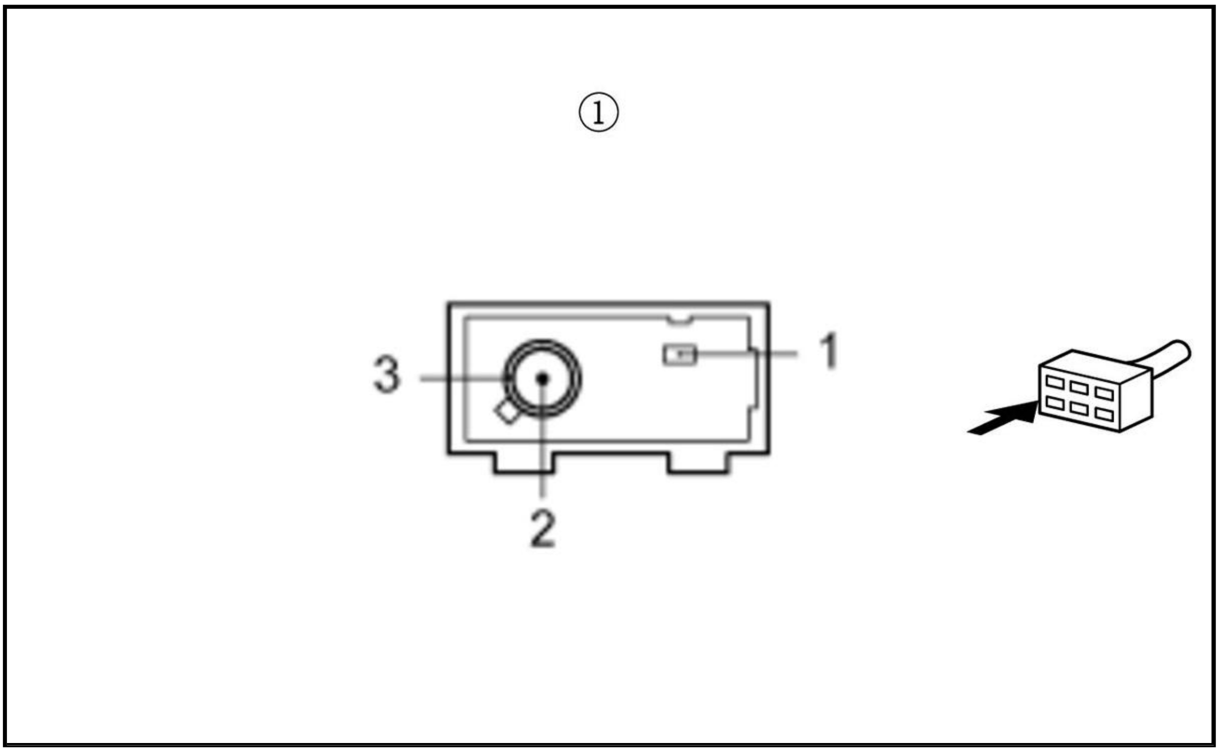
-2. Disconnect the following connector.

Roof antenna connector A (3P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Roof antenna connector A (3P): disconnected
Test point 1	Roof antenna connector A (3P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there about 9.0 V?

YES

The ANT +B wire is OK. Go to step 7.

NO

Go to step 5.

5. Shorted wire check (ANT +B line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Tuner unit connector C (5P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The ANT +B wire is not shorted to ground. Go to step 6.

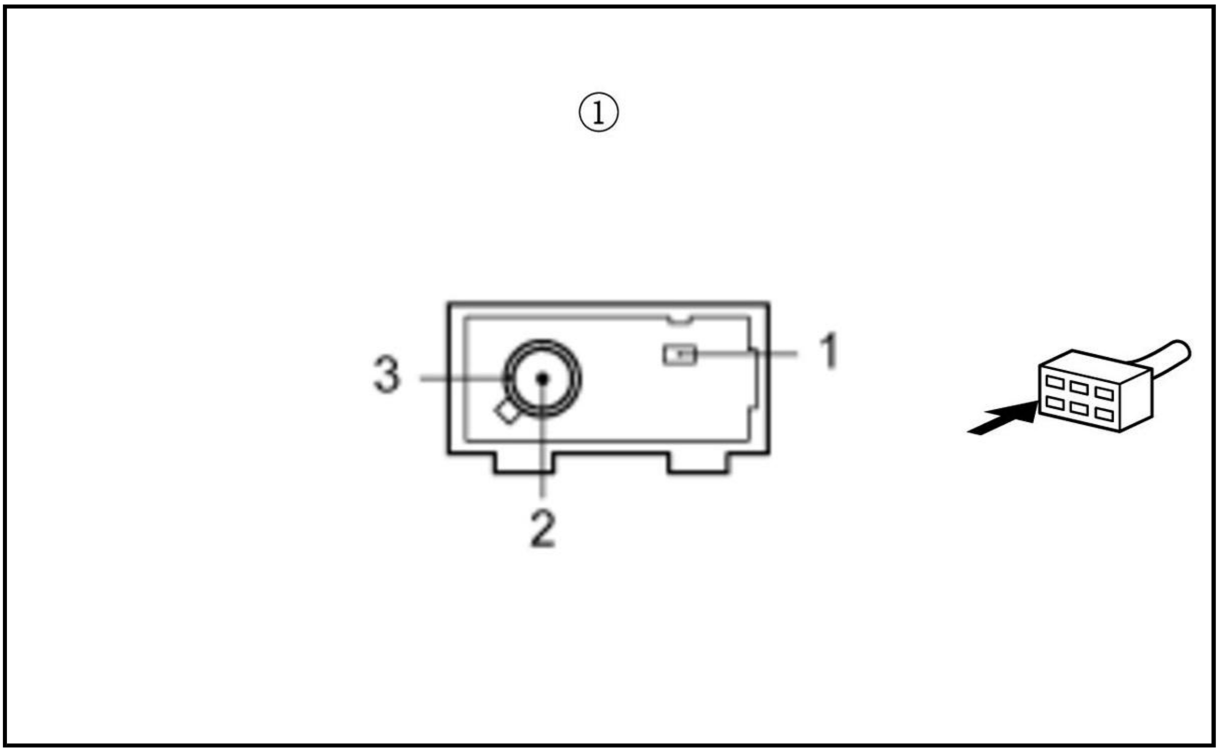
NO

Repair a short to body ground in the wire.

6. Open wire check (ANT +B line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 1**
Test point 2	Roof antenna connector A (3P) (male terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Replace the tuner unit .

NO

Repair an open in the wire.

7. Shorted wire check (RF IN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Tuner unit connector C (5P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 2**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RF IN wire is not shorted to ground. Go to step 8.

NO

There is a short to body ground in the wire. Replace the affected antenna lead.

8. Shorted wire check (RF IN line to SH (RF IN) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 2**
Test point 2	**Tuner unit connector C (5P) No. 4**

Is there 1.0 MΩ or more?

YES

The RF IN wire is not shorted to SH (RF IN) wire. Go to step 9.

NO

There is a short in the wire. Replace the affected antenna lead.

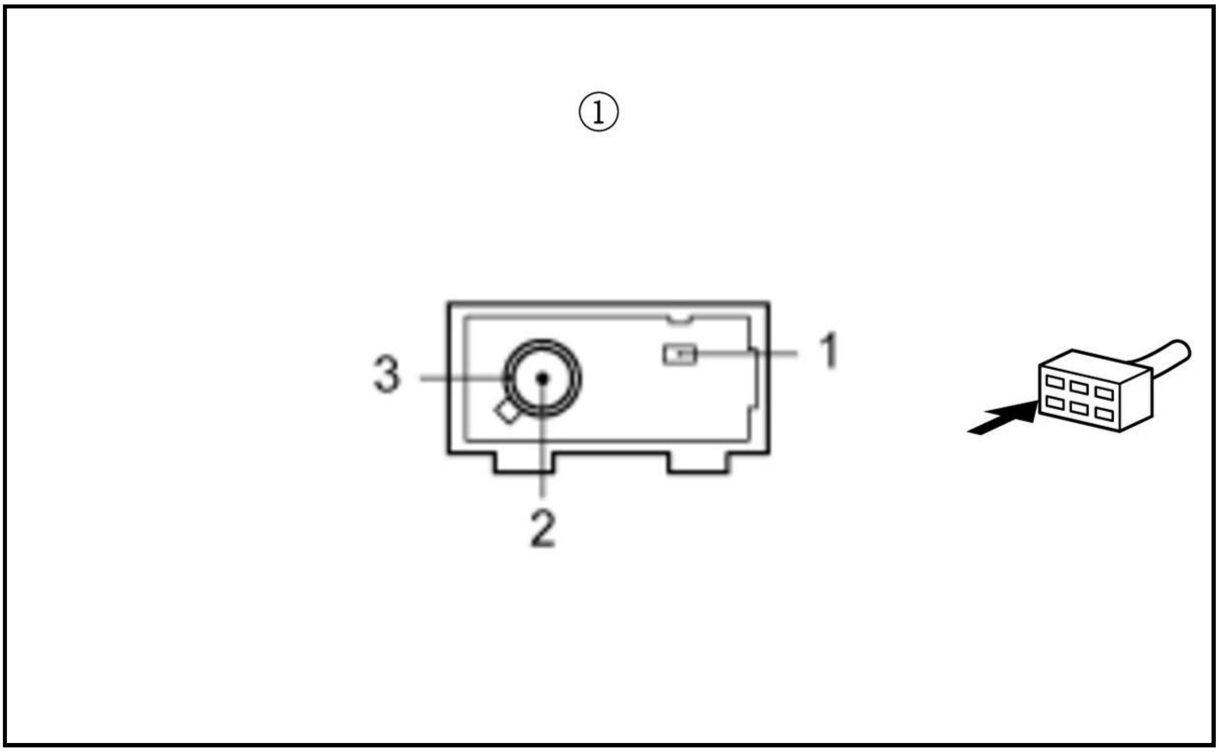
9. Open wire check (RF IN line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 2**

Test point 2	Roof antenna connector A (3P) (male terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

The RF IN wire is OK. Go to step 10.

NO

There is an open in the wire. Replace the affected antenna lead.

10. Roof antenna check (substitution)

-1. **Substitute a known-good roof antenna** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original roof antenna .

NO

Replace the tuner unit .

11. Shorted wire check (SPDIF1 SIG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector L (2P) (with navigation)
Audio unit connector L (2P) (without navigation)
Tuner unit connector B (2P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector L (2P) (with navigation): disconnected
B	Audio unit connector L (2P) (without navigation): disconnected
B	Tuner unit connector B (2P): disconnected
Test point 1	**Tuner unit connector B (2P) No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The SPDIF1 wire is not shorted to ground. Go to step 12.

NO

There is a short to body ground in the wire. Replace the affected shielded harness.

12. Shorted wire check (SPDIF1 SIG line to SPDIF1 SH line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector L (2P) (with navigation): disconnected
B	Audio unit connector L (2P) (without navigation): disconnected
B	Tuner unit connector B (2P): disconnected
Test point 1	**Tuner unit connector B (2P) No. 1**
Test point 2	**Tuner unit connector B (2P) No. 2**

Is there 1.0 MΩ or more?

YES

The SPDIF1 SIG and the SPDIF1 SH wires are not shorted. Go to step 13.

NO

There is a short in the wires. Replace the affected shielded harness.

13. Open wire check (SPDIF1 SIG line, SPDIF1 SH line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector L (2P) (with navigation): disconnected
B	Audio unit connector L (2P) (without navigation): disconnected
B	Tuner unit connector B (2P): disconnected
Test point 1	**Audio-navigation unit connector L (2P) (with navigation) No. 1**
	Audio unit connector L (2P) (without navigation) No. 1
Test point 2	**Tuner unit connector B (2P) No. 1**

Test point 1	**Audio-navigation unit connector L (2P) (with navigation) No. 2**
	Audio unit connector L (2P) (without navigation) No. 2
Test point 2	**Tuner unit connector B (2P) No. 2**

Is there 1.0 Ω or less?

YES

The SPDIF1 SIG and the SPDIF1 SH wires are OK. Go to step 14.

NO

There is an open in the wire(s). Replace the affected shielded harness.

14. Tuner unit check (substitution)

-1. **Substitute a known-good tuner unit** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original tuner unit .

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

REARVIEW CAMERA IMAGE DOES NOT CHANGE WHEN SELECTING DIFFERENT VIEWS

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- You can select up to three different rearview camera angles when backing up. If there is no camera image on the display, **go to Rearview camera image does not come on troubleshooting**.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Shift the transmission to R position/mode.

-3. Operate the audio unit to see if the rearview image changes between the wide view, the normal view, and the top down view.

Does the rearview camera image change properly?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 2.

2. Shorted wire check (CAMERA_BIT0 line, CAMERA_BIT1 line)

-1. Shift the transmission to Neutral or P position/mode.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connectors.

Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)
Rearview camera 8P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 31**
B	**Audio unit connector C (32P) (without navigation) No. 31**
Test point 2	Body ground

Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 32**
B	**Audio unit connector C (32P) (without navigation) No. 32**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The CAMERA_BIT0 and the CAMERA_BIT1 wires are not shorted to ground. Go to step 3.

NO

Repair a short to body ground in the wire(s).

3. Shorted wire check (CAMERA_BIT0 line to CAMERA_BIT1 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 31**
B	**Audio unit connector C (32P) (without navigation) No. 31**
Test point 2	**Audio-navigation unit connector C (32P) (with navigation) No. 32**
B	**Audio unit connector C (32P) (without navigation) No. 32**

Is there 1.0 MΩ or more?

YES

The CAMERA_BIT0 and the CAMERA_BIT1 wires are not shorted. Go to step 4.

NO

Repair a short in the wires.

4. Open wire check (CAMERA_BIT0 line, CAMERA_BIT1 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 31**
B	**Audio unit connector C (32P) (without navigation) No. 31**
Test point 2	**Rearview camera 8P connector No. 3**

Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 32**
B	**Audio unit connector C (32P) (without navigation) No. 32**
Test point 2	**Rearview camera 8P connector No. 4**

Is there 1.0 Ω or less?

YES

The CAMERA_BIT0 and the CAMERA_BIT1 wires are OK. Go to step 5.

NO

Repair an open in the wire(s).

5. Voltage check (CAMERA_BIT0 line)

-1. Reconnect the following connectors.

Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)
Rearview camera 8P connector

-2. Turn the vehicle to the ON mode.

-3. Shift the transmission to R position/mode.

-4. Measure the voltage between test points 1 and 2 as specified in the table.

Test condition	Vehicle ON mode
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 31**
B	**Audio unit connector C (32P) (without navigation) No. 31**
Test point 2	Body ground

Selected view mode	Voltage
Wide View	0 V
Normal View	About 5 V - 8 V
Top Down View	0 V

Is the voltage OK?

YES

Go to step 6.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

6. Voltage check (CAMERA_BIT1 line)

-1. Measure the voltage between test points 1 and 2 as specified in the table.

Test condition	Vehicle ON mode
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 32**
B	**Audio unit connector C (32P) (without navigation) No. 32**
Test point 2	Body ground

Selected view mode	Voltage
Wide View	0 V
Normal View	0 V
Top Down View	About 5 V - 8 V

Is the voltage OK?

YES

Replace the rearview camera .

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

REARVIEW CAMERA IMAGE DOES NOT COME ON

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Shift the transmission to R position/mode.

Does the display image change to rearview when the transmission is shifted to R position/mode?

YES

Intermittent failure, the system is OK at this time.

NO: Display audio type

The failure is duplicated, go to step 2.

NO: Color audio type

The failure is duplicated, go to step 5.

2. System Diagnostic Mode check

-1. Shift the transmission to P position/mode.

Go into the System Diagnostic Mode, and use the System Links to check the Rear Wide Camera icon status.

- **With navigation**
- **Without navigation**

Is the Rear Camera icon green?

YES

Go to step 3.

NO: With navigation

Go to Navigation Unit DTC 2608 (R-Camera Diag) troubleshooting .

NO: Without navigation

Go to Audio Unit DTC 2608 (R-Camera Diag) troubleshooting .

3. Determine possible failure area (BACK_LT line, others):

Go into the System Diagnostic Mode, and use the Vehicle Status to check the BACK signal;

- **With navigation**
- **Without navigation**

-2. Shift the transmission to R position/mode.

Does the BACK signal change from [0] to [1] when the transmission is shifted from P position/mode to R position/mode?

YES

Go to step 12.

NO

Go to step 4.

4. Open wire check (BACK_LT line)

-1. Shift the transmission to P position/mode.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connector.

Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)

-4. Turn the vehicle to the ON mode.

-5. Shift the transmission to R position/mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 15**
B	**Audio unit connector C (32P) (without navigation) No. 15**
Test point 2	Body ground

Is there battery voltage?

YES: with navigation

Replace the audio-navigation unit .

YES: without navigation

Replace the audio unit .

NO

Repair an open in the wire.

5. In Line Diag check

-1. Shift the transmission to P position/mode.

-2. **Go into the System Diagnostic Mode, and use the In Line Diag to check the rearview camera connection**.

Does the Rear Camera indicate OK?

YES

Go to step 10.

NO

Go to step 6.

6. Determine possible failure area (CAMERA_ADPT line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rearview camera 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
B	B
Test point 1	**Rearview camera 8P connector No. 6**
Test point 2	Body ground

Is there about 5.0 V?

YES

Go to step 8.

NO

Go to step 7.

7. Open wire check (CAMERA_ADPT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio unit connector C (32P) No. 16**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

Replace the audio unit .

8. Determine possible failure area (rearview camera, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Rearview camera 8P connector No. 5**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Replace the rearview camera .

NO

Go to step 9.

9. Open wire check (SH_CAMERA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio unit connector C (32P) No. 28**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the audio unit .

NO

There is an open in the wire(s). Replace the affected shielded harness.

10. Determine possible failure area (B-CAN lines, others)

-1. **Go into the System Diagnostic Mode, and use the MICU_ICU in the Vehicle Information to check the BACK signal**.

-2. Shift the transmission to R position/mode.

Does the C_BACKLTSW signal change from [0] to [1] when the transmission is shifted from P position/mode to R position/mode?

YES

Go to step 12.

NO

Go to step 11.

11. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Shift the transmission to P position/mode.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connectors.

Body control module connector B (36P)
Audio unit connector A (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Body control module connector B (36P): disconnected
B	Audio unit connector A (24P): disconnected
Test point 1	**Body control module connector B (36P) No. 20**
Test point 2	**Audio unit connector A (24P) No. 14**

Test point 1	**Body control module connector B (36P) No. 21**
Test point 2	**Audio unit connector A (24P) No. 24**

Is there 1.0 Ω or less?

YES

Replace the audio unit .

NO

Repair an open in the wire(s).

12. Shorted wire check (CAMERA_VCC, CAMERA_GND, CAMERA_V, CAMERA_V_GND lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)
Rearview camera 8P connector

-3. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected

Connector	Terminal
Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)	No. 13
	No. 14
	No. 29
	No. 30

Is there 1.0 MΩ or more?

YES

The CAMERA_VCC, CAMERA_GND, CAMERA_V, and CAMERA_V_GND wires are not shorted to ground. Go to step 13.

NO

There is a short to body ground in the wire(s). Replace the affected shielded harness.

13. Shorted wire check (CAMERA lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected

Test point 1: Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)	Test point 2: Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)
No. 13	No. 14, No. 28, No. 29, No. 30
No. 14	No. 28, No. 29, No. 30
No. 28	No. 29, No. 30
No. 29	No. 30

Is there 1.0 MΩ or more between any of the terminals?

YES

The CAMERA wires are not shorted in the wires. Go to step 14.

NO

There is a short in the wires. Replace the affected shielded harness.

14. Open wire check (CAMERA_VCC, CAMERA_GND, CAMERA_V, CAMERA_V_GND lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected

Test point 1:Audio-navigation unit connector C (32P) (with navigation) **Audio unit connector C (32P) (without navigation)**	**Test point 2:Rearview camera 8P connector**
No. 13	No. 2
No. 14	No. 8
No. 29	No. 7
No. 30	No. 1

Is there 1.0 Ω or less?

YES

The CAMERA_VCC, CAMERA_GND, CAMERA_V, and CAMERA_V_GND wires are OK. Go to step 15.

NO

There is an open in the wire(s). Replace the affected shielded harness.

15. Voltage check (CAMERA_VCC line)

-1. Reconnect the following connectors.

Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation) Rearview camera 8P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 13**

B	**Audio unit connector C (32P) (without navigation) No. 13**
Test point 2	Body ground

Is there about 8.0 V?

YES

Go to step 16.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

16. Rearview camera check (substitution)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good rearview camera** , and recheck.

Does the symptom go away?

YES

Replace the original rearview camera .

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

THE MID DOES NOT DISPLAY THE AUDIO UNIT INFORMATION

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- If the audio remote-HFL switch does not respond, **go to Audio remote-HFL switch does not work properly (audio unit buttons work) troubleshooting**.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Select Audio and HFL from the multi-information display (MID) menu screen.

Are audio and HFL information displayed?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 2.

2. Shorted wire check (LVDS2+ line, LVDS2- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio unit connector J (3P)
Gauge control module connector C (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector J (3P): disconnected
B	Gauge control module connector C (3P): disconnected
Test point 1	**Audio unit connector J (3P) No. 1**
Test point 2	Body ground

Test point 1	**Audio unit connector J (3P) No. 2**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The LVDS2+ and the LVDS2- wires are not shorted to ground. Go to step 3.

NO

There is a short to body ground in the wire. Replace the affected shielded harness.

3. Shorted wire check (LVDS2+ line to LVDS2- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector J (3P): disconnected
B	Gauge control module connector C (3P): disconnected
Test point 1	**Audio unit connector J (3P) No. 1**
Test point 2	**Audio unit connector J (3P) No. 2**

Is there 1.0 MΩ or more?

YES

The LVDS2+ wire and the LVDS2- wire are not shorted. Go to step 4.

NO

There is a short in the wires. Replace the affected shielded harness.

4. Shorted wire check (LVDS2 SH line to another lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector J (3P): disconnected
B	Gauge control module connector C (3P): disconnected
Test point 1	**Audio unit connector J (3P) No. 1**
Test point 2	**Audio unit connector J (3P) No. 3**

Test point 1	**Audio unit connector J (3P) No. 2**
Test point 2	**Audio unit connector J (3P) No. 3**

Is there 1.0 MΩ or more?

YES

The LVDS2 SH wire is not shorted. Go to step 5.

NO

There is a short in the wires. Replace the affected shielded harness.

5. Open wire check (LVDS2+ line, LVDS2- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector J (3P): disconnected
B	Gauge control module connector C (3P): disconnected
Test point 1	**Audio unit connector J (3P) No. 1**
Test point 2	**Gauge control module connector C (3P) No. 1**

Test point 1	**Audio unit connector J (3P) No. 2**
Test point 2	**Gauge control module connector C (3P) No. 2**

Is there 1.0 Ω or less?

YES

The LVDS2+ and the LVDS2- wires are OK. Go to step 6.

NO

There is an open in the wire(s). Replace the affected shielded harness.

6. Audio unit check (substitution)

-1. Substitute a known-good audio unit.

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original audio unit .

NO

Replace the gauge control module .

USB CHARGER DOES NOT WORK

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the connectors for poor connections or loose terminals.
- Check the fuses and relays associated with the system, and check for a short in the related lines.

1. Problem verification

-1. Connect a known-good USB device to the USB port(s) of the USB charger unit.

-2. Turn the vehicle to the ON mode.

Can the connection be checked (battery charging status) on the device?

YES

Intermittent failure, the system is OK at this time. Inspect the connectors of the USB device and USB port for wear.

NO

The failure is duplicated, go to step 2.

2. Open wire check (+B BACK UP or +B_USB_CHARGER line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

USB charger unit 3P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	USB charger unit 3P connector: disconnected
Test point 1	**USB charger unit 3P connector No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

The +B BACK UP or +B_USB_CHARGER wire is OK. Go to step 3.

NO

Repair an open in the wire.

3. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	USB charger unit 3P connector: disconnected
Test point 1	**USB charger unit 3P connector No. 3**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 4.

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

4. Open wire check (ACC line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	USB charger unit 3P connector: disconnected
Test point 1	**USB charger unit 3P connector No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The ACC wire is OK. **Replace the USB charger unit** .

NO

Repair an open in the wire.

USB DEVICE DOES NOT FUNCTION

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the USB's specifications:
-
    - Mass-storage class ready digital audio player with USB 2.0 port
    - More than 256 MB storage space
    - Supports MP3, WMA, and AAC (encoded with the iTunes) files, DRM files are not supported
- Not all players and player functions work with the USB adapter. Please see the Owner's Manual for more information. Always test the customer's USB device in a known-good vehicle of the same year and trim (if possible). Technologies change and are updated frequently which may result that USB devices may work in newer vehicles, but not in older vehicles of the same model.
- If Unsupported Ver appears on the display, the vehicle is OK, there is a software problem with the USB device.
- Check the connectors for poor connections or loose terminals.
- Display audio type: Before doing this troubleshooting, check the hard error code;
-
    - -

      With navigation
    - -

      Without navigation

1. Determine possible failure area (USB device, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the customer's USB device to a known-good vehicle (same year/trim) that is equipped with a USB adapter, and check the USB device operation.

Does the USB device work properly in the known-good vehicle?

YES

Go to step 2.

NO

See the Owner's Manual for details about the USB device requirements and approved file types.

2. Problem verification 1

   -1. On the customer's vehicle, connect the customer's USB device to the USB port A.

   -2. Turn the vehicle to the ON mode.

   -3. Check the USB device operation in the customer's vehicle.

   Does the USB device work properly in the customer's vehicle?

   YES: With USB port B

   Go to step 3.

   YES: Without USB port B

   Intermittent failure, the system is OK at this time. Inspect the connectors of the USB device and USB port for wear.

   NO: With USB port B

   The failure is duplicated, go to step 4.

   NO: Without USB port B

   The failure is duplicated, go to step 5.

3. Problem verification 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the customer's USB device from the USB port A.

   -3. Connect the customer's USB device to the USB port B.

   -4. Turn the vehicle to the ON mode.

   -5. Check the USB device operation in the customer's vehicle.

   Does the USB device work properly in the customer's vehicle?

   YES

   Intermittent failure, the system is OK at this time. Inspect the connectors of the USB device and USB port for wear.

   NO

   The failure is duplicated, go to step 6.

4. Determine possible failure area (USB1 line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the customer's USB device from the USB port A.

-3. Connect the customer's USB device to the USB port B located in the center console.

-4. Turn the vehicle to the ON mode.

-5. Check the USB device operation in the customer's vehicle.

Does the USB device work properly in the customer's vehicle?

YES

Go to step 5.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

5. Open wire check (USB1 lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

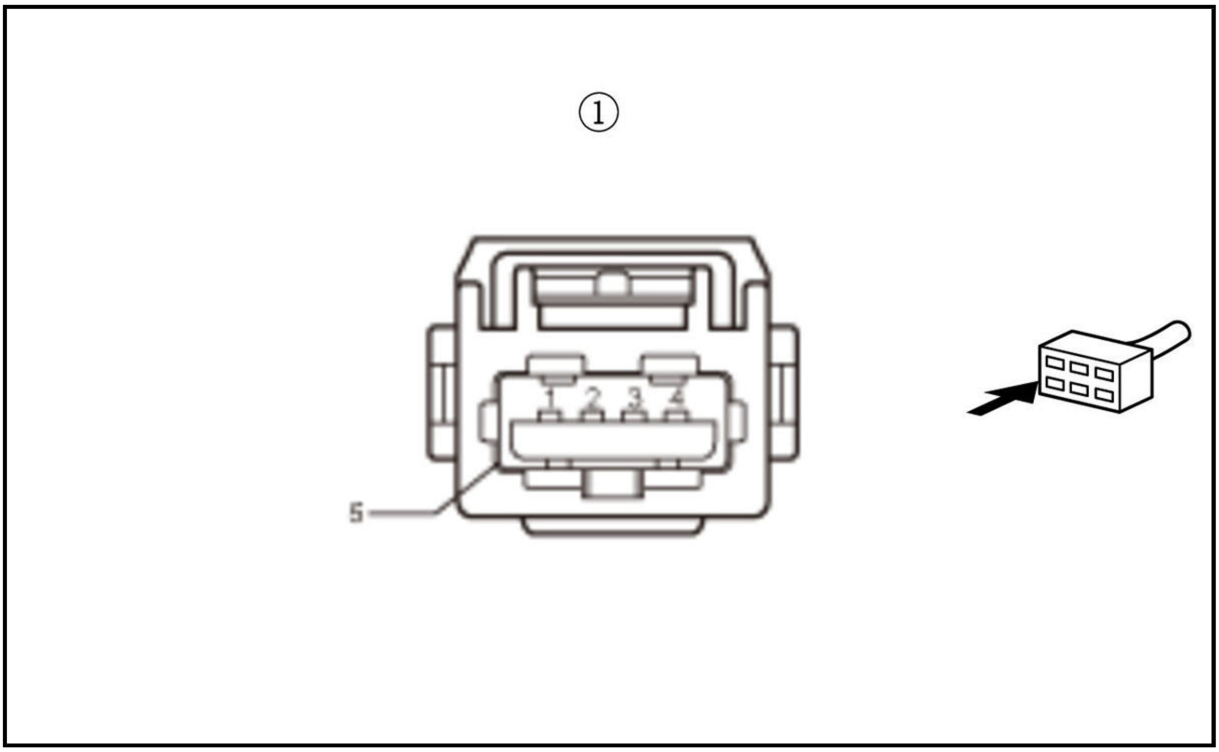
-2. Disconnect the following connector.

Audio-navigation unit connector F (5P) (with navigation) Audio unit connector F (5P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector F (5P) (with navigation): disconnected Audio unit connector F (5P) (without navigation): disconnected

Test point 1:Audio-navigation unit connector F (5P) (with navigation) **Audio unit connector F (5P) (without navigation)**	**Test point 2: USB port A 5P connector (female terminals):** ①
No. 1	No. 1
No. 2	No. 4
No. 3	No. 2
No. 4	No. 3



Is there 1.0 Ω or less?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

There is an open in the wire(s). Replace the affected shielded harness.

6. Open wire check (USB2 lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

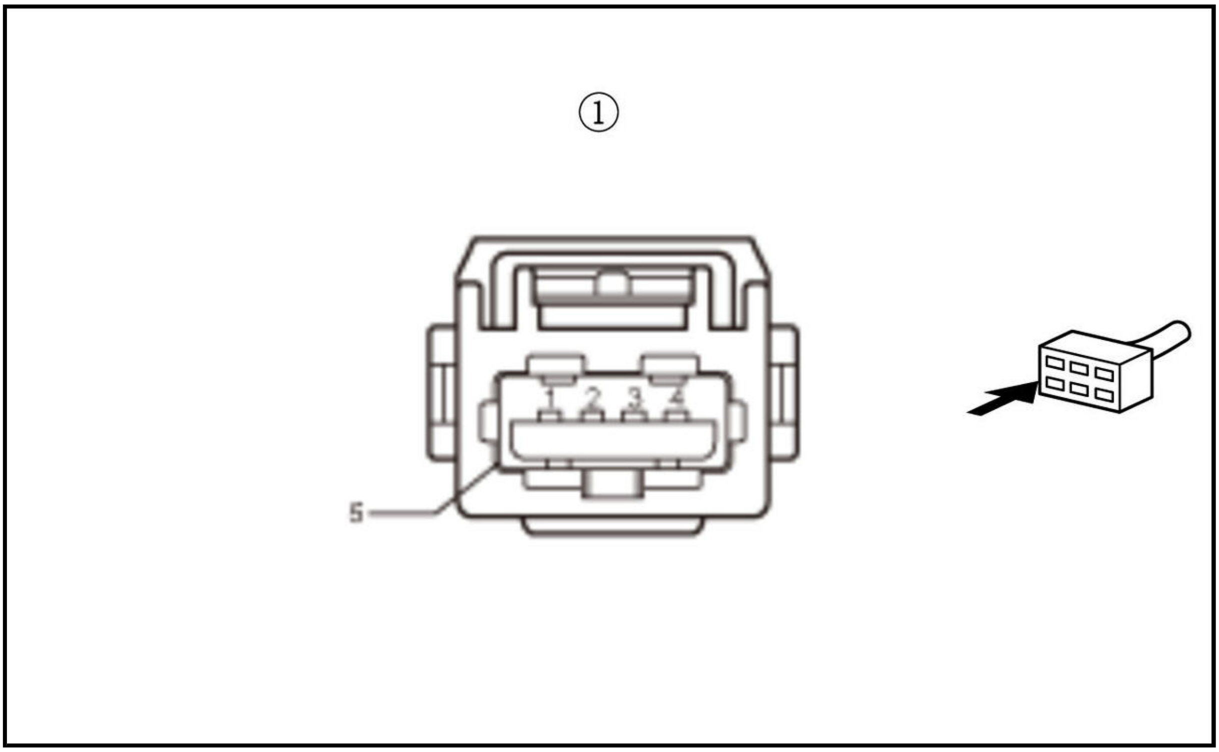
Audio-navigation unit connector G (5P) (with navigation) Audio unit connector G (5P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector G (5P) (with navigation): disconnected Audio unit connector G (5P) (without navigation): disconnected

Test point 1:Audio-navigation unit connector G (5P) (with navigation) **Audio unit connector G (5P) (without navigation)**	**Test point 2: USB port B 5P connector (female terminals):** ①
No. 1	No. 1
No. 2	No. 4
No. 3	No. 2

Test point 1:Audio-navigation unit connector G (5P) (with navigation) **Audio unit connector G (5P) (without navigation)**	**Test point 2: USB port B 5P connector (female terminals):** ①
No. 4	No. 3



Is there 1.0 Ω or less?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

There is an open in the wire(s). Replace the affected shielded harness.

VOLUME DOES NOT INCREASE WITH SPEED

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- If possible, have the customer demonstrate their concern and compare it against a known-good vehicle.
- Check for B-CAN DTCs and resolve them before troubleshooting.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Test-drive the vehicle at freeway speeds, and monitor if the volume increases.

Does the volume increase?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 2.

2. Determine possible failure area (audio setting, others)

   -1. Verify the SVC mode setting in the audio system sound set-up.

   Is the SVC set to off?

   YES

   Change the setting to SVC MID, and recheck.

   NO

   Go to step 3.

3. Determine possible failure area (audio unit, others):

   Go into the System Diagnostic Mode:

   - Display Audio Type: Do the Vehicle Status diagnosis to check the Speed indication;
   -
     - **With navigation**
     - **Without navigation**
   - Color Audio Type: **Do the VSPNE in the Vehicle Information to check the C_VSP indication**.

   -2. Test-drive the vehicle with the help of an assistant, and then watch the vehicle speed in the center display.

   Is the vehicle speed indicated?

   YES: With stereo amplifier

   Go to step 4.

   YES: Without stereo amplifier, with navigation

   Replace the audio-navigation unit .

   YES: Without stereo amplifier, without navigation

   Replace the audio unit .

   NO

   Go to step 5.

4. Stereo amplifier check (substitution)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Substitute a known-good stereo amplifier, and recheck** .

   Does the symptom go away?

   YES

Replace the original stereo amplifier .

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

5. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Gauge control module connector A (32P)

Audio-navigation unit connector A (24P) (with navigation)
Audio unit connector A (24P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	Audio-navigation unit connector A (24P) (with navigation): disconnected
B	Audio unit connector A (24P) (without navigation): disconnected
Test point 1	**Gauge control module connector A (32P) No. 30**
Test point 2	**Audio-navigation unit connector A (24P) (with navigation) No. 14**
	Audio unit connector A (24P) (without navigation) No. 14

Test point 1	**Gauge control module connector A (32P) No. 31**
Test point 2	**Audio-navigation unit connector A (24P) (with navigation) No. 24**
	Audio unit connector A (24P) (without navigation) No. 24

Is there 1.0 Ω or less?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair an open in the wire(s).

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE AUDIO SYSTEM

NOTE: **Refer to How to Troubleshoot the Navigation System for information about the audio-navigation unit** .

Forced Rebooting of Audio Unit (Display audio type)

If the system freezes, and the screen does not respond, you can attempt rebooting the audio unit by pressing and holding the AUDIO POWER (⏻) button for 5 seconds. When the function is effective, the confirmation screen appears.

Anti-Theft Feature (With audio system theft protection)

The audio unit has an anti-theft protection circuit. When one of the following occurs, the unit enters the anti-theft mode:

- Disconnecting the 12 volt battery terminal.
- Disconnecting audio unit connector A (24P).
- Removing the +B line's fuses.

After the service, reconnect power to the audio unit, and turn the vehicle to the ON mode. There are two ways to exit the anti-theft mode:

- Press and hold the AUDIO POWER (⏻) button for at least 2 seconds. The audio unit automatically exits the anti-theft mode. If the audio unit does not exit anti-theft mode, turn the vehicle to the OFF (LOCK) mode then the ON mode (if possible, start the engine), and try to release the anti-theft several times.
- Enter the 5-digit anti-theft code. If the input of code fails 10 times in a row, the screen is locked for 60 minutes.

When the audio unit is installed in another vehicle (same Year/Model/Trim), like in cases where a known-good unit was substituted for testing, **do the Anti-Theft Skip mode in the System Diagnostic Mode (display audio type)**, or **do the Anti-Theft Temporary Cancellation in the System Diagnostic Mode (color audio type)**. These mode will release the anti-theft code for 150 seconds.

Global Positioning System (GPS) Limitations (Display audio type)

The GPS signal is used for some functions about the audio unit. The GPS cannot detect the vehicle's position or elevation during the following instances:

- For the first 5 to 10 minutes after reconnecting the 12 volt battery (this process can take as long as 45 minutes).
- When the satellite signals are blocked by tall buildings, mountains, tunnels, large trees, inside parking structures or large trucks.
- When the GPS antenna is blocked by metallic window tinting or by an object placed above it in the vehicle. The GPS antenna requires a clear unobstructed view of the sky.
- When there is no satellite signal output (signal output is sometimes stopped for satellite servicing).
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.

The accuracy of the GPS is reduced during these instances:

- Metallic window tinting above the GPS antenna.
- When only three or fewer satellite signals are received (Four satellite signals are required for accurate positioning).
- When driving near high tension power lines.
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.
- When the satellite control centers are experiencing problems.

LCD Unit Limitations (Display audio type)

The center display unit is touch sensitive. Touch the display directly to select items on the screen.

- Heavy gloves, fingernails or pens cannot be used on the touch panel.
- In cold temperatures, the display may stay dark for the first minute until it warms up.
- When the display is too hot because of direct summer sunlight, it remains dark until the temperature drops (you may see an error message displayed stating this fact).
- Fingerprints on the screen may be noticeable. Clean the screen with a soft, damp cloth. You may use a mild cleaner intended for eye glasses or computer screens. To avoid scratching the panel, do not rub too hard or use abrasive cleaners or shop towels.

How to Check Error History (Audio DTCs) (Display audio type)

NOTE: The audio DTCs cannot be retrieved with the HDS.

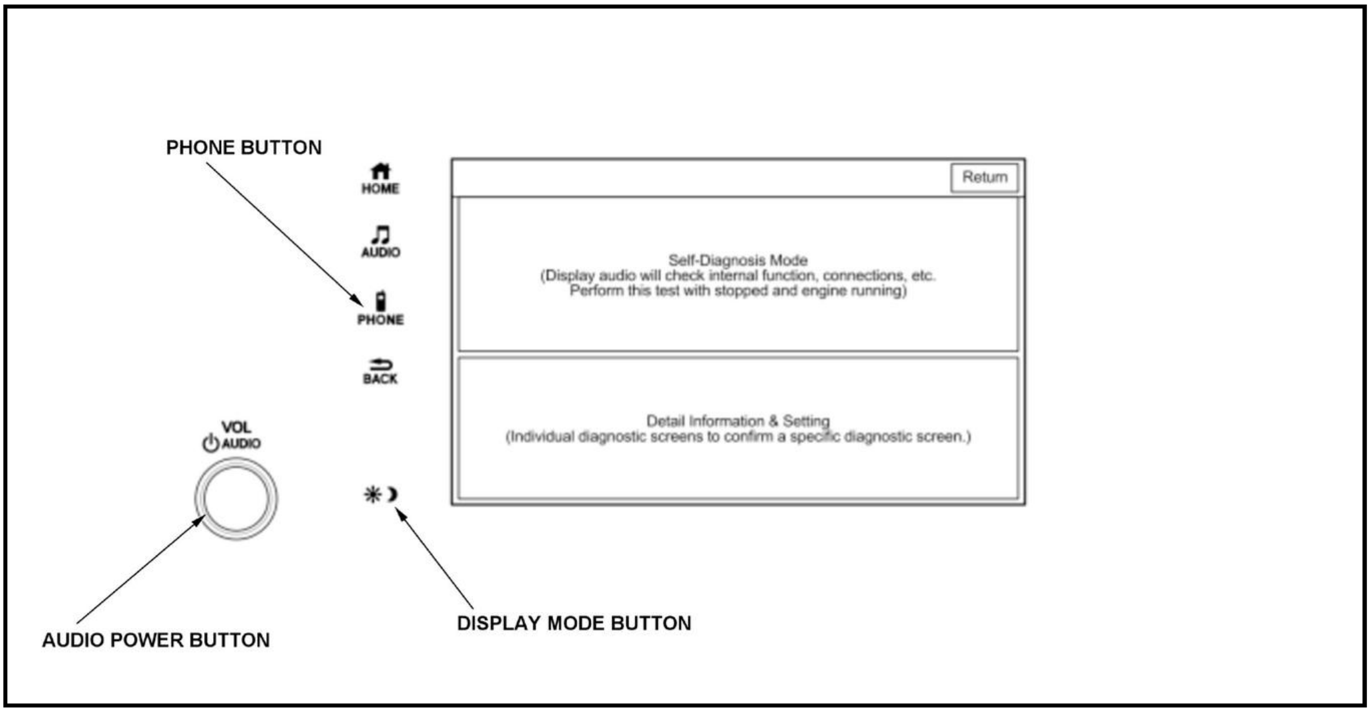
The Error History feature is to record intermittent audio/navigation issues that occur while the customer is using the system. Sometimes the customer complaint cannot be duplicated. The error history may record the information needed to diagnose the problem. To check the error history:

1. Turn the vehicle to the ON mode.

2. Press and hold the PHONE button, the DISPLAY MODE (☼ ☽) button, and the AUDIO POWER (⏻) button until the Select Diagnosis Items menu screen is displayed:

NOTE: The buttons needs to be pressed together simultaneously.

Displaying Select Diagnosis Items Menu Screen



Self-Diagnosis Mode
(Display audio will check internal function, connections, etc.
Perform this test with stopped and engine running)

Detail Information & Setting
(Individual diagnostic screens to confirm a specific diagnostic screen.)

3. When the Select Diagnosis Items menu appears, select the Self-Diagnosis Mode.

4. When the audio unit has hard error codes, the Error History icon (A) appears yellow. When no hard error codes are stored, the icon appears gray. To view the errors with their navigation DTC, select the Error History icon.

DESCRIPTION AND OPERATION

AUDIO SYSTEM DESCRIPTION

Basic Configuration

The Audio and Visual system consists of a digital audio/video playback function, communication to the customer's device, and displaying the driver's support information.

Audio Unit

The audio unit acts as a processor which includes playback functions of the USB, Bluetooth B® audio, iPod for music, and an internal radio tuner or an external radio tuner that is controlled with digital communication. Select audio functions from audio unit buttons, touch screen (touch the display directly to select items on the screen), or the audio remote switch (on the steering wheel).

There are two kinds of audio units according to a vehicle model:

B	Display Audio type	Color Audio type
With Navigation	o	x
Without Navigation	o	o

Display Audio type

The audio unit acts as a head unit that controls external audio/visual system related devices which do not have an audio disc player and a control module. The center display unit acts as an user interface and is located on the front of the audio unit. An antenna for Bluetooth B® communication, and an antenna for wireless LAN communication are built into the audio unit. Each function regarding the system is installed in the audio unit as applications. As an advanced feature, a smartphone linkage and video playback functions are available.

An audio unit with navigation function is referred to as an audio-navigation unit. This unit has a built-in gyro sensor and a navigation map data (**refer to the Navigation System Description**).

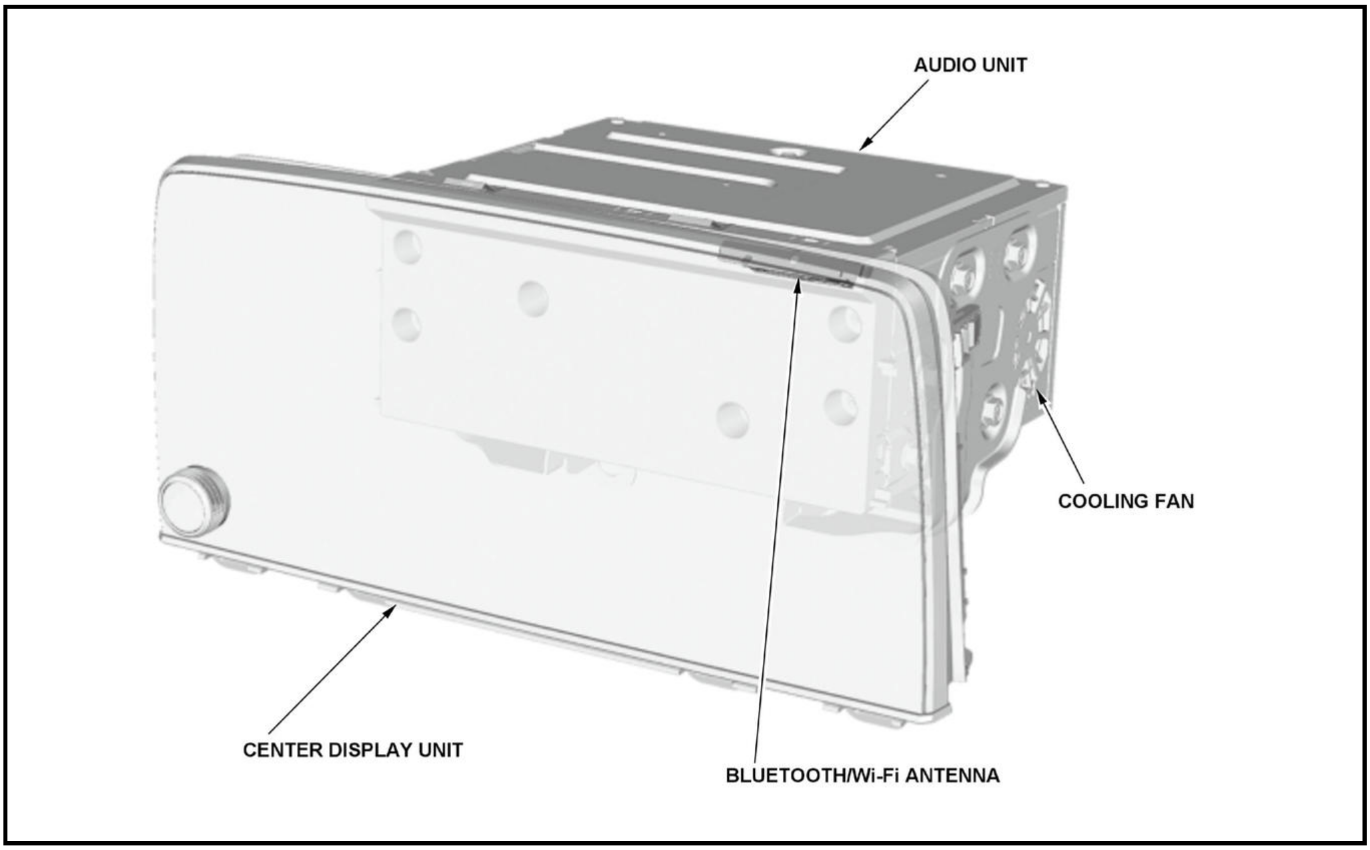
The SD card is a storage media that saves the navigation map data. The audio-navigation unit and the SD card cannot be substituted separately because the SD card module is not a removable type.

Both the audio-navigation unit and the audio unit have a GPS antenna circuit. The GPS information is used for a function that needs vehicle location other than the navigation function.

For vehicles with Sirius XM B® radio, the XM receiver circuit is built into the audio unit circuit. The XM satellite/terrestrial signal is received by the XM antenna built-in the roof antenna. The audio unit holds XM presets and settings even when the 12 volt battery is disconnected (AM/FM presets are stored in the tuner unit).

There are two audio systems available for the display audio type:

- The system with stereo amplifier: An external stereo amplifier (10 channels output) and 10 speakers are equipped. The audio unit outputs a digital audio signal to the stereo amplifier.
- The system without stereo amplifier: 8 speakers are equipped. In this case, a power amplifier is built into the audio unit.



Fail-Safe Function

The audio unit performs a fail-safe control when the system detects an abnormal high temperature in the unit:

Built-in cooling fan on/off control: When the audio unit temperature is too high, the audio unit turns the cooling fan on until the temperature cools down.

Self-Diagnostic Function

The audio unit has a self-diagnostic function to check the failure of the audio unit or its connection. Additionally, the audio unit has original hard error codes that can be displayed on the diagnostic screen to identify the failure part.

Forced Rebooting Function

If the system is frozen, and the screen does not respond, you can attempt rebooting the audio unit by pressing and holding the AUDIO POWER (⏻) button for 5 seconds.

Center Display Unit (Display Audio type)

The center display unit has a 7-inch WVGA color TFT LCD that is driven by IPS (In-plane Switching) system with an electrostatic capacitive touch panel. The surface of the display is given an anti-glare coating. This unit displays the navigation map, vehicle information, various menu screens, and a rearview or LaneWatch* image, and can operate the audio, navigation, and HFL systems by touching the display. The HVAC information is displayed if the audio unit receives a feedback signal from the climate control unit via the B-CAN.

*: With LaneWatch

Controls

The center display unit turns on when the DISP CONT signal changes from OFF to ON.

MULTI INFORMATION DISPLAY
GAUGE CONTROL MODULE
Remote switch operation and status
LIN
AUDIO REMOTE-HFL SWITCH

Fail-Safe Function

The center display unit performs a fail-safe control when the system detects an abnormal high temperature in the unit:

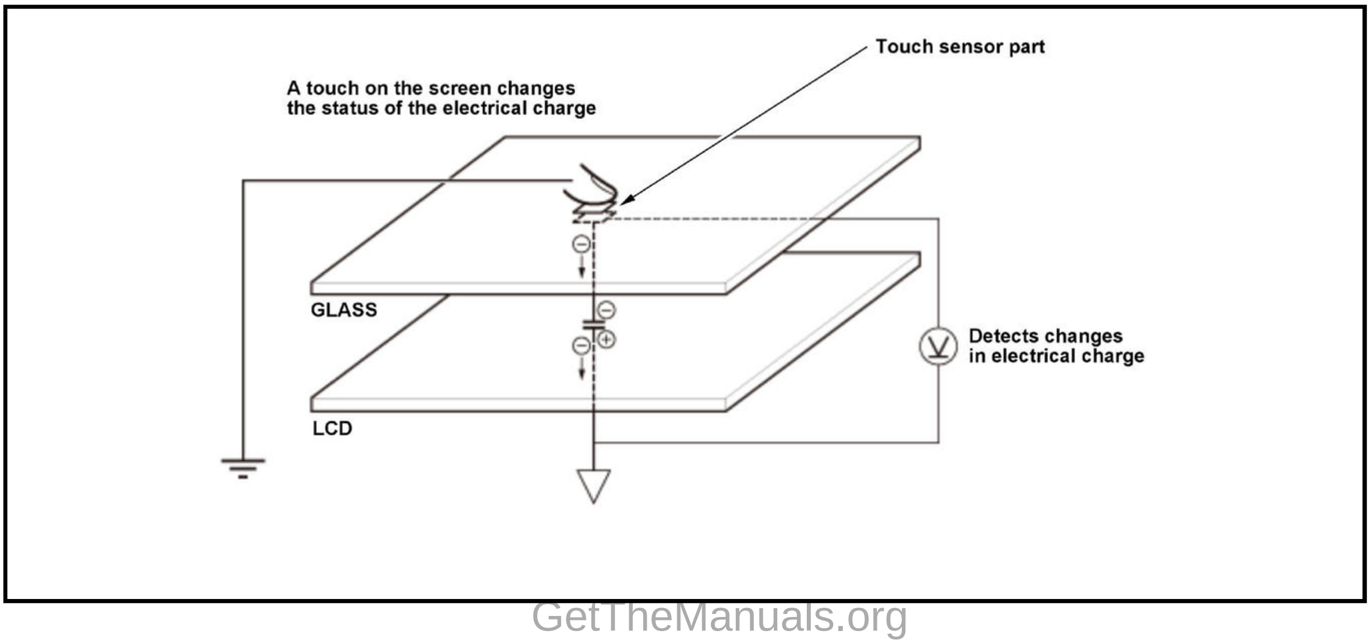
- When the center display unit temperature rises over about 86 deg.F (30 deg.C), the display brightness dims gradually.
- When the center display unit temperature rises 158 deg.F (70 deg.C), the display brightness dims to 75 % of normal brightness.
- When the center display unit temperature rises over 176 deg.F (80 deg.C) for 8 minutes, the center display unit sends the error status to the audio unit, and the center display unit displays the error message and then turns off (the background system stays on).
- When the center display unit temperature drops to below 167 deg.F (75 deg.C), the display back light turns on, and the display brightness returns gradually as the temperature drops.

Self-Diagnostic Function

The audio unit can check the center display unit status by performing the System Diagnostic Mode.

Electrostatic Capacitive Touch Panel

To use the touch screen, bring your finger close to the screen or gently touch it with your finger. The touch sensor senses the change of the electrical charge when your finger is close to the screen and detects the position of the electrical charge. Use only a gentle touch to select or move the screen image. A hard finger press is not necessary. The screen cannot sense your touch if you wear heavy gloves, use a fingernail, or a pen.

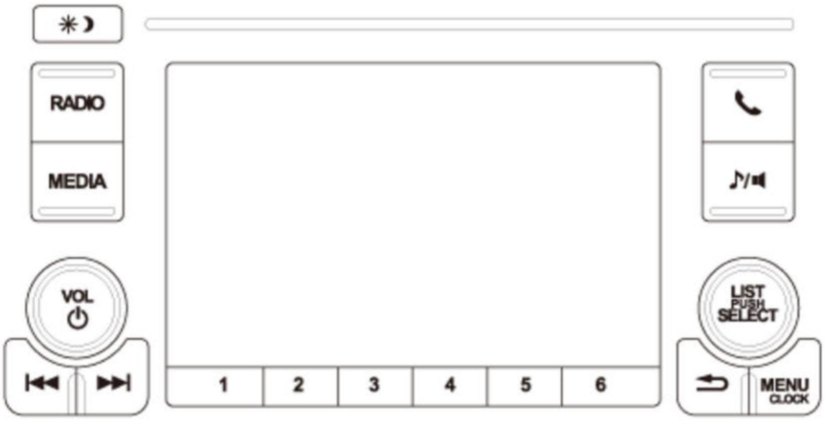


Touch sensor part
A touch on the screen changes the status of the electrical charge
GLASS
LCD
Detects changes in electrical charge

Color Audio type

The audio unit is a simple component which does not have an audio disc player, and has a 5-inch VGA color TFT LCD panel. The screen is not a touch sensitive and displays audio and HandsFreeLink (HFL) information. Additionally, the screen shows the rearview image when the transmission is shifted to the R position/mode. The audio panel has an illumination dimming function that is controlled by the B-CAN information. An antenna for Bluetooth B® communication is built in the audio unit. As an advanced feature, the HFL function includes an external microphone that located in the roof console.

The AM/FM (RBDS) radio tuner is built into the audio unit. This unit holds AM/FM presets even when the 12 volt battery is disconnected.



Fail-Safe Function

The audio unit performs the fail-safe control when the system detects an abnormal high temperature in the unit:

- When the surface of the LCD temperature rises over 194 deg.F (90 deg.C), the display back light turns off.
- When the surface of the LCD temperature drops to below 189 deg.F (87 deg.C), the display back light turns on.

Self-Diagnostic Function

The audio unit has the self-diagnostic function to check the failure of the audio unit or its connection.

Audio System Functions

Anti-Theft Function (With Audio System Theft Protection)

The audio unit has an anti-theft protection function separate from the security system of the vehicle. If the audio unit is removed from the vehicle, the audio unit requires a procedure to unlock the security system in order to use it again after the audio unit is reconnected.

There are two kinds of anti-theft mode release procedures:

- While displaying the security code entry screen or the conformation screen of the anti-theft system, press and hold the AUDIO POWER (⏻) button for at least 2 seconds. The audio unit automatically exits the

anti-theft mode.
- While displaying the security code entry screen, enter the 5-digit anti-theft code.

The System Diagnostic Mode (includes checking hard error codes) can be used even if the audio unit is in the anti-theft mode.

If you substitute the audio unit into another vehicle, you must either enter the anti-theft code or perform the anti-theft skip mode in the System Diagnostic mode (This mode will release the anti-theft code for 150 seconds).

Muting Logic

The outline of the audio interruption function is shown in the following table.

With Stereo Amplifier

Contents	Audio Output			
	Front CH (driver's side)	Front CH (passenger's side)	Rear CH	Subwoofer CH
System beep	Beep and audio	Beep and audio	Audio	Audio
Pressing TALK/BACK buttons	Feedback output	Muted	Muted	Muted
Guidance	Guidance output and attenuated audio	Attenuated audio	Attenuated audio	Attenuated audio
HFL	HFL output	HFL output	Muted	Muted
HFL and Guidance	Guidance output	HFL output	Muted	Muted

Without Stereo Amplifier

Contents	Audio Output		
	Front CH (driver's side)	Front CH (passenger's side)	Rear CH
System beep	Beep and audio	Beep and audio	Audio
Pressing TALK/BACK buttons	Feedback output	Muted	Muted
Guidance	Guidance output and attenuated audio	Attenuated audio	Attenuated audio
HFL	HFL output	HFL output	Muted
HFL and Guidance	Guidance output	HFL output	Muted

Speed-Sensitive Volume Compensation (SVC)

All audio systems are equipped with speed-sensitive volume compensation (SVC). The audio unit receives the vehicle speed pulse (VSP) from the gauge control module (B-CAN). The system processes the speed input and increases the audio system volume level as the vehicle speed increases to compensate for the interior noise that occurs at higher speeds. When the vehicle slows down, the volume returns to its normal level. For vehicles with a stereo amplifier, SVC function is controlled by the stereo amplifier. The SVC has four settings: SVC OFF, SVC LOW, SVC MID, and SVC HIGH that can be adjusted using the audio unit.

Operation Restriction

The audio unit has a function that restricts certain operations of audio and visual systems that may affects safe driving.

Clock Function

The audio unit has a real time clock circuit that operates the clock even if the vehicle is in the OFF (LOCK) mode. Also, the audio unit (display audio type) can adjust the internal clock by linking a smartphone. Additionally, the audio unit with a GPS antenna can display clock information by receiving the GPS signal.

USB Connection

For vehicles with an audio unit (display audio type), two USB ports are equipped for an external device input and a smartphone connection. The USB port A is based on the specification of USB Battery Charging 1.2 (BC 1.2) that supports high-speed charging of the USB device. The audio unit can detect the USB device type (BC 1.2 or not), and change the charging mode automatically. The USB port B supports charging to USB devices by a 1.0 A electric supply.

For vehicles with an audio unit (color audio type), a USB port is equipped for an external device input. The USB port supports charging to USB devices by a 1.0 A electric supply.

USB Audio

The audio system can play digital music from portable audio players, a USB drive, etc. When the device is plugged into the vehicle's USB port, and the vehicle is turned to the ACCESSORY mode, the audio unit begins to communicate with the connected USB device, and to supply the VBUS power. The audio unit controls the device when searching and playing the files. Not all players and player functions work with the USB adapter. Please see the Owner's Manual for more information.

Supported Devices

- Supports for USB Mass storage class/Bulk-only transport.
- USB 2.0 Full-speed capable.
- At least 256 MB storage capacity.
- USB formatted to be compatible with Windows-based operating systems.
- If the USB has a security feature, like write protection, it must be turned off.

There are many different USB devices, manufacturers, and configurations with new devices being released every day, which makes it impossible to test all USB devices with the audio system. Even if the USB device has all these requirements, it may not be compatible.

Hard drives do not support overwriting the data for the track order, which is why they are not recommended.

When you disconnect a USB device, the data for the track order remains in the audio unit's memory so when you reconnect the same USB device, the audio unit continues playing from the location where it was disconnected. If a new USB device is connected, the data for the track order is rewritten and you need to select the album or music file.

Bluetooth B® Connection

The audio unit can be paired with a Honda approved cell phone or a device for Bluetooth B® communication. Pairing procedures vary by the connection history and Bluetooth B® version of the cell phone or the device. Refer to the Owner's Manual.

The audio unit supports Bluetooth B® Ver 4.0+EDR (Ver 2.1+EDR*). Bluetooth B®enables audio streaming, wireless play back on an audio device, hands-free calling with a cell phone, data communication, and phone book loading.

*: Color audio type

Bluetooth B® Audio

Bluetooth B® audio allows approved Bluetooth B® cell phones equipped with music function to play music via the vehicle's audio system using a Bluetooth B® technology. You can control the cell phone's music player remotely using the wireless connection.

- You can play music stored in your cell phone using the wireless connection.
- You can choose the next song, a previous song and resume/pause via the wireless connection.

NOTE: Not all cell phones support the Bluetooth B® audio function.

Supported Devices

- Bluetooth B® music phones that support A2DP 1.2 and AVRCP 1.0, 1.3, and 1.4.
- Bluetooth B® adapters for portable music devices including iPod are not supported.

NOTE: Availability of the functions depends on the connected cell phone.

Wireless LAN Connection (Display Audio type)

The audio unit supports wireless LAN connection based on the IEEE 802.11 a/b/g/n standard. The audio unit can connect the device that has a function as a Wi-Fi access point.

Video Playback Function (Display Audio type)

The audio system can play digital compressed video from a HDMI device or a USB device (MP4 is supported).

HD Radio (TM) (Display Audio Type)

HD Radio (TM) is a crystal clear digital audio broadcast by local radio stations. There is no charge for HD radio. Simply tune to your favorite station, and if the station is broadcasting with HD Radio (TM) technology, then the audio unit will automatically pick up the digital signal, and begin playing the crystal clear, subscription free audio. Refer to your Owner's Manual to determine how your particular receiver indicates HD Radio (TM) reception and how to transition from the main program to the multicast program(s).

- The HD1 channel acquires the analog station first and then blends with the digital signal. Therefore, the digital audio may have a short delay.
- There is no analog signal available on the HD2/HD3 channels. Therefore, there is a short delay while decoding the digital audio. Audio will begin playing when available.
- Go to www.hdradio.com for stations in the area to verify correct operation on the station.

Song By Voice (TM) (Display Audio Type)

A customer can use the Song By Voice (TM) feature to select and play the audio files in an iPod or a USB device with voice commands.

When an iPod or a USB device is connected to the audio unit, the unit makes a dictionary from the album name, folder name, artist name, track name, and the file name.

If a different device is connected, or the customer updates the files on the connected device, a new dictionary is created.

Smartphone Linkage Function (Display Audio type)

This function helps ensure the safe use of a smartphone while driving. Connect a smartphone to the audio unit to use it. Connection methods vary depending on carriers.

When using the navigation function via a smartphone, the audio unit can display the navigation map screen that is in the connected smartphone. In this case, the GPS signal is received by the audio unit, and the vehicle signals are received from the F-CAN and the B-CAN as information of vehicle position tuning.

When using the voice recognition function via a smartphone, the HFL microphone in the roof console picks up the driver's voice, and sends the voice signal to the smartphone via the audio unit using Bluetooth B®.

When the voice recognition is in use, the audio unit sends the fan mute signal to the climate control unit via the B-CAN. The blower fan operating voltage may be reduced depending on the current fan speed.

HondaLink Assist (USA and Canada models Display Audio Type)

HondaLink delivers remote services to the vehicle using the customer's compatible Bluetooth B® cell phone.

If the SRS airbag is deployed, the SRS unit sends a signal to the audio unit via the F-CAN. Then, the audio unit calls a Public Safety Answering Point (PSAP) automatically using the customer's compatible Bluetooth B® cell phone, and sends the vehicle location using Dual-Tone Multi-Frequency (DTMF). The audio unit uses the GPS antenna for tracking the vehicle location.

Tuner Unit

The tuner unit is a separate digital radio tuner interface. Received AM/FM radio waves are processed on the digital signal processor (DSP) and sent to the audio unit via the dedicated digital audio line (SPDIF1). At this time, HD radio (TM) sound signal is separated from normal AM radio sound signal. All of the information about AM/FM reception (includes RBDS information) are sent from the tuner unit via the dedicated serial bus (RS485). This unit holds AM/FM radio frequency presets even when the 12 volt battery is disconnected.

For vehicles with Sirius XM B® radio, the antenna for receiving AM/FM radio waves and satellite/terrestrial (XM) signal uses a roof antenna type. AM/FM radio wave is amplified by the AM/FM antenna amplifier. The sensitivity of the FM wave is raised by the auto gain control. The XM antenna receives satellite signal and terrestrial signal by using the high-gain antenna. Signals are sent to the audio unit via the dedicated single line (SAT/TER).

Self-Diagnostic Function

The audio unit can check the tuner unit status by performing the System Diagnostic Mode.

Stereo Amplifier

The stereo amplifier is a separated power amplifier interface. Digital audio signal (SPDIF2) that is received from the audio unit is processed on the DSP, and sent to each speaker after amplified by the AMP IC.

The stereo amplifier communicates with the audio-navigation unit or the audio unit using the dedicated serial bus (RS485). This communication includes the vehicle speed (for SVC) information, audio settings, and the MUTE commands. The stereo amplifier adjusts the speaker outputs by oneself which is based on the received information.

The stereo amplifier receives the noise cancelling signal (ANC), guidance signal, and system beep signal via independent lines, and mixes them to the applicable audio lines.

Fail-Safe Function

The stereo amplifier performs a fail-safe control when the stereo amplifier detects an abnormal high temperature. The stereo amplifier then sends the error status to the audio unit, and the center display unit displays an error message which then the stereo amplifier inhibits sound output.

When the temperature cools down, the stereo amplifier outputs the sound again.

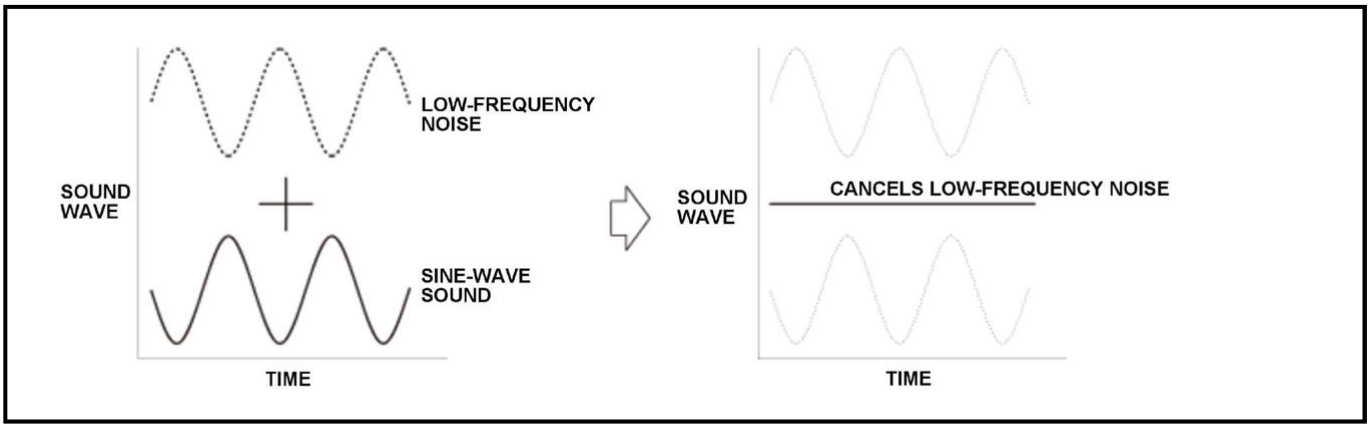
Active Noise Cancellation (ANC)/Active Sound Control

Both the active noise cancellation (ANC) and the active sound control are built into the ANC/active sound control unit. Both systems eliminate unwanted sound entering the passenger compartment. There are two microphones mounted in the headliner; one is just behind the front overhead roof console and the other is just ahead of the rear map lights. The microphones capture low frequencies entering the passenger compartment and send a signal to the ANC/active sound control unit. The ANC/active sound control unit then creates the sound wave that is sent out through the speakers to eliminate the unwanted sound.

Active Noise Cancellation (ANC)

The ANC system works to cancel the engine booming sound up to about 2, 000 rpm (min -1). The ANC/active sound control unit receives the engine speed pulse (NEP) from the PCM and outputs a sine-wave-sound through the audio speakers to cancel the low-frequency noise from the engine. The ANC system also uses two microphones to detect and monitor the low frequency noise in the passenger compartment. The microphones feedback the noise information to the audio unit or the audio-navigation unit which adjusts the speaker output to reduce the noise. The ANC also receives the output of the door open/close signal from the MICU. Whenever any door is opened, the ANC system temporarily stops working. Each signal is sent to the ANC/active sound control unit via F-CAN.

The ANC/Active sound control unit monitors the stereo amplifier output signals to the subwoofer, and if the subwoofer gives a sound more than the rated value, the ANC/Active sound control unit stops ANC control. This control is not for deleting bass of an audio output.



Active Sound Control

The active sound control is the next generation control of eliminating the unwanted sound in the passenger compartment. The active sound control has a much broader range than the ANC system. In addition to the microphones in the headliner, the active sound control also receives the output from the engine speed pulse (NEP) to provide various levels of the sound cancelling depending on changes in the engine RPM.

Front ANC/Active Sound Control Microphone

Receives a voice command, and transmits them to the audio unit or the audio-navigation unit. The microphone unit consists of two microphones. One of the microphones is combined with the ANC/active sound control microphone. It detects the driver's voice and the passenger's voice separately. (**refer to the HandsFreeLink System Description for the HFL Microphone functions** .)

Audio Remote-HFL Switch

There are two kinds of audio remote-HFL switches according to a vehicle model:

- With multi-information display: The audio remote switch and the HFL switch are integrated into the audio remote-HFL switch that uses a digital communication (LIN).
- Without multi-information display: The audio remote switch and the HFL switch are integrated into the audio remote-HFL switch that uses the resistor divider circuit.

With multi-information display, the audio remote-HFL switch has an electrostatic capacitance touch sensor (see Center Display Unit) for specific button operation.

When using any button or the touch switch on the audio remote-HFL switch, the control signal is sent to the audio unit via the gauge control module. The gauge control module reflects the control information of the audio remote-HFL switch as indication to the multi-information display (MID).

If the LIN circuit is open or shorted between the gauge control module and the audio remote-HFL switch, the gauge control module triggers the related DTC.

Multi-View Rearview Camera

The multi-view rearview camera is a function that provides three different view images to the driver by the camera that is installed in the vehicle's rear end. The view images can be changed by the user. The rearview guide lines change according to the selected view. The rearview camera is connected directly to the audio unit.

- Normal View Mode

  The display shows the standard view.

- Wide View Mode

  The display shows wider visibility than the normal view, which helps the driver confirm any objects approaching from right and left.

- Top Down View Mode

  The display shows the view from the top angle of the vehicle, which helps the driver confirm the distance from any object behind.

Basic Control

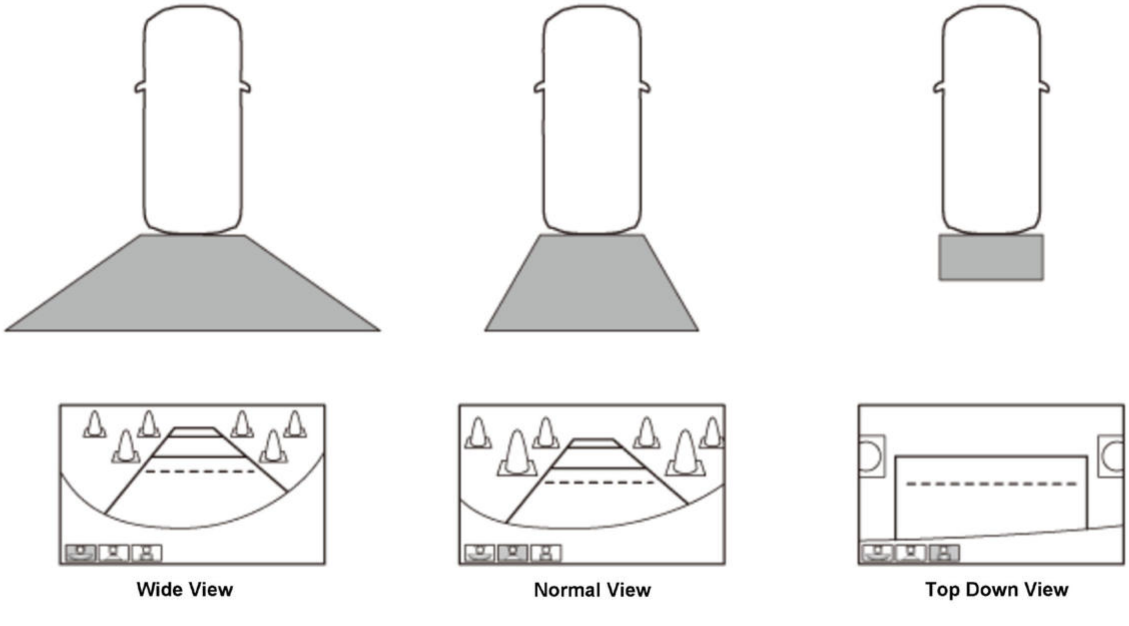
The audio unit outputs the power source (CAMERA VCC) to the rearview camera under some conditions:

- Turn the vehicle to the ACCESSORY mode.
-
    - If the audio unit does not detect the BACK LT signal for 5 minutes, the audio unit cancels outputting the power source to the rearview camera.
- Detecting the BACK LT signal (when the transmission is shifted to R position/mode).
-
    - If the audio unit does not detect the BACK LT signal for 5 minutes after cancelling the rearview mode, the audio unit cancels outputting the power source to the rearview camera.
- When using the Rear Camera diagnosis in the System Diagnostic Mode.
-
    - If the audio unit does not detect the BACK LT signal for 5 minutes after exiting the System Diagnostic Mode, the audio unit cancels outputting the power source to the rearview camera.

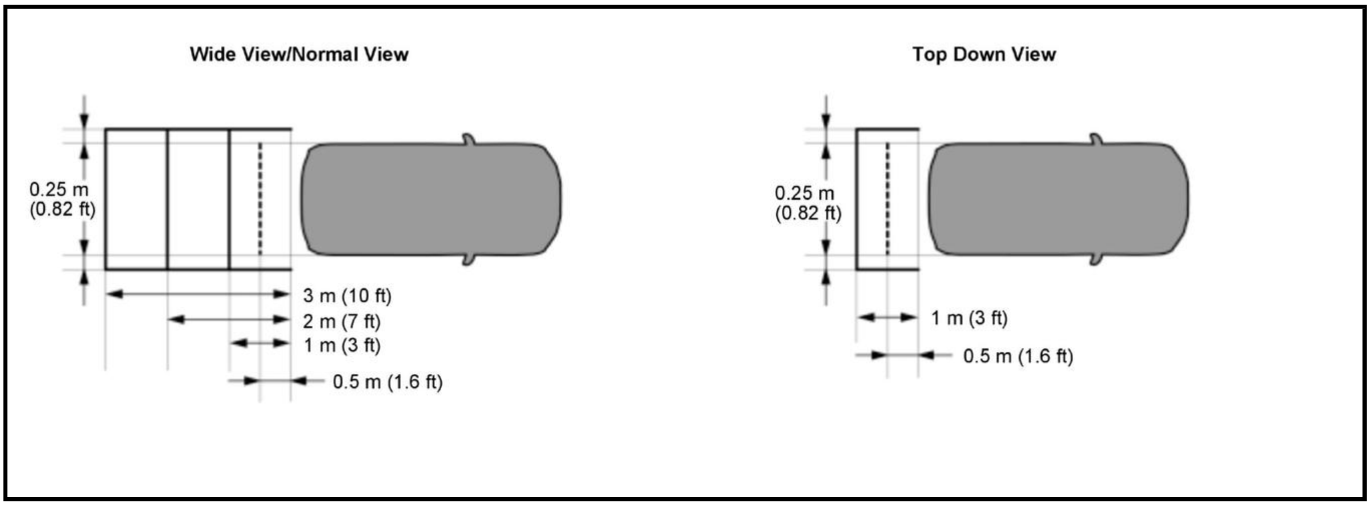
When the audio unit detects the BACK LT signal for at least 0.5 seconds, the audio unit display turns on the rearview camera image. The display delays for 0.5 seconds to prevent changing the screen image too frequently because of incorrect shift position/mode selection. You can change the view mode by touching the mode icon* 1 or by pressing the SELECTOR knob* 2.

*1: Display audio type
*2: Color audio type

While displaying the rearview image, the LaneWatch function cannot be used because the LaneWatch image can be misunderstood as the rearview image.



Guidelines type A



Wide View/Normal View
0.25 m (0.82 ft)
3 m (10 ft)
2 m (7 ft)
1 m (3 ft)
0.5 m (1.6 ft)
Top Down View

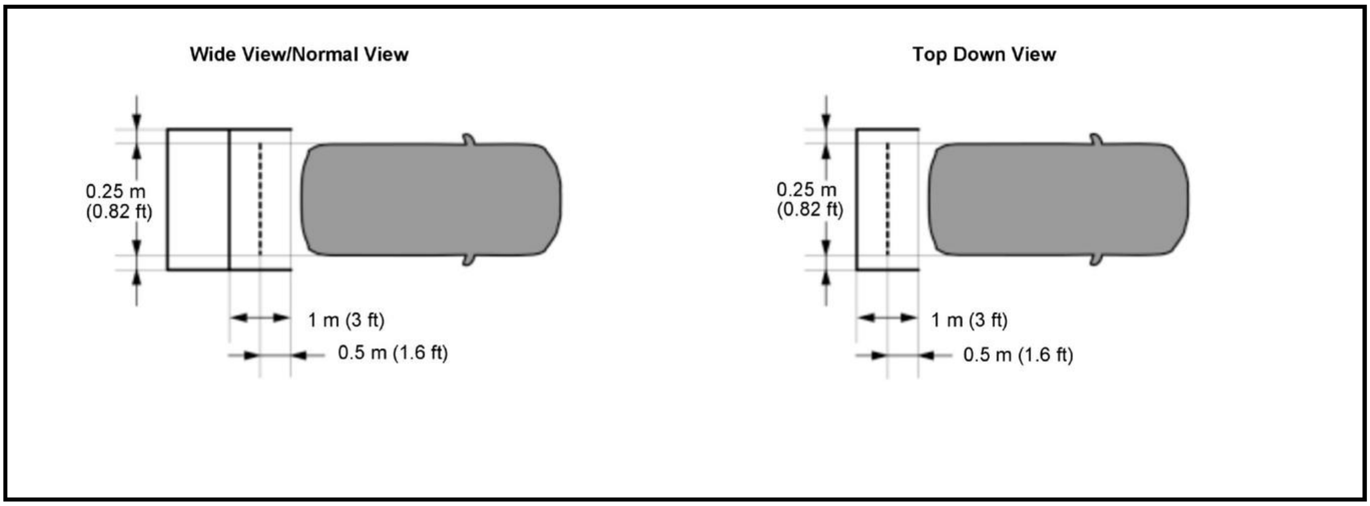
1 m (3 ft)
0.5 m (1.6 ft)

Guidelines type B



Wide View/Normal View
0.25 m (0.82 ft)
1 m (3 ft)
0.5 m (1.6 ft)
Top Down View
0.25 m (0.82 ft)
1 m (3 ft)
0.5 m (1.6 ft)

Changing Camera Views

When the rearview camera image is displayed, touching the mode icon sends a signal from the audio unit to the rearview camera using the CAMERA BIT0 and CAMERA BIT1 signal lines to change the rearview camera view.

B	Wide	Normal	Top Down
CAMERA BIT0 Signal	OFF (0 V)	ON (5 V - 8 V)	OFF (0 V)
CAMERA BIT1 Signal	OFF (0 V)	OFF (0 V)	ON (5 V - 8 V)

View Mode Memorization

Any time the audio unit loses power (battery disconnected, audio unit disconnected, etc.) the rearview camera defaults to the normal angle view. The rearview camera will also default to this angle if you had the top down angle selected when you turn the vehicle to the OFF (LOCK) mode. If you change the rearview camera to the wide view, the rearview camera will remember this view when you turn the vehicle to the ON mode.

Dynamic Guideline (Display Audio type)

When the rearview image is displayed with the guide line, the guide line changes according to the steering angle input (When the steering rotates 90 degrees or more). The steering angle information is received from the gauge control module via the B-CAN as vehicle signals.

USB Charger Unit

The USB charger unit controls an output current for charging of a USB device. The USB port C and D (CHARGE ONLY) located on the center console are a dedicated USB charging port. The USB charger unit is based on the specification of the USB Battery Charging 1.2 (BC 1.2) that supports high-speed charging of the USB device. The USB charger unit can detect the USB device type (BC 1.2 or not), and change the charging mode automatically.

The USB charger unit is launched by turning the vehicle to the ACCESSORY mode. When you connect the USB device to the USB port C and D (CHARGE ONLY), the USB charger unit supplies the appropriate current (1.0 A - 2.1 A) to the USB device via the USB VBUS. In this case, the USB charger unit detects the electrical characteristics from the USB DATA lines. No data communication occurs between the USB charger unit and the USB device. Also, there is no connection between the USB charger unit and the audio-navigation unit or the audio unit.

DIAGNOSIS

AUDIO SYSTEM DIAGNOSTIC MODE (COLOR AUDIO TYPE)

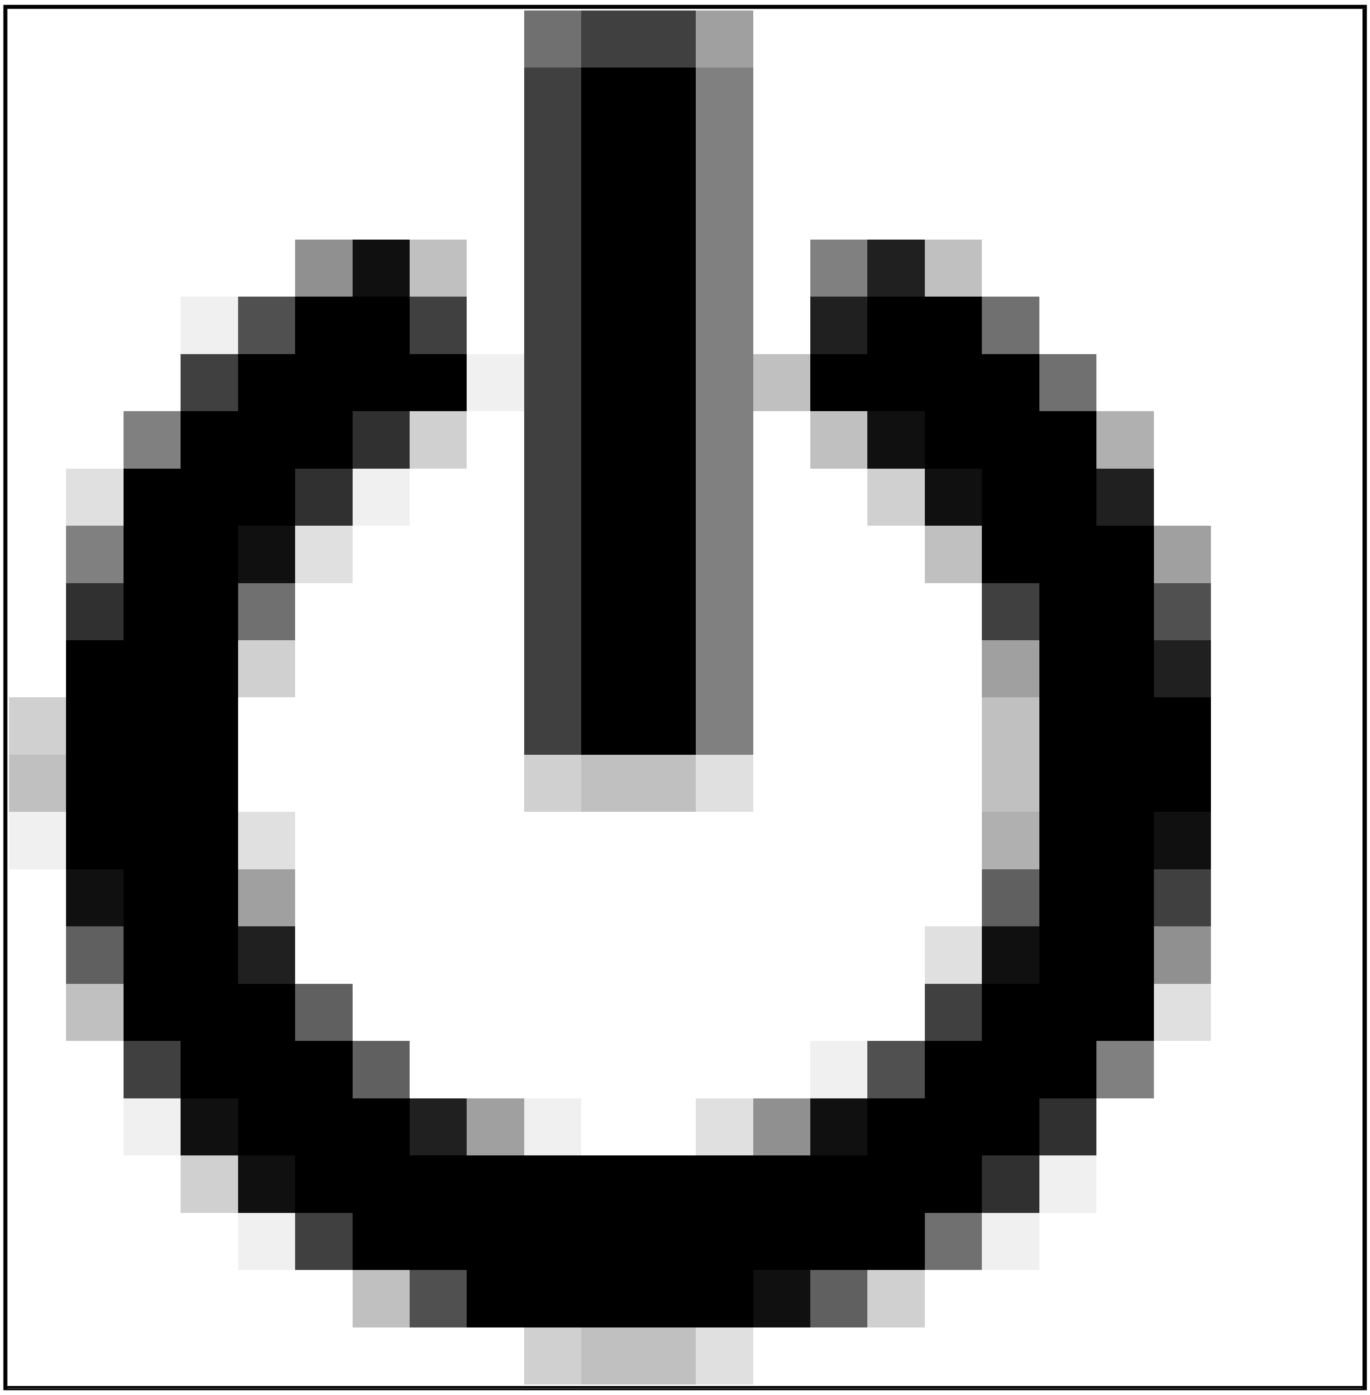
Start-Up Procedure and Diagnostic Menu

NOTE:

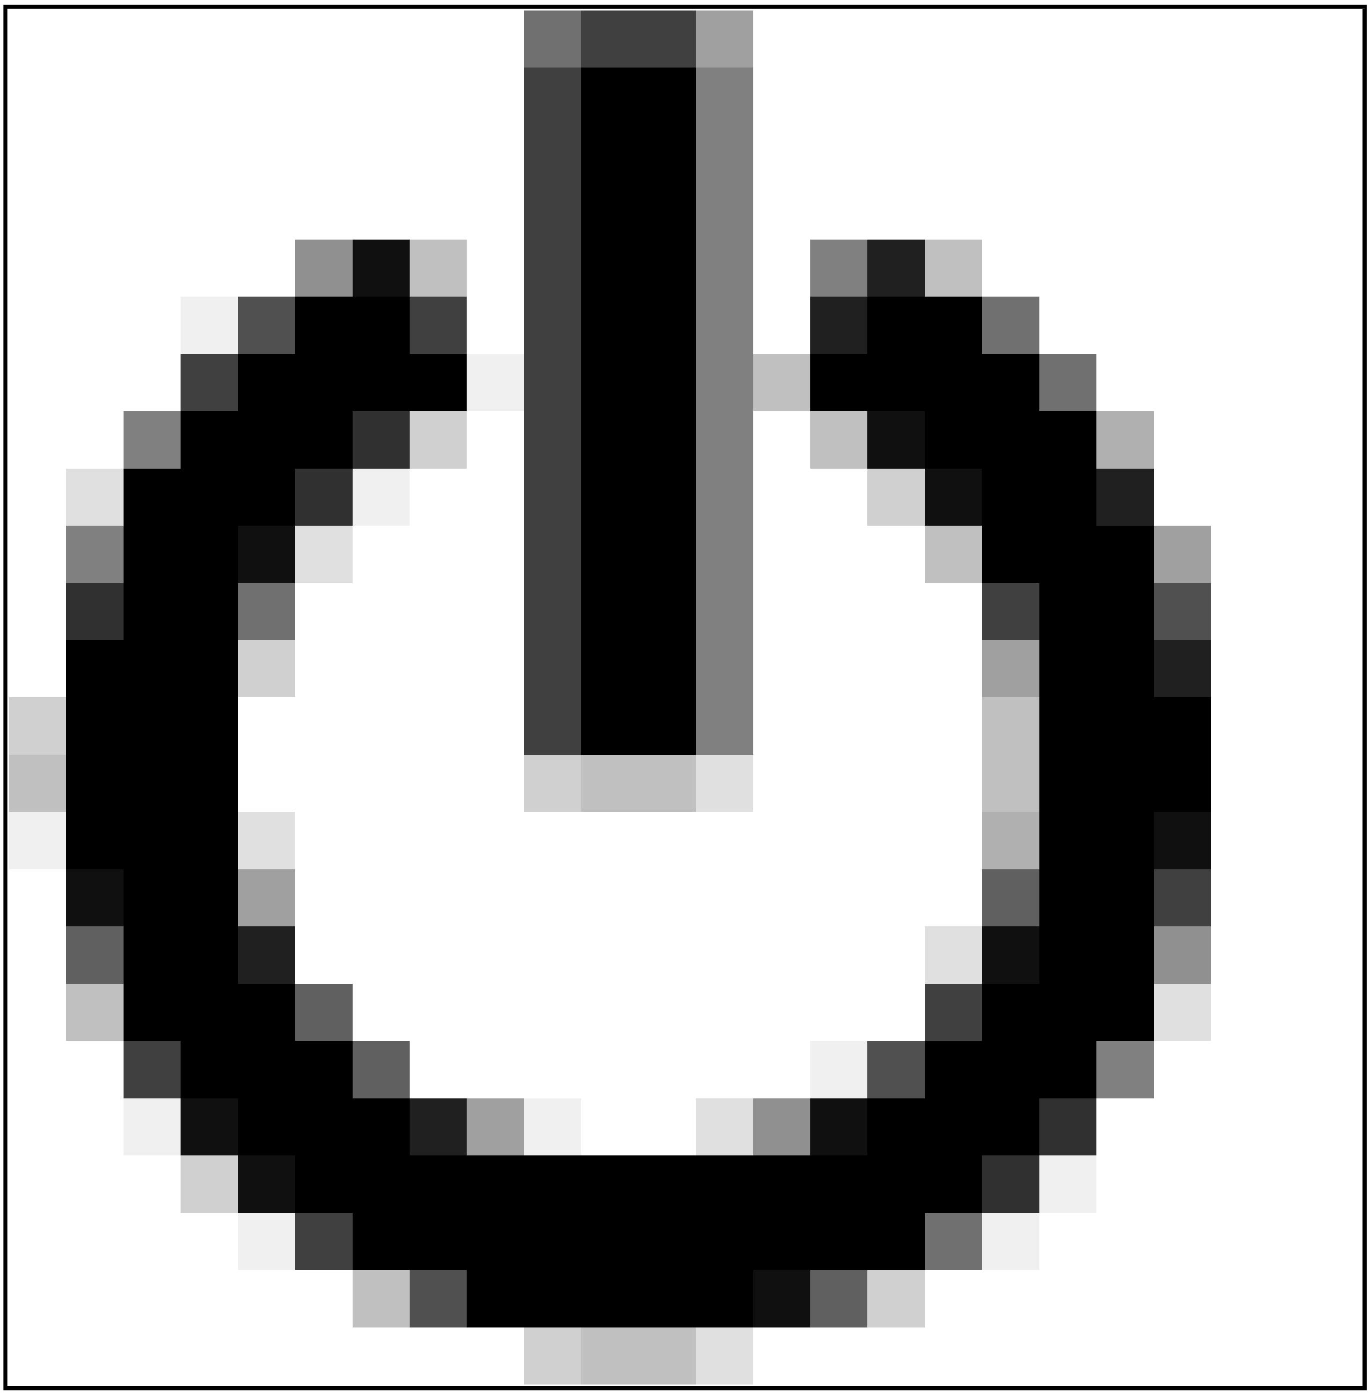
- Check the vehicle 12 volt battery condition first .
- The screens detail indicated may change depending on equipment or specification.

1. Turn the vehicle to the ON mode. If needed, start the engine.

2. Press the POWER button to turn off the audio unit.



3. Press and hold the preset No. 1 button, then preset No. 6 button and then the VOLUME/POWER knob. The display screen goes directly to the Manual Diag menu shown.



NOTE: Do not press preset No. 1 and No. 6 buttons simultaneously.

- Preset No. 5 button: Connection
- Preset No. 6 button: Vehicle information

5. To end the system diagnostic mode, press the VOLUME/POWER knob, or turn the vehicle to the OFF (LOCK) mode.

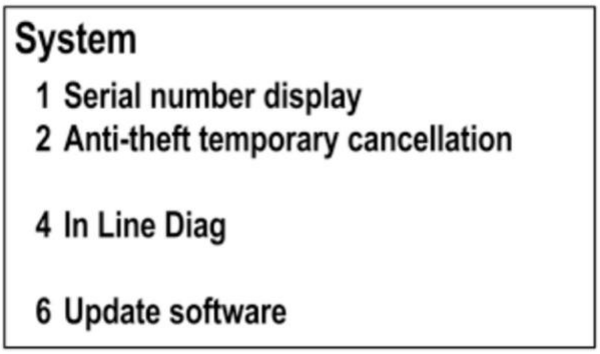
How to Obtain the Audio Unit Serial Number (With Audio System Theft Protection)

NOTE: This procedure can be done only before anti-theft mode is cancelled.

1. Turn the vehicle to the ON mode. Make sure the audio unit is in the anti-theft mode.

2. Go into the System Diagnostic Mode, and select the System diagnosis, then press the preset No. 1 button

3. The screen displays an 8-digit audio unit serial number.



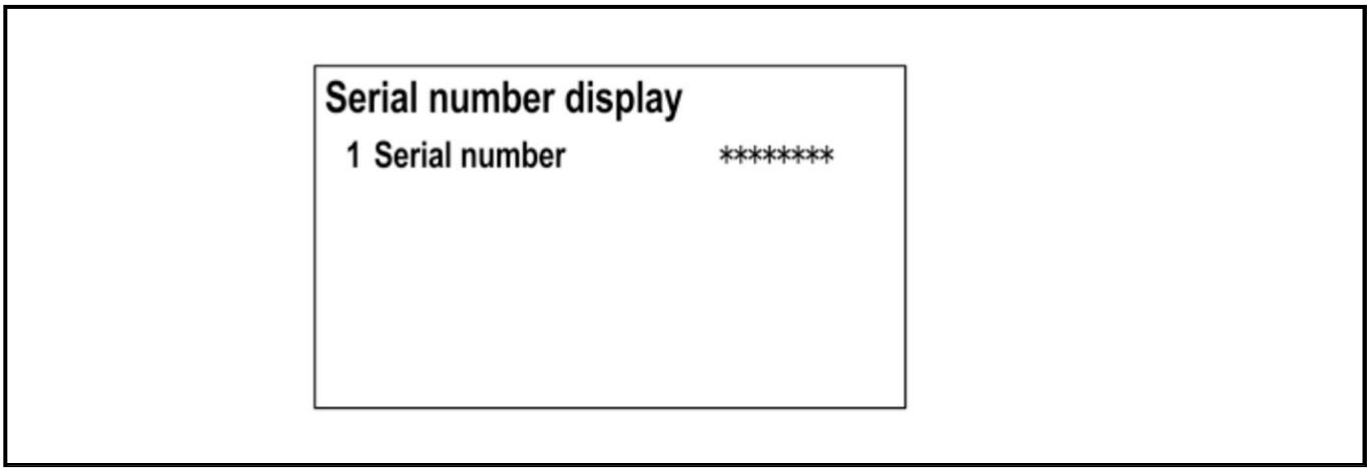
System

1 Serial number display

2 Anti-theft temporary cancellation

4 In Line Diag

6 Update software



Serial number display

1 Serial number ********

4. Use all 8 numbers as the serial number when using the Interactive Network (iN) to retrieve the 5-digit anti-theft code.

Anti-Theft Temporary Cancellation

5. Return to the System diagnosis, when preset No. 2 button is pressed, the anti-theft mode is cancelled temporarily, and the system returns to the normal audio screen automatically.

System

This diagnosis displays the current version information about each module in the audio unit, and result of the In Line Diag, and detects the hard keys.

To start the diagnosis, press the preset button to select the diagnosis number you want to check.

NOTE: Items not listed are not available in this model.

- Preset No. 1 button: Driver distraction prevention
- Preset No. 3 button: Knob check
- Preset No. 4 button: In Line Diag
- Preset No. 5 button: Knob illumination check
- Preset No. 6 button: Update software (factory use only)

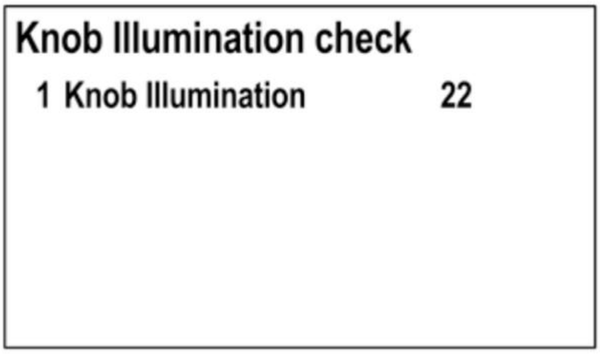
Result: OK

Push SELECT to exit

Knob Illumination Check

This diagnosis checks the dimming circuit of the audio unit buttons.

When rotating the LIST/SELECT knob, you should see the value change from 1 (max low) to 22 (max high).



Knob Illumination check

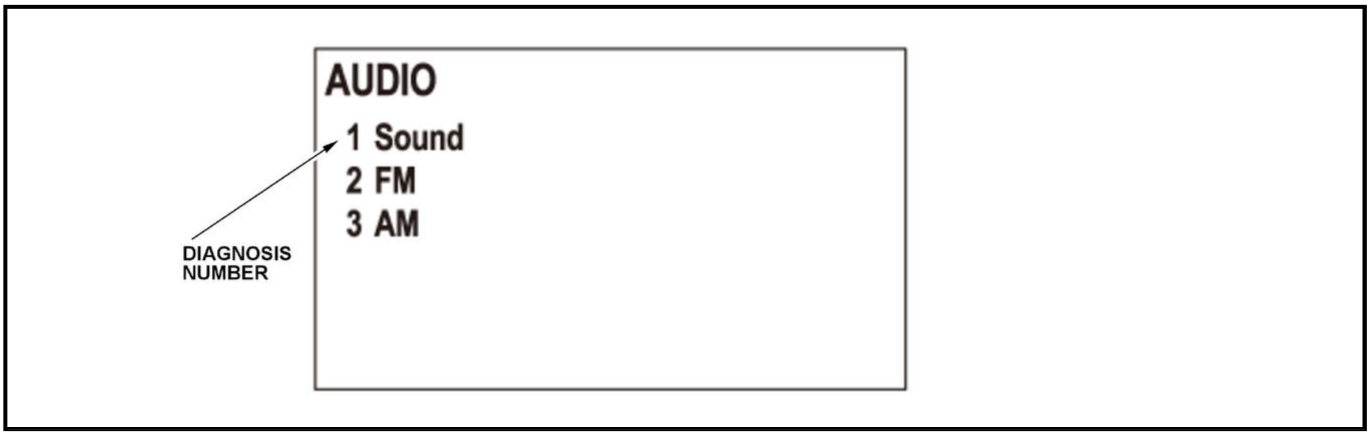
1 Knob Illumination 22

AUDIO

This diagnosis checks the audio unit sound system.

To start the diagnosis, press the preset button to select the diagnosis number you want to check.

- Preset No. 1 button: Sound
- Preset No. 2 button: FM
- Preset No. 3 button: AM



Sound (Speaker Check)

This diagnosis checks the audio speakers individually. The EQ (diagnosis No. 2) and the Loudness (diagnosis No. 3) are not supported in this diagnosis.

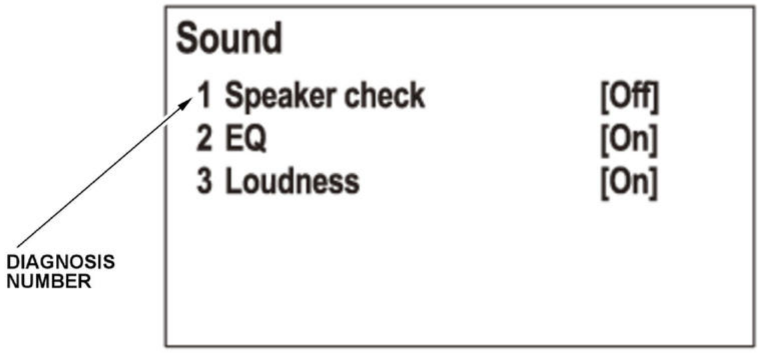
Press the preset No. 1 button to check speakers. A tone should sound from the speaker.

Each time you press the preset No. 1 button, the system checks the speakers in this order: ① -> ② -> ③ -> ④ -> ⑤ -> ⑥ -> ①

NOTE: If the audio system is not equipped with tweeter, the audio unit outputs a tone from each front door speaker when the FLTW or the FRTW is selected.

B	Display Message	Vehicle Test Condition
①	Off	Speaker check mode is OFF.
②	FL	You should hear a tone from the left front door speaker and the left front tweeter*.
③	FR	You should hear a tone from the right front door speaker and the right front tweeter*.
④	RR	You should hear a tone from the right rear door speaker and the right rear tweeter*.
⑤	RL	You should hear a tone from the left rear door speaker and the left rear tweeter*.
⑥	All	You should hear a tone from all speakers.

*: With tweeter



Sound
1 Speaker check [Off]
2 EQ [On]
3 Loudness [On]

FM

This diagnosis checks the FM reception level in the electric field strength (dB). This level then can be used in the diagnosis of audio unit reception quality.

Reception Level Check

Preparation:

- Park the vehicle outside in a good location away from tall buildings, mountains, high-voltage power line or any other object that may interfere with reception.
- Tune to a powerful local FM radio station then write down the radio station number.

Tune to the FM radio station you wrote down in preparation using the SEEK/DOWN (⏮) or SEEK/UP (⏭) button, and note the reception level of that station.

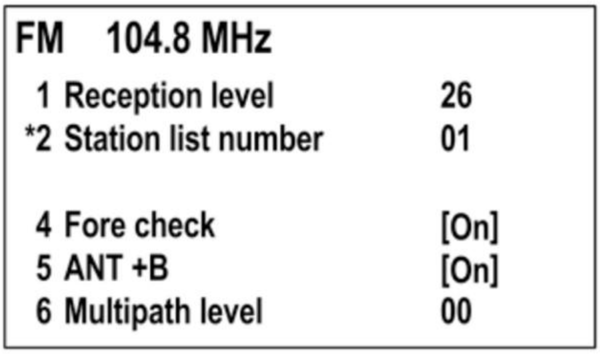
Press the preset No. 6 button to turn the AM/FM antenna power (ANT +B) off.

Note the decibel level of that station with the AM/FM antenna power off.

Press the preset No. 6 button to turn the AM/FM antenna power (ANT +B) on.

Compare your results to a known-good, (make sure it is the same year and trim level) in the same location and direction, and under the same environmental conditions.

- If the reception level is within 10 % of the known-good vehicle, no repair is needed at this time.
- If the reception level is at least 10 % less than the known good vehicle, **go to Poor AM or FM radio reception or interference troubleshooting**.



FM 104.8 MHz
1 Reception level 26
*2 Station list number 01

4 Fore check [On]
5 ANT +B [On]

AM

This diagnostic screen checks the AM reception level in the electric field strength (dB). This level then can be used in the diagnosis of audio unit reception quality.

Reception Level Check

Preparation:

- Park the vehicle outside in a good location away from tall buildings, mountains, high-voltage power line or any other object that may interfere with reception.
- Tune to a powerful local AM radio station then write down the radio station number.

Tune to the AM radio station you wrote down in preparation using the SEEK/DOWN (⏮) or SEEK/UP (⏭) button, and note the reception level of that station.

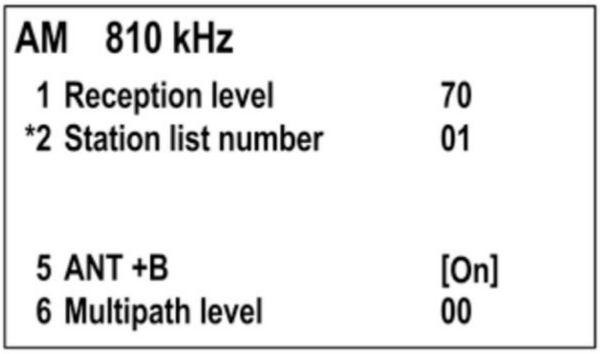
Press the preset No. 5 button to turn the AM/FM antenna power (ANT +B) off.

Note the decibel level of that station with the AM/FM antenna power off.

Press the preset No. 5 button to turn the AM/FM antenna power (ANT +B) on.

Compare your results to a known-good, (make sure it is the same year and trim level) in the same location and direction, and under the same environmental conditions.

- If the reception level is within 10 % of the known-good vehicle, no repair is needed at this time.
- If the reception level is at least 10 % less than the known good vehicle, **go to Poor AM or FM radio reception or interference troubleshooting**.



```
AM   810 kHz
  1 Reception level          70
 *2 Station list number      01

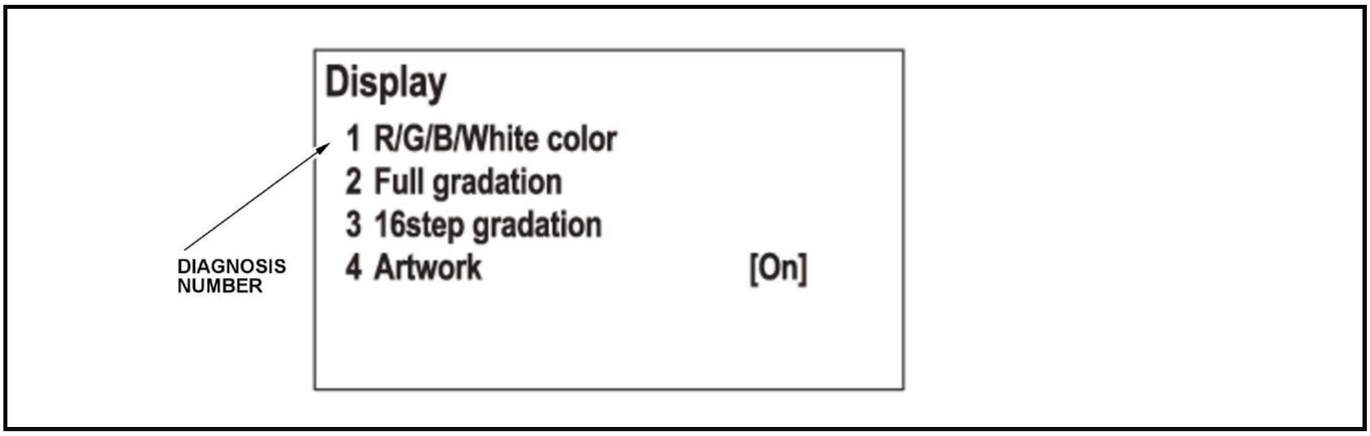
  5 ANT +B                   [On]
  6 Multipath level          00
```

Display

These screens allow you to troubleshoot the LCD display built into the audio unit. Select the item you want to check, and follow the diagnostic instructions.

To start the diagnosis, press the preset button to select the diagnosis number you want to check. The Artwork (diagnosis No. 4) is not supported in this diagnosis.

- Preset No. 1 button: R/G/B/White color
- Preset No. 2 button: Full gradation
- Preset No. 3 button: 16 step gradation

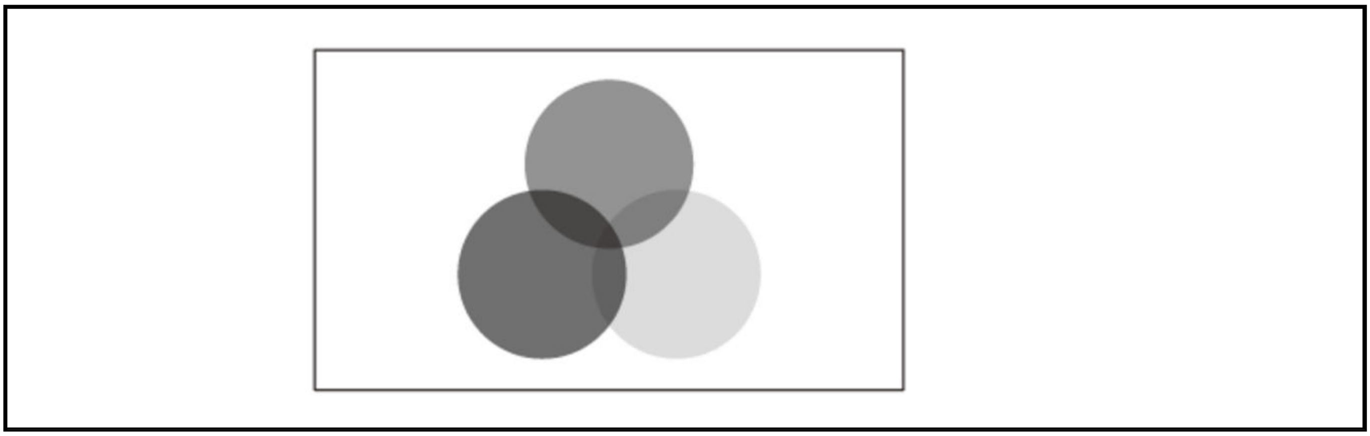


Display
1 R/G/B/White color
2 Full gradation
3 16step gradation
4 Artwork [On]
DIAGNOSIS NUMBER

R/G/B/White Color

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

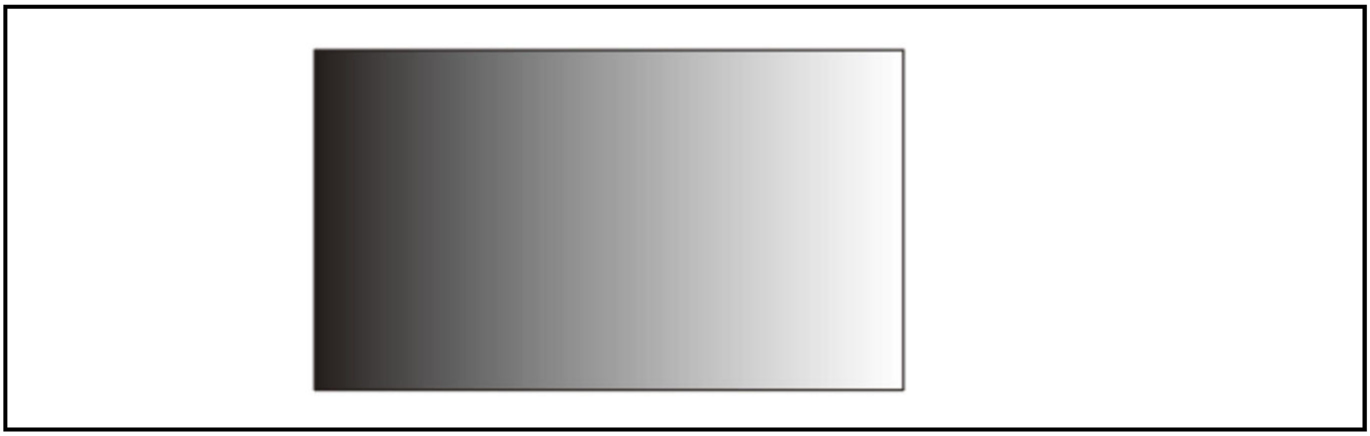
This screen verifies that the audio unit is displaying the RGB (Red, Green, and Blue) components properly. The three primary colors should all appear without distortion. The combination of all three should produce a central white section.



Full Gradation

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

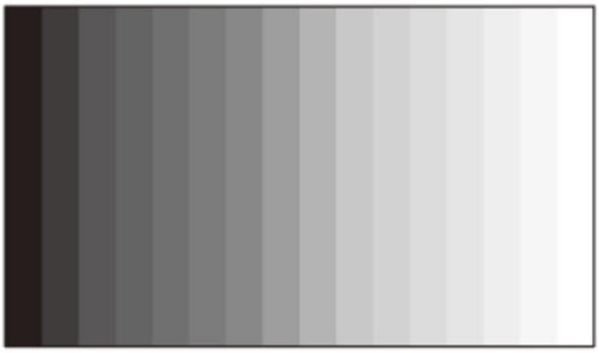
This screen checks problems with contrast. You should be able to see the changes in the smooth across the scale.



16 Step Gradation

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks problems with contrast. You should be able to see the changes from bar to bar across the scale. It is normal for the two bars on either side to appear the same.

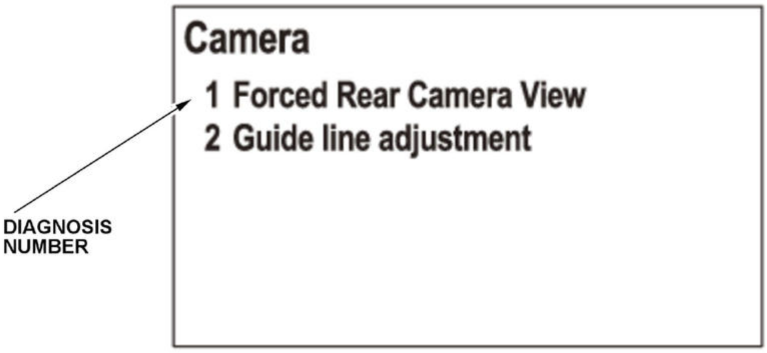


Camera

This screen checks the rearview camera image, and adjusts the guideline.

To start the diagnosis, press the preset button to select the diagnosis number you want to check.

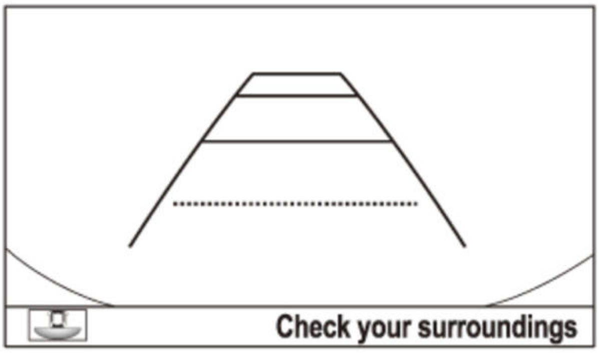
- Preset No. 1 button: Forced Rear Camera View
- Preset No. 2 button: Guideline adjustment



Camera
1 Forced Rear Camera View
2 Guide line adjustment
DIAGNOSIS NUMBER

Forced Rear Camera View

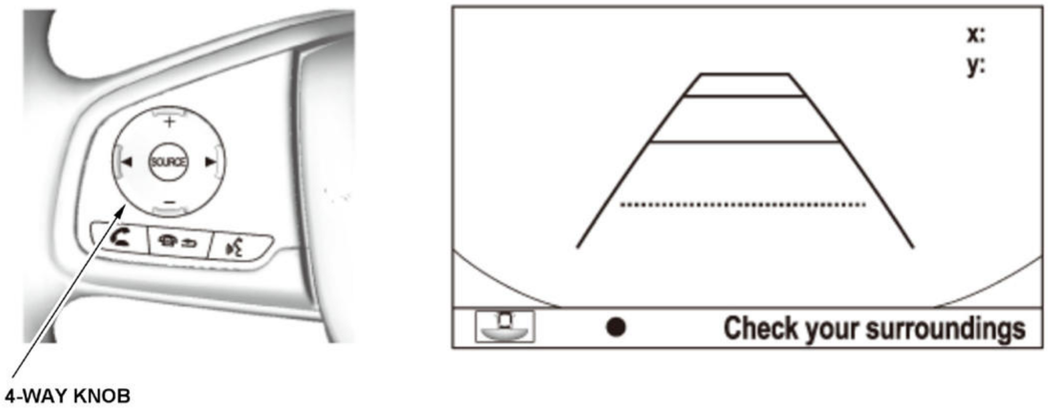
This diagnosis displays the rearview camera image forcibly.



Check your surroundings

Guide Line Adjustment

This diagnostic adjusts the rearview camera image guide lines. If you need to adjust a guide line, refer to the following procedures.



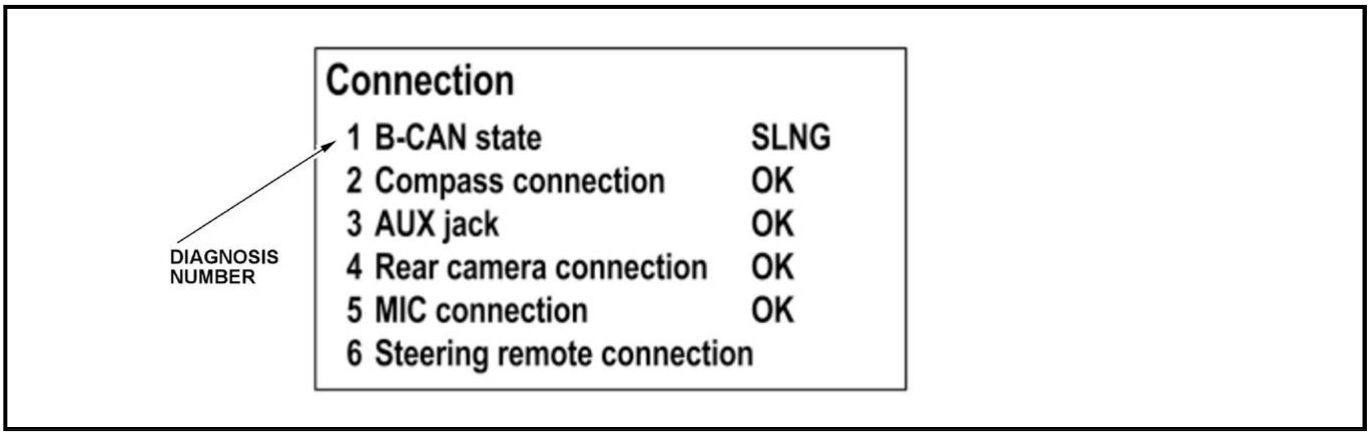
Title	Procedures	
Guide Line Adjustment	1	Press and hold the point up or down use the 4-WAY knob on the audio remote switch and select the view mode (Wide View, Normal View, Top Down View) for the rearview camera you want to adjust.
	2	You will move to the camera guideline adjustment mode by pressing the MENU button on the audio panel.
	3	Use LIST/SELECT knob on the audio panel and select the camera guide line you want to adjust. **NOTE:** After selecting the camera guide line, you will move to the point adjustment mode on the selected camera guide line by pressing the MENU button. By using the LIST/SELECT knob, you can select the point on the camera guide line you want to adjust.
	4	Use the 4-WAY knob on the audio remote switch and adjust the camera guide line or the point of the camera guide line.
	5	By pressing the RETURN button on the audio panel, the adjusted guide line data is saved.

If you need to reset the guide line to the factory settings, refer to the following procedures.

Title	Procedures	
Factory Settings	1	You will move to the camera guideline adjustment mode by pressing the MENU button on the audio panel.
	2	Press and hold the No. 2 button for more than 5 seconds, the guideline is reset to the factory default.

Connection

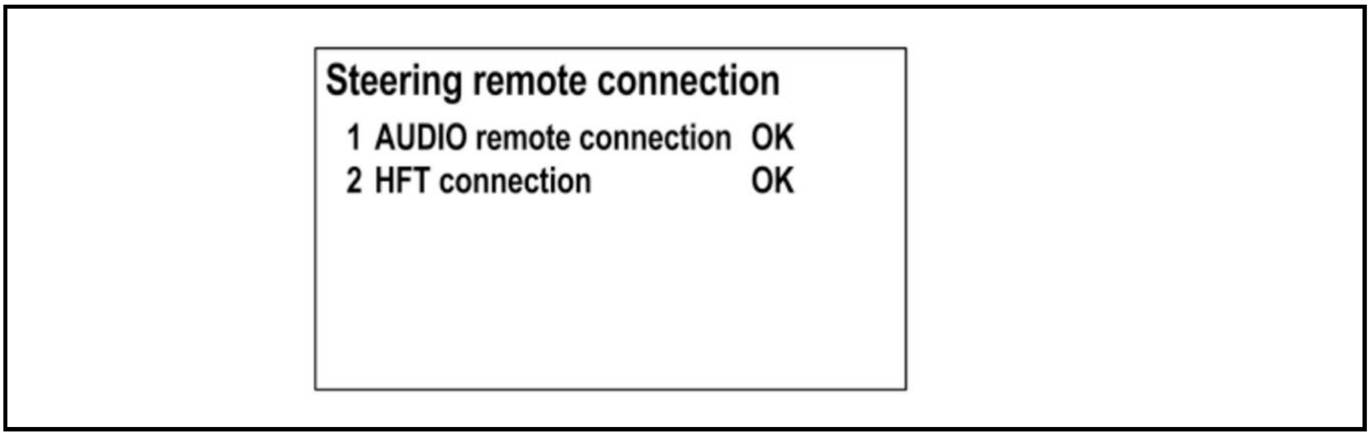
This diagnosis checks the connection between each component connected to the audio unit.



Connection

1 B-CAN state SLNG
2 Compass connection OK
3 AUX jack OK
4 Rear camera connection OK
5 MIC connection OK
6 Steering remote connection

To diagnose the Steering remote connection, press the preset No. 6 button.



Steering remote connection

1 AUDIO remote connection OK
2 HFT connection OK

Diagnosis Number	Item	Description
1	B-CAN state	This diagnosis checks whether the audio unit is receiving B-CAN data properly. If the B-CAN state shows NG, check for B-CAN DTCs with the HDS. If no DTCs are detected, check for continuity in the B-CAN lines between the audio unit and the gauge control module.
2	Compass connection	The diagnosis check whether the audio unit is connecting the electric compass.
3	AUX jack	The diagnosis check whether the audio unit is connecting the auxiliary jack assembly.
4	Rear camera connection	The diagnosis check whether the audio unit is connecting the rearview camera.
5	MIC connection	This diagnosis checks whether the audio unit is connecting the HFL microphone properly.
6	Steering remote connection	This diagnosis checks whether the audio unit is connecting the audio remote-HFL switch properly. Press any audio remote-HFL switch button to check the connection.

Vehicle Information

Use this screen to confirm that the audio unit is properly receiving input signals. The displayed value changes each time according to the state of input signal.

To start the diagnosis, press the preset button to select the diagnosis number you want to check.

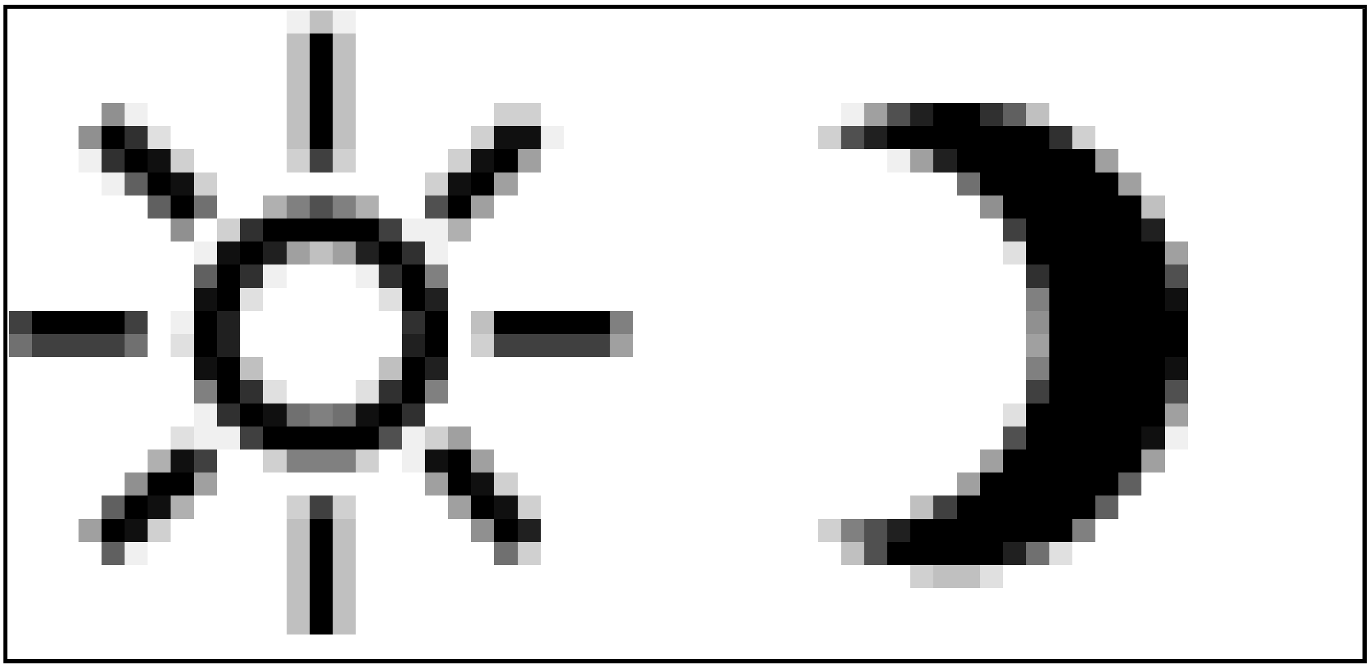
AUDIO SYSTEM DIAGNOSTIC MODE (DISPLAY AUDIO TYPE)

NOTE:

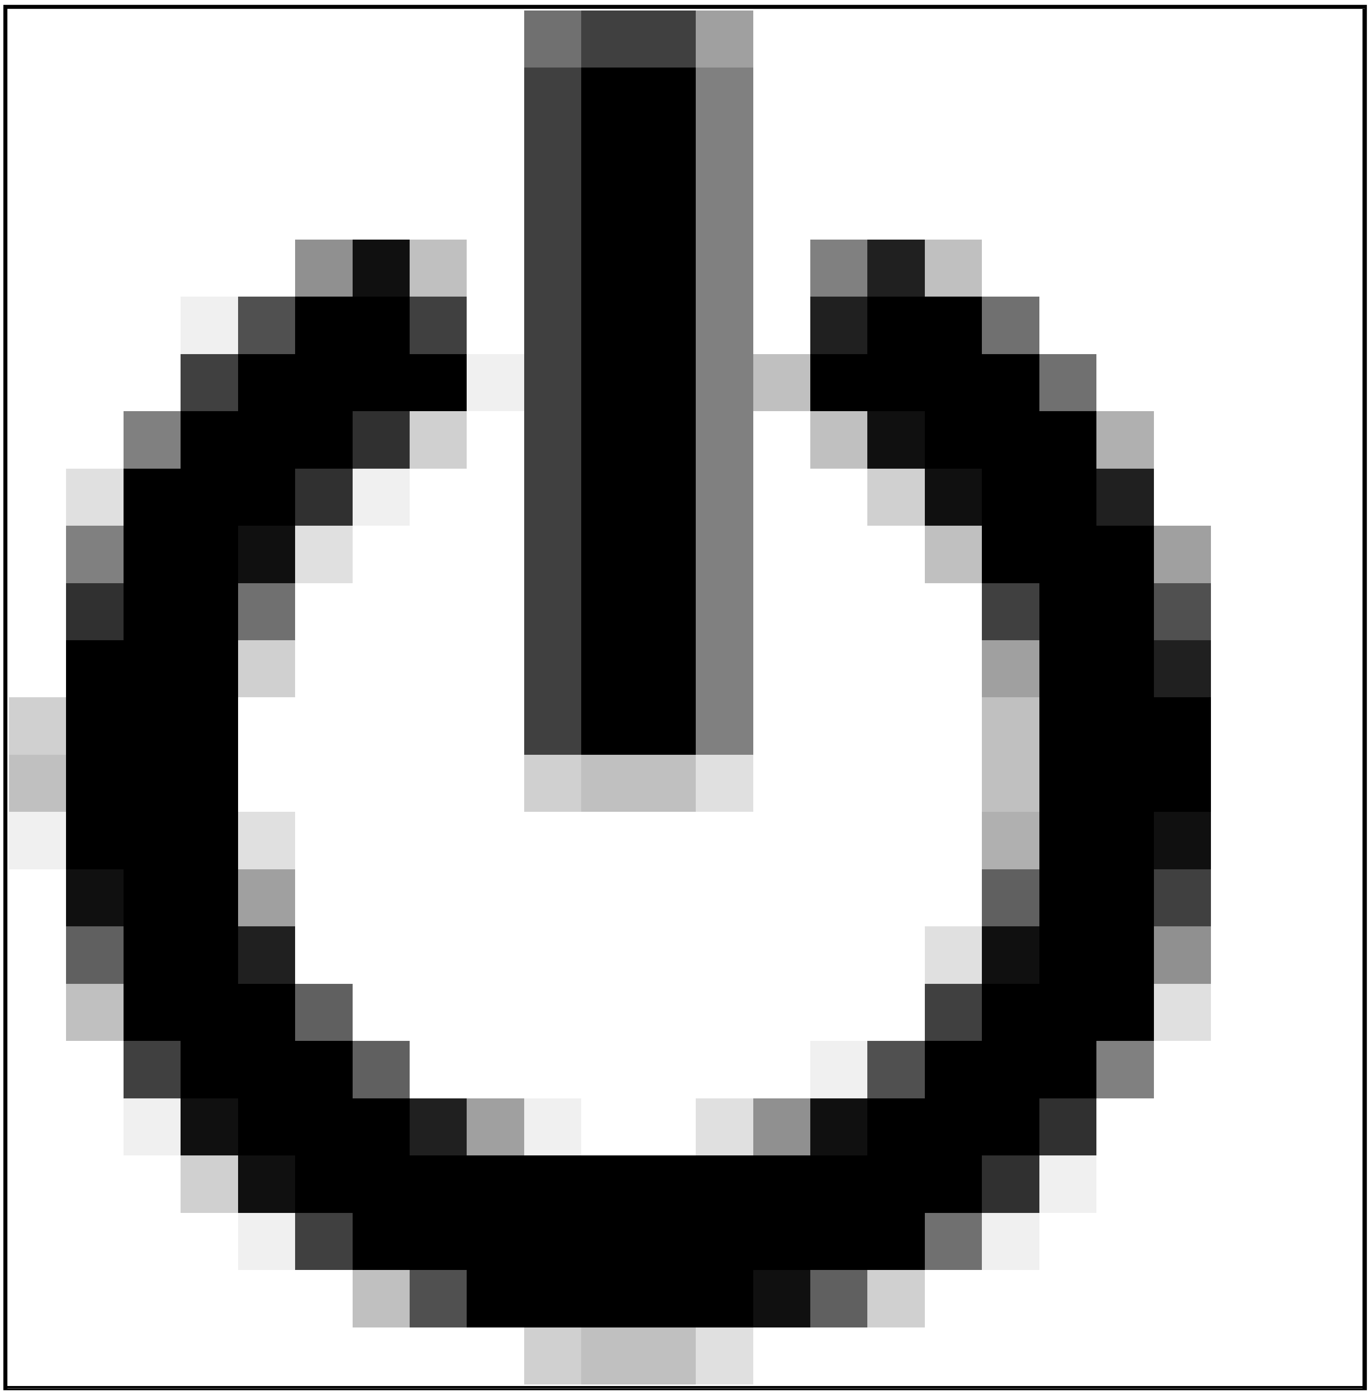
- **Check the vehicle 12 volt battery condition first** .
- This diagnosis is applied to the audio unit (without navigation) only. **Refer to the navigation system section for audio-navigation unit System Diagnostic Mode** .
- The screens detail indicated may change depending on equipment or specification.

Start-Up Procedure and Diagnostic Menu

1. Turn the vehicle to the ON mode. If needed, start the engine. Press and hold the PHONE button, the DISPLAY MODE (



) button, and the AUDIO POWER button until the Select Diagnosis Items menu screen is displayed:



NOTE: The buttons needs to be pressed together simultaneously.

- Self-Diagnosis Mode (runs the automatic diagnosis of the audio system)
- Detail Information and Setting (allows you to manually diagnose the audio system)

Press any icon if you want to see details

The diagnosis tests the following:

- Most of the wires connecting the external audio components shown in the block diagram.
- The results from the various components shown in the block diagram.
- The audio unit checks the microphone by listening to the "Pi Pi Pon" sound produced by the audio unit from the speakers when the diagnosis is started. This requires that the audio system be operating normally.

When the diagnosis finishes, the icons turn different colors based on their test status.

NOTE: By selecting the Help icon, you can see a description for each color.

Icon Colors	Description
Green	The system ran a diagnosis and the results are OK.
Red*	Errors that require replacement of hardware or harness. Examples are connection error or memory diagnosis errors. Select the red icon and check each diagnostic screen (refer to the description for diagnostic screens in the Unit Check).

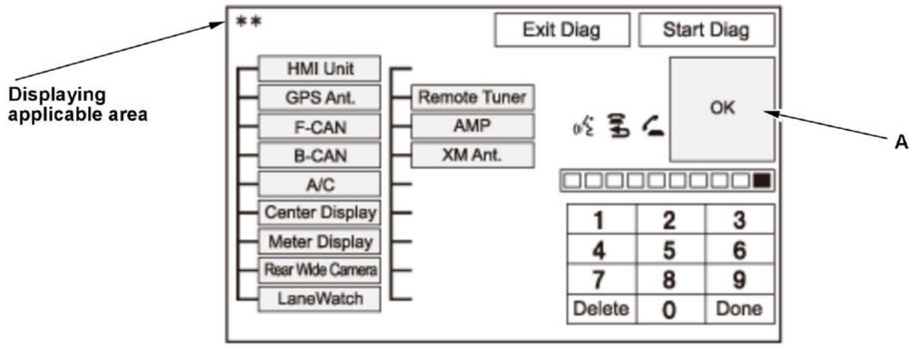
Icon Colors	Description
Yellow	• Errors that do not require hardware replacement, or the connection check is in the state which is not done. Such as leaving the vehicle in the ACCESSORY mode or because of a missing accessory. • When the audio unit detects a failure, and stores DTC, the Error History icon turns yellow.
White	The diagnosis is running. The screen functions are locked out while the diagnosis runs.
Gray	• The system cannot automatically check this function. You have to select the diagnosis item and manually do additional testing, like checking the audio unit buttons in the Hard Key test. When you complete the Hard Key test and return to the System Links screen, the gray icon turns green. • The Vehicle Status icon anytime shows gray. • When the audio unit does not store DTCs, the Error History icon shows gray.

*: The F-CAN icon and the B-CAN icon turns red when the vehicle is in the ACCESSORY mode. Check the System Links with the engine running, and if the F-CAN icon and the B-CAN icon turns green, the system is OK at this time.

4. Select the icon to see the details of that diagnostic function. The icon colors on the screen may not change until you exit and reenter the Self-Diagnosis mode. In some cases, you may have to restart the engine for the indication to change. After you repair the affected component or harness, repeat this diagnosis.

Factory Diagnostic Screen In Line Diag and Linking

If the vehicle left the factory in the factory diagnostic mode, you will see this screen every time you turn the vehicle to the ON mode. Sometimes this screen also appears after you replace the audio unit with a new or remanufactured unit. Normally the factory does the steps necessary to verify proper operation and terminate the factory diagnosis. Until the proper confirmation sequence is done, the screen appears every time you turn the vehicle to the ON mode.



NOTE: The system cannot complete a full diagnosis unless vehicle is in the ON mode.

1. Select the Start Diag icon to check the connection between the audio unit and related components. When the connection diagnosis is in progress, the icon (A) indicates Detecting..., and each icon turns white. If the connection is OK, the icon turns green. If the connection is NG, the icon turns red. Check for connection between the audio unit and related unit on the failure connection line.

NOTE: When the item is a variation equipment, the icon shows yellow, and it is not reflected in diagnosis.

2. If the connection diagnosis is finished, press the steering commander switch buttons (the TALK button, PICK-UP button, and the HANG-UP/BACK button) to check the HFL switch. As each button is pressed, the

corresponding icon on the display should turn green.

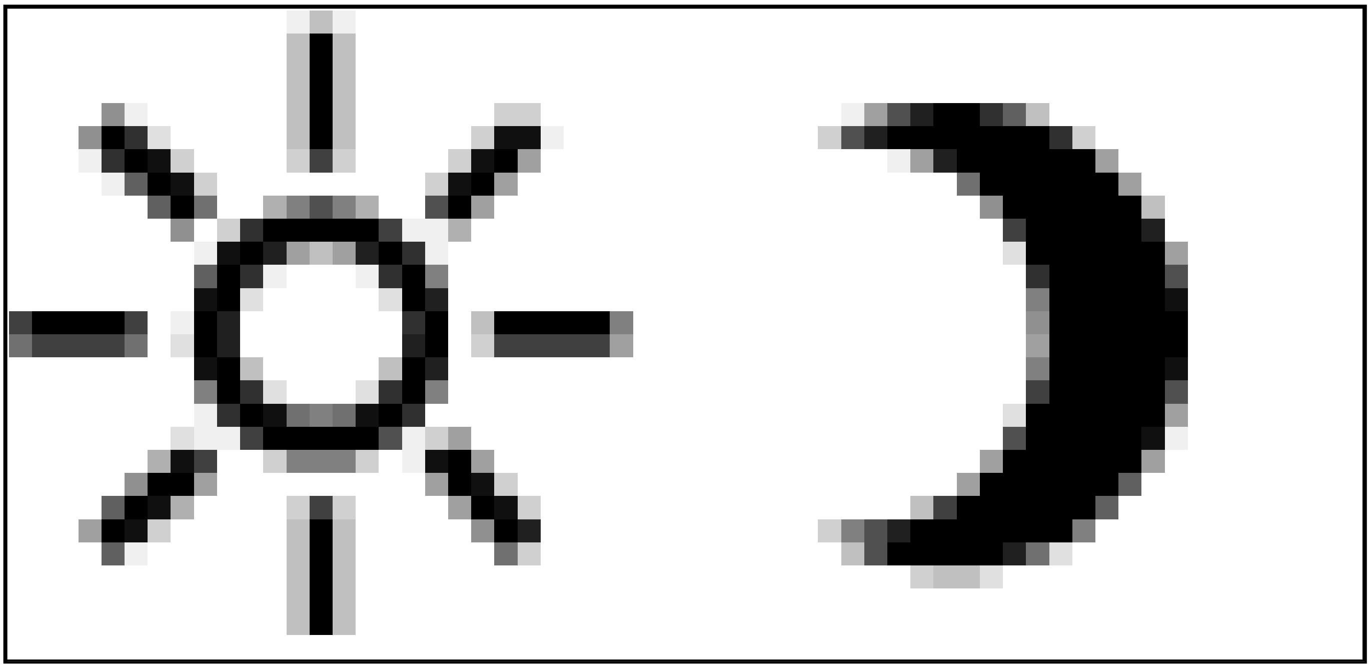
3. Press the TALK button, and within 5 seconds in a normal voice say ' 'testing' '. The Mic Level indicator on the screen should momentarily turn green.

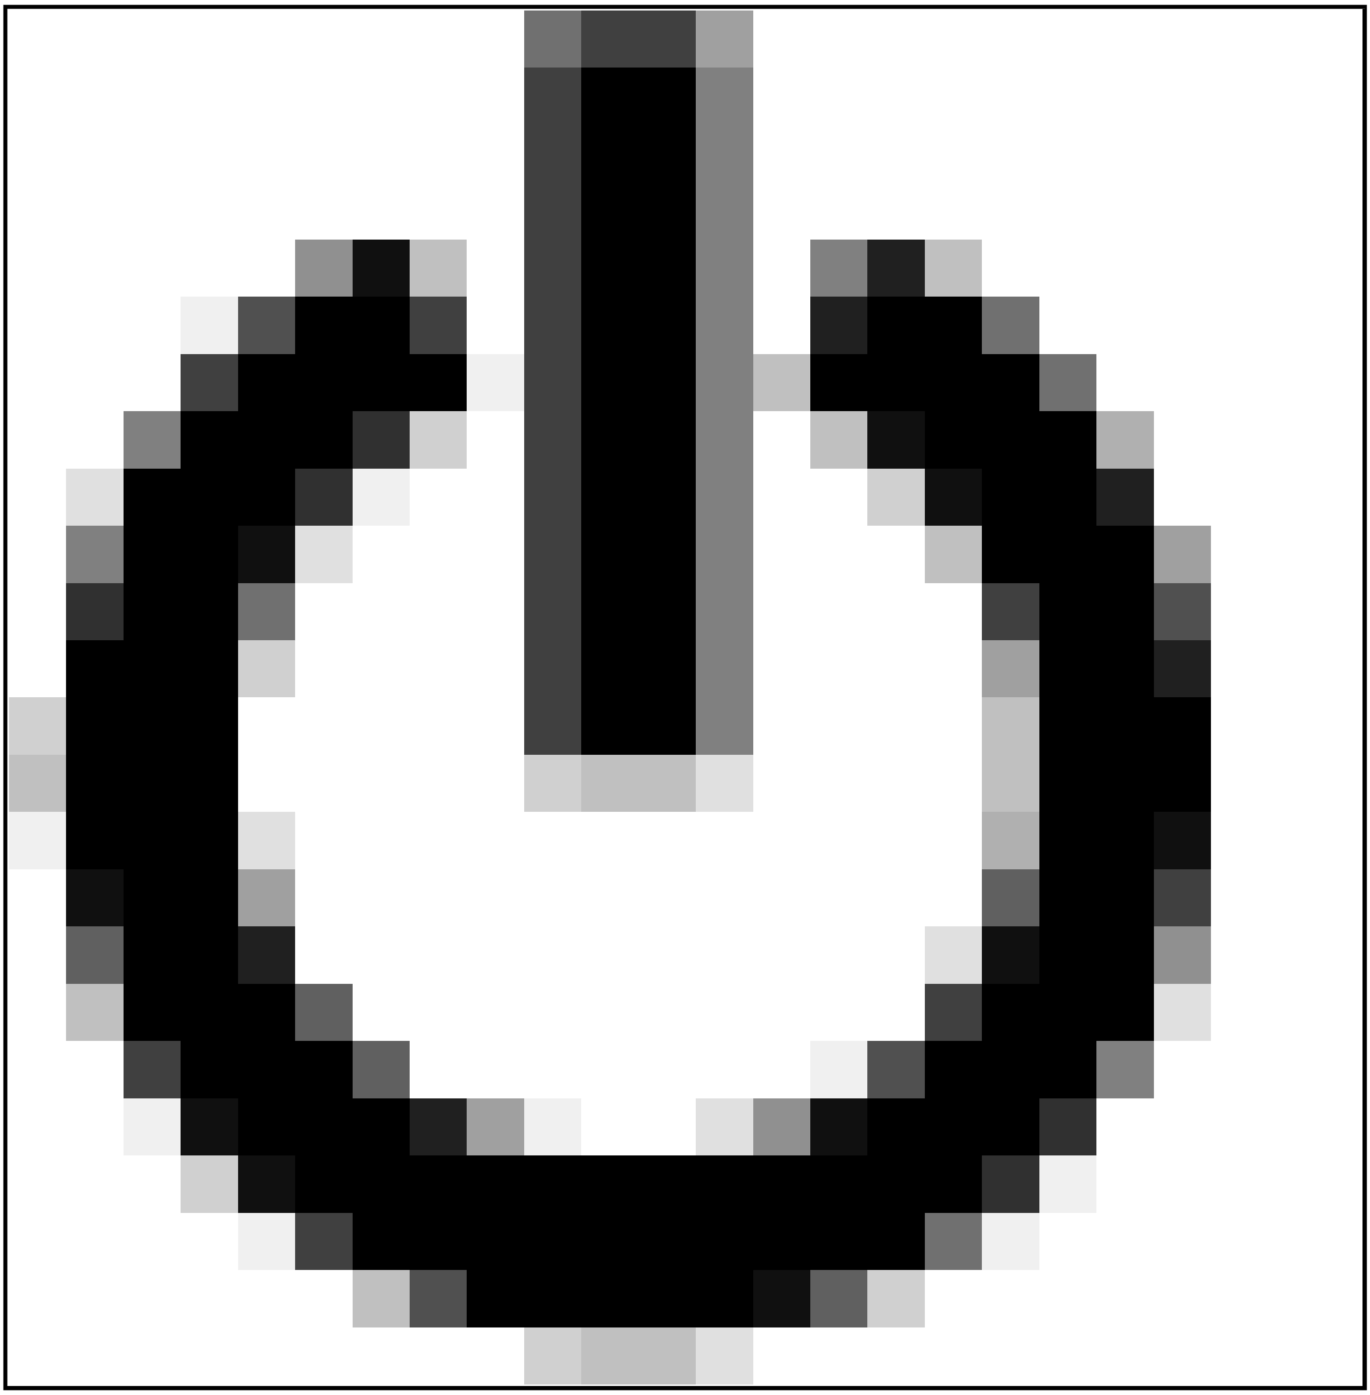
4. If all the diagnosis are OK, the icon (A) indicates OK. Select the Exit Diag icon to exit the diagnostic mode. The In Line Diag should not appear again.

Forced Completing of In Line Diag and Linking

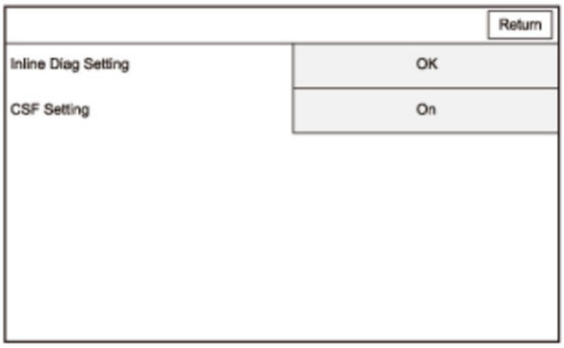
Follow these steps to prevent the screen from appearing in the future:

1. While displaying the In Line Diag screen, press and hold the PHONE button, the DISPLAY MODE button, and the AUDIO POWER button until the Select Diagnosis Items menu screen is displayed.





2. While displaying the Select Diagnosis Items menu screen, press and hold the HOME button until the In Line Diag setting screen is displayed.



Inline Diag Setting: OK

CSF Setting: On

3. Set the Inline Diag Setting to OK (complete). The system restarts and a normal start-up process occurs. The In Line Diag should not appear again.

Detail Information and Setting

RGB Color

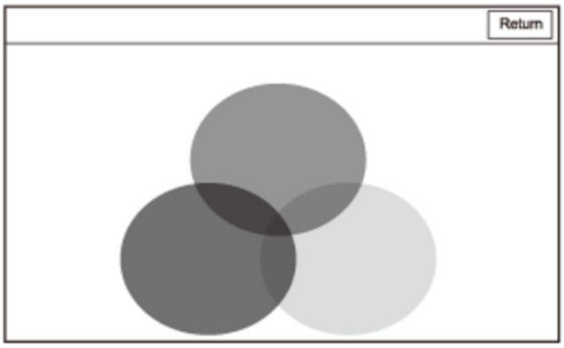
NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen verifies that the display is receiving the video (R, G, B, and Composite sync) signals properly. The three primary colors should all appear without distortion. The combination of all three should produce a central white section. If any of the color circles are missing, **replace the center display unit** .

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

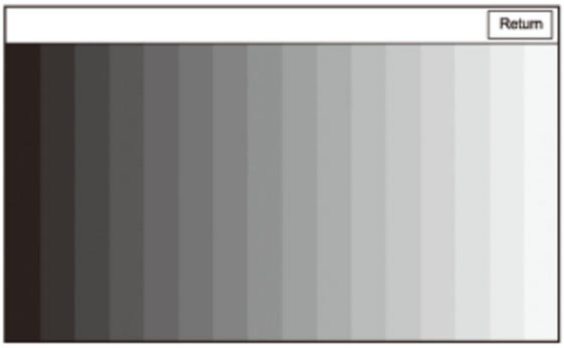


Gray Tone

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks problems with contrast in 16 gradations. You should be able to see the changes from bar to bar across the scale. It is normal for the two bars on either side to appear the same.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

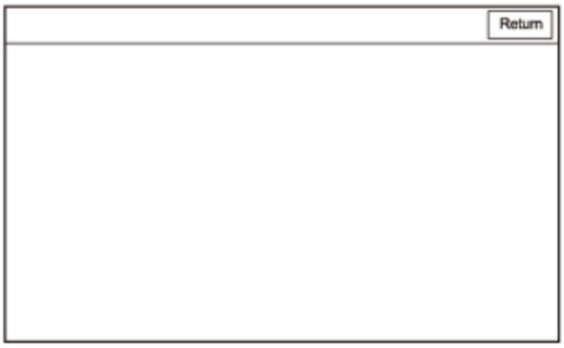


White Raster

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks for pixels that may be dead (off). The entire display must be white.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

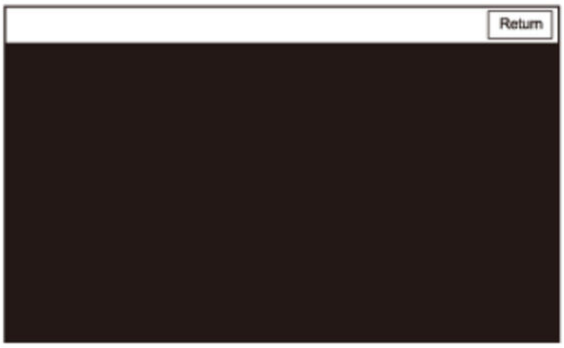


Black Raster

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

This screen checks for pixels that may be stuck on. The entire display must be black.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.

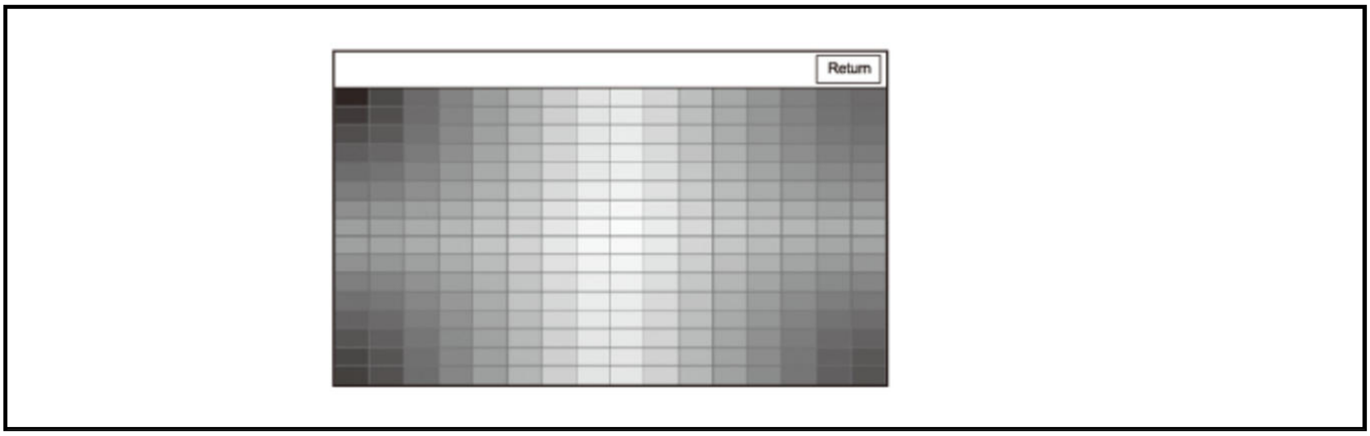


Color Pattern

NOTE: Displaying an anomaly in this diagnosis screen is not necessarily a failure.

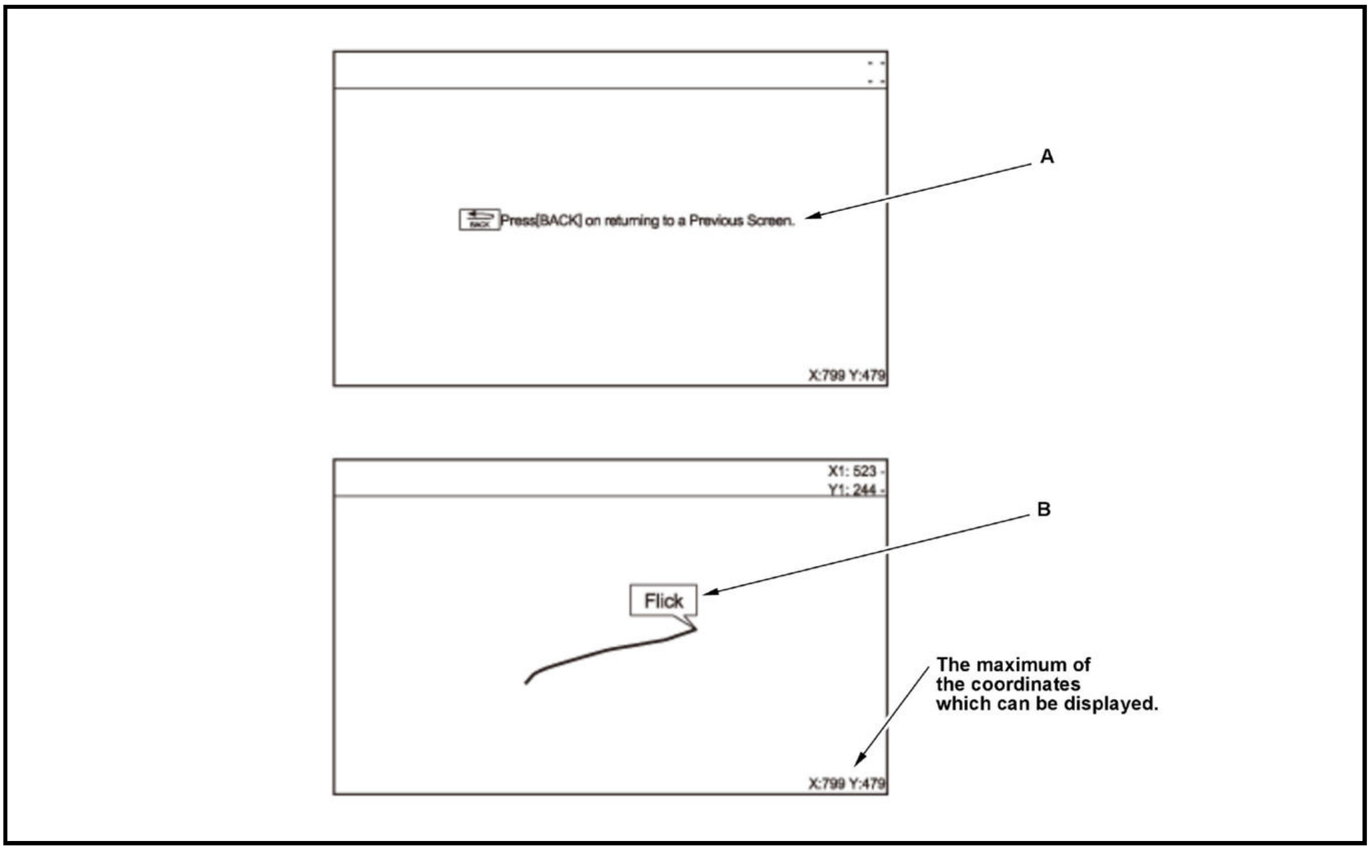
The screen shows the colors being used for the map and menu screens. This is for factory use only. To check the color signal, use the RGB Color diagnosis.

The diagnostic screen is displayed in full screen mode while pressing the HOME button.



Touch Panel Check

This check allows you to check the sensitivity of touch panel. If the screen is operated in the state while the telop (A) is displayed, the track changes to black, and the action name (Tap, Double tap, Pinch, Slide, and Flick) appears on the caption (B) for 5 seconds. The screen displays the coordinates of where the screen was touched. If the BACK button is pressed, the screen returns to the Monitor Check menu. If another location other than the location pressed responds, do the Touch Panel Adjustment.



Press[BACK] on returning to a Previous Screen.

The maximum of the coordinates which can be displayed.

Touch Panel Adjustment

This screen adjusts the alignment of these touch locations with the location of the buttons images on the screen.

The screen consists of the + icons. Touch the center of the five + icons on order 1-5. To store the settings, select the Set.

NOTE: Touch the center of the +icon correctly.

When selecting the Set icon, the audio unit reflects the result of the touch panel adjustment. Select Return to exit the Touch Panel Adjustment screen.

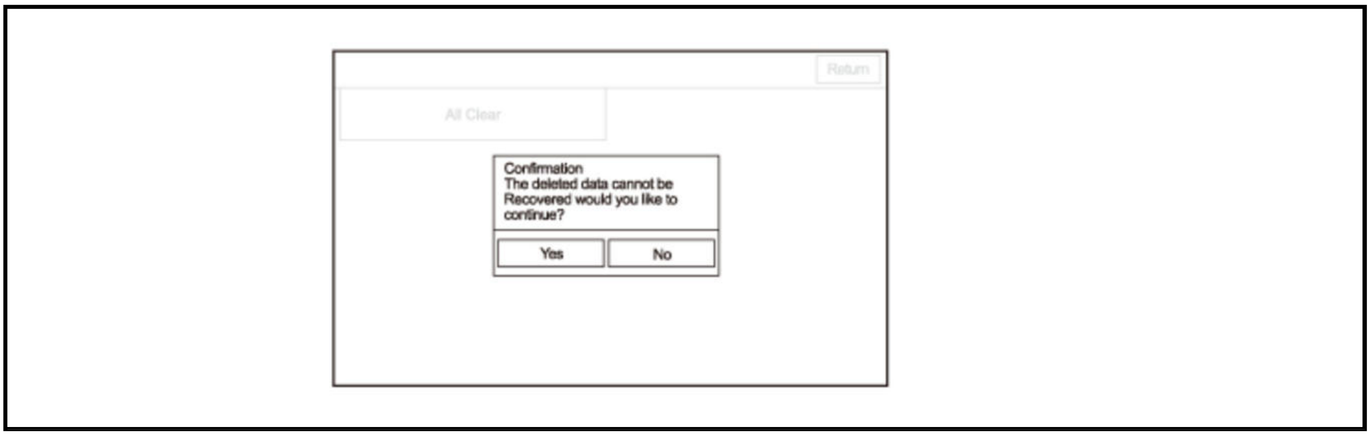
When selecting the Yes icon, the second confirmation screen appears.



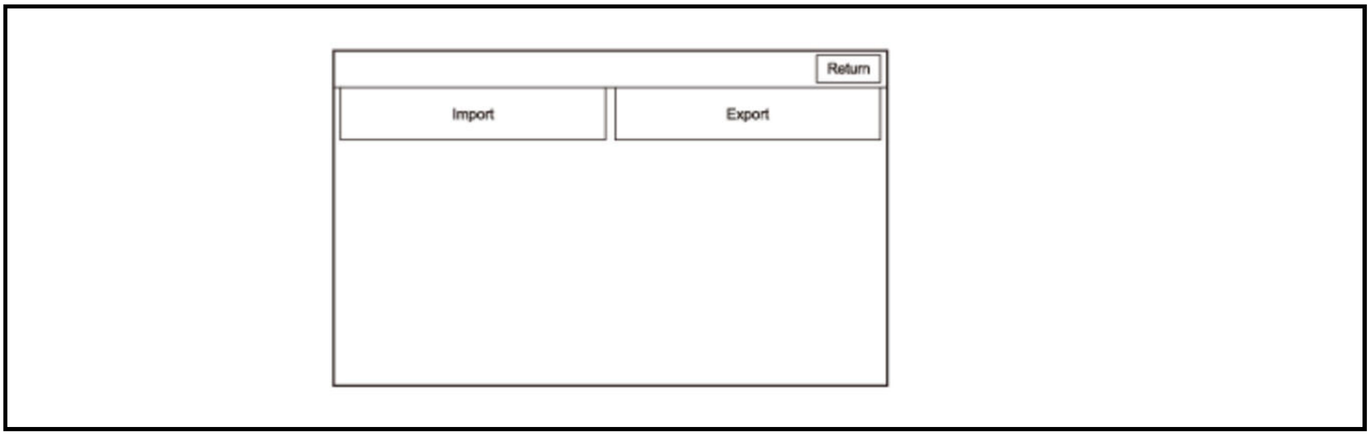
Confirmation
The deleted data cannot be Recovered would you like to continue?

When selecting the Yes icon, the system restarts after performing the All Clear process. After the restart, a normal start-up process occurs.

Save User's Memory

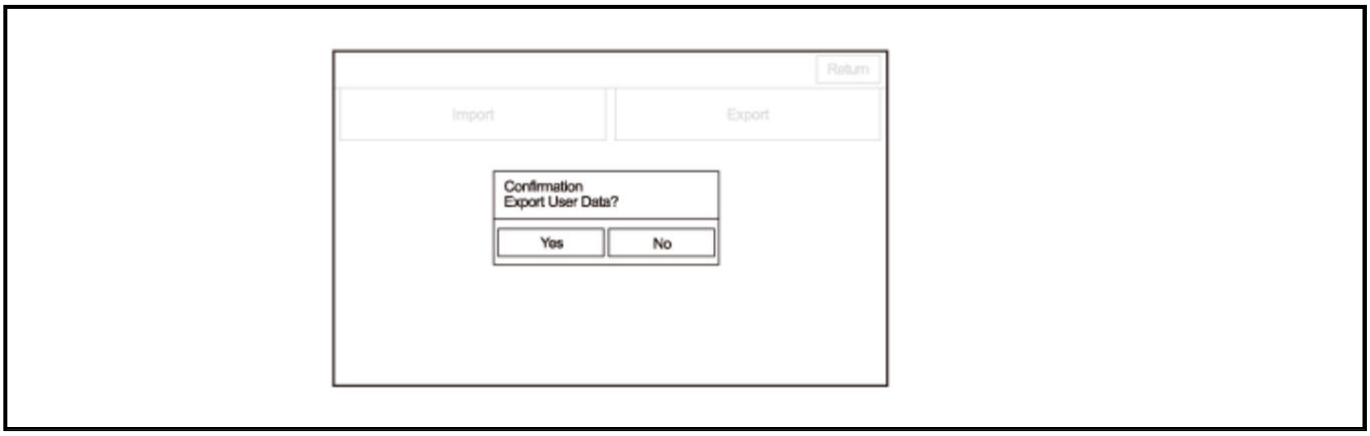
When replacing the audio unit, this function allows the technician to transfer the customer's personal data to the new audio unit. The transferred information includes their setup settings and personal addresses. The dealer inserts a USB device into the USB port A or B, and then selects the Save Users Memory function. The two functions in this diagnostic screen are Export and Import. Export saves the customer's data to the USB device, and Import moves the USB device files to the new audio unit.

This function does not start until you connect a USB device to the USB port.



1. Select the Export icon to move the customer's data from the original audio unit to the USB device. Select the Yes icon on the Export User Data Confirmation screen. The process takes only a couple of seconds. The system stores. DAT files on the USB device.

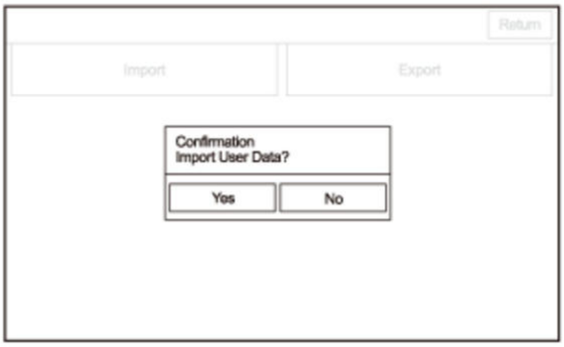
NOTE: If the Export icon is grayed out, check the USB port.



Confirmation
Export User Data?

2. After replacing the new audio unit, allow the system to boot up. Insert the USB device into the USB port A or B and enter the Save Users Memory in the System Diagnostic Mode.

3. Select the Import icon to move the two files stored by the Export process from the USB device to the new audio unit. Select the Yes icon on the Import User Data Confirmation screen. When the transfer is finished (a few seconds) the system automatically reboots. After the system reboots, remove the USB device from the USB port.

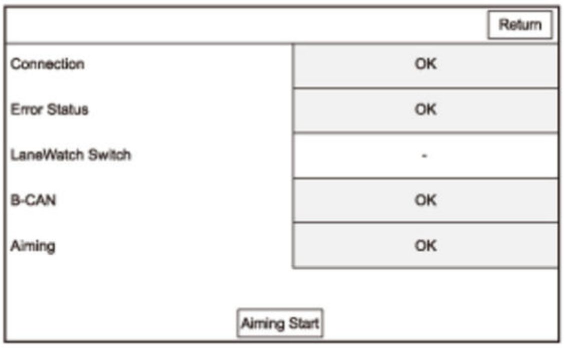


Confirmation
Import User Data?

LaneWatch

This diagnosis checks the LaneWatch status.

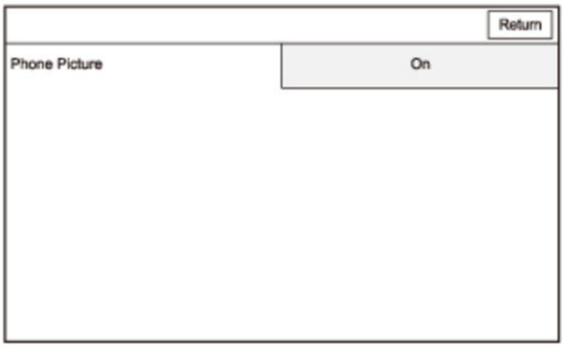
- If Connection shows hyphen (-), **check for hard error codes**.
- Error Status: Indicates LaneWatch camera status OK or NG. If Error Status shows NG, **replace the LaneWatch camera** . When the LaneWatch camera is disconnected, the status shows hyphen (-).
- If Error Status shows OK, press the HOME button to display the LaneWatch camera image. To return to the previous screen, press the HOME button again.
- LaneWatch Switch: LaneWatch switch status on or off. When the LaneWatch switch is pressing, the status shows ON. When the LaneWatch switch is released, the status shows hyphen (-).
- B-CAN: Checks whether the audio unit has received specific B-CAN data from the body control module. If B-CAN shows NG, check for B-CAN DTCs with the HDS. If DTCs are not detected, check for B-CAN lines continuity between the audio unit and the body control module.
- If Connection, Error Status, LaneWatch Switch, and B-CAN shows OK, the LaneWatch camera aiming procedure is available. If the LaneWatch camera need to aiming, **refer to the How to Start LaneWatch Camera Aiming** . When the aiming fails, Aiming shows NG.



Connection	OK
Error Status	OK
LaneWatch Switch	-
B-CAN	OK
Aiming	OK

Phone Picture

This screen allows you to enable or disable the Show Contact Picture with On/Off.



Phone Picture: On

Anti-Theft Skip

This selection can cancel the anti-theft mode temporarily (for 150 seconds).

The Anti-Theft Skip icon is grayed out when the anti-theft mode is already canceled.

Other

Select the item you want to check.

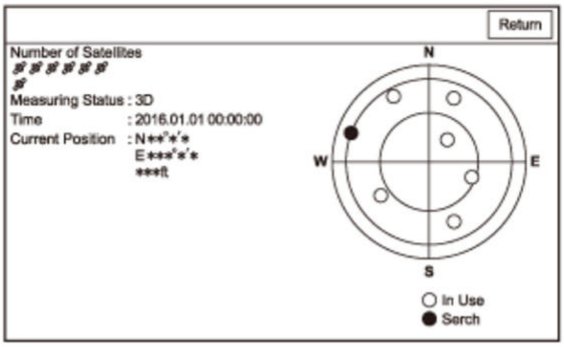
GPS Information

This screen shows the current status of GPS reception. The circular diagram shows the current location of the GPS satellites (yellow numbers) as they would appear in the sky. The outer circle represents the horizon (0 degrees elevation). The middle and inner circles represents 30 and 60 degrees respectively. The very center of the diagram (90 degrees elevation) is directly overhead. Nearby obstructions, like tall buildings will block satellites in that direction. That is why it is necessary to be in an open area to effectively troubleshoot GPS reception issues. The satellite numbers shown on the diagram while pressing the HOME button that correspond to the PRN (satellite ID number). There are always at least 24 active GPS satellites in orbit. Because satellites fail, and have to be removed from service, spares are always parked in orbit, ready to be activated. This is why the PRN can be greater than 24.

NOTE: When you use this screen for troubleshooting, park the vehicle outside, away from buildings, tall trees, and hightension wires for at least 10 minutes with the engine running.

- The Number of Satellites box shows the number of acquired satellites (maximum of 12). It should contain three or more icons.
- The Current Position shows latitude, longitude, and elevation (in feet). If there are less than four satellites, the elevation can be grossly inaccurate.
- The date/time field shows the current date and time that is received from the GPS satellite.



Measuring Status : 3D

Time : 2016.01.01 00:00:00

DTC TROUBLESHOOTING INDEX

AUDIO SYSTEM DTC TROUBLESHOOTING INDEX

NOTE: These DTCs cannot be read with the HDS. To view them, refer to How to Check for Error History (Audio DTCs).

DTC	Description	Circuit
1102	USB Diag	USB
1301	GPS Antenna Error	GPS antenna

DTC	Description	Circuit
1302	GPS Receiver Error 1	GPS receiver
1306	Vehicle Speed Pulse	PCM or TCM
1702	XM Antenna Error	XM antenna
2608	R-Camera Diag	Rearview camera
2610	DRAM Diag	Audio unit DRAM
2618	LaneWatch Diag	LaneWatch camera
2701	GPS Diag: Antenna	GPS antenna
2703	Aircon Diag	Climate control unit

GENERAL INFORMATION

AUDIO SYSTEM ERROR CODES

NOTE: The audio system can display a few error codes when some problems are detected with the audio unit and the USB. This is not a complete list of audio error codes. Refer to symptom troubleshooting.

Audio Unit Error Messages (Display audio type)

Error Message Displayed	Possible Cause	Solution
The system is unable to start due to excessive heat. The system will start after the system cools.	This message appears when the display temperature is too high.	Park the vehicle in a cooler place for a while. If the high temperature status is cancelled, the audio unit turns on the display.
Sounds are restricted because the AMP is in protection mode.	This message appears when the stereo amplifier temperature is too high, and the stereo amplifier inhibits sound output.	Park the vehicle in a cooler place for a while. If the high temperature status is cancelled, the stereo amplifier outputs the sound again.

USB Error Messages

Error Message Displayed	Possible Cause	Solution
The connected USB device has a problem. See Owner's Manual* 1	Faulty power supply to USB device.	Check for hard error code: - **With navigation** - **Without navigation**
Bad USB Device Please Check Owner's Manual* 2	Faulty power supply to USB device.	Disconnect the USB device, and turn the vehicle to the OFF (LOCK) mode then the ON mode. Then connect a known-good USB device to the USB port. If the error message appears on the screen, **replace the audio unit** .
Connect Retry	The audio unit failed to synchronize with the iPod.	Appears when the system does not acknowledge the iPod. Reconnect the iPod.
No Data	No music file(s) can be found in a USB device.	Check the music files in the USB device.
USB Error	There is an internal problem with the audio unit.	**Replace the audio-navigation unit** or **the audio unit** .
Unplayable File	The audio unit cannot read the file(s).	- Check the files in the USB device. There is a possibility

Error Message Displayed	Possible Cause	Solution
		that the files have been damaged - The WMA files or the AAC file cannot be read with the (DRM) copy protection rights
Unsupported	- Unsupported USB device is connected - Unsupported file system - USB device communication error	Connect the applicable USB device (see the Owner's Manual).
Unsupported Version	Unsupported version iPod is connected.	Connect the applicable iPod (see the Owner's Manual).

*1: Display audio type

*2: Color audio type

XM Error Messages

NOTE: Do these checks with the vehicle parked outside with a clear view of the southern horizon.

Error Message Displayed	Possible Cause	Solution
Channel Not Subscribed	Selected XM channel is not subscribed.	Check the XM channel subscription status.

Error Message Displayed	Possible Cause	Solution
Channel Not Available	Selected XM channel is not in service.	Try another XM channel.
No Signal	Loss of signal.	Both terrestrial and satellite antennas have lost the signal. Park the vehicle outside with a clear view of the southern horizon.
Antenna Disconnected	XM antenna/antenna lead error.	Check for hard error code: - **With navigation** - **Without navigation**

SYMPTOM TROUBLESHOOTING

AUDIO SYSTEM SYMPTOM TROUBLESHOOTING

AM/FM radio display is blank or no station information is displayed

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Turn on the audio system, and select AM or FM.

   Does the AM or FM radio station information display blankΩ

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time. If the AM or FM sound is not heard, **go to Poor or no sound with AM/FM radio troubleshooting**.

2. Determine possible failure area (TUNER 6V line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Tuner unit connector A (10P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Tuner unit connector A (10P) No. 10**
Test point 2	Body ground

Is there about 6.0 V?

YES

The TUNER 6V wire is OK. Go to step 5.

NO

Go to step 3.

3. Open wire check (TUNER 6V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 1**
B	**Audio unit connector E (16P) (without navigation) No. 1**
Test point 2	Body ground

Is there about 6.0 V?

YES

Repair an open in the wire.

NO

The TUNER 6V wire is not open. Go to step 4.

4. Shorted wire check (TUNER 6V line)

-1. Disconnect the following connector.

Audio-navigation unit connector E (16P) (with navigation)Audio unit connector E (16P) (without navigation)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 1**
B	**Audio unit connector E (16P) (without navigation) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

5. Determine possible failure area (TUNER GND line, others)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Tuner unit connector A (10P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

The TUNER GND wire is OK. Go to step 7.

NO

Go to step 6.

6. Open wire check (TUNER GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 9**
B	**Audio unit connector E (16P) (without navigation) No. 9**
Test point 2	Body ground

Is there continuity?

YES

Repair an open in the wire.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

7. Determine possible failure area (TUNER 9V line, others)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Tuner unit connector A (10P) No. 1**
Test point 2	Body ground

Is there about 9.0 V?

YES

The TUNER 9V wire is OK. Go to step 10.

NO

Go to step 8.

8. Open wire check (TUNER 9V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Tuner unit connector A (10P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 2**
B	**Audio unit connector E (16P) (without navigation) No. 2**
Test point 2	Body ground

Is there about 9.0 V?

YES

Repair an open in the wire.

NO

The TUNER 9V wire is not open. Go to step 9.

9. Shorted wire check (TUNER 9V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector E (16P) (with navigation)Audio unit connector E (16P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 2**
B	**Audio unit connector E (16P) (without navigation) No. 2**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

10. Shorted wire check (TUNER RS485+ line, TUNER RS485- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector E (16P) (with navigation) Audio unit connector E (16P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected

Test point 1	**Tuner unit connector A (10P) No. 5**
Test point 2	Body ground

Test point 1	**Tuner unit connector A (10P) No. 7**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire(s). Replace the affected shielded harness.

NO

The TUNER RS485+ and the TUNER RS485**-** wires are not shorted to ground. Go to step 11.

11. Shorted wire check (TUNER RS485+ line to TUNER RS485- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Tuner unit connector A (10P) No. 5**
Test point 2	**Tuner unit connector A (10P) No. 7**

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The TUNER RS485+ wire and the TUNER RS485**-** wire are not shorted. Go to step 12.

12. Shorted wire check (TUNER RS485 SH line to another lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Tuner unit connector A (10P) No. 5**
Test point 2	**Tuner unit connector A (10P) No. 6**

Test point 1	**Tuner unit connector A (10P) No. 6**
Test point 2	**Tuner unit connector A (10P) No. 7**

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The TUNER RS485 SH wire is not shorted. Go to step 13.

13. Open wire check (TUNER RS485+ line, TUNER RS485- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tuner unit connector A (10P): disconnected
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
Test point 1	**Tuner unit connector A (10P) No. 5**
Test point 2	**Audio-navigation unit connector E (16P) (with navigation) No. 15**

B	Audio unit connector E (16P) (without navigation) No. 15

Test point 1	Tuner unit connector A (10P) No. 7
Test point 2	Audio-navigation unit connector E (16P) (with navigation) No. 16
B	Audio unit connector E (16P) (without navigation) No. 16

Is there continuity?

YES

The TUNER RS485+ and the TUNER RS485**-** wires are OK. Go to step 14.

NO

There is an open in the wire(s). Replace the affected shielded harness.

14. Tuner unit check (substitution)

-1. Substitute a known-good tuner unit.

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original tuner unit .

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

Audio remote-HFL switch does not work properly (audio unit buttons work)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Using the audio remote-HFL switch buttons, check if the audio system and the HFL system operates properly.

Are the audio system and the HFL system operation OK?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 2.

2. Determine possible failure area (audio remote-HFL switch, others):

Go into the System Diagnostic Mode;

- With navigation: **Use the Hard Key test under the Unit Check menu** .
- Display audio type without navigation: **Use the Hard Key test under the Unit Check menu**.
- Color audio type: **Use the Knob Check test under the Version/System menu**.

-2. Check the audio remote-HFL switch status.

Do all of the buttons fail to respond?

YES: With multi-information display

Go to step 3.

YES: Without multi-information display

Go to step 5.

NO

Replace the audio remote-HFL switch .

3. Gauge control module DTCs check

-1. Check for gauge control module DTCs with the HDS.

DTC Description	DTC
B1195 Gauge control module lost communication with Audio Remote Switch(LIN bus connected)	B

DTC (Gauge Control Module)

Is DTC B1195 indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 4.

4. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Gauge control module connector A (32P)

Audio-navigation unit connector A (24P) (with navigation)
Audio unit connector A (24P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Gauge control module connector A (32P): disconnected
B	Audio-navigation unit connector A (24P) (with navigation): disconnected
B	Audio unit connector A (24P) (without navigation): disconnected
Test point 1	**Gauge control module connector A (32P) No. 30**
Test point 2	**Audio-navigation unit connector A (24P) No. 14**
	Audio unit connector A (24P) No. 14

Test point 1	**Gauge control module connector A (32P) No. 31**
Test point 2	**Audio-navigation unit connector A (24P) No. 24**
	Audio unit connector A (24P) No. 24

Is there continuity?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair an open in the wire(s).

5. Audio remote switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio remote-HFL switch 12P connector

-3. **Do the Audio Remote-HFL Switch Test** .

Is the audio remote-HFL switch OK?

YES

Go to step 6.

NO

Replace the audio remote-HFL switch .

6. Shorted wire check (AUDIO REMOTE SW line, HFT/NAVI REMOTE SW line)

-1. Disconnect the following connector.

Audio unit connector A (24P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio remote-HFL switch 12P connector: disconnected
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 9**

Test point 2	Body ground

Test point 1	**Audio unit connector A (24P) No. 20**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire(s).

NO

The AUDIO REMOTE SW and the HFT/NAVI REMOTE SW wires are not shorted to ground. Go to step 7.

7. Determine possible failure area (HFT/NAVI REMOTE SW line, others)

-1. Reconnect the audio remote-HFL switch 12P connector.

-2. Measure the resistance between test points 1 and 2 as specified in the table.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 9**
Test point 2	**Audio unit connector A (24P) No. 19**

Button held down	VOL DOWN (-)	VOL UP(+)	LEFT	RIGHT	SOURCE	No button pressed
Resistance	About 99 Ω	About 357 Ω	About 775 Ω	About 1.7 kΩ	About 3.7 kΩ	About 10 kΩ

Is the resistance OK?

YES

Go to step 8.

NO

Go to step 9.

8. Open wire check (HFT/NAVI REMOTE SW line)

-1. Measure the resistance between test points 1 and 2 as specified in the table.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 19**
Test point 2	**Audio unit connector A (24P) No. 20**

Button held down	HANG-UP	PICK-UP	No button pressed
Resistance	About 47 Ω	About 222 Ω	About 10 kΩ

Is the resistance OK?

YES

Replace the audio unit .

NO

Repair an open or high resistance in the HFT/NAVI REMOTE SW wire.

9. Determine possible failure area (AUDIO REMOTE SW line, REMOTE SW GND line)

    -1. Measure the resistance between test points 1 and 2 as specified in the table.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 19**
Test point 2	**Audio unit connector A (24P) No. 20**

Button held down	HANG-UP	PICK-UP	No button pressed
Resistance	About 47 Ω	About 222 Ω	About 10 kΩ

    Is the resistance OK?

    YES

    Repair an open or high resistance in the AUDIO REMOTE SW wire.

    NO

    Repair an open or high resistance in the REMOTE SW GND wire.

Audio system sound is weak or distorted (display is normal)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    Go into the System Diagnostic Mode, and use the speaker check mode.

    - **With navigation**
    - **Without navigation**

    Is there tone from the speakers, and is the tone quality normal in each channel?

    YES

    Intermittent failure, the system is OK at this time.

    NO: With stereo amplifier

    The failure is duplicated, go to step 2.

    NO: Without stereo amplifier

    The failure is duplicated, go to step 5.

2. Determine possible failure area (speaker lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Stereo amplifier connector A (18P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Stereo amplifier connector A (18P): disconnected

Test point 1:Stereo amplifier connector A (18P)	**Test point 2:Stereo amplifier connector A (18P)**	**Resistance**
No. 2	No. 4	About 2 Ω
No. 5	No. 6	About 4 Ω
No. 7	No. 8	About 4 Ω* 1 About 3.2 Ω* 2
No. 9	No. 10	About 4 Ω* 1 About 3.2 Ω* 2
No. 12	No. 13	About 4 Ω
No. 14	No. 15	About 3.2 Ω
No. 16	No. 17	About 3.2 Ω

*1: Connect rear door speaker connector and disconnect rear tweeter connector.

*2: Disconnect rear door speaker connector and connect rear tweeter connector.

Is the resistance OK?

YES

Go to step 4.

NO

Go to step 3.

3. Speaker check

-1. **Test the speaker on the faulty speaker lines** .

Is the speaker OK?

YES

Repair a faulty speaker wire(s).

NO

Replace the speaker .

4. Speaker visual check

-1. **Remove the speaker** that is duplicating the failure, and check the speaker for any damage.

Is there any damage?

YES

Replace the speaker .

NO

Replace the stereo amplifier .

5. Determine possible failure area (speaker lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector A (24P) (with navigation)Audio unit connector A (24P) (without navigation)
Left front tweeter 2P connector
Right front tweeter 2P connector
Left rear tweeter 2P connector
Right rear tweeter 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected
B	Left front tweeter 2P connector: disconnected
B	Right front tweeter 2P connector: disconnected
B	Left rear tweeter 2P connector: disconnected
B	Right rear tweeter 2P connector: disconnected

Test point 1:Audio-navigation unit connector A (24P) (with navigation) **Audio unit connector A (24P) (without navigation)**	**Test point 2:Audio-navigation unit connector A (24P) (with navigation)** **Audio unit connector A (24P) (without navigation)**	**Resistance**
No. 5	No. 6	About 4 Ω* 1 About 3.2 Ω* 2
No. 7	No. 8	About 4 Ω* 1 About 3.2 Ω* 2
No. 15	No. 16	About 4 Ω* 1 About 3.2 Ω* 2
No. 17	No. 18	About 4 Ω* 1 About 3.2 Ω* 2

*1: Connect door speaker connector and disconnect tweeter connector.*2: Disconnect door speaker connector and connect tweeter connector.

Is the resistance OK?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Go to step 6.

6. Speaker check

   -1. Test the speaker on the faulty speaker lines .

   Is the speaker OK?

   YES

   Repair an open in the wire.

   NO

   Replace the speaker .

Audio unit button illumination does not work

NOTE:

- Check the vehicle 12 volt battery condition first .
- Check for B-CAN DTCs and resolve them before troubleshooting.
- Check the connectors for poor connections or loose terminals.

1. Relay control module DTCs check

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

   -3. Wait for at least 10 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   DTC (Relay Control Module)

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 2.

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Turn the combination light switch to the PARKING ( ) position.

   -3. Check the illumination of the audio unit buttons.

   Are the buttons illuminated?

YES

Intermittent failure, the audio unit is OK at this time.

NO

The failure is duplicated, go to step 3.

3. Determine possible failure area (interior lights circuit, others)

-1. Check the illumination of several other buttons not related to the audio system.

Are the buttons illuminated?

YES

Go to step 4.

NO

Troubleshoot the interior lights.

4. Determine possible failure area (audio unit, others)

-1. **Go into the System Diagnostic Mode, and use the ILLUMI in the Vehicle Information to check the ILLUMI signal**.

Does the METER_ILL STATUS signal change from [0] to [1] when the combination light switch is turned to the parking light position?

YES

Replace the audio unit .

NO

Go to step 5.

5. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the combination light switch off.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connectors.

Gauge control module connector A (32P)
Audio unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	Audio unit connector A (24P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 30**
Test point 2	**Audio unit connector A (24P) No. 14**

Test point 1	**Gauge control module connector A (32P) No. 31**

Test point 2	**Audio unit connector A (24P) No. 24**

Is there continuity?

YES

Replace the audio unit .

NO

Repair an open in the wire(s).

Audio unit power will not turn on (No information display)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check if the Display Mode (☼ ☽) button has been pressed, and turned off the display (see the Owner's Manual for more information).
- Check the connectors for poor connections or loose terminals.
- Check the fuses and **relays** associated with the system, and check for a short in the related lines.

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check if the display indicates any information.

   Is any information displayed?

   YES

   Intermittent failure, the system is OK at this time.

   NO: Display audio type

   The failure is duplicated, go to step 2.

   NO: Color audio type

   The failure is duplicated, go to step 8.

2. Determine possible failure area (LVDS1 circuit, others)

   -1. Shield the center display unit from the sun with your hand, and check that the display is back lit (only the back light is on).

   Can you see the back light?

   YES

   Go to step 11.

   NO

   Go to step 3.

3. Open wire check (+B BACKUP2 SUB/+B AUDIO line) 1

-1. Disconnect the following connector.

Center display unit connector A (5P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The +B BACKUP2 SUB/+B AUDIO wire is OK. Go to step 4.

NO

Repair an open in the wire.

4. Open wire check (GND line) 1

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 5**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 5.

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

5. Determine possible failure area (DISP CONT line, others)

-1. Reconnect center display unit connector A (5P).

-2. Disconnect the following connector.

Audio unit connector E (16P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Audio unit connector E (16P): disconnected
Test point 1	**Audio unit connector E (16P) No. 4**
Test point 2	Body ground

Is there about 3.3 V?

YES

The DISP CONT wire is OK. Go to step 7.

NO

Go to step 6.

6. Open wire check (DISP CONT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Audio unit connector E (16P): disconnected
Test point 1	**Center display unit connector A (5P) No. 4**
Test point 2	Body ground

Is there about 3.3 V?

YES

Repair an open in the wire.

NO

Replace the center display unit .

7. Determine possible failure area (center display unit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect audio unit connector E (16P).

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio unit connector E (16P) No. 4**
Test point 2	Body ground

Is there less than 0.2 V?

Yes

Replace the center display unit .

No

Go to step 8.

8. Open wire check (+B BACKUP2 SUB/+B AUDIO line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector A (24P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The +B BACKUP2 SUB/+B AUDIO wire is OK. Go to step 9.

NO

Repair an open in the wire.

9. Open wire check (ACC CUT(VST)/ACC/IG1 WITH DIODE FMVSS line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 23**
Test point 2	Body ground

Is there battery voltage?

YES

The ACC CUT(VST)/ACC/IG1 WITH DIODE FMVSS wire is OK. Go to step 10.

NO

Repair an open in the wire.

10. Open wire check (GND line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect audio unit connector A (24P).

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio unit connector A (24P) No. 1**
Test point 2	Body ground

Is there less than 0.2 V?

YES: Display audio type

Replace the audio unit .

YES: Color audio type

Substitute the known good audio panel then recheck. If the symptom does not go away, replace the audio unit.

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

11. Shorted wire check (LVDS1+ line to LVDS1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio unit connector H (3P)
Center display unit connector B (3P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector H (3P): disconnected
B	Center display unit connector B (3P): disconnected
Test point 1	**Center display unit connector B (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 2**

Is there 1.0 MΩ or more?

YES

The LVDS1+ wire and the LVDS1- wire are not shorted. Go to step 12.

NO

There is a short in the wires. Replace the affected shielded harness.

12. Shorted wire check (LVDS1 SH line to another lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector H (3P): disconnected
B	Center display unit connector B (3P): disconnected
Test point 1	**Center display unit connector B (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 3**

Test point 1	**Center display unit connector B (3P) No. 2**
Test point 2	**Center display unit connector B (3P) No. 3**

Is there 1.0 MΩ or more?

YES

The LVDS1 SH wire is not shorted. Go to step 13.

NO

There is a short in the wires. Replace the affected shielded harness.

13. Open wire check (LVDS1+ line, LVDS1- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector H (3P): disconnected
B	Center display unit connector B (3P): disconnected
Test point 1	**Audio unit connector H (3P) No. 1**
Test point 2	**Center display unit connector B (3P) No. 1**

Test point 1	**Audio unit connector H (3P) No. 2**
Test point 2	**Center display unit connector B (3P) No. 2**

Is there 1.0 Ω or less?

YES

The LVDS1+ and the LVDS1**-** wires are OK. Go to step 14.

NO

There is an open in the wire(s). Replace the affected shielded harness.

14. Center display unit check (substitution)

-1. Substitute a known-good center display unit.

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original center display unit .

NO

Replace the audio unit .

Auxiliary input sound is low or cannot be heard

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Use auxiliary stereo cables with 3.5 mm ends only.
- Auxiliary accessories may be played on the audio unit using the auxiliary input.
- Check the connectors for poor connections or loose terminals.

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Turn on the audio system.

-3. Connect an auxiliary audio accessory to the auxiliary input jack.

Does the display change to the AUX mode?

YES

Go to step 2.

NO

The failure is duplicated, go to step 4.

2. Problem verification 2

-1. Check the auxiliary audio source sound.

Is the sound normal?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 3.

3. Determine possible failure area (auxiliary audio accessory, others)

-1. Substitute a known-good auxiliary audio accessory and/or auxiliary stereo cable, and recheck.

Is the sound normal?

YES

Original auxiliary audio accessory or auxiliary stereo cable is faulty.

NO

Go to step 8.

4. Determine possible failure area (auxiliary jack assembly, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the auxiliary audio accessory from the auxiliary input jack.

-3. Disconnect the following connector.

Auxiliary jack assembly 5P connector

-4. Connect terminals A and B with a jumper wire.

Terminal A	**Auxiliary jack assembly 5P connector No. 4**
Terminal B	**Auxiliary jack assembly 5P connector No. 5**

-5. Turn the vehicle to the ON mode.

-6. Turn on the audio system.

Does the display change to the AUX mode?

YES

Replace the auxiliary jack assembly .

NO

Go to step 5.

5. Determine possible failure area (AUX detect circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Auxiliary jack assembly 5P connector: disconnected
Test point 1	**Auxiliary jack assembly 5P connector No. 4**
Test point 2	**Auxiliary jack assembly 5P connector No. 5**

Is there about 3.3 V?

YES

Replace the audio unit .

NO

Go to step 6.

6. Determine possible failure area (AUX DET line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Auxiliary jack assembly 5P connector: disconnected
Test point 1	**Auxiliary jack assembly 5P connector No. 5**
Test point 2	Body ground

Is there about 3.3 V?

YES

Repair an open in the wire.

NO

Go to step 7.

7. Open wire check (AUX DET line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Auxiliary jack assembly 5P connector: disconnected
Test point 1	**Audio unit connector C (32P) No. 9**
Test point 2	Body ground

Is there about 3.3 V?

YES

Repair an open in the wire.

NO

Replace the audio unit .

8. Shorted wire check (AUX SGND, AUX R CH, AUX L CH lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the auxiliary audio accessory from the auxiliary input jack.

-3. Disconnect the following connectors.

Audio unit connector C (32P)
Auxiliary jack assembly 5P connector

-4. Check for continuity between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector C (32P): disconnected
B	Auxiliary jack assembly 5P connector: disconnected

Connector	Terminal
Audio unit connector C (32P)	No. 24
	No. 25
	No. 26

Is there continuity?

YES

There is a short to body ground in the wire(s). Replace the affected shielded harness.

NO

The AUX SGND, AUX LCH, and AUX RCH wires are not shorted to ground. Go to step 9.

9. Shorted wire check (AUX SH line to another lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector C (32P): disconnected
B	Auxiliary jack assembly 5P connector: disconnected

Test point 1:Audio unit connector C (32P)	Test point 2:Audio unit connector C (32P)
No. 8	No. 24, No. 25, No. 26

Is there continuity between any of the terminals?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The AUX SH wire is OK. Go to step 10.

10. Open wire check (AUX SGND, AUX R CH, AUX L CH lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector C (32P): disconnected
B	Auxiliary jack assembly 5P connector: disconnected

Test point 1:Audio unit connector C (32P)	Test point 2:Auxiliary jack assembly 5P connector
No. 24	No. 1
No. 25	No. 3
No. 26	No. 2

Is there continuity?

YES

The AUX SGND, AUX L CH, and AUX R CH wires are OK. Go to step 11.

NO

There is an open in the wire(s). Replace the affected shielded harness.

11. Auxiliary jack assembly check (substitution)

-1. **Substitute a known-good auxiliary jack assembly** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original auxiliary jack assembly .

NO

Replace the audio unit .

Booming sound while driving with audio system on or off

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check for F-CAN and B-CAN DTCs and resolve them before troubleshooting.
- Check the connectors for poor connections or loose terminals.
- Check the fuses and **relays** associated with the system, and check for a short in the related lines.
- The front ANC/active sound control microphone is the same parts as the front HFL-navigation-ANC/active sound control microphone and the front HFL-ANC/active sound control microphone.

1. Problem verification

-1. Make sure all doors, hood, and the tailgate are closed.

-2. Start the engine.

Is a booming sound or a low-frequency hum heard from speakers?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (speaker output circuit, others)

-1. **Go into the System Diagnostic Mode, and use the speaker check mode**.

Is the sound quality normal at each speaker?

YES

Go to step 3.

NO

Go to No sound is heard from all the speakers (display is normal) troubleshooting.

3. Open wire check (+B BACK UP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ANC/active sound control unit 20P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 11**
Test point 2	Body ground

Is there battery voltage?

YES

The +B BACK UP wire is OK. Go to step 4.

NO

Repair an open in the wire.

4. Open wire check (IG1 METER line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

B	ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 12**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 METER wire is OK. Go to step 5.

NO

Repair an open in the wire.

5. Determine possible failure area (SWD+B line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The SWD+B wire is OK. Go to step 8.

NO

Go to step 6.

6. Open wire check (SWD+B line)

-1. Disconnect the following connector.

Stereo amplifier connector C (16P) (with stereo amplifier)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected
Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 21**
B	**Audio unit connector A (24P) (without navigation) No. 21**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open in the wire.

NO

The SWD+B wire is not open. Go to step 7.

7. Shorted wire check (SWD+B line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P) (with navigation)Audio unit connector A (24P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 21**
B	**Audio unit connector A (24P) (without navigation) No. 21**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

8. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect the following connector.

ANC/active sound control unit 20P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**ANC/active sound control unit 20P connector No. 1**
Test point 2	Body ground

Is there less than 0.2 V?

YES

The GND wire is OK. Go to step 9.

NO

Repair an open or high resistance in the wire or poor ground (G402).

9. Determine possible failure area (MIC PWR line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front ANC/active sound control microphone 8P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**Front ANC/active sound control microphone 8P connector No. 4**
Test point 2	Body ground

Is there about 8.0 V?

YES

The MIC PWR wire is OK. Go to step 12.

NO

Go to step 10.

10. Open wire check (MIC PWR line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (36P) (with navigation) No. 7**
B	**Audio unit connector C (36P) (without navigation) No. 7**

Test point 2	Body ground

Is there about 8.0 V?

YES

Repair an open in the wire.

NO

The MIC PWR wire is not open. Go to step 11.

11. Shorted wire check (MIC PWR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector C (36P) (with navigation)Audio unit connector C (36P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Front ANC/active sound control microphone 8P connector: disconnected Audio-navigation unit connector C (36P) (with navigation): disconnected Audio unit connector C (36P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector C (36P) (with navigation) No. 7**

B	**Audio unit connector C (36P) (without navigation) No. 7**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire.

NO: With navigation

Replace the audio-navigation unit .

NO: without navigation

Replace the audio unit .

12. Determine possible failure area (ANC F MIC+8V line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**Front ANC/active sound control microphone 8P connector No. 8**
Test point 2	Body ground

Is there about 8.0 V?

YES

The ANC F MIC+8V wire is OK. Go to step 16.

NO

Go to step 13.

13. Open wire check (ANC F MIC+8V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 18**
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

The ANC F MIC+8V wire is not open. Go to step 14.

14. Shorted wire check (ANC F MIC+8V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ANC/active sound control unit 20P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Front ANC/active sound control microphone 8P connector: disconnected ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 18**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected shielded harness.

NO

The ANC F MIC+8V wire is not shorted to ground. Go to step 15.

15. Shorted wire check (SH ANC F MIC line to ANC F MIC+8V line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Front ANC/active sound control microphone 8P connector: disconnected ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 7**
Test point 2	**ANC/active sound control unit 20P connector No. 18**

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

Replace the ANC/active sound control unit .

16. Open wire check (MIC GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Front ANC/active sound control microphone 8P connector: disconnected
Test point 1	**Front ANC/active sound control microphone 8P connector No. 1**
Test point 2	Body ground

Is there continuity?

YES

The MIC GND wire is OK. Go to step 17.

NO

There is an open in the wire. Replace the affected shielded harness.

17. Determine possible failure area (front ANC/active sound control microphone, others)

-1. Reconnect the following connector.

Front ANC/active sound control microphone 8P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

NOTE: Use the voltmeter in AC range.

Test condition	Vehicle ON mode, make a loud noise like clapping your hands in front of the front ANC/active sound control microphone.
Test point 1	**ANC/active sound control unit 20P connector No. 18**
Test point 2	**ANC/active sound control unit 20P connector No. 7**

Does the voltage change when making a loud noise in front of the microphone?

YES

Go to step 18.

NO

Replace the front ANC/active sound control microphone .

18. Determine possible failure area (ANC R MIC circuit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rear ANC/active sound control microphone 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear ANC/active sound control microphone 2P connector: disconnected
Test point 1	**Rear ANC/active sound control microphone 2P connector No. 1**
Test point 2	**Rear ANC/active sound control microphone 2P connector No. 2**

Is there about 8.0 V?

YES

Go to step 23.

NO

Go to step 19.

19. Open wire check (SH ANC R MIC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear ANC/active sound control microphone 2P connector: disconnected
Test point 1	**Rear ANC/active sound control microphone 2P connector No. 2**
Test point 2	Body ground

Is there continuity?

YES

The SH ANC R MIC wire is not open. Go to step 20.

NO

There is an open in the wire. Replace the affected shielded harness.

20. Open wire check (ANC R MIC+8V line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rear ANC/active sound control microphone 2P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 17**
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

The ANC R MIC+8V wire is not open. Go to step 21.

21. Shorted wire check (ANC R MIC+8V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ANC/active sound control unit 20P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear ANC/active sound control microphone 2P connector: disconnected ANC/active sound control unit 20P connector: disconnected

Test point 1	**ANC/active sound control unit 20P connector No. 17**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected shielded harness.

NO

The ANC R MIC+8V wire is not shorted to ground. Go to step 22.

22. Shorted wire check (SH ANC R MIC line to ANC R MIC+8V line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rear ANC/active sound control microphone 2P connector: disconnected ANC/active sound control unit 20P connector: disconnected
Test point 1	**ANC/active sound control unit 20P connector No. 6**
Test point 2	**ANC/active sound control unit 20P connector No. 17**

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

Replace the ANC/active sound control unit .

23. Determine possible failure area (rear ANC/active sound control microphone, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect the following connector.

Rear ANC/active sound control microphone 2P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

NOTE: Use the voltmeter in AC range.

Test condition	Vehicle ON mode, make a loud noise like clapping your hands in front of the rear ANC/active sound control microphone.
Test point 1	**ANC/active sound control unit 20P connector No. 17**
Test point 2	**ANC/active sound control unit 20P connector No. 6**

Does the voltage change when making a loud noise in front of the microphone?

YES

Go to step 24.

NO

Replace the rear ANC/active sound control microphone .

24. Shorted wire check (ANC lines) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

ANC/active sound control unit 20P connector Stereo amplifier connector C (16P) (with stereo amplifier)Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation)Audio unit connector C (32P) (without stereo amplifier and without navigation)

-3. Check for continuity between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation): disconnected Audio unit connector C (32P) (without stereo amplifier and without navigation): disconnected

Connector	Terminal
ANC/active sound control unit 20P connector	No. 9
	No. 10
	No. 19
	No. 20

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The ANC wires are not shorted to ground. Go to step 25.

25. Shorted wire check (ANC lines) 2

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation): disconnected Audio unit connector C (32P) (without stereo amplifier and without navigation): disconnected

Test point 1:**ANC/active sound control unit 20P connector**	Test points 2:**ANC/active sound control unit 20P connector**
No. 8	No. 9, No. 10, No. 19, No. 20
No. 9	No. 10, No. 19, No. 20
No. 10	No. 19, No. 20
No. 19	No. 20

Is there continuity between any of the terminals?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The ANC wires are not shorted in the wires. Go to step 26.

26. Open wire check (ANC lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation): disconnected Audio unit connector C (32P) (without stereo amplifier and without navigation): disconnected

With stereo amplifier

Test point 1:ANC/active sound control unit 20P connector	**Test point 2:Stereo amplifier connector C (16P)**
No. 9	No. 1
No. 10	No. 2
No. 19	No. 9
No. 20	No. 10

Without stereo amplifier and with navigation

No. 9	No. 2
No. 10	No. 18
No. 19	No. 1
No. 20	No. 17

Without stereo amplifier and without navigation

Test point 1:ANC/active sound control unit 20P connector	**Test point 2:Audio unit connector C (32P)**
No. 9	No. 2
No. 10	No. 18
No. 19	No. 1

Test point 1:ANC/active sound control unit 20P connector	**Test point 2:Audio unit connector C (32P)**
No. 20	No. 17

Is there continuity?

YES

The ANC wires are OK. Go to step 27.

NO

There is an open in the wire(s). Replace the affected shielded harness.

27. Open wire check (F-CAN lines)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P) (1.5 L engine)PCM connector A (51P) (2.4 L engine)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ANC/active sound control unit 20P connector: disconnected Stereo amplifier connector C (16P) (with stereo amplifier): disconnected Audio-navigation unit connector C (32P) (without stereo amplifier and with navigation): disconnected Audio unit connector C (32P) (without stereo amplifier and without navigation): disconnected PCM connector A (50P) (1.5 L engine): disconnected PCM connector A (51P) (2.4 L engine): disconnected

Test point 1	**PCM connector A (50P) (1.5 L engine) No. 39**
B	**PCM connector A (51P) (2.4 L engine) No. 2**
Test point 2	**ANC/active sound control unit 20P connector No. 4**

Test point 1	**PCM connector A (50P) (1.5 L engine) No. 38**
B	**PCM connector A (51P) (2.4 L engine) No. 1**
Test point 2	**ANC/active sound control unit 20P connector No. 5**

Is there continuity?

YES

The F-CAN wires are OK. Go to step 28.

NO

Repair an open in the wire(s).

28. ANC/active sound control unit check (substitution)

-1. **Substitute a known-good ANC/active sound control unit** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original ANC/active sound control unit .

NO: with stereo amplifier

Replace the stereo amplifier .

NO: without stereo amplifier and with navigation

Replace the audio-navigation unit .

NO: without stereo amplifier and without navigation

Replace the audio unit .

Center display unit does not dim

NOTE:

- Check the vehicle 12 volt battery condition first .
- Turn the headlight on, and check that the dash brightness setting is not set to high.
- Check the connectors for poor connections or loose terminals.

1. Relay control module DTCs check

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

   -3. Wait for at least 10 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   DTC (Relay Control Module)

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 2.

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Turn the combination light switch to the PARKING ( ) position.

   -3. Check the illumination of the center display unit screen and buttons.

   Does the center display brightness change?

   YES

   Intermittent failure, the audio unit is OK at this time.

   NO

   The failure is duplicated, go to step 3.

3. Determine possible failure area (interior lights circuit, others)

   -1. Check the illumination of several other buttons not related to the audio/navigation system.

   Are the buttons illuminated?

YES

Go to step 4.

NO

Troubleshoot the interior lights.

4. Open wire check (ILLUMI+ line)

-1. Turn the combination light switch off.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connector.

Center display unit connector A (5P)

-4. Turn the combination lighting switch to the PARKING ( ) position.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Center display unit connector A (5P): disconnected
Test point 1	**Center display unit connector A (5P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the center display unit .

NO

Repair an open in the wire.

No sound is heard from all the speakers (display is normal)

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Display audio type: **If the center display unit displays an error message, follow the instructions**.
- Before doing this troubleshooting, **go to Audio-navigation unit power will not turn on (No information display) troubleshooting**.
- Check the connectors for poor connections or loose terminals.
- Check the fuses and **relays** associated with the system, and check for a short in the related lines.

1. Operation check

-1. Turn the vehicle to the ON mode.

-2. Check that the volume level is not set to the MIN level.

Is it at the MIN level?

YES

Raise the volume level, and recheck the function.

NO: Display audio type

Go to step 2.

NO: Color audio type

Go to step 4.

2. Audio system check

-1. Check if the center display unit keeps indicating audio mute indication.

Is audio mute indication displayed?

YES

Go to step 3.

NO

Go to step 4.

3. Open wire check (ACC CUT(VST)/ACC/IG1 WITH DIODE FMVSS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P) (with navigation)Audio unit connector A (24P) (without navigation)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 23**
B	**Audio unit connector A (24P) (without navigation) No. 23**
Test point 2	Body ground

Is there battery voltage?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair an open in the wire.

4. Problem verification:

Go into the System Diagnostic Mode, and use the speaker check mode.

- **With navigation**
- **Without navigation**

Did all speakers produce a tone?

YES

Intermittent failure, the system is OK at this time. Check for loose connections. If the tone is weak or distorted, **go to Audio system sound is weak or distorted (display is normal) troubleshooting**.

NO: With stereo amplifier

The failure is duplicated, go to step 5.

NO: Without stereo amplifier

The failure is duplicated, go to step 19.

5. System Diagnostic Mode check:

Go into the System Diagnostic Mode, and use the System Links to check the AMP icon status.

- **With navigation**
- **Without navigation**

Is the AMP icon green?

YES

Go to step 15.

NO

Go to step 6.

6. Open wire check (+B AUDIO AMP line)

-1. Disconnect the following connector.

Stereo amplifier connector A (18P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Stereo amplifier connector A (18P): disconnected
Test point 1	**Stereo amplifier connector A (18P) No. 3**
Test point 2	Body ground

Is there battery voltage?

YES

The +B AUDIO AMP wire is OK. Go to step 7.

NO

Repair an open in the wire.

7. Determine possible failure area (SWD+B line, others)

-1. Disconnect the following connector.

Stereo amplifier connector C (16P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Stereo amplifier connector A (18P): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	**Stereo amplifier connector C (16P) No. 14**
Test point 2	Body ground

Is there battery voltage?

YES

The SWD+B wire is OK. Go to step 10.

NO

Go to step 8.

8. Open wire check (SWD+B line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Stereo amplifier connector A (18P): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 21**
B	**Audio unit connector A (24P) (without navigation) No. 21**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open in the wire.

NO

The SWD+B wire is not open. Go to step 9.

9. Shorted wire check (SWD+B line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P) (with navigation)Audio unit connector A (24P) (without navigation)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Stereo amplifier connector A (18P): disconnected
B	Stereo amplifier connector C (16P): disconnected
B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector A (24P) (with navigation) No. 21**
B	**Audio unit connector A (24P) (without navigation) No. 21**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair a short to body ground in the wire.

10. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect stereo amplifier connector A (18P).

-3. Reconnect stereo amplifier connector C (16P).

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Stereo amplifier connector A (18P) No. 1**
Test point 2	Body ground

Is there less than 0.2 V?

YES

The GND wire is OK. Go to step 11.

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

11. Shorted wire check (RS485+ line, RS485- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector E (16P) (with navigation)Audio unit connector E (16P) (without navigation)
Stereo amplifier connector C (16P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 7**
B	**Audio unit connector E (16P) (without navigation) No. 7**
Test point 2	Body ground

Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 8**
B	**Audio unit connector E (16P) (without navigation) No. 8**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RS485+ and the RS485- wires are not shorted to ground. Go to step 12.

NO

There is a short to body ground in the wire(s). Replace the affected shielded harness.

12. Shorted wire check (RS485+ line to RS485- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 7**
B	**Audio unit connector E (16P) (without navigation) No. 7**

Test point 2	**Audio-navigation unit connector E (16P) (with navigation) No. 8**
B	**Audio unit connector E (16P) (without navigation) No. 8**

Is there 1.0 MΩ or more?

YES

The RS485+ and the RS485- wires are not shorted. Go to step 13.

NO

There is a short in the wires. Replace the affected shielded harness.

13. Shorted wire check (AMP RS485 SH line to another lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
B	Stereo amplifier connector C (16P): disconnected

Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 6**
B	**Audio unit connector E (16P) (without navigation) No. 6**
Test point 2	**Audio-navigation unit connector E (16P) (with navigation) No. 7**
B	**Audio unit connector E (16P) (without navigation) No. 7**

Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 6**
B	**Audio unit connector E (16P) (without navigation) No. 6**
Test point 2	**Audio-navigation unit connector E (16P) (with navigation) No. 8**
B	**Audio unit connector E (16P) (without navigation) No. 8**

Is there 1.0 MΩ or more?

YES

The AMP RS485 SH wire is OK. Go to step 14.

NO

There is a short in the wires. Replace the affected shielded harness.

14. Open wire check (RS485+ line, RS485- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector E (16P) (with navigation): disconnected Audio unit connector E (16P) (without navigation): disconnected
B	Stereo amplifier connector C (16P): disconnected
Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 7**
B	**Audio unit connector E (16P) (without navigation) No. 7**
Test point 2	**Stereo amplifier connector C (16P) No. 15**

Test point 1	**Audio-navigation unit connector E (16P) (with navigation) No. 8**
B	**Audio unit connector E (16P) (without navigation) No. 8**
Test point 2	**Stereo amplifier connector C (16P) No. 7**

Is there 1.0 Ω or less?

YES

The RS485+ and the RS485**-** wires are OK. Go to step 18.

NO

There is an open in the wire(s). Replace the affected shielded harness.

15. Shorted wire check (SPDIF2 SIG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector M (4P) (with navigation)Audio unit connector M (4P) (without navigation)
Stereo amplifier connector D (2P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector M (4P) (with navigation): disconnected Audio unit connector M (4P) (without navigation): disconnected
B	Stereo amplifier connector D (2P): disconnected
Test point 1	**Audio-navigation unit connector M (4P) (with navigation) No. 1**
B	**Audio unit connector M (4P) (without navigation) No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The SPDIF2 SIG wire is not shorted to ground. Go to step 16.

NO

There is a short to body ground in the wire(s). Replace the affected shielded harness.

16. Shorted wire check (SPDIF2 SIG line to SPDIF2 SH line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector M (4P) (with navigation): disconnected Audio unit connector M (4P) (without navigation): disconnected
B	Stereo amplifier connector D (2P): disconnected
Test point 1	**Audio-navigation unit connector M (4P) (with navigation) No. 1**
B	**Audio unit connector M (4P) (without navigation) No. 1**
Test point 2	**Audio-navigation unit connector M (4P) (with navigation) No. 3**
B	**Audio unit connector M (4P) (without navigation) No. 3**

Is there 1.0 MΩ or more?

YES

The SPDIF2 SIG and the SPDIF2 SH wires are not shorted. Go to step 17.

NO

There is a short in the wires. Replace the affected shielded harness.

17. Open wire check (SPDIF2 SIG line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector M (4P) (with navigation): disconnected Audio unit connector M (4P) (without navigation): disconnected
B	Stereo amplifier connector D (2P): disconnected
Test point 1	**Audio-navigation unit connector M (4P) (with navigation) No. 1**
B	**Audio unit connector M (4P) (without navigation) No. 1**
Test point 2	**Stereo amplifier connector D (2P) No. 1**

Is there 1.0 Ω or less?

YES

The SPDIF2 SIG wire is OK. Go to step 18.

NO

There is an open in the wire(s). Replace the affected shielded harness.

18. Stereo amplifier check (substitution)

-1. **Substitute a known-good stereo amplifier** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original stereo amplifier .

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

19. Shorted wire check (SPKR lines) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P) (with navigation)Audio unit connector A (24P) (without navigation)

-3. Measure the resistance between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected

Connector	Terminal
Audio-navigation unit connector A (24P) (with navigation) **Audio unit connector A (24P) (without navigation)**	No. 5
	No. 6
	No. 7
	No. 8
	No. 15
	No. 16
	No. 17
	No. 18

Is there 1.0 MΩ or more?

YES

The SPKR wires are not shorted to ground. Go to step 20.

NO

Repair a short to body ground in the wire(s).

20. Shorted wire check (SPKR lines) 2

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector A (24P) (with navigation): disconnected Audio unit connector A (24P) (without navigation): disconnected

Test point 1:Audio-navigation unit connector A (24P) (with navigation) **Audio unit connector A (24P) (without navigation)**	**Test point 2:Audio-navigation unit connector A (24P) (with navigation)** **Audio unit connector A (24P) (without navigation)**	**Resistance**
No. 5	No. 6	About 4 Ω
No. 7	No. 8	About 4 Ω
No. 15	No. 16	About 4 Ω

Test point 1:Audio-navigation unit connector A (24P) (with navigation) **Audio unit connector A (24P) (without navigation)**	**Test point 2:Audio-navigation unit connector A (24P) (with navigation)** **Audio unit connector A (24P) (without navigation)**	**Resistance**
No. 17	No. 18	About 4 Ω

Is the resistance OK?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair a short in the wires.

Poor AM or FM radio reception or interference

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check for aftermarket accessories plugged into the vehicle accessory power sockets.
- Check for any radio frequency modulators that are plugged into the FM antenna lead. These modulators allow customers to play audio from accessories like CD players or game consoles using the audio system, but they can create interference issues.
- Check the radio reception in an open area. Compare it to a known-good vehicle whenever possible. Poor reception/interference can be caused by the following:
-
  - The radio station is far away
  - Atmospheric conditions are unfavorable
  - Tall buildings, mountains, or high-voltage power lines are nearby
  - Electrical loads like the rear window defroster, seat heaters, game consoles, etc.

- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Park the vehicle in an open area.

   -2. Turn the vehicle to the ON mode.

   -3. Turn on the audio system, and select AM or FM radio station.

   Is the sound quality normal?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   The failure is duplicated, go to step 2.

2. Reception/interference check

   -1. Check if the radio reception/interference is the same as the known-good vehicle in several locations.

   Is the AM or FM sound quality the same?

   YES

   Multipath interference or weak station. Operation is normal.

   NO

   Go to step 3.

3. Determine possible failure area (ANT +B line, others)

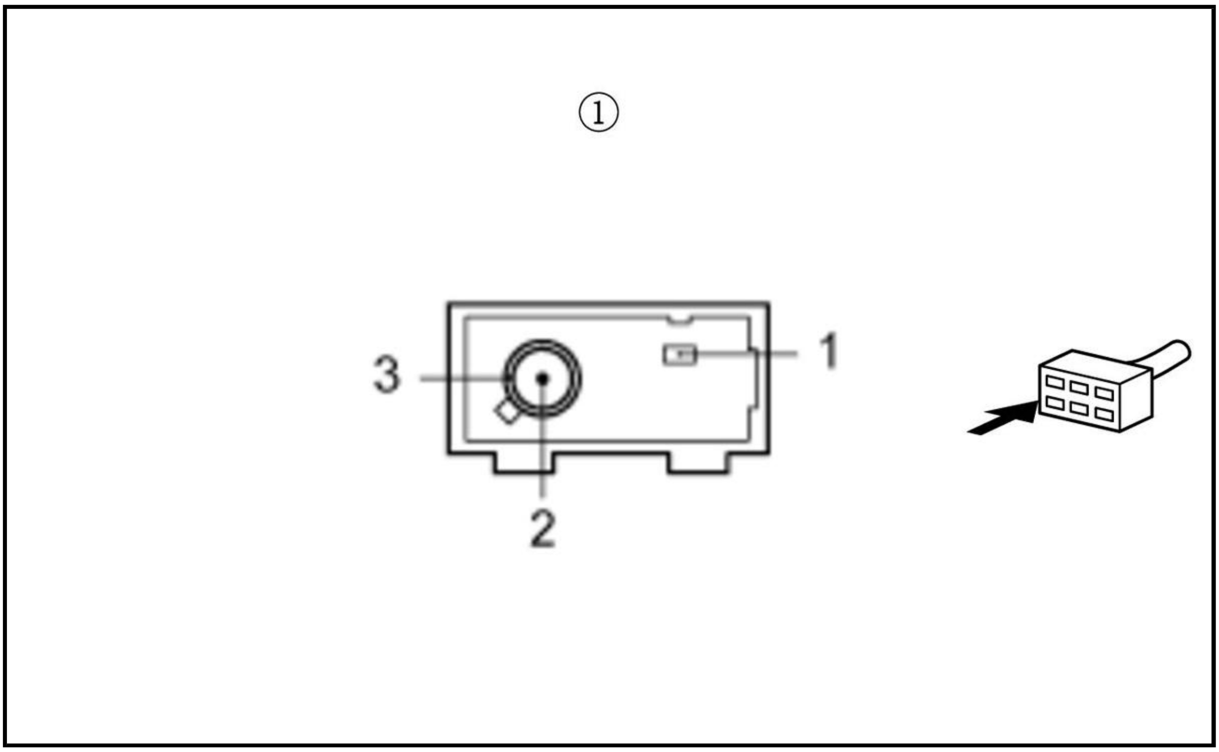
   -1. Disconnect the following connector.

Roof antenna connector A (3P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Roof antenna connector A (3P): disconnected
Test point 1	Roof antenna connector A (3P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The ANT +B wire is OK. Go to step 6.

NO

Go to step 4.

4. Shorted wire check (ANT +B line)

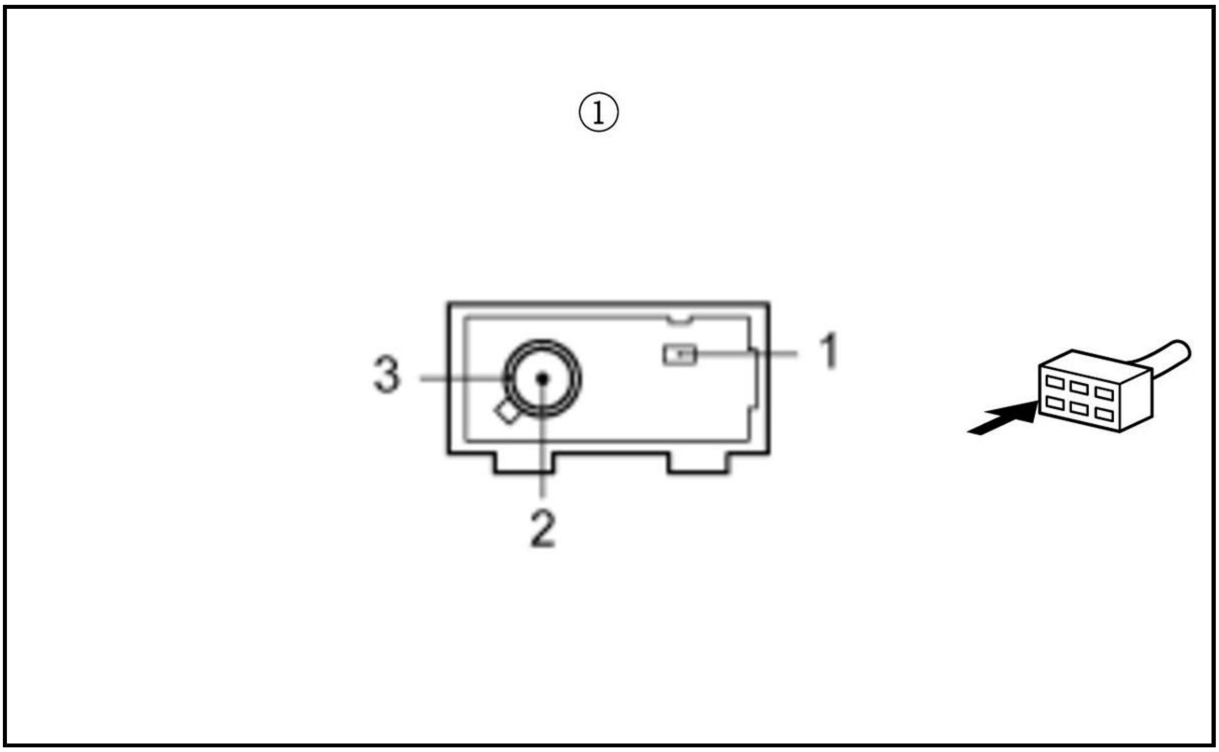
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector E (3P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Audio unit connector E (3P): disconnected
Test point 1	Roof antenna connector A (3P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the wire.

NO

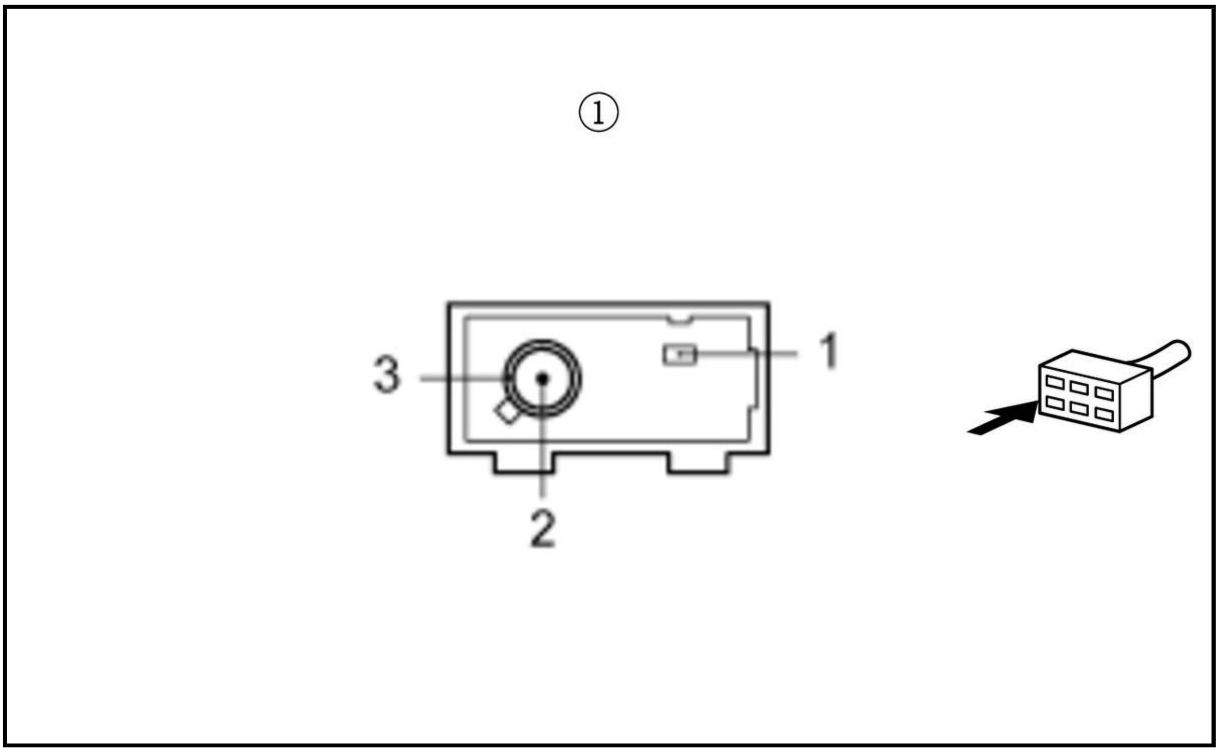
The ANT +B wire is not shorted to ground. Go to step 5.

5. Open wire check (ANT +B line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Audio unit connector E (3P): disconnected

Test point 1	**Audio unit connector E (3P) No. 1**
Test point 2	Roof antenna connector A (3P) (male terminals) No. 1: ①



Is there continuity?

YES

Replace the audio unit .

NO

Repair an open in the wire.

6. Shorted wire check (RF IN line)

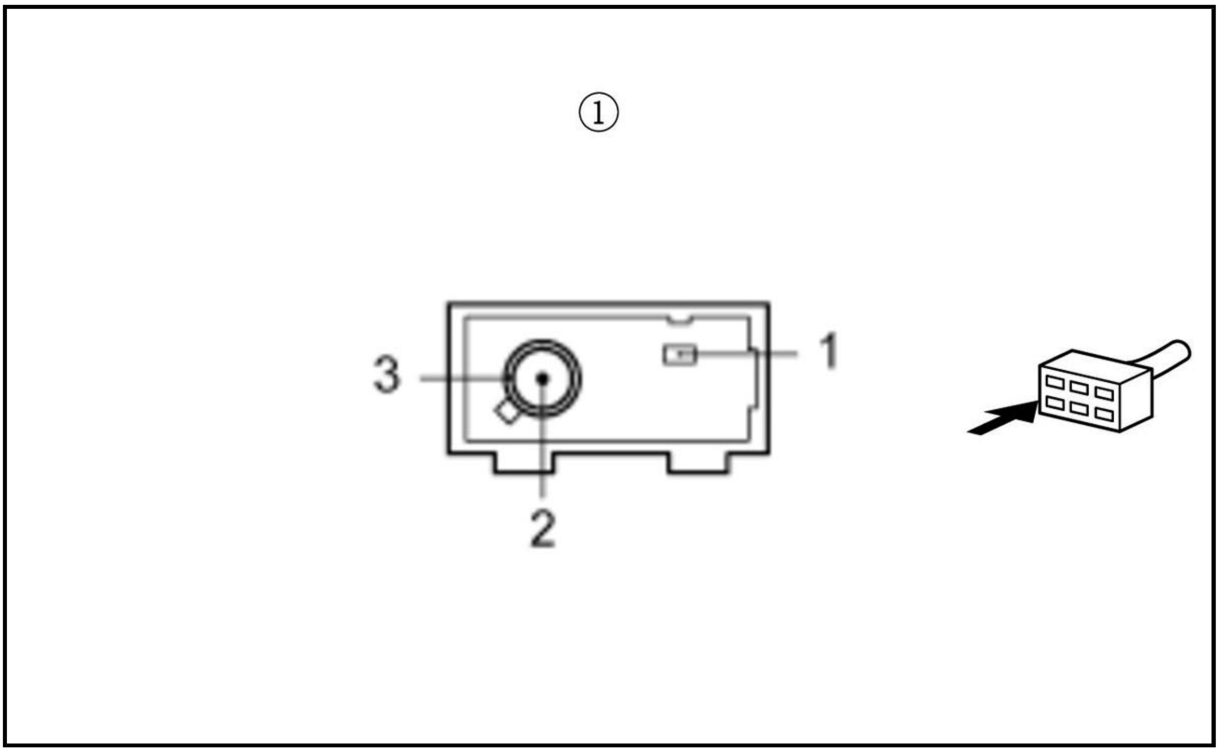
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector E (3P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Audio unit connector E (3P): disconnected
Test point 1	Roof antenna connector A (3P) (male terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected antenna lead.

NO

The RF IN wire is not shorted to ground. Go to step 7.

7. Shorted wire check (RF IN line to SH (RF IN) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected

B	Audio unit connector E (3P): disconnected
Test point 1	**Audio unit connector E (3P) No. 2**
Test point 2	**Audio unit connector E (3P) No. 3**

Is there continuity?

YES

There is a short in the wire. Replace the affected antenna lead.

NO

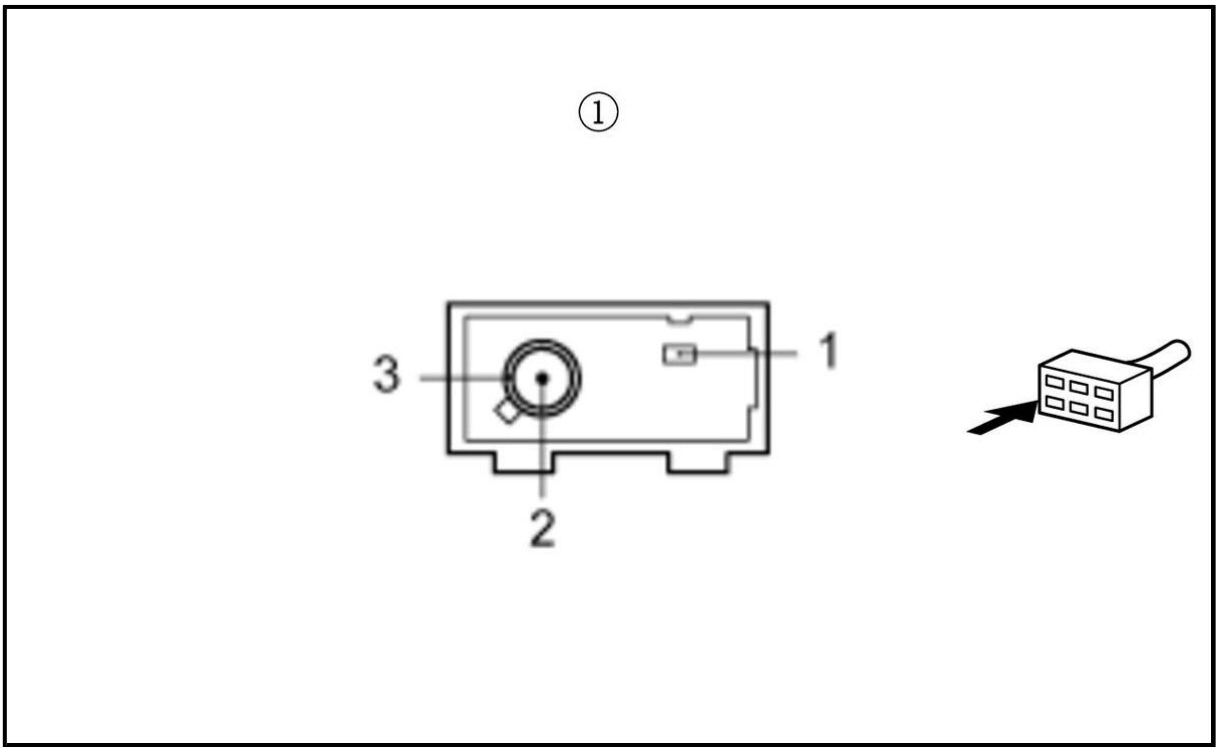
The RF IN wire is not shorted to SH(RF IN) wire. Go to step 8.

8. Open wire check (RF IN line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected

B	Audio unit connector E (3P): disconnected
Test point 1	Roof antenna connector A (3P) (male terminals) No. 2: ①
Test point 2	**Audio unit connector E (3P) No. 2**



Is there continuity?

YES

The RF IN wire is OK. Go to step 9.

NO

There is an open in the wire. Replace the affected antenna lead.

9. Roof antenna check (substitution)

-1. **Substitute a known-good roof antenna** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original roof antenna .

NO

Replace the audio unit .

Poor or no sound with AM/FM radio

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check for aftermarket accessories plugged into the vehicle accessory power sockets.

- Check for any radio frequency modulators that are plugged into the FM antenna lead. These modulators allow customers to play audio from accessories like CD players or game consoles using the audio system, but they can create interference issues.
- Check the radio reception in an open area. Compare it to a known-good vehicle whenever possible. Poor reception/interference can be caused by the following:
-
    - The radio station is far away
    - Atmospheric conditions are unfavorable
    - Tall buildings, mountains, or high-voltage power lines are nearby
    - Electrical loads like the rear window defroster, seat heaters, game consoles, etc.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Park the vehicle in an open area.

   -2. Turn the vehicle to the ON mode.

   -3. Turn on the audio system, and select AM or FM radio station.

   Is the sound quality normal?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   The failure is duplicated, go to step 2.

2. Reception/interference check

   -1. Check if the radio reception/interference is the same as the known-good vehicle in several locations.

   Is the AM or FM sound quality the same?

   YES

   Multipath interference or weak station. Operation is normal.

   NO

   Go to step 3.

3. Seek stop test

   -1. Select the SCAN to check if the number of received radio station are the same as the known-good vehicle.

   Are the number of radio station the same?

   YES

   Go to step 11.

   NO

   Go to step 4.

4. Determine possible failure area (ANT +B line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

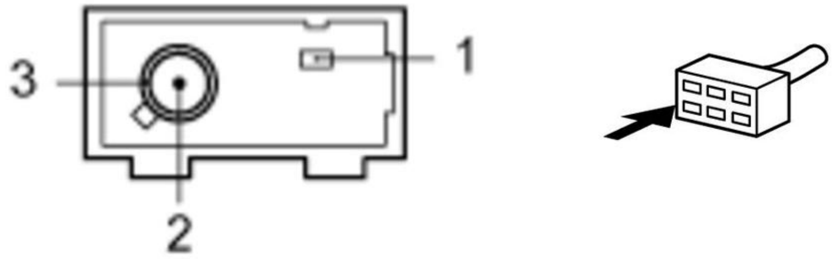
Roof antenna connector A (3P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Roof antenna connector A (3P): disconnected
Test point 1	Roof antenna connector A (3P) (male terminals) No. 1: ①
Test point 2	Body ground

①



Is there about 9.0 V?

YES

The ANT +B wire is OK. Go to step 7.

NO

Go to step 5.

5. Shorted wire check (ANT +B line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Tuner unit connector C (5P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire.

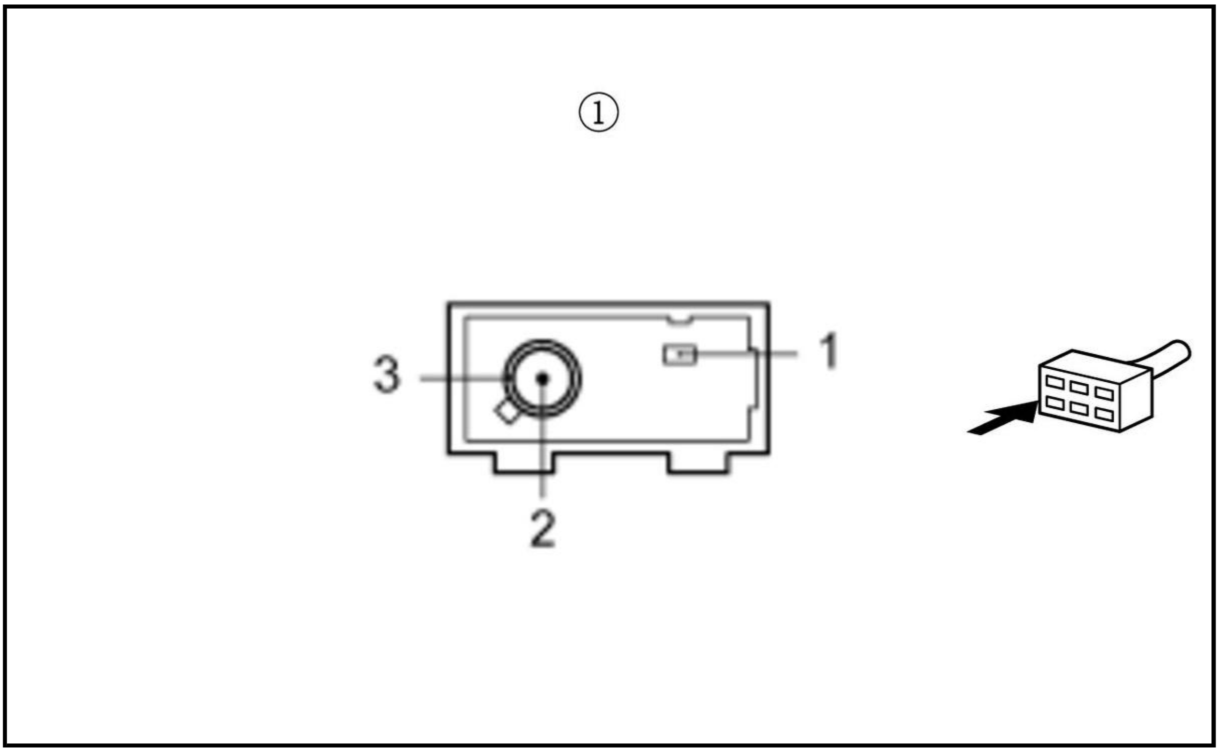
NO

The ANT +B wire is not shorted to ground. Go to step 6.

6. Open wire check (ANT +B line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 1**
Test point 2	Roof antenna connector A (3P) (male terminals) No. 1: ①



Is there continuity?

YES

Replace the tuner unit .

NO

Repair an open in the wire.

7. Shorted wire check (RF IN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Tuner unit connector C (5P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected antenna lead.

NO

The RF IN wire is not shorted to ground. Go to step 8.

8. Shorted wire check (RF IN line to SH (RF IN) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 2**
Test point 2	**Tuner unit connector C (5P) No. 4**

Is there continuity?

YES

There is a short in the wire. Replace the affected antenna lead.

NO

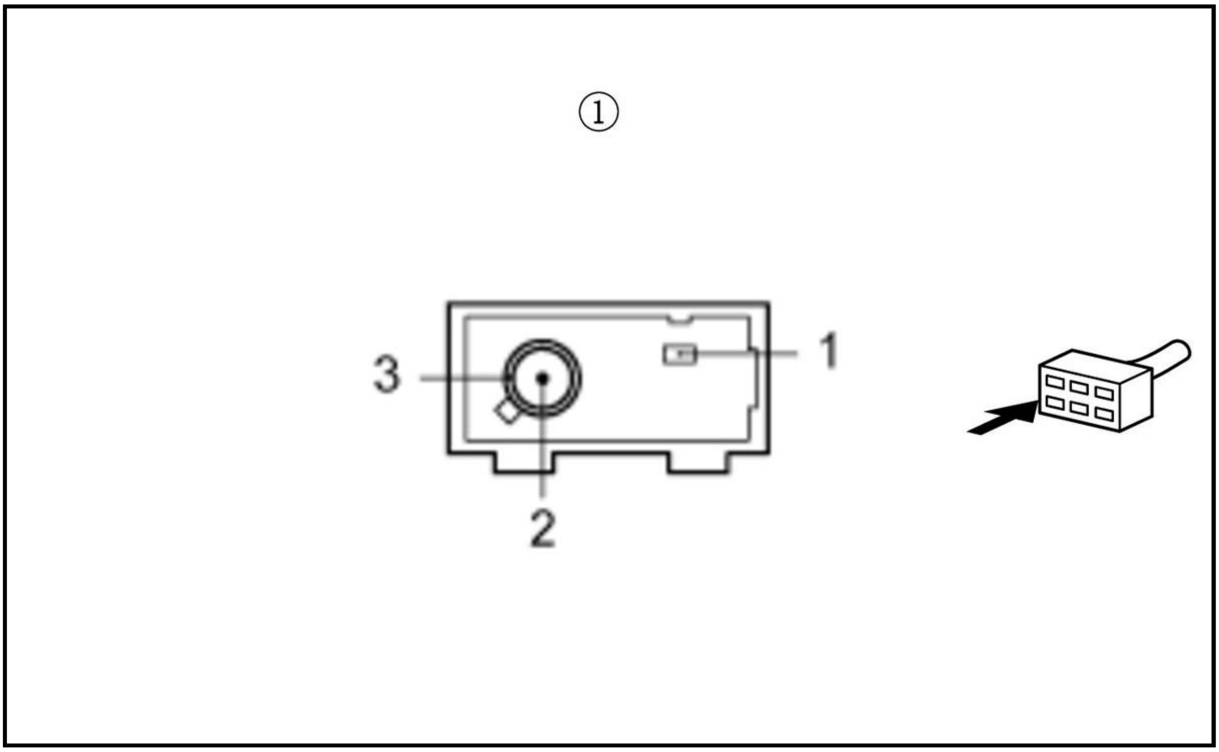
The RF IN wire is not shorted to SH(RF IN) wire. Go to step 9.

9. Open wire check (RF IN line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector A (3P): disconnected
B	Tuner unit connector C (5P): disconnected
Test point 1	**Tuner unit connector C (5P) No. 2**

Test point 2	Roof antenna connector A (3P) (male terminals) No. 2: ①



Is there continuity?

YES

The RF IN wire is OK. Go to step 10.

NO

There is an open in the wire. Replace the affected antenna lead.

10. Roof antenna check (substitution)

-1. **Substitute a known-good roof antenna** .

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original roof antenna .

NO

Replace the tuner unit .

11. Shorted wire check (SPDIF1 SIG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector L (2P) (with navigation)
Audio unit connector L (2P) (without navigation)
Tuner unit connector B (2P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector L (2P) (with navigation): disconnected
B	Audio unit connector L (2P) (without navigation): disconnected
B	Tuner unit connector B (2P): disconnected
Test point 1	**Tuner unit connector B (2P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected shielded harness.

NO

The SPDIF1 wire is not shorted to ground. Go to step 12.

12. Shorted wire check (SPDIF1 SIG line to SPDIF1 SH line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector L (2P) (with navigation): disconnected
B	Audio unit connector L (2P) (without navigation): disconnected
B	Tuner unit connector B (2P): disconnected
Test point 1	**Tuner unit connector B (2P) No. 1**
Test point 2	**Tuner unit connector B (2P) No. 2**

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The SPDIF1 SIG and the SPDIF1 SH wires are not shorted. Go to step 13.

13. Open wire check (SPDIF1 SIG line, SPDIF1 SH line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector L (2P) (with navigation): disconnected
B	Audio unit connector L (2P) (without navigation): disconnected
B	Tuner unit connector B (2P): disconnected
Test point 1	**Audio-navigation unit connector L (2P) (with navigation) No. 1**
	Audio unit connector L (2P) (without navigation) No. 1
Test point 2	**Tuner unit connector B (2P) No. 1**

Test point 1	**Audio-navigation unit connector L (2P) (with navigation) No. 2**
	Audio unit connector L (2P) (without navigation) No. 2
Test point 2	**Tuner unit connector B (2P) No. 2**

Is there continuity?

YES

The SPDIF1 SIG and the SPDIF1 SH wires are OK. Go to step 14.

NO

There is an open in the wire(s). Replace the affected shielded harness.

14. Tuner unit check (substitution)

    -1. **Substitute a known-good tuner unit** .

    -2. Reconnect all the connectors, and recheck.

    Does the symptom go away?

    YES

    Replace the original tuner unit .

    NO: With navigation

    Replace the audio-navigation unit .

    NO: Without navigation

    Replace the audio unit .

Rearview camera image does not change when selecting different views

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- You can select three different rearview camera angles for backing up. If there is no camera image on the display, **go to Rearview camera image does not come on troubleshooting**.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Shift the transmission to R position/mode.

    -3. Operate the audio unit to see if the rearview image changes between the wide view, the normal view, and the top down view.

    Does the rearview camera image change properly?

    YES

    Intermittent failure, the system is OK at this time.

    NO

    The failure is duplicated, go to step 2.

2. Shorted wire check (CAMERA BIT0 line, CAMERA BIT1 line)

    -1. Shift the transmission to Neutral or P position/mode.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connectors.

Audio-navigation unit connector C (32P) (with navigation)Audio unit connector C (32P) (without navigation)
Rearview camera 8P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 31**
B	**Audio unit connector C (32P) (without navigation) No. 31**
Test point 2	Body ground

Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 32**
B	**Audio unit connector C (32P) (without navigation) No. 32**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire(s).

NO

The CAMERA BIT0 and the CAMERA BIT1 wires are not shorted to ground. Go to step 3.

3. Shorted wire check (CAMERA BIT0 line to CAMERA BIT1 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 31**
B	**Audio unit connector C (32P) (without navigation) No. 31**
Test point 2	**Audio-navigation unit connector C (32P) (with navigation) No. 32**
B	**Audio unit connector C (32P) (without navigation) No. 32**

Is there continuity?

YES

Repair a short in the wires.

NO

The CAMERA BIT0 and the CAMERA BIT1 wires are not shorted. Go to step 4.

4. Open wire check (CAMERA BIT0 line, CAMERA BIT1 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 31**
B	**Audio unit connector C (32P) (without navigation) No. 31**
Test point 2	**Rearview camera 8P connector No. 3**

Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 32**
B	**Audio unit connector C (32P) (without navigation) No. 32**
Test point 2	**Rearview camera 8P connector No. 4**

Is there continuity?

YES

The CAMERA BIT0 and the CAMERA BIT1 wires are OK. Go to step 5.

NO

Repair an open in the wire(s).

5. Voltage check (CAMERA BIT0 line)

-1. Reconnect audio-navigation unit connector C (32P) (with navigation).

-2. Reconnect audio unit connector C (32P) (without navigation).

-3. Reconnect the rearview camera 8P connector.

-4. Turn the vehicle to the ON mode.

-5. Shift the transmission to R position/mode.

-6. Measure the voltage between test points 1 and 2 as specified in the table.

Test condition	Vehicle ON mode
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 31**
B	**Audio unit connector C (32P) (without navigation) No. 31**
Test point 2	Body ground

Selected view mode	Voltage
Wide View	0 V
Normal View	About 5 V - 8 V
Top Down View	0 V

Is the voltage OK?

YES

Go to step 6.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

6. Voltage check (CAMERA BIT1 line)

-1. Measure the voltage between test points 1 and 2 as specified in the table.

Test condition	Vehicle ON mode
Test point 1	Audio-navigation unit connector C (32P) (with navigation) No. 32
B	Audio unit connector C (32P) (without navigation) No. 32

Test point 2	Body ground

Selected view mode	Voltage
Wide View	0 V
Normal View	0 V
Top Down View	About 5 V - 8 V

Is the voltage OK?

YES

Replace the rearview camera .

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

Rearview camera image does not come on

NOTE:

- Check the vehicle 12 volt battery condition first .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Shift the transmission to R position/mode.

Does the center display image change to rearview when the transmission is shifted to R position/mode?

YES

Intermittent failure, the system is OK at this time.

NO: Display audio type

The failure is duplicated, go to step 2.

NO: Color audio type

The failure is duplicated, go to step 5.

2. System Diagnostic Mode check

   -1. Shift the transmission to P position/mode.

   Go into the System Diagnostic Mode, and use the System Links to check the Rear Wide Camera icon status.

   - **With navigation**
   - **Without navigation**

   Is the Rear Camera icon green?

   YES

   Go to step 3.

   NO: With navigation

   Go to Navigation Unit DTC 2608 (R-Camera Diag) troubleshooting .

   NO: Without navigation

   Go to Audio Unit DTC 2608 (R-Camera Diag) troubleshooting .

3. Determine possible failure area (BACK LT line, others):

   Go into the System Diagnostic Mode, and use the Vehicle Status to check the BACK signal;

   - **With navigation**
   - **Without navigation**

   -2. Shift the transmission to R position/mode.

   Does the BACK signal change from [0] to [1] when the transmission is shifted from P position/mode to R position/mode?

   YES

   Go to step 12.

   NO

   Go to step 4.

4. Open wire check (BACK LT line)

   -1. Shift the transmission to P position/mode.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Disconnect the following connector.

Audio-navigation unit connector C (32P) (with navigation)Audio unit connector C (32P) (without navigation)

   -4. Turn the vehicle to the ON mode.

   -5. Shift the transmission to R position/mode.

   -6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 15**
B	**Audio unit connector C (32P) (without navigation) No. 15**
Test point 2	Body ground

Is there battery voltage?

YES: with navigation

Replace the audio-navigation unit .

YES: without navigation

Replace the audio unit .

NO

Repair an open in the wire.

5. In Line Diag check

-1. Shift the transmission to P position/mode.

-2. **Go into the System Diagnostic Mode, and use the In Line Diag to check the rearview camera connection**.

Does the Rear Camera indicate OK?

YES

Go to step 10.

NO

Go to step 6.

6. Determine possible failure area (CAMERA ADPT line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rearview camera 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
B	B
Test point 1	**Rearview camera 8P connector No. 6**
Test point 2	Body ground

Is there about 5.0 V?

YES

Go to step 8.

NO

Go to step 7.

7. Open wire check (CAMERA ADPT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio unit connector C (32P) No. 16**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

Replace the audio unit .

8. Determine possible failure area (rearview camera, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Rearview camera 8P connector No. 5**
Test point 2	Body ground

Is there continuity?

YES

Replace the rearview camera .

NO

Go to step 9.

9. Open wire check (SH CAMERA line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio unit connector C (32P) No. 28**
Test point 2	Body ground

Is there continuity?

YES

There is an open in the wire(s). Replace the affected shielded harness.

NO

Replace the audio unit .

10. Determine possible failure area (BACK LT line, others)

    -1. **Go into the System Diagnostic Mode, and use the MICU_ICU in the Vehicle Information to check the BACK signal**.

    -2. Shift the transmission to R position/mode.

    Does the C_BACKLTSW signal change from [0] to [1] when the transmission is shifted from P position/mode to R position/mode?

    YES

    Go to step 12.

    NO

    Go to step 11.

11. Open wire check (B-CAN_H line, B-CAN_L line)

    -1. Shift the transmission to P position/mode.

    -2. Turn the vehicle to the OFF (LOCK) mode.

    -3. Disconnect the following connectors.

Body control module connector B (36P)
Audio unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Body control module connector B (36P): disconnected
B	Audio unit connector A (24P): disconnected
Test point 1	**Body control module connector B (36P) No. 20**
Test point 2	**Audio unit connector A (24P) No. 14**

Test point 1	**Body control module connector B (36P) No. 21**
Test point 2	**Audio unit connector A (24P) No. 24**

Is there continuity?

YES

Replace the audio unit .

NO

Repair an open in the wire(s).

12. Shorted wire check (CAMERA VCC, CAMERA GND, CAMERA V, CAMERA V GND lines)

    -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector C (32P) (with navigation)Audio unit connector C (32P) (without navigation)
Rearview camera 8P connector

-3. Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected

Connector	Terminal
Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)	No. 13
	No. 14
	No. 29
	No. 30

Is there continuity?

YES

There is a short to body ground in the wire(s). Replace the affected shielded harness.

NO

The CAMERA VCC, CAMERA GND, CAMERA V, and CAMERA V GND wires are not shorted to ground. Go to step 13.

13. Shorted wire check (CAMERA lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected

Test point 1: Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)	**Test point 2:**Audio-navigation unit connector C (32P) (with navigation) Audio unit connector C (32P) (without navigation)
No. 13	No. 14, No. 28, No. 29, No. 30
No. 14	No. 28, No. 29, No. 30
No. 28	No. 29, No. 30
No. 29	No. 30

Is there continuity between any of the terminals?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The CAMERA wires are not shorted in the wires. Go to step 14.

14. Open wire check (CAMERA VCC, CAMERA GND, CAMERA V, CAMERA V GND lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector C (32P) (with navigation): disconnected Audio unit connector C (32P) (without navigation): disconnected
B	Rearview camera 8P connector: disconnected

Test point 1:Audio-navigation unit connector C (32P) (with navigation) **Audio unit connector C (32P) (without navigation)**	**Test point 2:Rearview camera 8P connector**
No. 13	No. 2
No. 14	No. 8
No. 29	No. 7
No. 30	No. 1

Is there continuity?

YES

The CAMERA VCC, CAMERA GND, CAMERA V, and CAMERA V GND wires are OK. Go to step 15.

NO

There is an open in the wire(s). Replace the affected shielded harness.

15. Voltage check (CAMERA VCC line)

-1. Reconnect audio-navigation unit connector C (32P) (with navigation).

-2. Reconnect audio unit connector C (32P) (without navigation).

-3. Reconnect the rearview camera 8P connector.

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**Audio-navigation unit connector C (32P) (with navigation) No. 13**
B	**Audio unit connector C (32P) (without navigation) No. 13**
Test point 2	Body ground

Is there about 8.0 V?

YES

Go to step 16.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

16. Rearview camera check (substitution)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. **Substitute a known-good rearview camera** , and recheck.

    Does the symptom go away?

    YES

    Replace the original rearview camera .

    NO: With navigation

    Replace the audio-navigation unit .

    NO: Without navigation

    Replace the audio unit .

The MID does not display the audio unit information

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- If the audio remote-HFL switch does not respond, **go to Audio remote-HFL switch does not work properly (audio unit buttons work) troubleshooting**.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Select Audio and HFL from the multi-information display (MID) menu screen.

    Are audio and HFL information displayed?

    YES

    Intermittent failure, the system is OK at this time.

    NO

    The failure is duplicated, go to step 2.

2. Shorted wire check (LVDS2+ line, LVDS2- line)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Disconnect the following connectors.

Audio unit connector J (3P)
Gauge control module connector C (3P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector J (3P): disconnected
B	Gauge control module connector C (3P): disconnected
Test point 1	**Audio unit connector J (3P) No. 1**
Test point 2	Body ground

Test point 1	**Audio unit connector J (3P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected shielded harness.

NO

The LVDS2+ and the LVDS2**-** wires are not shorted to ground. Go to step 3.

3. Shorted wire check (LVDS2+ line to LVDS2- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector J (3P): disconnected
B	Gauge control module connector C (3P): disconnected
Test point 1	**Audio unit connector J (3P) No. 1**
Test point 2	**Audio unit connector J (3P) No. 2**

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The LVDS2+ wire and the LVDS2**-** wire are not shorted. Go to step 4.

4. Shorted wire check (LVDS2 SH line to another lines)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector J (3P): disconnected
B	Gauge control module connector C (3P): disconnected
Test point 1	**Audio unit connector J (3P) No. 1**
Test point 2	**Audio unit connector J (3P) No. 3**

Test point 1	**Audio unit connector J (3P) No. 2**
Test point 2	**Audio unit connector J (3P) No. 3**

Is there continuity?

YES

There is a short in the wires. Replace the affected shielded harness.

NO

The LVDS2 SH wire is not shorted. Go to step 5.

5. Open wire check (LVDS2+ line, LVDS2- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector J (3P): disconnected
B	Gauge control module connector C (3P): disconnected
Test point 1	**Audio unit connector J (3P) No. 1**
Test point 2	**Gauge control module connector C (3P) No. 1**

Test point 1	**Audio unit connector J (3P) No. 2**
Test point 2	**Gauge control module connector C (3P) No. 2**

Is there continuity?

YES

The LVDS2+ and the LVDS2**-** wires are OK. Go to step 6.

NO

There is an open in the wire(s). Replace the affected shielded harness.

6. Audio unit check (substitution)

-1. Substitute a known-good audio unit.

-2. Reconnect all the connectors, and recheck.

Does the symptom go away?

YES

Replace the original audio unit .

NO

Replace the gauge control module .

USB charger does not work

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the connectors for poor connections or loose terminals.
- Check the fuses and **relays** associated with the system, and check for a short in the related lines.

1. Problem verification

-1. Connect a known-good USB device to the USB port(s) of the USB charger unit.

-2. Turn the vehicle to the ON mode.

Can the connection be checked (battery charging status) on the device?

YES

Intermittent failure, the system is OK at this time. Inspect the connectors of the USB device and USB port for wear.

NO

The failure is duplicated, go to step 2.

2. Open wire check (+B USB CHARGER/+B BACK UP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

USB charger unit 3P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	USB charger unit 3P connector: disconnected
Test point 1	**USB charger unit 3P connector No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

The +B USB CHARGER/+B BACK UP wire is OK. Go to step 3.

NO

Repair an open in the wire.

3. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	USB charger unit 3P connector: disconnected
Test point 1	**USB charger unit 3P connector No. 3**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 4.

NO

Repair an open or high resistance in the ground wire or poor ground (G402).

4. Open wire check (ACC line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	USB charger unit 3P connector: disconnected
Test point 1	**USB charger unit 3P connector No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The ACC wire is OK. **Replace the USB charger unit** .

NO

Repair an open in the wire.

USB device does not function

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- Check the USB's specifications:
-
    - Mass-storage class ready digital audio player with USB 2.0 port
    - More than 256 MB storage space
    - Supports MP3, WMA, and AAC (encoded with the iTunes) files, DRM files are not supported
- Not all players and player functions work with the USB adapter. Please see the Owner's Manual for more information. Always test the customer's USB device in a known-good vehicle of the same year and trim (if possible). Technologies change and are updated frequently which may result that USB devices may work in newer vehicles, but not in older vehicles of the same model.
- If Unsupported Ver appears on the display, the vehicle is OK, there is a software problem with the USB device.
- Check the connectors for poor connections or loose terminals.
- Display audio type: Before doing this troubleshooting, check the hard error code;
-
    - **With navigation**
    - **Without navigation**

1. Determine possible failure area (USB device, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Connect the customer's USB device to a known-good vehicle (same year/trim) that is equipped with a USB adapter, and check the USB device operation.

   Does the USB device work properly in the known-good vehicle?

   YES

   Go to step 2.

   NO

   See the Owner's Manual for details about the USB device requirements and approved file types.

2. Problem verification 1

   -1. On the customer's vehicle, connect the customer's USB device to the USB port A.

   -2. Turn the vehicle to the ON mode.

   -3. Check the USB device operation in the customer's vehicle.

   Does the USB device work properly in the customer's vehicle?

   YES: With USB port B

   Go to step 3.

   YES: Without USB port B

   Intermittent failure, the system is OK at this time. Inspect the connectors of the USB device and USB port for wear.

   NO: With USB port B

   The failure is duplicated, go to step 4.

   NO: Without USB port B

   The failure is duplicated, go to step 5.

3. Problem verification 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the customer's USB device from the USB port A.

   -3. Connect the customer's USB device to the USB port B.

   -4. Turn the vehicle to the ON mode.

   -5. Check the USB device operation in the customer's vehicle.

   Does the USB device work properly in the customer's vehicle?

   YES

   Intermittent failure, the system is OK at this time. Inspect the connectors of the USB device and USB port for wear.

   NO

   The failure is duplicated, go to step 6.

4. Determine possible failure area (USB1 line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the customer's USB device from the USB port A.

   -3. Connect the customer's USB device to the USB port B located in the center console.

   -4. Turn the vehicle to the ON mode.

   -5. Check the USB device operation in the customer's vehicle.

Does the USB device work properly in the customer's vehicle?

YES

Go to step 5.

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

5. Open wire check (USB1 lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

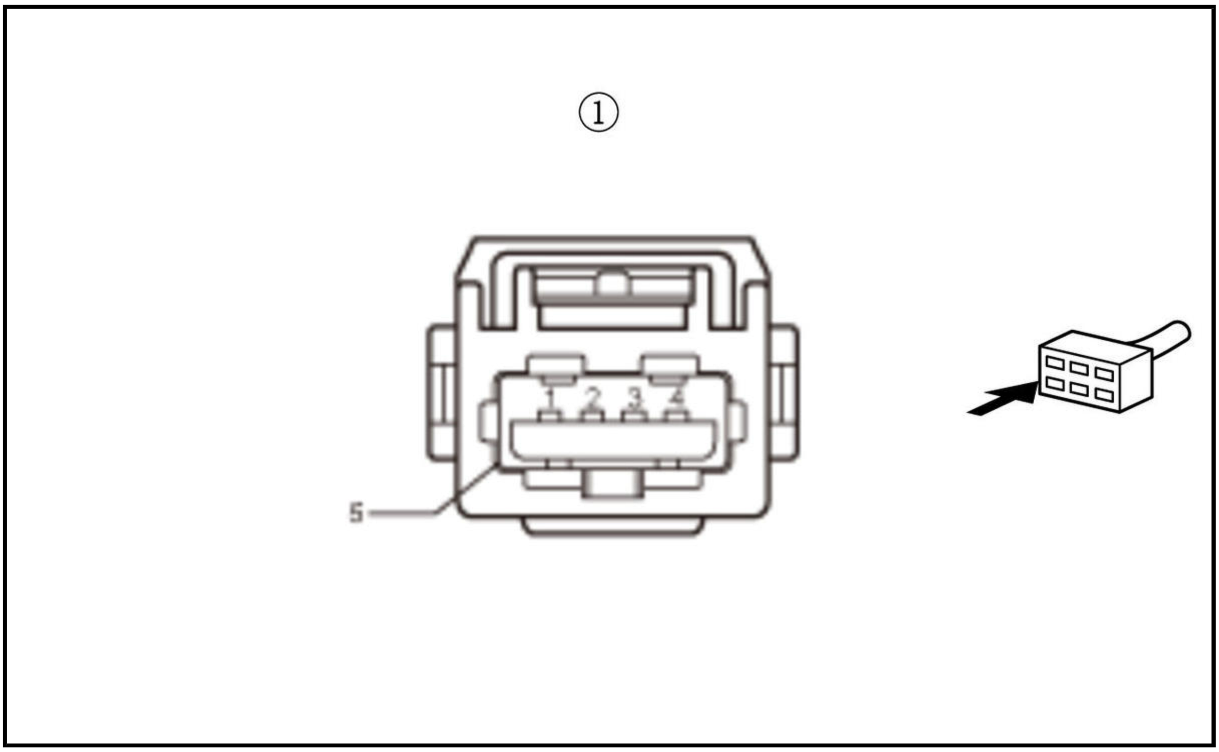
-2. Disconnect the following connector.

Audio-navigation unit connector F (5P) (with navigation)Audio unit connector F (5P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector F (5P) (with navigation): disconnected Audio unit connector F (5P) (without navigation): disconnected

Test point 1:Audio-navigation unit connector F (5P) (with navigation) **Audio unit connector F (5P) (without navigation)**	**Test point 2:USB port A 5P connector (female terminals):** ①
No. 1	No. 1
No. 2	No. 4
No. 3	No. 2
No. 4	No. 3



Is there continuity?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

There is an open in the wire(s). Replace the affected shielded harness.

6. Open wire check (USB2 lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

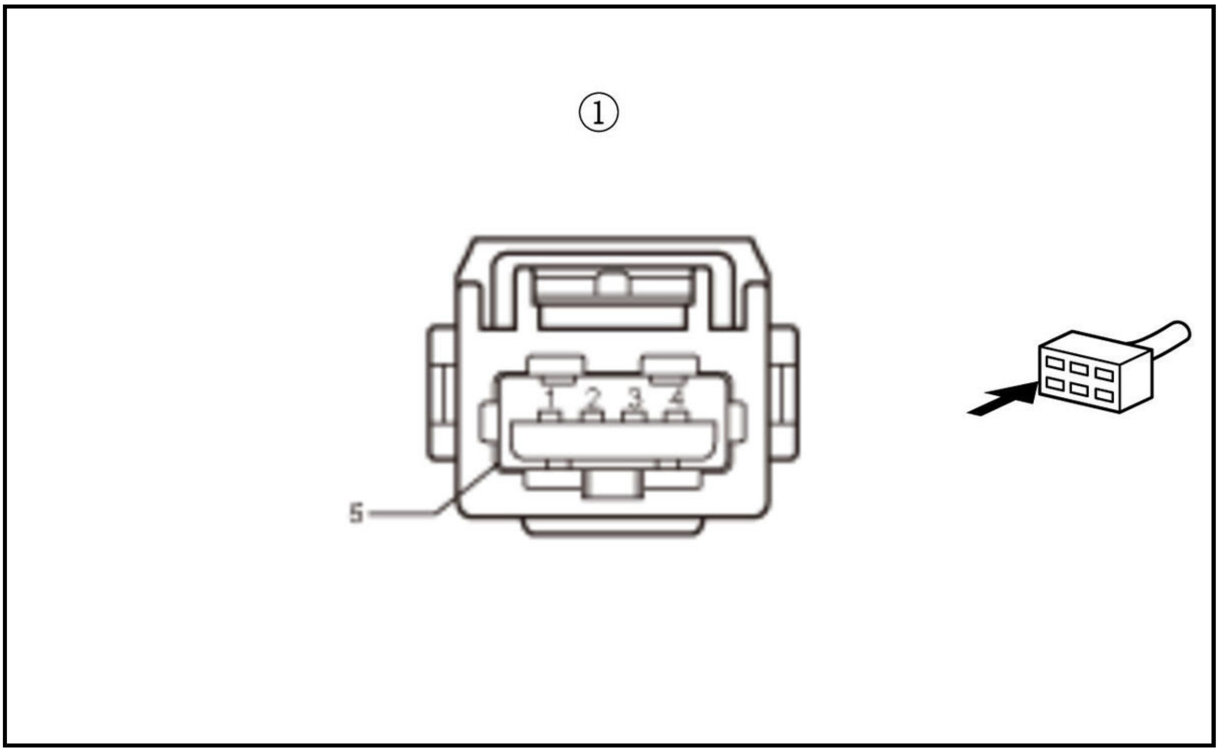
Audio-navigation unit connector G (5P) (with navigation)Audio unit connector G (5P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector G (5P) (with navigation): disconnected Audio unit connector G (5P) (without navigation): disconnected

Test point 1:Audio-navigation unit connector G (5P) (with navigation) **Audio unit connector G (5P) (without navigation)**	**Test point 2:USB port B 5P connector (female terminals):** ①
No. 1	No. 1
No. 2	No. 4
No. 3	No. 2

Test point 1:Audio-navigation unit connector G (5P) (with navigation) **Audio unit connector G (5P) (without navigation)**	**Test point 2:USB port B 5P connector (female terminals):** ①
No. 4	No. 3



Is there continuity?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

There is an open in the wire(s). Replace the affected shielded harness.

Volume does not increase with speed

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- If possible, have the customer demonstrate their concern and compare it against a known-good vehicle.
- Check for B-CAN DTCs and resolve them before troubleshooting.
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Test-drive the vehicle at freeway speeds, and monitor if the volume increases.

Does the volume increase?

YES

Intermittent failure, the system is OK at this time.

NO

The failure is duplicated, go to step 2.

2. Determine possible failure area (audio setting, others)

   -1. Verify the SVC mode setting in the audio system sound set-up.

   Is the SVC set to off?

   YES

   Change the setting to SVC MID, and recheck.

   NO

   Go to step 3.

3. Determine possible failure area (audio unit, others):

   Go into the System Diagnostic Mode:

   - Display Audio Type: Do the Vehicle Status diagnosis to check the Speed indication;
   -
     - **With navigation**
     - **Without navigation**
   - Color Audio Type: **Do the VSPNE in the Vehicle Information to check the C_VSP indication**.

   -2. Test-drive the vehicle with the help of an assistant, and then watch the vehicle speed in the center display.

   Is the vehicle speed indicated?

   YES: With stereo amplifier

   Go to step 4.

   YES: Without stereo amplifier, with navigation

   Replace the audio-navigation unit .

   YES: Without stereo amplifier, without navigation

   Replace the audio unit .

   NO

   Go to step 5.

4. Stereo amplifier check (substitution)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Substitute a known-good stereo amplifier, and recheck** .

   Does the symptom go away?

   YES

Replace the original stereo amplifier .

NO: With navigation

Replace the audio-navigation unit .

NO: Without navigation

Replace the audio unit .

5. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Gauge control module connector A (32P)

Audio-navigation unit connector A (24P) (with navigation)
Audio unit connector A (24P) (without navigation)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	Audio-navigation unit connector A (24P) (with navigation): disconnected
B	Audio unit connector A (24P) (without navigation): disconnected
Test point 1	Gauge control module connector A (32P) No. 30
Test point 2	Audio-navigation unit connector A (24P) (with navigation) No. 14
	Audio unit connector A (24P) (without navigation) No. 14

Test point 1	Gauge control module connector A (32P) No. 31
Test point 2	Audio-navigation unit connector A (24P) (with navigation) No. 24
	Audio unit connector A (24P) (without navigation) No. 24

Is there continuity?

YES: With navigation

Replace the audio-navigation unit .

YES: Without navigation

Replace the audio unit .

NO

Repair an open in the wire(s).

SYMPTOM TROUBLESHOOTING INDEX

AUDIO SYSTEM SYMPTOM TROUBLESHOOTING INDEX(COLOR AUDIO TYPE)

Symptom	Diagnostic Procedure	Also Check for
Poor AM or FM radio reception or interference	Symptom Troubleshooting	• Check radio reception: Do the FM or AM in the System Diagnostic Mode

Symptom	Diagnostic Procedure	Also Check for
		- Aftermarket FM modulator - Loose antenna amplifier mounting bolt
Audio unit will not turn on (No information display)	**Symptom Troubleshooting**	B
No sound is heard from all the speakers (display is normal)	**Symptom Troubleshooting**	Aftermarket amplifier or speakers
Audio system sound is weak or distorted (display is normal)	**Symptom Troubleshooting**	- Fader and balance positions - Aftermarket amplifier or speakers
Auxiliary input sound is low or cannot be heard	**Symptom Troubleshooting**	- Auxiliary audio device volume is too low - Auxiliary stereo cables compatibility
AM/FM radio preset memory is lost	**Replace the audio unit**	Internal error
Audio unit button does not work	**Do the Knob Check in the System Diagnostic Mode**	Check the connector for poor connections or loose terminals between the audio unit and the audio panel
Volume does not increase with speed	**Symptom Troubleshooting**	Speed-sensitive Volume Control settings (see the Owner's Manual)
Volume is too high or too low when driving at freeway speeds	B	Speed-sensitive Volume Control settings (see the Owner's Manual)

System always comes up in-line diagnostic mode	Factory diagnostic screen In Line Diag	B

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE AUDIO SYSTEM

NOTE: Refer to How to Troubleshoot the Navigation System for information about the audio-navigation unit .

How to Recognize Audio Unit and Audio-Navigation Unit (Display audio type)

There are two kinds of audio units with a 7-inch display unit depending on the vehicle model. These units exist as an audio unit (without navigation) and an audio-navigation unit (with navigation), and appear the same. However, the audio-navigation unit displays a Honda Globe screen after displaying a Honda logo screen* every time when you turn the vehicle to the ACCESSORY mode.

*: When the vehicle is turned to the ACCESSORY or ON mode.

Forced Rebooting of Audio Unit (Display audio type)

If the system is frozen, and the screen does not respond, you can attempt rebooting the audio unit by pressing and holding the AUDIO POWER (⏻) button for 5 seconds. When the function is effective, the confirmation screen appears.

Anti-Theft Feature (With audio system theft protection)

The audio unit has an anti-theft protection circuit. When one of the following occurs, the unit enters the anti-theft mode:

- Disconnecting the 12 volt battery terminal.
- Disconnecting audio unit connector A (24P).
- Removing the +B line's fuses.

After the service, reconnect power to the audio unit, and turn the vehicle to the ON mode. There are two ways to exit the anti-theft mode:

- Press and hold the AUDIO POWER (⏻) button for at least 2 seconds. The audio unit automatically exits the anti-theft mode. If the audio unit does not exit anti-theft mode, turn the vehicle to the OFF (LOCK) mode then the ON mode (if possible, start the engine), and try to release the anti-theft several times.
- Enter the 5-digit anti-theft code. If the input of code fails 10 times in a row, the screen is locked for 60 minutes.

When the audio unit is installed in another vehicle (same Year/Model/Trim), like in cases where a known-good unit was substituted for testing, **do the Anti-Theft Skip mode in the System Diagnostic Mode (display audio type)**, or **do the Anti-Theft Temporary Cancellation in the System Diagnostic Mode (color audio type)**. These mode will release the anti-theft code for 150 seconds.

Global Positioning System (GPS) Limitations (Display audio type)

The GPS signal is used for some functions about the audio unit. The GPS cannot detect the vehicle's position or elevation during the following instances:

- For the first 5 to 10 minutes after reconnecting the 12 volt battery (this process can take as long as 45 minutes).
- When the satellite signals are blocked by tall buildings, mountains, tunnels, large trees, inside parking structures or large trucks.
- When the GPS antenna is blocked by metallic window tinting or by an object placed above it in the vehicle. The GPS antenna requires a clear unobstructed view of the sky.
- When there is no satellite signal output (signal output is sometimes stopped for satellite servicing).
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.

The accuracy of the GPS is reduced during these instances:

- Metallic window tinting above the GPS antenna.
- When only three or fewer satellite signals are received (Four satellite signals are required for accurate positioning).
- When driving near high tension power lines.
- When the satellite signals are blocked by the operation of some electronic aftermarket accessories including, but not limited to non-OEM in-dash entertainment units (amp, CD players/changers, radar detectors, theft recovery systems, etc.) and cell phones placed near the navigation system.
- When the satellite control centers are experiencing problems.

LCD Unit Limitations (Display audio type)

The center display unit is touch sensitive. Touch the display directly to select items on the screen.

- Heavy gloves, fingernails or pens cannot be used on the touch panel.
- In cold temperatures, the display may stay dark for the first minute until it warms up.
- When the display is too hot because of direct summer sunlight, it remains dark until the temperature drops (you may see an error message displayed stating this fact).
- Fingerprints on the screen may be noticeable. Clean the screen with a soft, damp cloth. You may use a mild cleaner intended for eye glasses or computer screens. To avoid scratching the panel, do not rub too hard or use abrasive cleaners or shop towels.

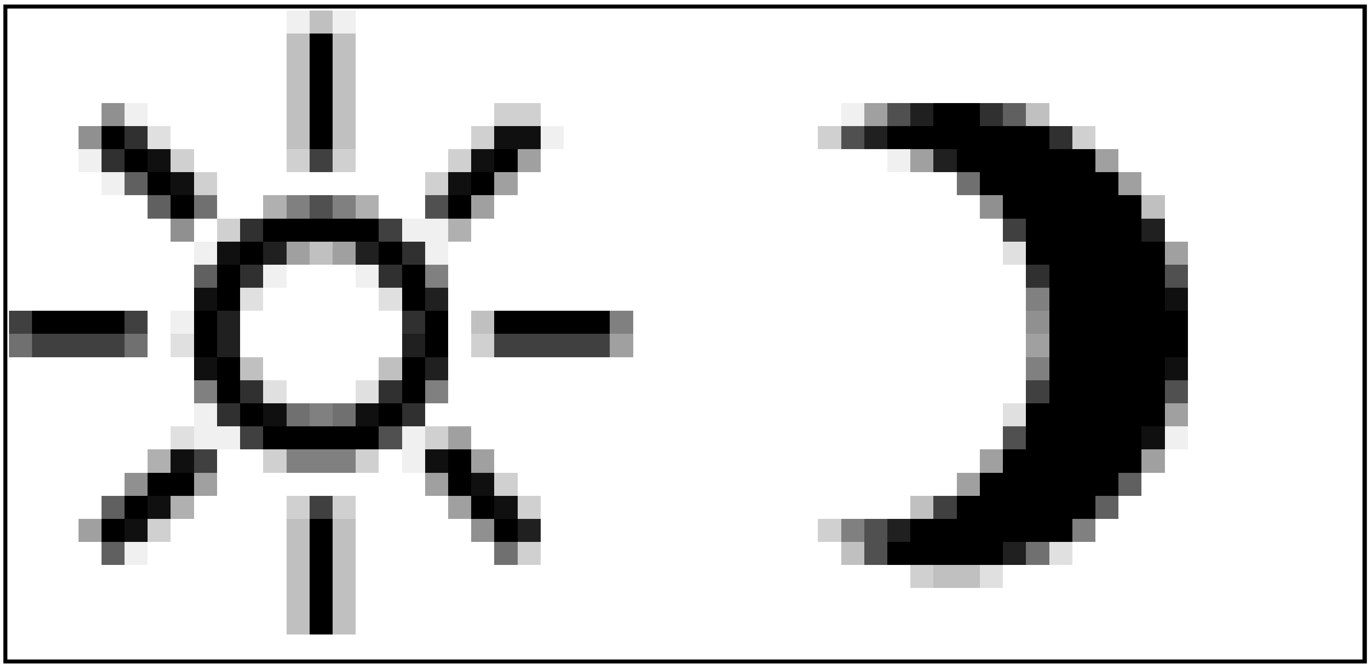
How to Check Error History (Audio DTCs) (Display audio type)

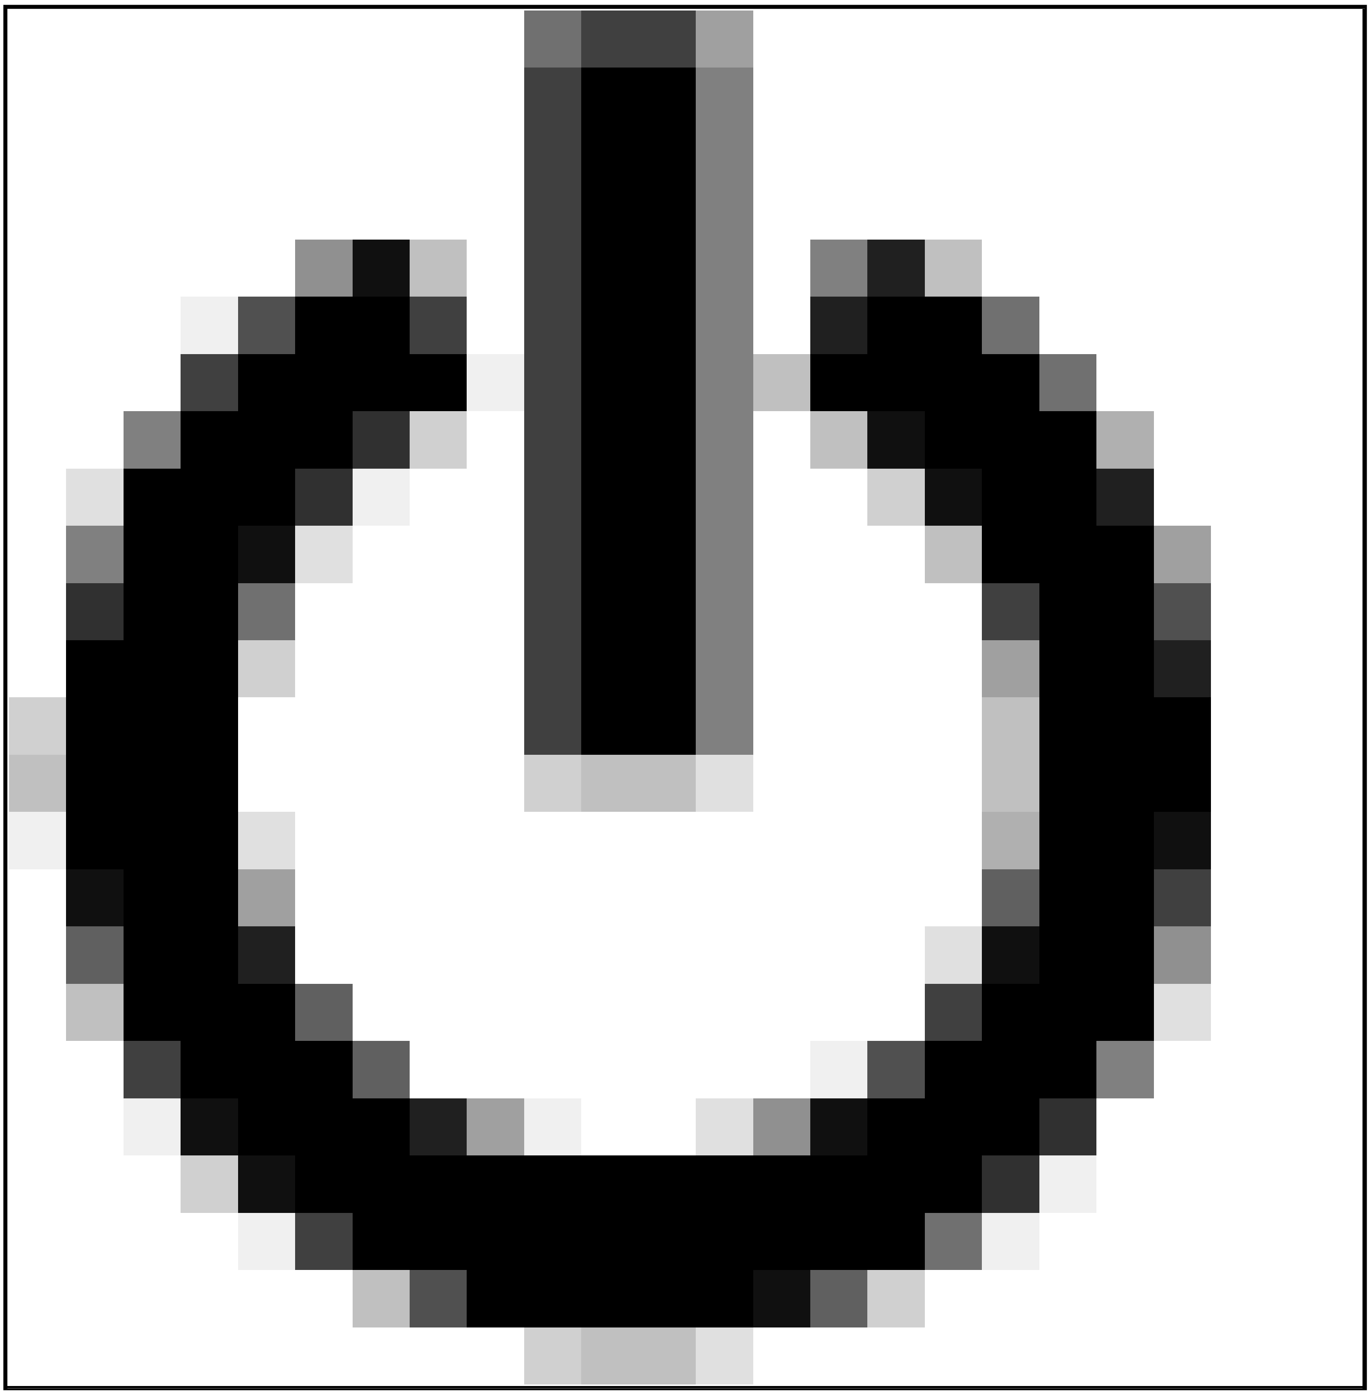
NOTE: The audio DTCs cannot be retrieved with the HDS.

The Error History feature is to record intermittent audio/navigation issues that occur while the customer is using the system. Sometimes the customer complaint cannot be duplicated. The error history may record the information needed to diagnose the problem. To check the error history:

1. Turn the vehicle to the ON mode.

2. Press and hold the PHONE button, the DISPLAY MODE button, and the AUDIO POWER button until the Select Diagnosis Items menu screen is displayed:





NOTE: The buttons needs to be pressed together simultaneously.

Displaying Select Diagnosis Items Menu Screen

Deleted data cannot be recoverd.
Continue?

9. Select the Yes icon. All Hard Error histories are cleared. Select the Return icon to exit the Error History.

REMOVAL & INSTALLATION TEST

AUDIO REMOTE - HFL SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. Driver's Airbag - Remove
2. Audio Remote-HFL Switch - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

Test

NOTE: Testing of the switch only applies to models without multi-information display.

1. Steering Wheel Trim - Remove
2. Audio Remote-HFL Switch - Test

 6 5 4 3 2 1 12 11 10 9 8 7 SOURCE TALK BUTTON HANG-UP BUTTON PICK-UP BUTTON	1. Measure the resistance between terminals No. 3 and No. 6 in each switch position according to the table. 2. Measure the resistance between terminals No. 6 and No. 9 in each switch position according to the table. 3. If the resistance is not as specified, replace the audio remote-HFL switch.

Button Held Down	Resistance
No button pressed	About 10 kΩ
HANG-UP	About 47 Ω

Button Held Down	Resistance
PICK-UP	About 222 Ω
TALK	About 2.2 kΩ

Button Held Down	Resistance
No button pressed	About 10 kΩ
SOURCE	About 3.7 kΩ
Right (CH +)	About 1.7 kΩ
Left (CH -)	About 775 Ω
+ (VOL.UP)	About 357 Ω
- (VOL.DOWN)	About 99 Ω

3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

SPEAKER REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: **How to read the torque specifications** .

Door Speaker

1. Door Panel - Remove
   - **Front door**
   - **Rear door**
2. Door Speaker - Remove

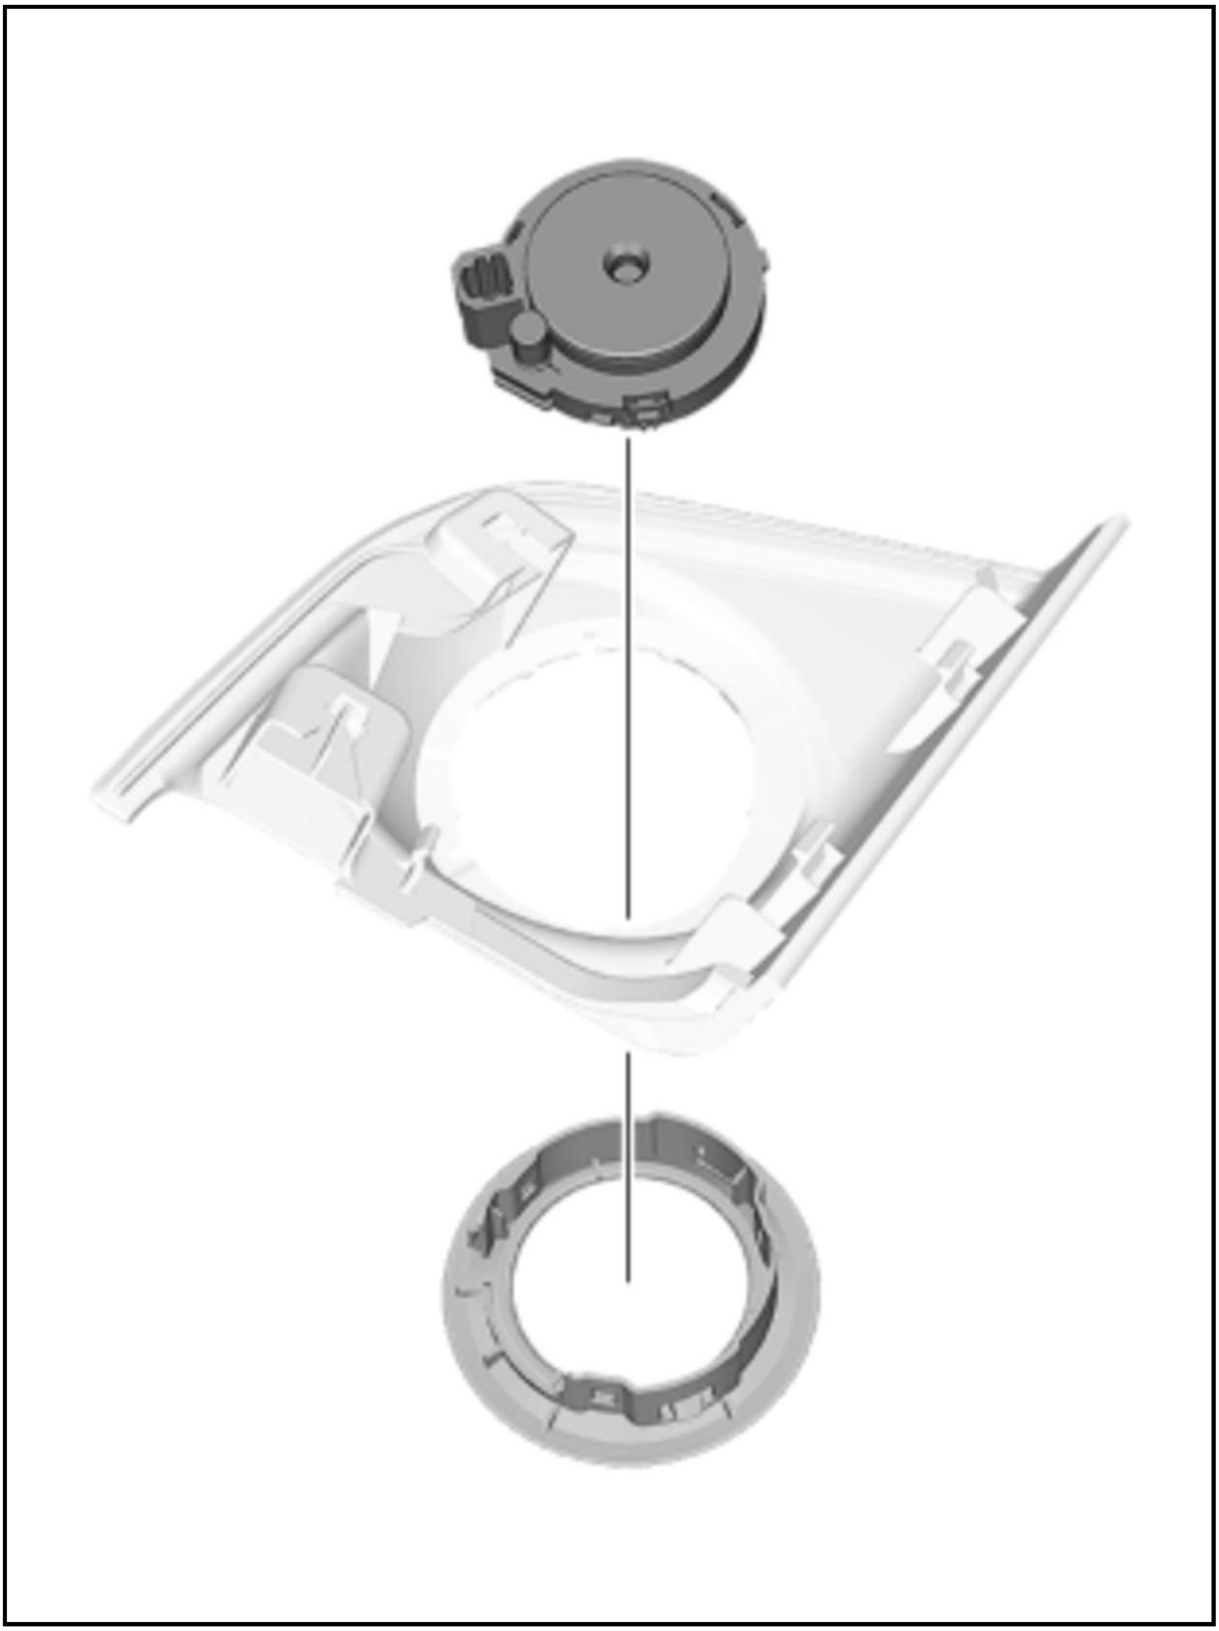
	1. Remove the bolt, then lift the door speaker (A) straight up to release the lower clips (B). 2. Disconnect the connector.

3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

   Front Tweeter

4. **Mirror Trim - Remove**
5. Front Tweeter - Remove

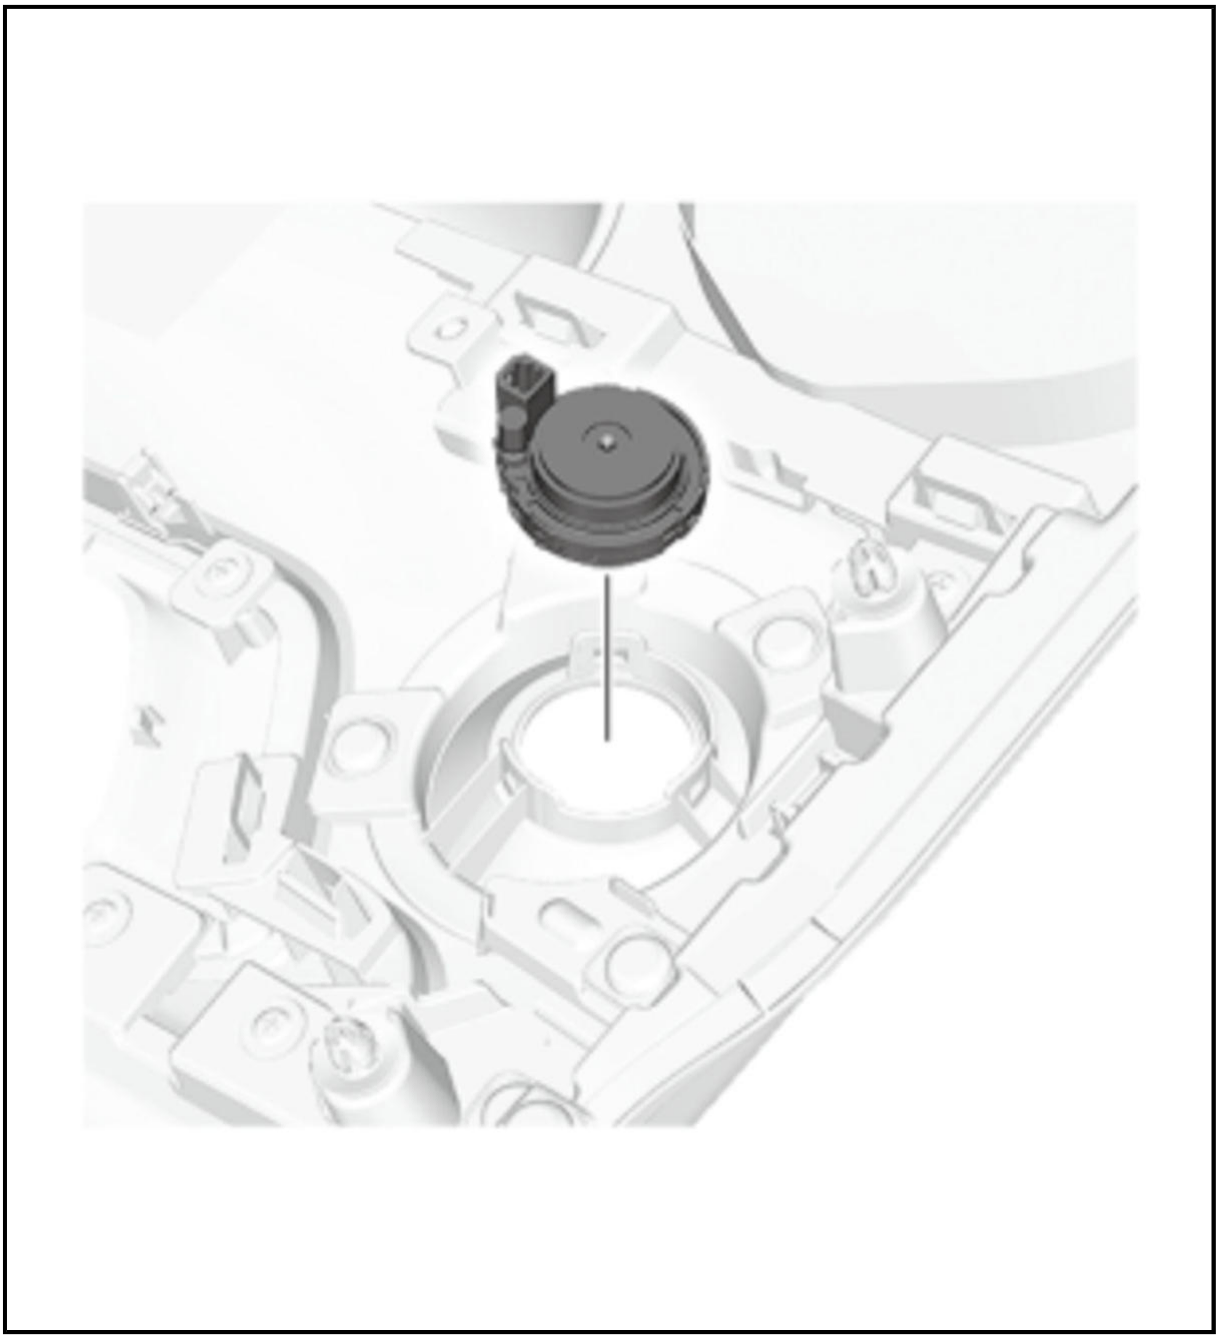


6. All Removed Parts - Install

   Install the parts in the reverse order of removal.

   Rear Tweeter

7. **Rear Door Panel - Remove**
8. Rear Tweeter - Remove

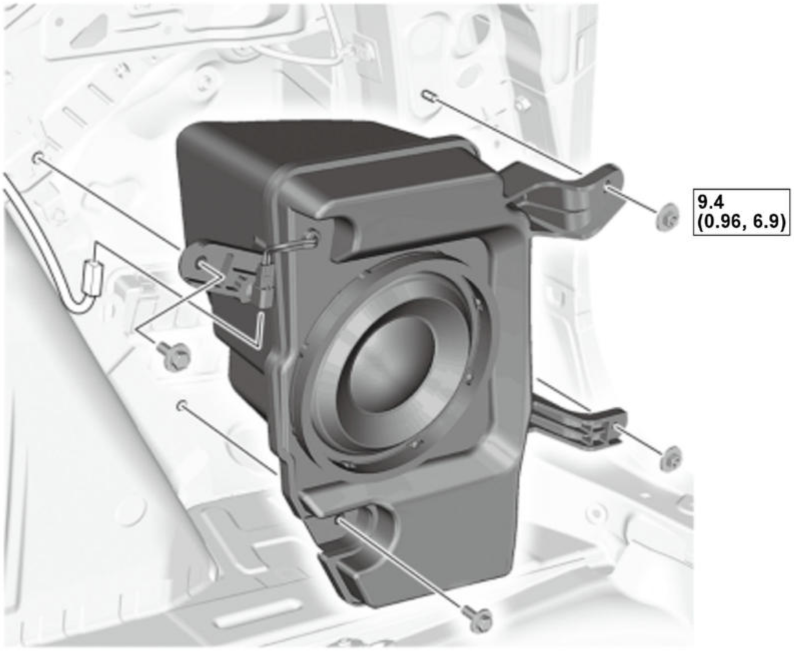


9. All Removed Parts - Install

   Install the parts in the reverse order of removal.

   Subwoofer

10. **Rear Side Trim Panel (Right Side) - Remove**
11. Subwoofer - Remove



12. All Removed Parts - Install

    Install the parts in the reverse order of removal.

Test

Door Speaker, Rear Speaker

1. Door Speaker, Rear Speaker - Test

	1. Measure the resistance between terminals No. 1 and No. 2. There should be about 4 Ω. 2. If the resistance is not as specified, replace the door speaker.

Tweeter

2. Tweeter - Test

	1. Measure the resistance between terminal No. 1 and the outside terminal of the capacitor (A). There should be about 4 Ω. Also visually check the capacitor for damage. 2. If the resistance is not as specified, replace the tweeter.

Subwoofer

3. Subwoofer - Test

	1. Measure the resistance between the terminals No. 1 and No. 2. There should be about 2 Ω. 2. If the resistance is not as specified, replace the subwoofer.

REMOVAL AND INSTALLATION

ANC/ACTIVE SOUND CONTROL MICROPHONE REMOVAL AND INSTALLATION

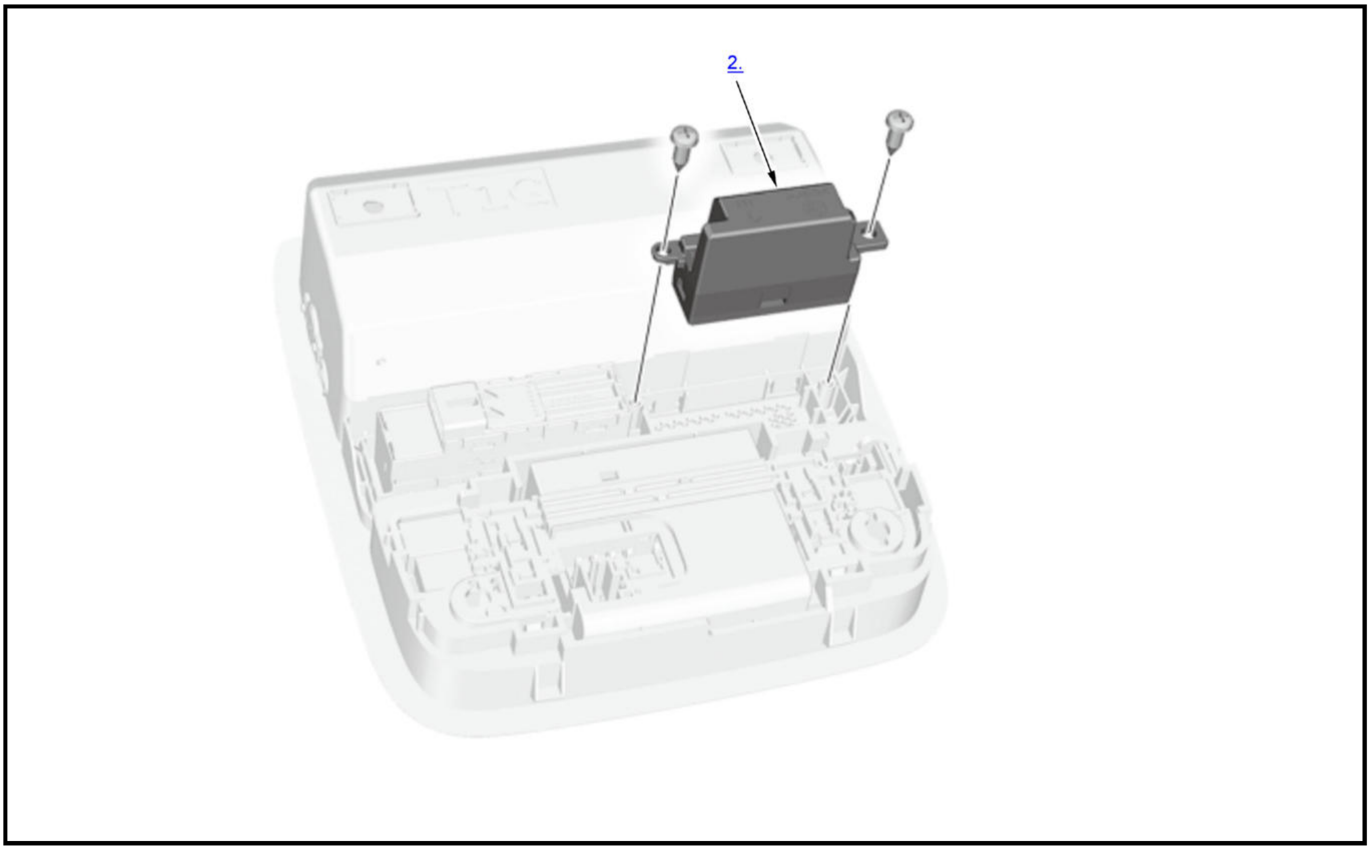
Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: The front HFL-ANC/active sound control microphone and the front HFL-navigation-ANC/active sound control microphone are the same parts.

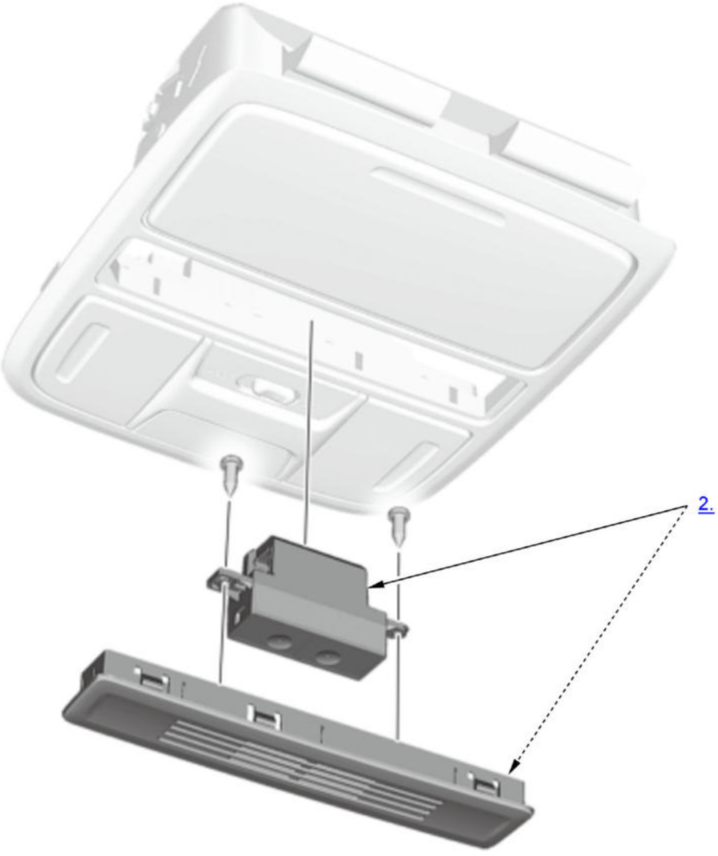
1

Front (Some of equipment next to microphone)



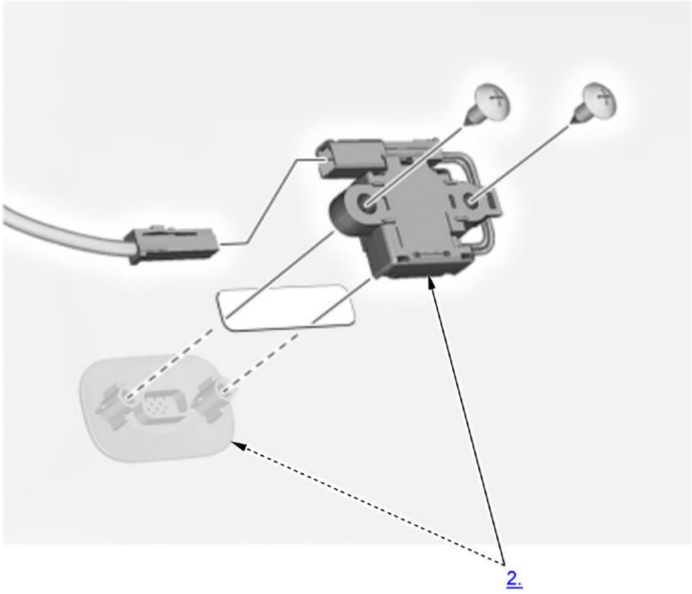
2

Front (Equipped with only microphone)



3

Rear



Front

1. **Roof Console Assembly - Remove**
2. Front ANC/Active Sound Control Microphone - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

   Rear

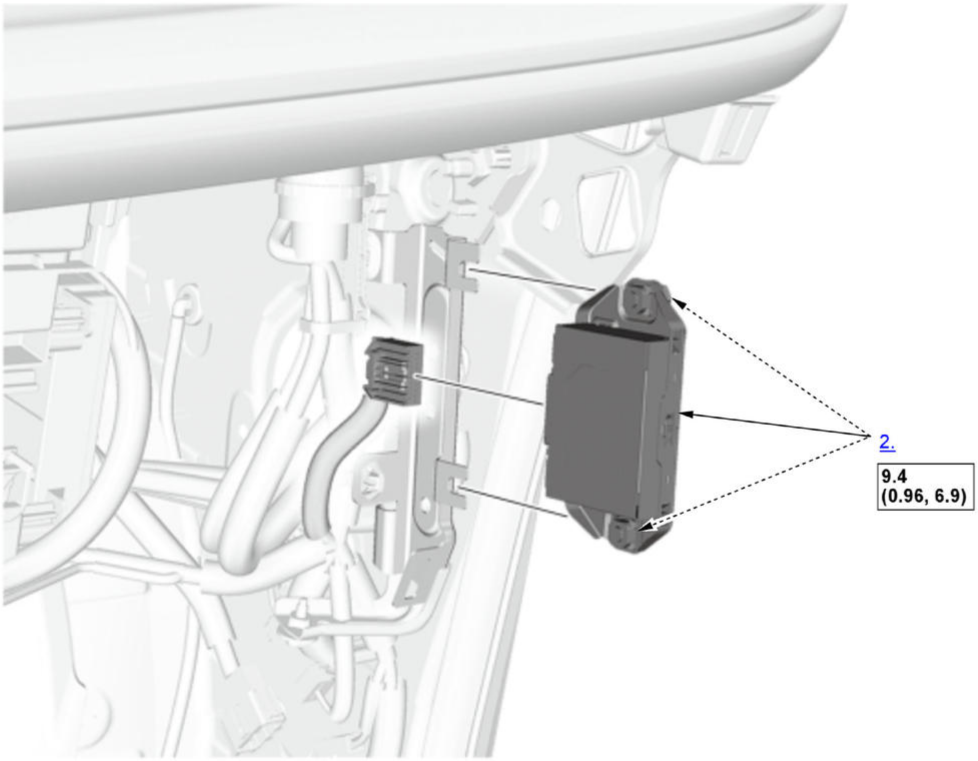
4. **Headliner - Remove**
5. Rear ANC/Active Sound Control Microphone - Remove
6. All Removed Parts - Install

   Install the parts in the reverse order of removal.

ANC/ACTIVE SOUND CONTROL UNIT REMOVAL AND INSTALLATION

Removal and Installation

1



▭	Torque: N.m (kgf.m, lbf.ft)

1. **Glove box - Remove**
2. ANC/Active Sound Control Unit - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

AUDIO UNIT REMOVAL AND INSTALLATION (COLOR AUDIO TYPE)

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- ℹ Where icon is shown, further information shown below.
- When working on electronic components, make sure the work area is clean and dust free.
- Make sure your hands are clean and free of oils and grease.
- If you are replacing the audio unit, write down the audio presets (if possible), and enter them into a new audio unit.

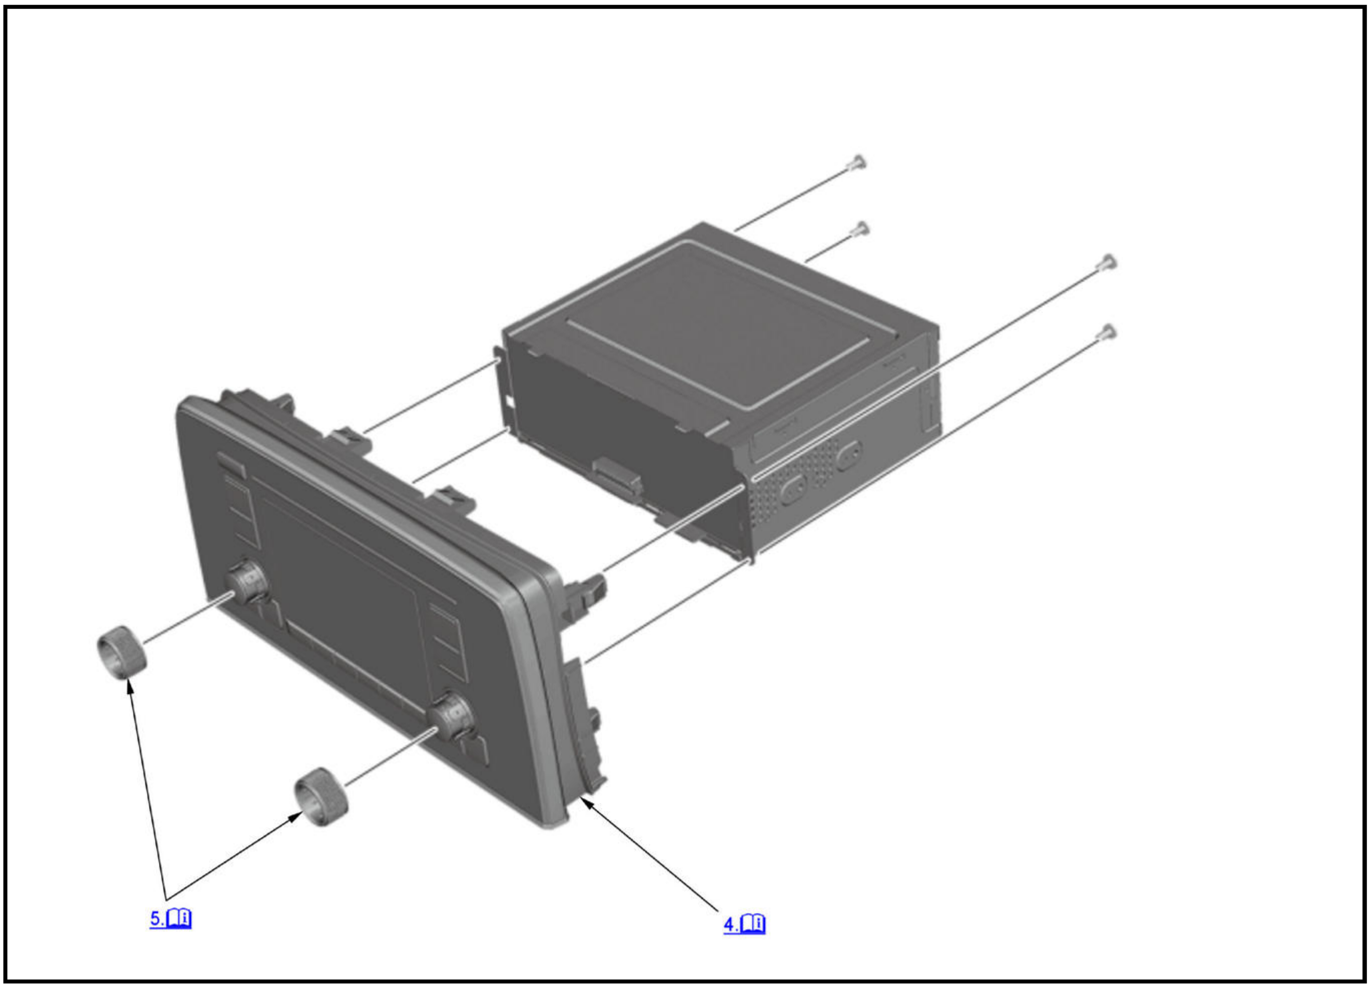
	Detailed information, notes, and precautions
	Torque: N.m (kgf.m, lbf.ft)



🕮i	Detailed information, notes, and precautions

1. **Climate Control Panel - Remove**
2. Audio Unit Assembly - Remove

   NOTE:

   - When installing, make sure all the connectors are secure.
   - After Installation, **do the System Links in the System Diagnostic Mode** to confirm that there are no problems in the system.
3. Audio Unit Bracket - Remove
4. Audio Panel - Remove

   NOTE:

   - Discharge static electricity from your body before and during the work.
   - Do not touch the circuit board(s) with your bare hands.
5. Volume/List Knob - Remove

   If necessary, remove the knob(s).

6. All Removed Parts - Install

   Install the parts in the reverse order of removal.

AUDIO UNIT REMOVAL AND INSTALLATION (DISPLAY AUDIO TYPE)

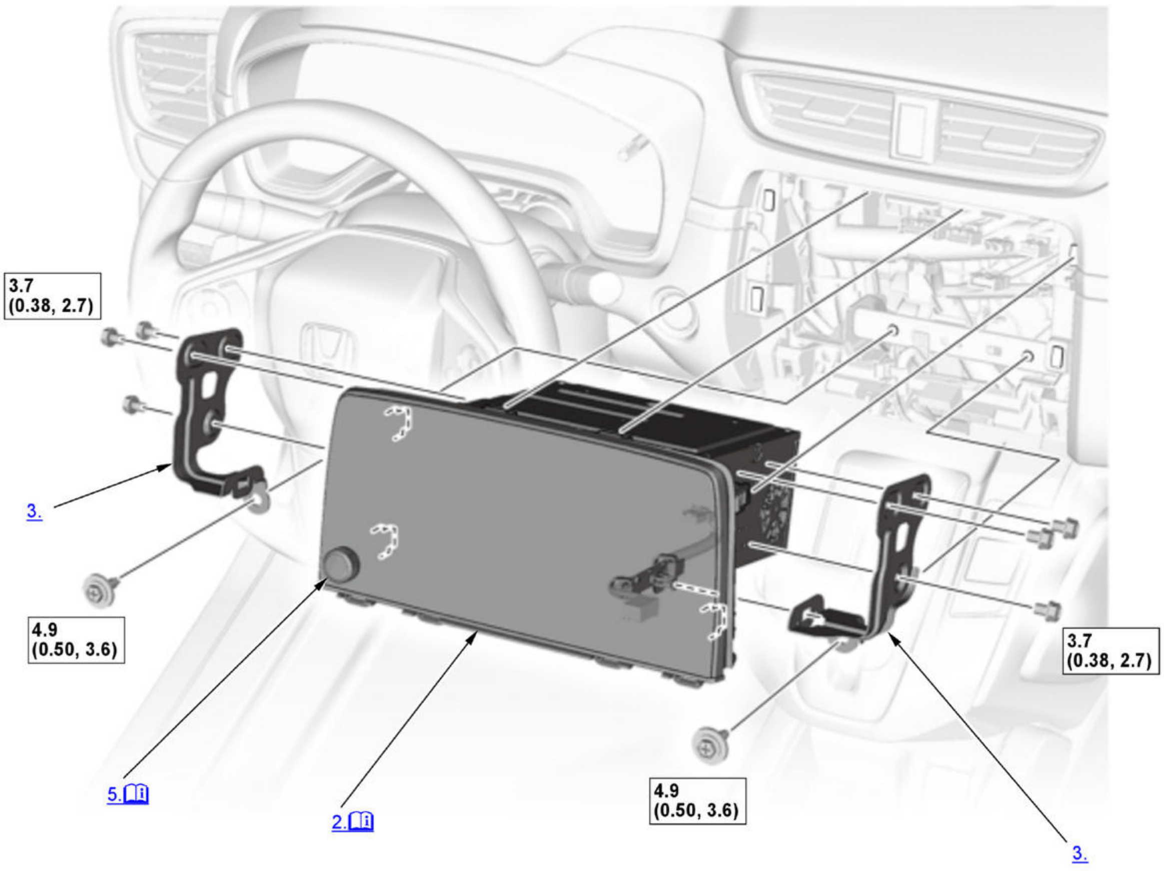
Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

- ℹ Where icon is shown, further information shown below.
- When working on electronic components, make sure the work area is clean and dust free.
- Make sure your hands are clean and free of oils and grease.

1



ℹ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)

1. Climate Control Panel - Remove
2. Audio Unit Assembly - Remove

   NOTE:

   - When installing, make sure all the connectors are secure.
   - After Installation, do the System Links in the System Diagnostic Mode to confirm that there are no problems in the system.

3. Audio Unit Bracket - Remove
4. Center Display Unit - Remove
5. Volume Knob - Remove

   If necessary, remove the knob.

6. All Removed Parts - Install

   Install the parts in the reverse order of removal.

AUDIO-NAVIGATION UNIT REMOVAL AND INSTALLATION

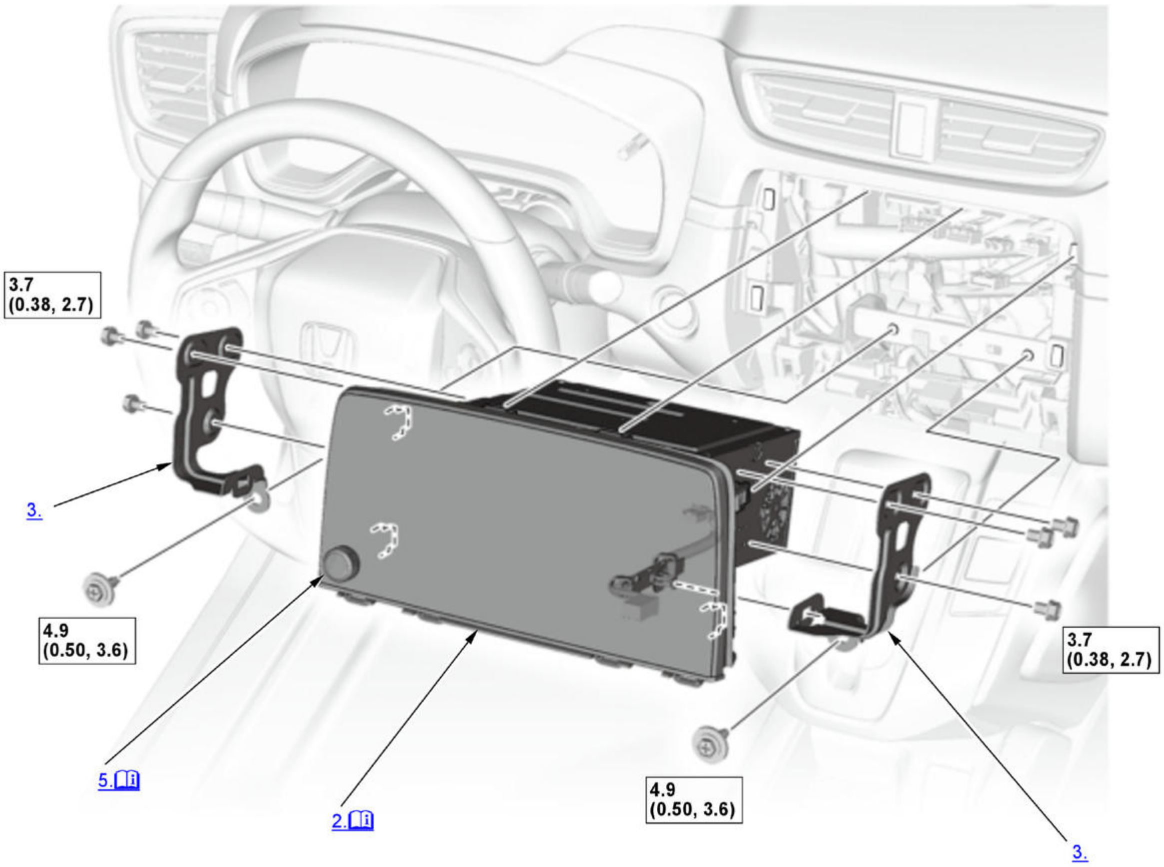
Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

- ℹ Where icon is shown, further information shown below.
- When working on electronic components, make sure the work area is clean and dust free.
- Make sure your hands are clean and free of oils and grease.
- When the audio-navigation unit is replaced or disconnected, do the Map Matching. This part of the initialization matches the GPS coordinates with a road on the map screen. To do this part of the procedure, make sure that the navigation system displays a map, and drive the vehicle on a mapped road shown on the map screen. Do not enter a destination at this time. When the name of the current road you are driving on appears at the bottom of the screen, the entire procedure is complete.

1



ℹ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)

1. Climate Control Panel - Remove
2. Audio-Navigation Unit Assembly - Remove

   NOTE:

   - When installing, make sure all the connectors are secure.
   - If the audio-navigation was replaced, it may take up to 30 minutes for the navigation system to calibrate and operate correctly.
   - After Installation, do the System Links in the System Diagnostic Mode to confirm that there are no problems in the system, then park the vehicle outside, and do the GPS initialization.
3. Audio-Navigation Unit Bracket - Remove
4. Center Display Unit - Remove
5. Volume Knob - Remove

   If necessary, remove the knob.

6. All Removed Parts - Install

   Install the parts in the reverse order of removal.

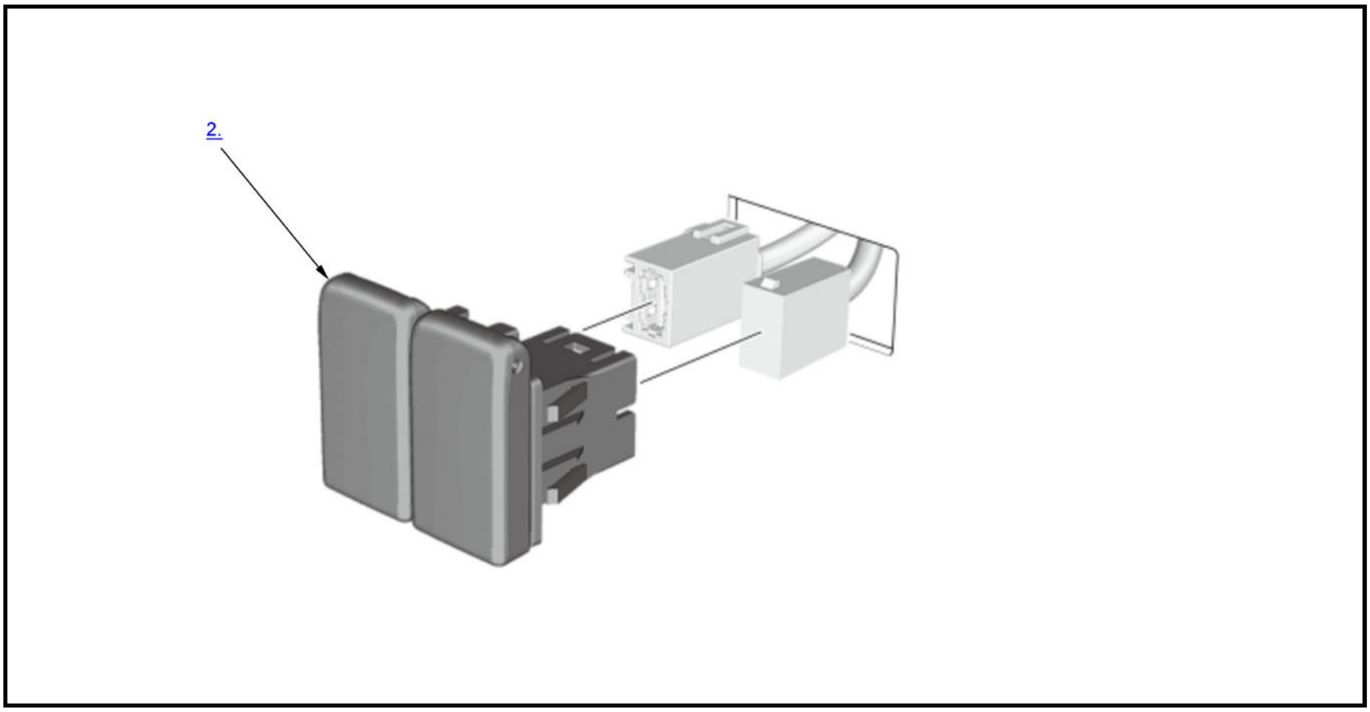
AUXILIARY JACK ASSEMBLY REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

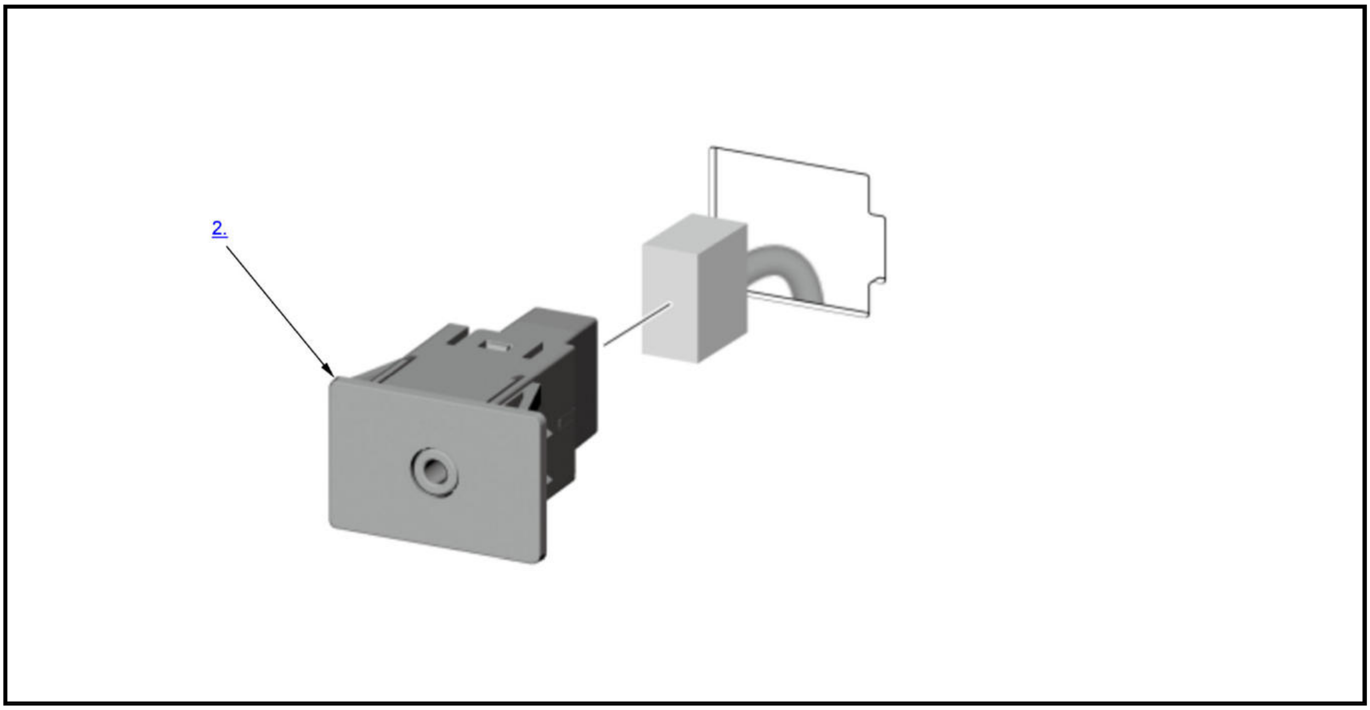
1

Without USB port light



2

With USB port light



Without USB Port Light

1. **Center Console Panel - Remove**

2. Auxiliary Jack Assembly - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

   With USB Port Light

4. Dashboard Center Lower Panel - Remove
5. Auxiliary Jack Assembly - Remove
6. All Removed Parts - Install

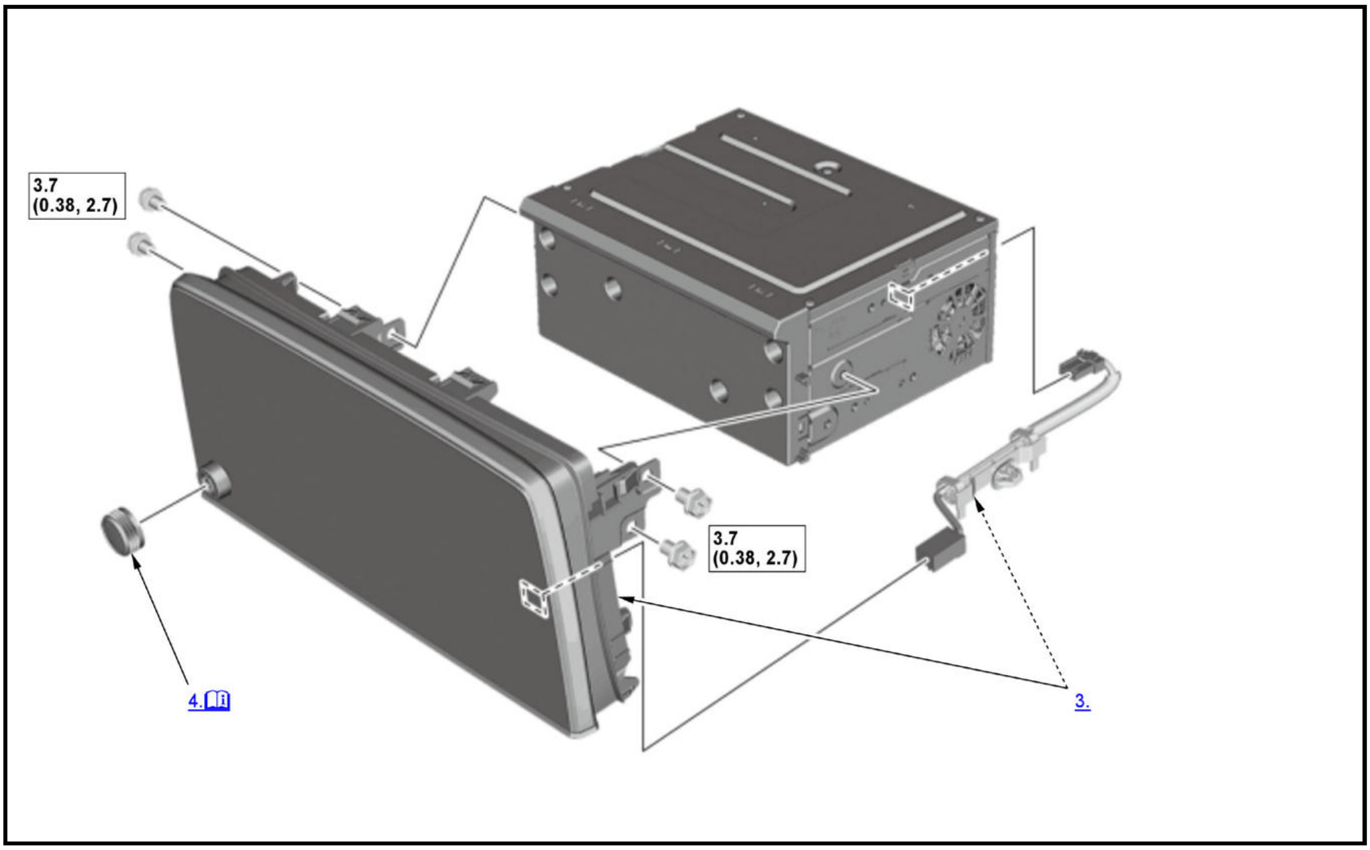
   Install the parts in the reverse order of removal.

CENTER DISPLAY UNIT REMOVAL AND INSTALLATION

Removal and Installation

NOTE: ℹ Where icon is shown, further information shown below.

1



ℹ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)

1. Audio-Navigation Unit Assembly - Remove (With Navigation)
2. Audio Unit Assembly - Remove (Without Navigation)
3. Center Display Unit - Remove
4. Volume Knob - Remove

   If necessary, remove the knob.

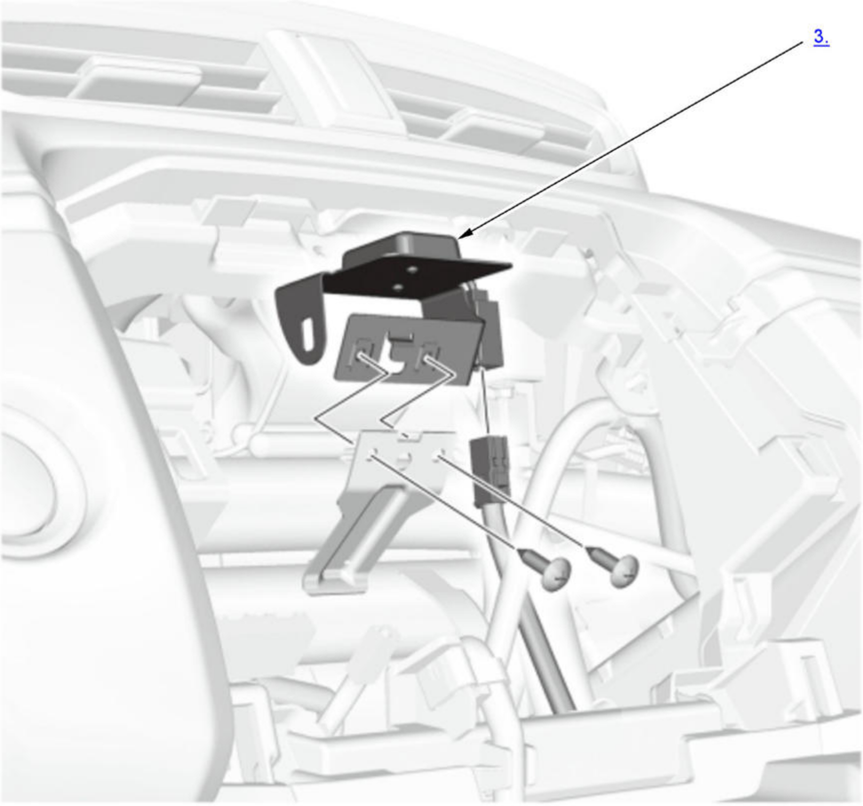
5. All Removed Parts - Install

   Install the parts in the reverse order of removal.

GPS ANTENNA REMOVAL AND INSTALLATION

Removal and Installation

1



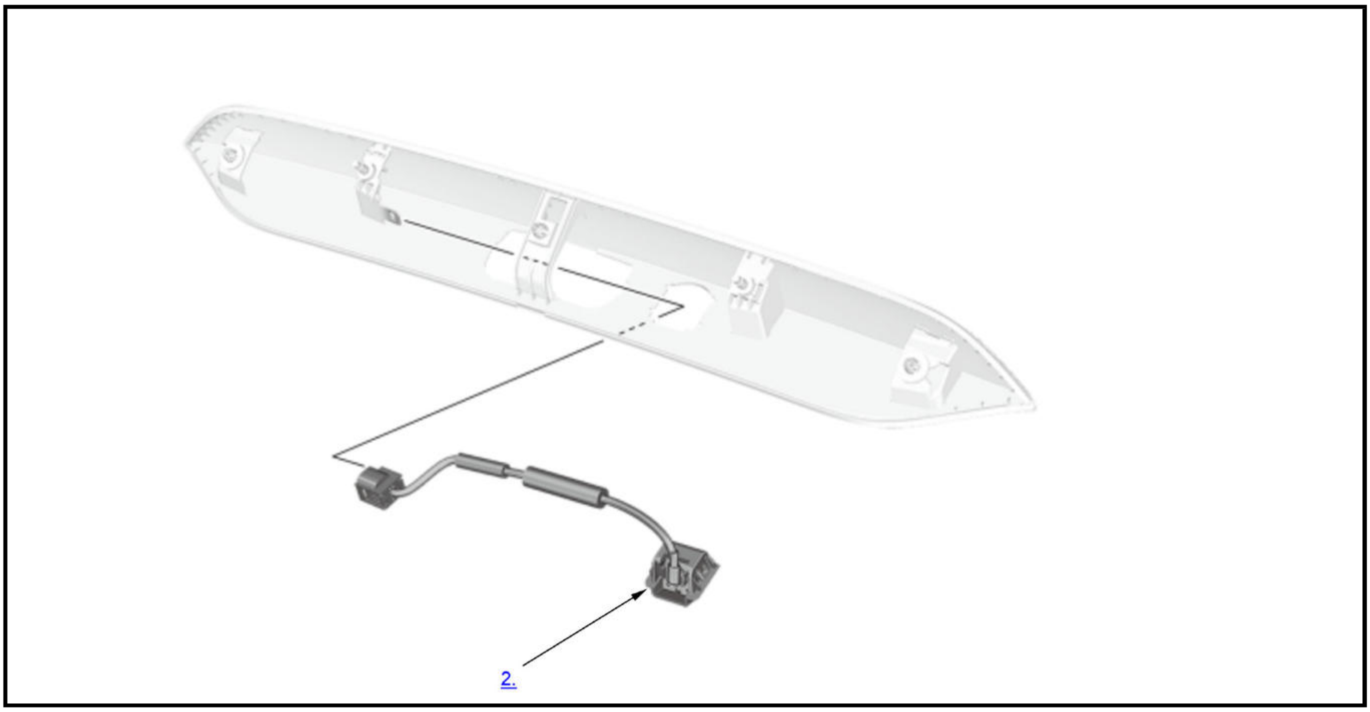
1. **Audio-Navigation Unit Assembly - Remove (With Navigation)**
2. **Audio Unit Assembly - Remove (Without Navigation)**
3. GPS Antenna - Remove
4. All Removed Parts - Install

   Install the parts in the reverse order of removal.

REARVIEW CAMERA REMOVAL AND INSTALLATION

Removal and Installation

1



1. **Rear License Trim - Remove**
2. Rearview Camera - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

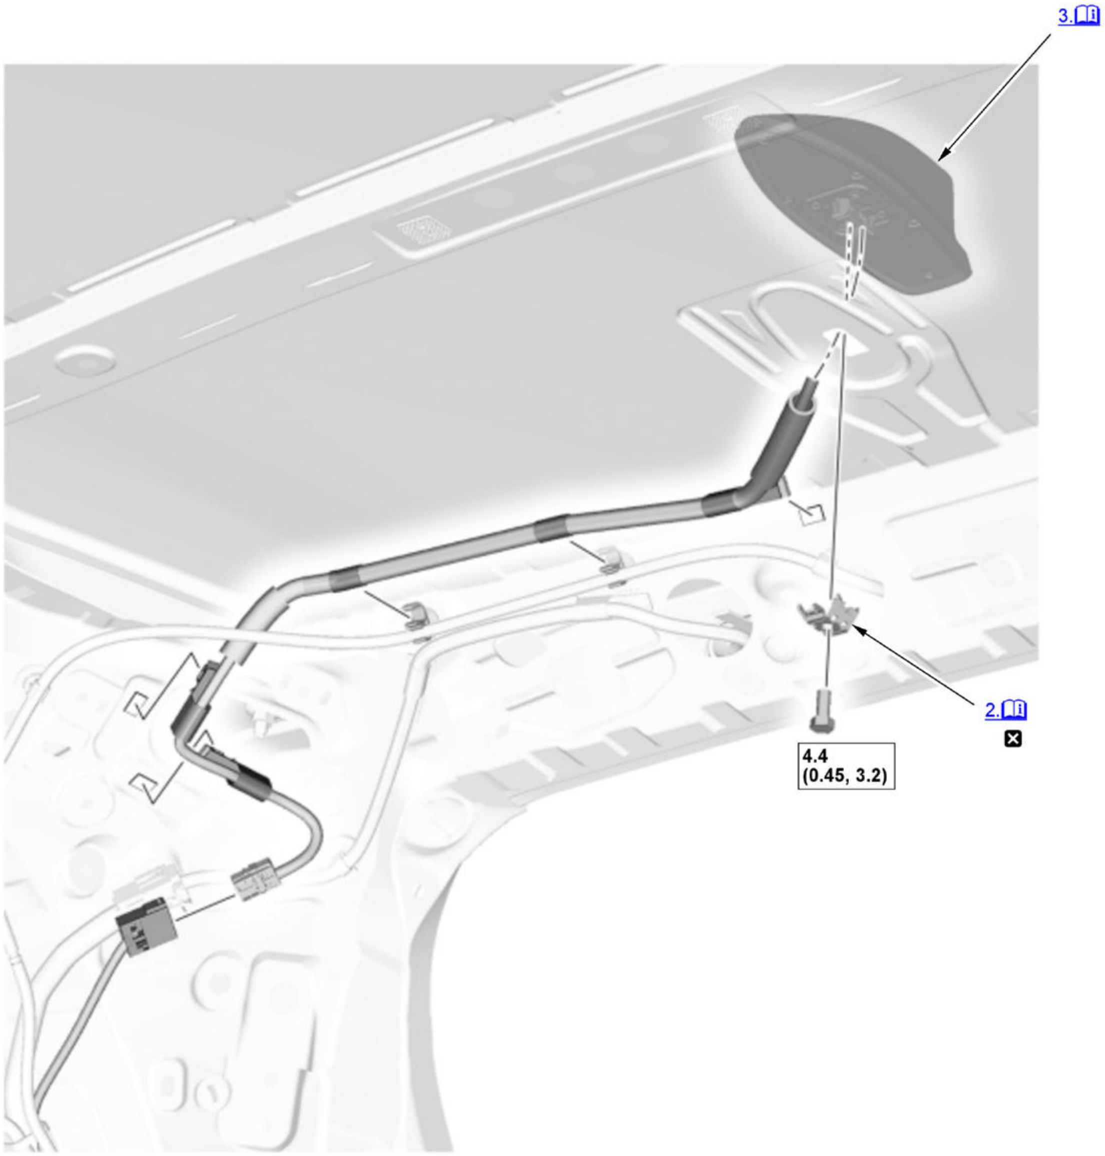
ROOF ANTENNA REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: 🛈 Where icon is shown, further information shown below.

1



ℹ	Detailed information, notes, and precautions

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Headliner - Remove**
2. Capture Washer - Remove

   NOTE: Make sure to use a new capture washer when installing the roof antenna.

3. Roof Antenna - Remove

   NOTE: Perform the shower test to confirm that there is no water leakage.

4. All Removed Parts - Install

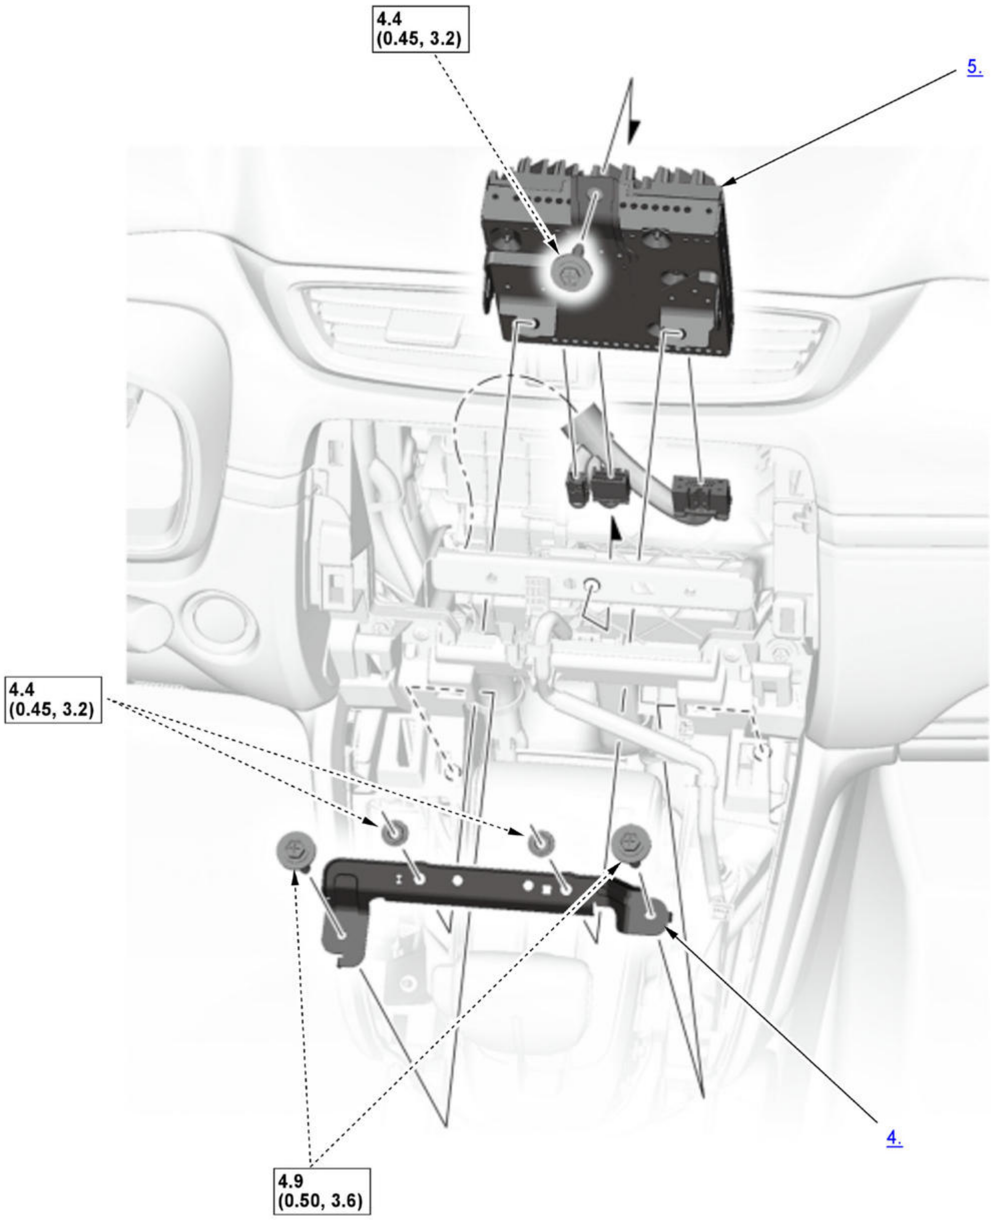
   Install the parts in the reverse order of removal.

STEREO AMPLIFIER REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1



☐	Torque: N.m (kgf.m, lbf.ft)

1. **Audio-Navigation Unit Assembly - Remove (With Navigation)**
2. **Audio Unit Assembly - Remove (Without Navigation)**
3. **Center Maintenance Cover - Remove**

   NOTE: The center maintenance cover is only available for the the side.

4. Stereo Amplifier Bracket - Remove
5. Stereo Amplifier - Remove

6. All Removed Parts - Install

   Install the parts in the reverse order of removal.

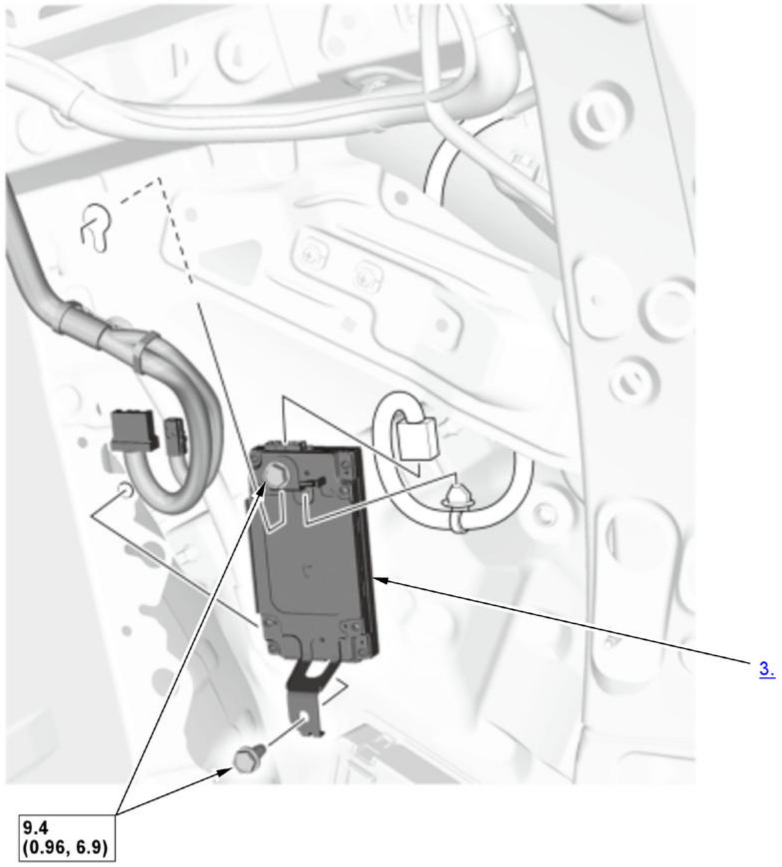
TUNER UNIT REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: If you are replacing the tuner unit, write down the AM/FM radio presets (if possible), and enter them into the new audio-navigation unit or the new audio unit.

1



▭	Torque: N.m (kgf.m, lbf.ft)

1. **Rear Side Trim Panel (Right Side) - Remove**
2. **Subwoofer - Remove (With subwoofer)**
3. Tuner Unit - Remove
4. All Removed Parts - Install

   Install the parts in the reverse order of removal.

USB ADAPTER HOLDER REMOVAL AND INSTALLATION

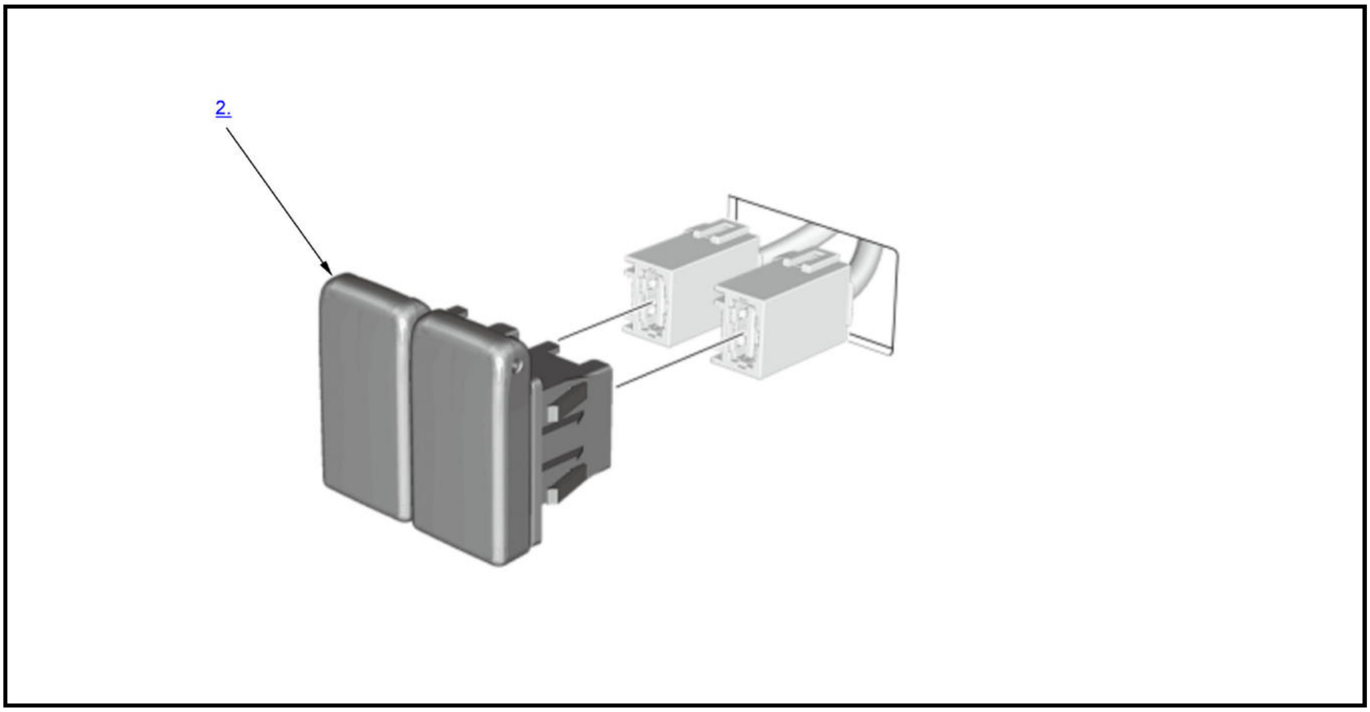
Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

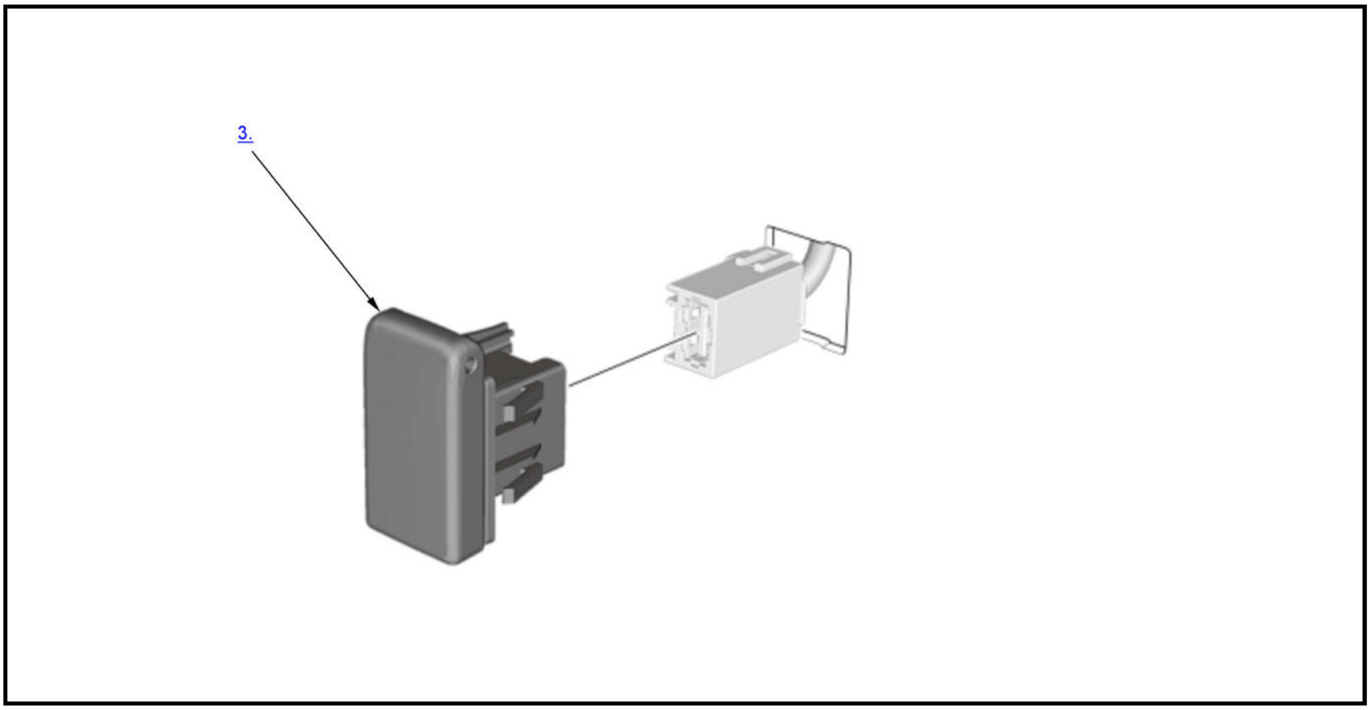
NOTE: USB adapter holder (one USB) with auxiliary jack assembly, refer to Auxiliary Jack Assembly Removal and Installation.

1

USB Adapter Holder (two USB) (Without USB port light)

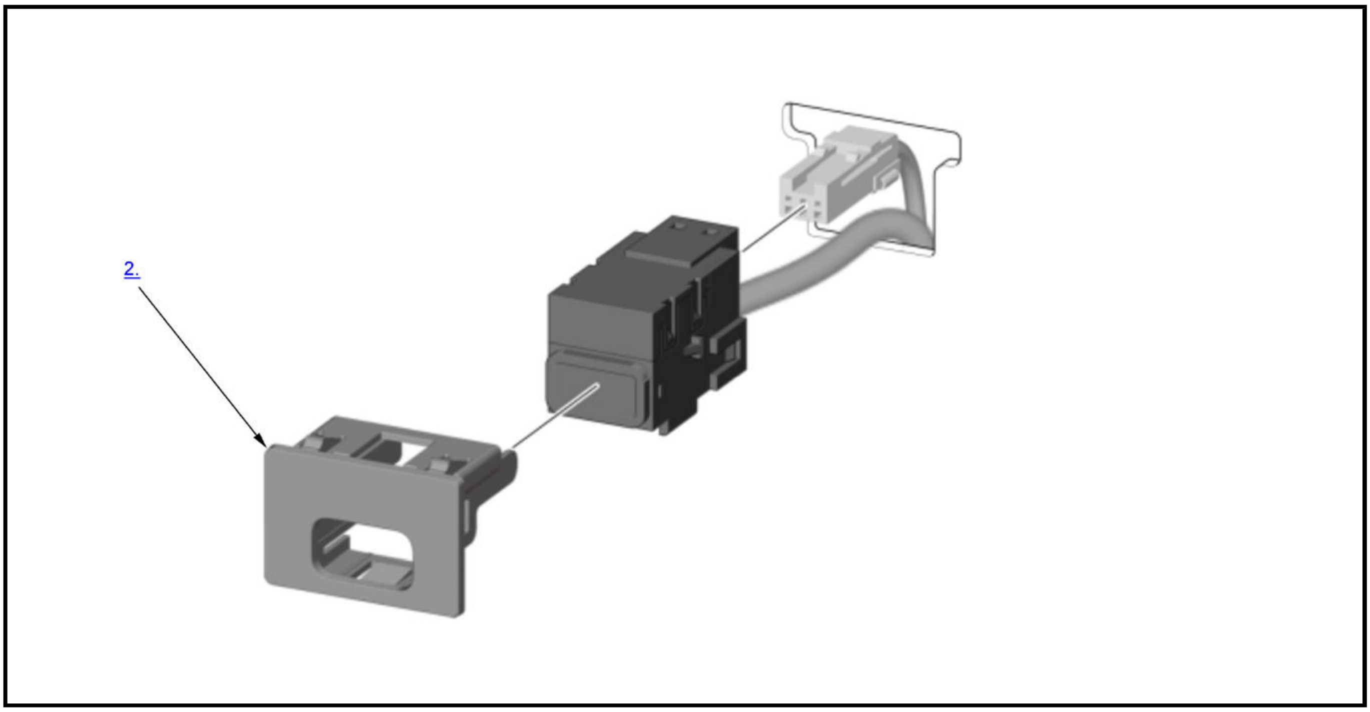


USB Adapter Holder (one USB without auxiliary jack assembly) (Without USB port light)



2

USB Adapter Holder (USB port A/B) (With USB port light)



Without USB Port Light

1. Center Console Panel - Remove
2. USB Adapter Holder (two USB) - Remove
3. USB Adapter Holder (one USB without auxiliary jack assembly) - Remove
4. All Removed Parts - Install

   Install the parts in the reverse order of removal.

   With USB Port Light

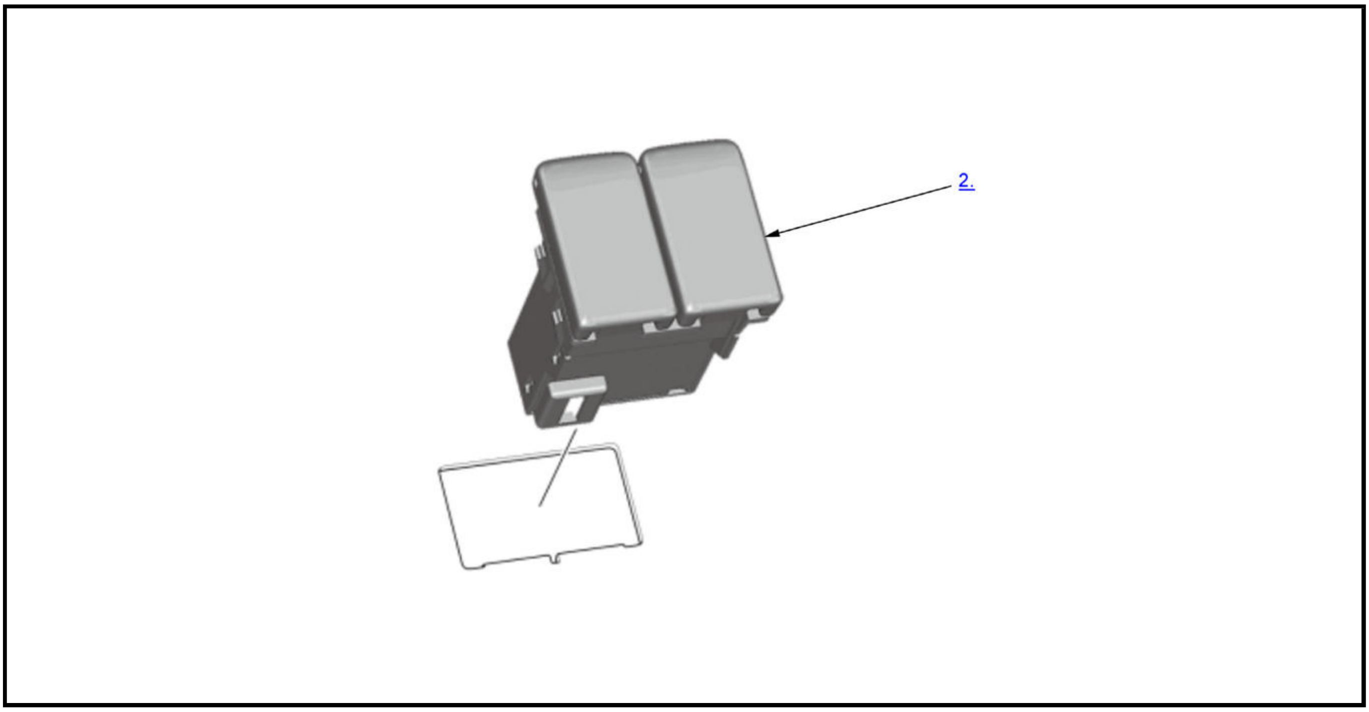
5. Dashboard Center Lower Panel - Remove
6. USB Adapter Holder (USB port A/B) - Remove
7. All Removed Parts - Install

   Install the parts in the reverse order of removal.

USB CHARGER UNIT REMOVAL AND INSTALLATION

Removal and Installation

1



1. **Center Console Rear Trim - Remove**
2. USB Charger Unit - Remove
3. All Removed Parts - Install

   Install the parts in the reverse order of removal.

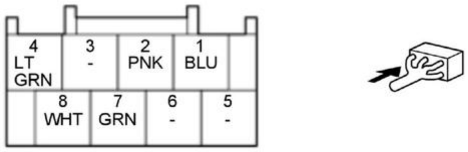
CONNECTOR VIEW

ANC/ACTIVE SOUND CONTROL MICROPHONE CONNECTOR FOR INPUTS AND OUTPUTS

Connector Index
Front ANC/Active Sound Control Microphone 8P Connector
Rear ANC/Active Sound Control Microphone 2P Connector

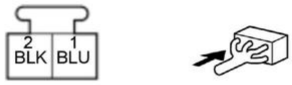
NOTE: The front HFL-navigation-ANC/active sound control microphone and the front HFL-ANC/active sound control microphone are the same parts.

Front ANC/Active Sound Control Microphone 8P Connector (female terminals)



Cavity	Terminal Name	Description
1	MIC GND	Ground for microphone
2	MIC+	Outputs microphone signal
3	---	Not used
4	MIC PWR	Microphone power source
5	---	Not used
6	---	Not used
7	HFT MUTE	Inputs HFL microphone directivity switching signal
8	ANC F MIC+8V	Outputs signal for front ANC/active sound control microphone

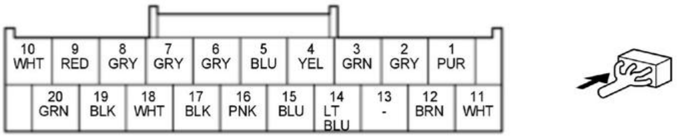
Rear ANC/Active Sound Control Microphone 2P Connector (female terminals)



Cavity	Terminal Name	Description
1	ANC R MIC+8V	Outputs signal for rear ANC/active sound control microphone
2	SH ANC R MIC	Shield for terminal No. 1

ANC/ACTIVE SOUND CONTROL UNIT CONNECTOR FOR INPUTS AND OUTPUTS

ANC/Active Sound Control Unit 20P Connector (female terminals)

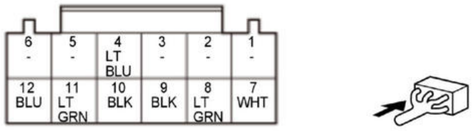


Cavity	Terminal Name	Description
1	GND	ANC/active sound control unit ground
2	AUD F MIX SH	Shield for terminals No. 15 and No. 16
3	SWD+B	Inputs signal for ANC/active sound control unit switching ON/OFF
4	F-CAN B_H	Communication signal
5	F-CAN B_L	Communication signal
6	SH ANC R MIC	Shield for terminal No. 17
7	SH ANC F MIC	Shield for terminal No. 18
8	ANC SH	Shield for terminals No. 9, No. 10, No. 19, and No. 20
9	ANC R-	Outputs noise cancelling signal to related units
10	ANC F-	Outputs noise cancelling signal to related units
11	+B BACK UP	+B power source
12	IG1 METER	IG1 power source
13	---	Not used
14	K LINE	Communication signal
15	AUD F MIX GND	Basis ground for terminals No. 16
16	AUD F MIX	Outputs noise cancelling mixing signal from related units
17	ANC R MIC+8V	Inputs signal for rear ANC/active sound control microphone
18	ANC F MIC+8V	Inputs signal for front ANC/active sound control microphone
19	ANC R+	Outputs noise cancelling signal to related units
20	ANC F+	Outputs noise cancelling signal to related units

AUDIO REMOTE-HFL SWITCH CONNECTOR FOR INPUTS AND OUTPUTS

Connector Index
Audio Remote-HFL Switch 12P Connector (with multi-information display)
Audio Remote-HFL Switch 12P Connector (without multi-information display)

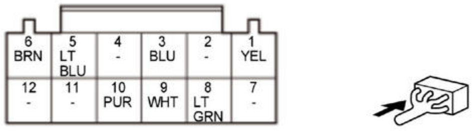
Audio Remote-HFL Switch 12P Connector (female terminals) (with multi-information display)



Cavity	Terminal Name	Description
1	---	Not used
2	---	Not used
3	---	Not used
4	ILL-(LED)	Outputs illumination control signal for related units
5	---	Not used
6	---	Not used
7	+B	+B power source
8	ILLUMI+	Outputs illumination signal
9*	STRG GND	Ground for related units
10	STRG GND	Audio remote-HFL switch ground
11*	HSW LIN	Communication signal
12	STRG SW LIN	Communication signal

*: With heated steering wheel

Audio Remote-HFL Switch 12P Connector (female terminals) (without multi-information display)



Cavity	Terminal Name	Description
1	ILLUMI+	Detects illumination signal

Cavity	Terminal Name	Description
2	---	Not used
3	AUDIO REMOTE SW	Outputs control signal from audio remote switch
4	---	Not used
5	ILL-(LED)	Outputs illumination control signal for related units
6	REMOTE SW GND	Audio remote-HFL switch ground
7	---	Not used
8	ILLUMI+	Outputs illumination signal for related units
9	HFT/NAVI REMOTE SW	Outputs control signal from HFL switch
10	ILL-(LED)	Outputs illumination control signal

Cavity	Terminal Name	Description
11	---	Not used
12	---	Not used

A17	FR SPKR+	Outputs sound signal for right front speakers
A18	FR SPKR-	Outputs sound signal for right front speakers
A19	REMOTE SW GND	Ground for audio remote-HFL switch
A20	HFT/NAVI REMOTE SW	Detects control signal from HFL switch
A21	SWD+B	Outputs signal for related unit switching on/off
A22	---	Not used
A23	IG1 WITH DIODE FMVSS* 1ACC CUT(VST)* 2* 3ACC* 2* 4	ACCESSORY power source
A24	B-CAN_L	Communication signal

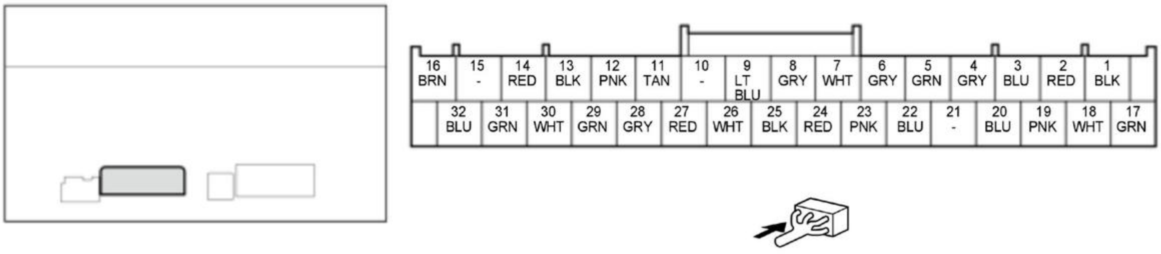
*1: With rearview camera diode

*2: Without rearview camera diode

*3: With auto idle stop system

*4: Without auto idle stop system

Audio Unit Connector C (32P) (female terminals)



Cavity	Terminal Name	Description
C1	ANC R+	Inputs noise cancelling signal from ANC/active sound control unit
C2	ANC R-	Inputs noise cancelling signal from ANC/active sound control unit
C3* 1	COMPASS 1	Communication signal
C4* 1	COMPASS 2	Communication signal
C5	HFT MUTE	Outputs HFL microphone directivity switching signal

*1: With electrical compass

*2: With auxiliary jack assembly

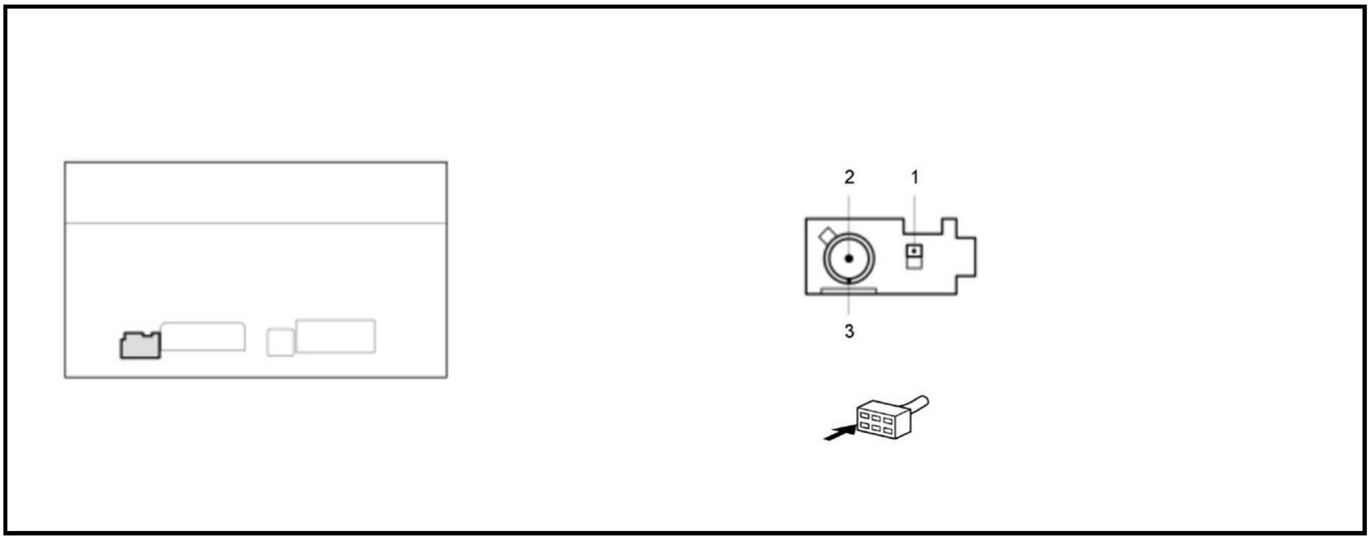
Cavity	Terminal Name	Description
C6	SH MIC	Shield for terminals No. 22 and No. 23
C7	MIC PWR	Power source for HFL microphone
C8* 2	AUX SH	Shield for terminals No. 24, No. 25, and No. 26
C9* 2	AUX DET	Detects connection signal for auxiliary jack assembly
C10	---	Not used
C11* 1	COMPASS 3	Communication signal
C12* 1	COMPASS 4	Communication signal
C13	CAMERA VCC	Power source for rearview camera
C14	CAMERA GND	Ground for rearview camera
C15	---	Not used
C16	CAMERA ADPT	Detects connection for rearview camera
C17	ANC F+	Inputs noise cancelling signal from ANC/active sound control unit
C18	ANC F-	Inputs noise cancelling signal from ANC/active sound control unit
C19	AUD F MIX	Inputs noise cancelling mixing signal from ANC/active sound control unit
C20	AUD F MIX GND	Basis ground for terminals No. 19
C21	---	Not used
C22	MIC+	Inputs sound signal from HFL microphone
C23	MIC GND	Ground for HFL microphone
C24* 2	AUX R CH	Inputs sound signal from auxiliary jack assembly
C25* 2	AUX SGND	Ground for sound signal from auxiliary jack assembly
C26* 2	AUC L CH	Inputs sound signal from auxiliary jack assembly
C27* 2	AUX GND	Ground for auxiliary jack assembly
C28	SH CAMERA	Shield for terminals No. 13, No. 14, No. 29, and No. 30
C29	CAMERA V	Inputs NTSC video signal from rearview camera

Cavity	Terminal Name	Description
C30	CAMERA V GND	Ground for NTSC video signal from rearview camera
C31	CAMERA BIT0	Outputs mode select signal for rearview camera
C32	CAMERA BIT1	Outputs mode select signal for rearview camera

*1: With electrical compass

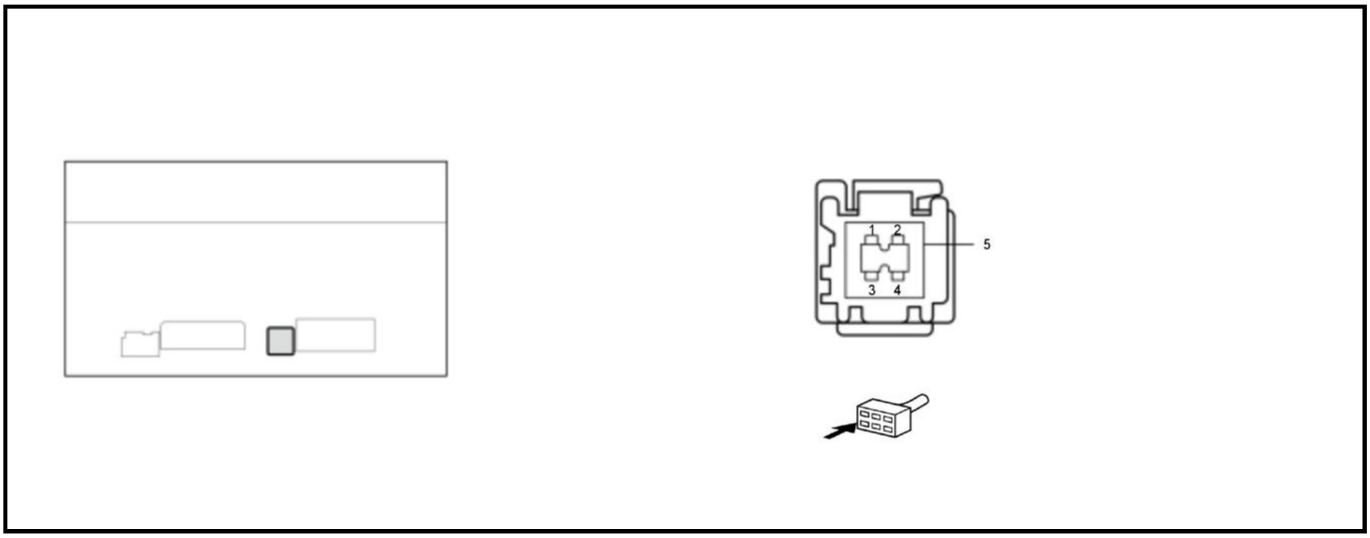
*2: With auxiliary jack assembly

Audio Unit Connector E (3P) (female terminals)



Cavity	Terminal Name	Description
E1	ANT+B	Power source for AM/FM antenna amplifier
E2	RF IN	Inputs AM/FM signal
E3	SH(RF IN)	Shield for terminal No. 2

Audio Unit Connector F (5P) (female terminals) (with USB)



Cavity	Terminal Name	Description
F1	USB1 GND	Ground for USB port
F2	USB1 VBUS	Outputs power source for USB port
F3	USB1 DATA+	Communication signal
F4	USB1 DATA-	Communication signal
F5	USB1 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

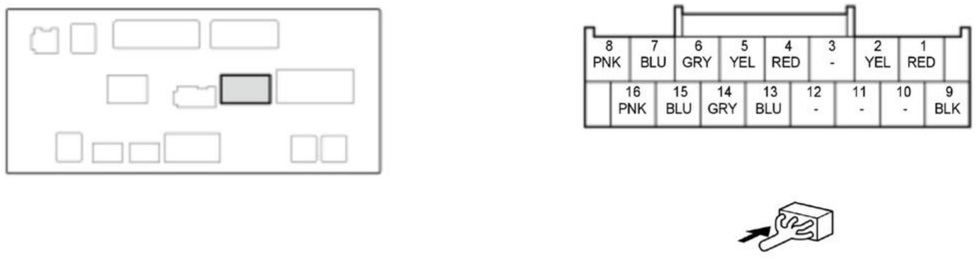
C32	CAMERA BIT1	Outputs mode select signal for rearview camera

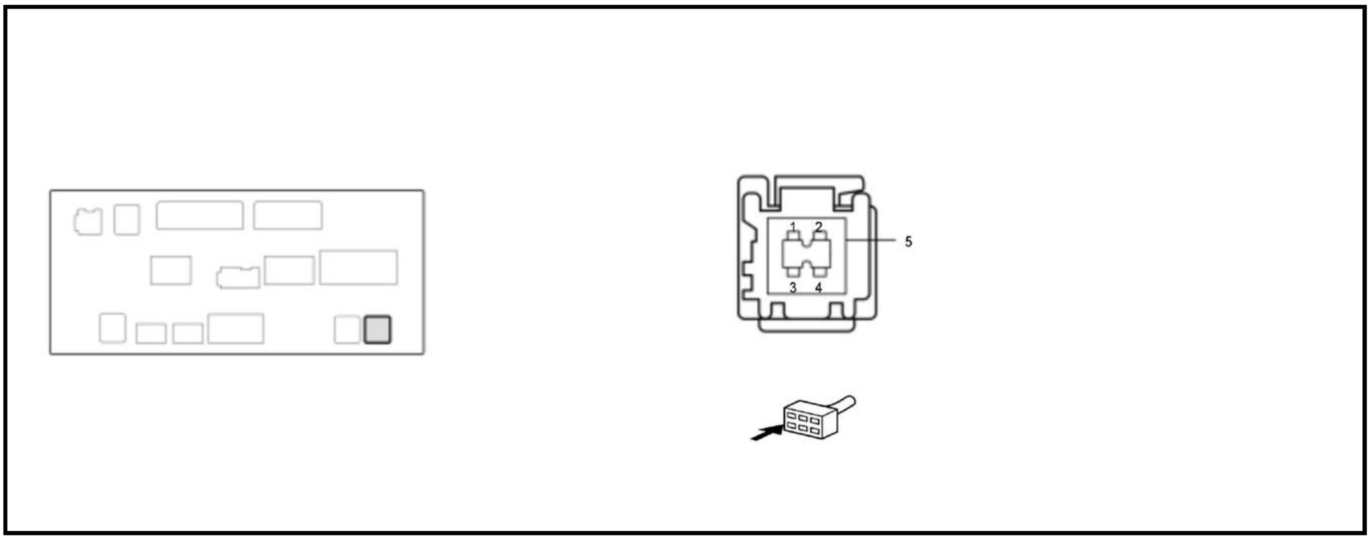
*: Without stereo amplifier

Audio Unit Connector E (16P) (female terminals)



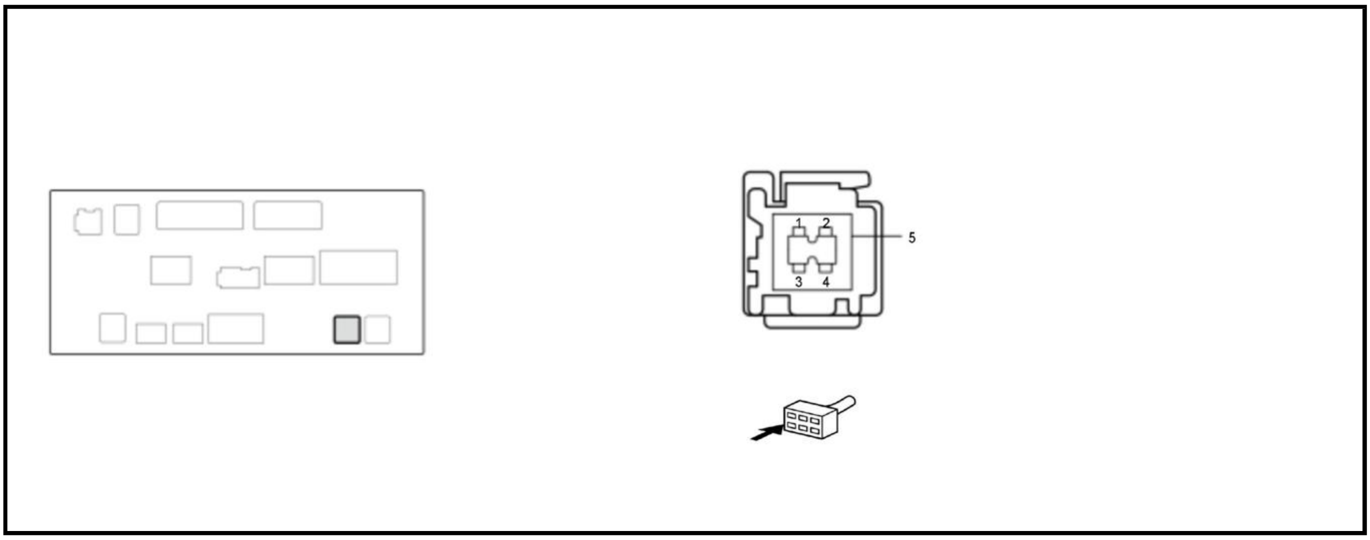
Cavity	Terminal Name	Description
E1	TUNER 6V	Power source for tuner unit
E2	TUNER 9V	Power source for tuner unit
E3	---	Not used
E4	DISP CONT	Outputs signal for center display unit switching on/off
E5	F-CAN B_H	Communication signal
E6	AMP RS485 SH	Shield for terminals No. 7 and No. 8
E7	RS485+	Communication signal
E8	RS485-	Communication signal
E9	TUNER GND	Ground for tuner unit
E10	---	Not used
E11	---	Not used
E12	---	Not used
E13	F-CAN B_L	Communication signal
E14	TUNER RS485 SH	Shield for terminals No. 15 and No. 16
E15	TUNER RS485+	Communication signal
E16	TUNER RS485-	Communication signal

Audio Unit Connector F (5P) (female terminals)



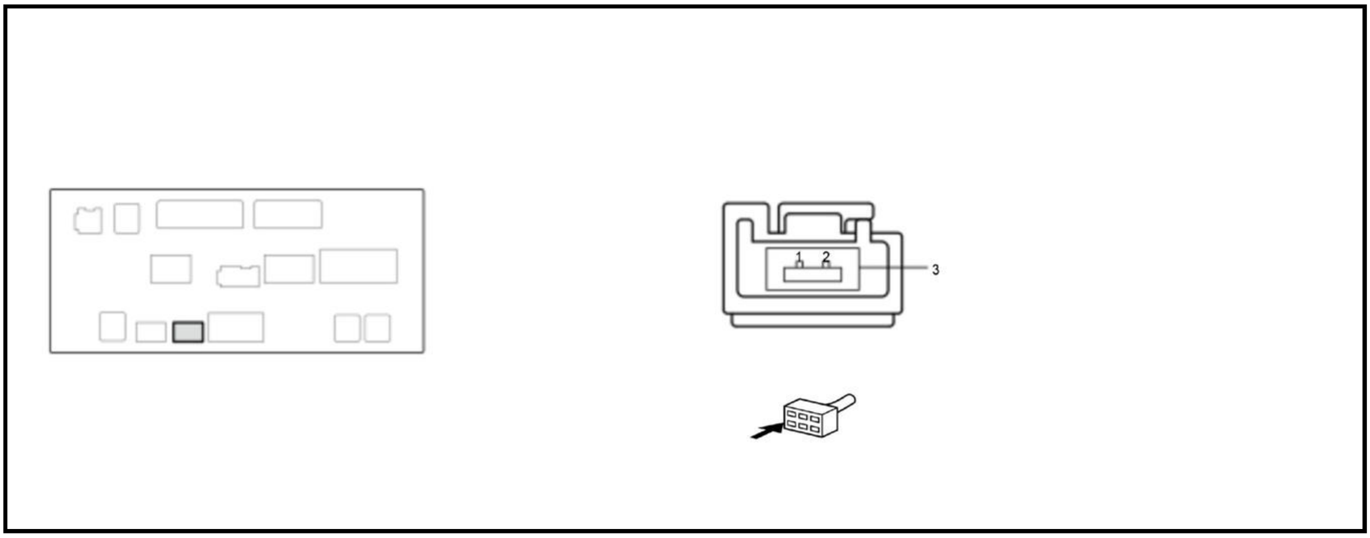
Cavity	Terminal Name	Description
F1	USB1 GND	Ground for USB port A
F2	USB1 VBUS	Outputs power source for USB port A
F3	USB1 DATA+	Communication signal
F4	USB1 DATA-	Communication signal
F5	USB1 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

Audio Unit Connector G (5P) (female terminals)



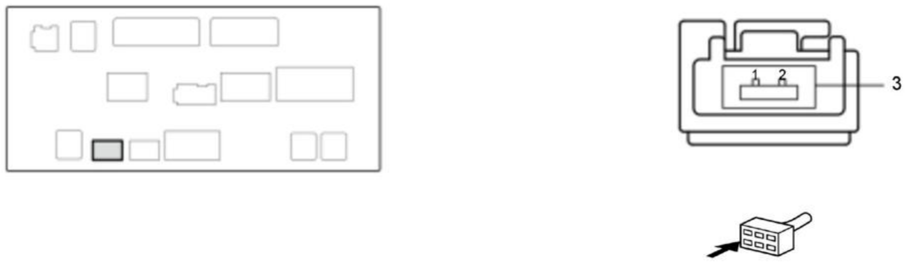
Cavity	Terminal Name	Description
G1	USB2 GND	Ground for USB port B
G2	USB2 VBUS	Outputs power source for USB port B
G3	USB2 DATA+	Communication signal
G4	USB2 DATA-	Communication signal
G5	USB2 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

Audio Unit Connector H (3P) (female terminals)



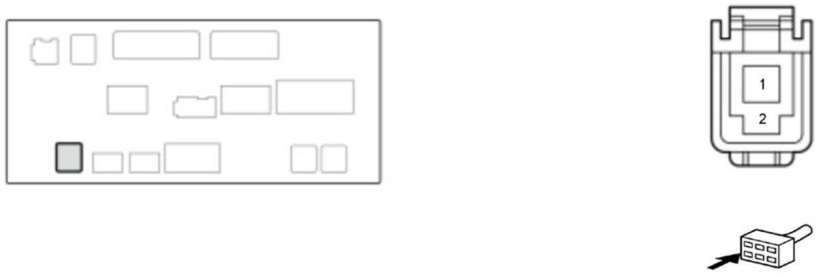
Cavity	Terminal Name	Description
H1	LVDS1+	Communication signal
H2	LVDS1-	Communication signal
H3	LVDS1 SH	Shield for terminals No. 1 and No. 2

Audio Unit Connector J (3P) (female terminals)



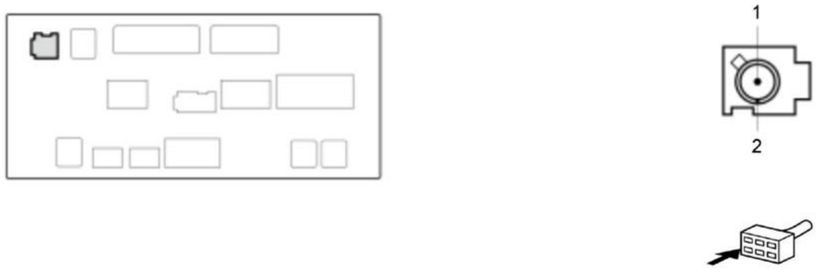
Cavity	Terminal Name	Description
J1	LVDS2+	Communication signal
J2	LVDS2-	Communication signal
J3	LVDS2 SH	Shield for terminals No. 1 and No. 2

Audio Unit Connector K (2P) (female terminals)



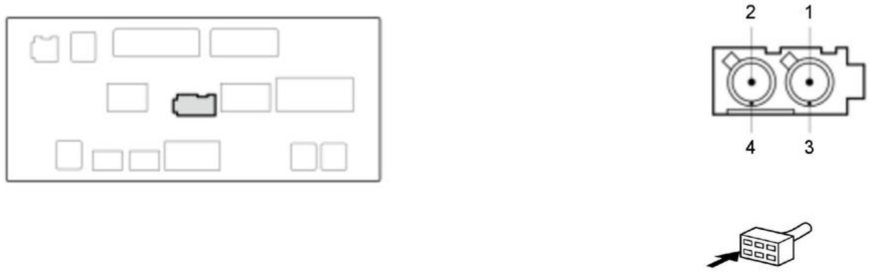
Cavity	Terminal Name	Description
K1	GPS ANT	Inputs GPS signal
K2	GPS SH	Shield for terminal No. 1

Audio Unit Connector L (2P) (female terminals)



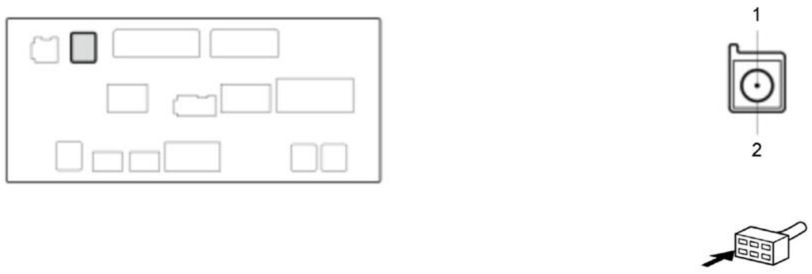
Cavity	Terminal Name	Description
L1	SPDIF1 SIG	Communication signal for tuner unit
L2	SPDIF1 SH	Shield for terminal No. 1

Audio Unit Connector M (4P) (female terminals) (with stereo amplifier)



Cavity	Terminal Name	Description
M1	SPDIF2 SIG	Communication signal
M2	---	Not used
M3	SPDIF2 SH	Shield for terminal No. 1
M4	---	Not used

Audio Unit Connector N (2P) (female terminals) (with XM)



Cavity	Terminal Name	Description
N1	SAT/TER	Inputs satellite/terrestrial signal
N2	SH (SAT/TER)	Shield for terminal No. 1

AUDIO-NAVIGATION UNIT CONNECTOR FOR INPUTS AND OUTPUTS

Connector Index
Audio-Navigation Unit Connector A (24P) (with rearview camera diode)
Audio-Navigation Unit Connector A (24P) (without rearview camera diode)

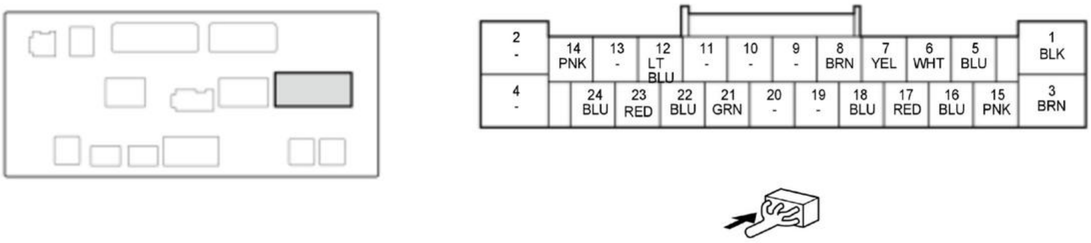
Audio-Navigation Unit Connector A (24P) (female terminals) (without rearview camera diode)



Cavity	Terminal Name	Description
A1	GND	Audio-navigation unit ground
A2	---	Not used
A3	+B BACKUP2 SUB* 4+B AUDIO* 5	+B power source
A4	---	Not used
A5* 1	RL SPKR+	Outputs sound signal for left rear speakers
A6* 1	RL SPKR-	Outputs sound signal for left rear speakers
A7* 1	RR SPKR+	Outputs sound signal for right rear speakers
A8* 1	RR SPKR-	Outputs sound signal for right rear speakers
A9	---	Not used
A10	---	Not used
A11	---	Not used
A12	K LINE	Communication signal
A13	---	Not used
A14	B-CAN_H	Communication signal
A15* 1	FL SPKR+	Outputs sound signal for left front speakers
A16* 1	FL SPKR-	Outputs sound signal for left front speakers
A17* 1	FR SPKR+	Outputs sound signal for right front speakers
A18* 1	FR SPKR-	Outputs sound signal for right front speakers
A19	---	Not used
A20	---	Not used
A21	SWD+B	Outputs signal for related unit switching on/off
A22	VSP	Inputs vehicle speed pulse
A23	IG1 WITH DIODE FMVSS* 2ACC CUT(VST)* 3* 4ACC* 3* 5	ACCESSORY power source
A24	B-CAN_L	Communication signal

*1: Without stereo amplifier

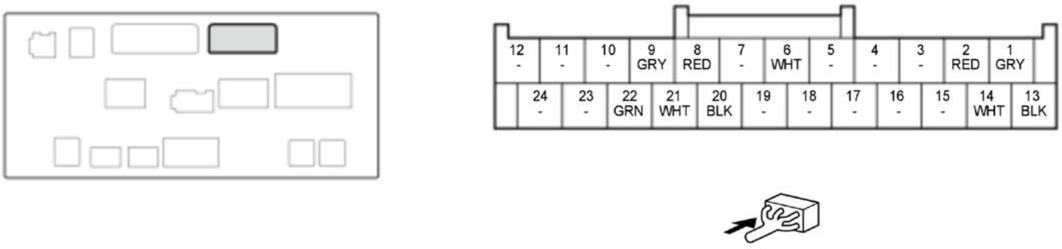
*2: With rearview camera diode

*3: Without rearview camera diode

*4: With auto idle stop system

*5: Without auto idle stop system

Audio-Navigation Unit Connector B (24P) (female terminals)

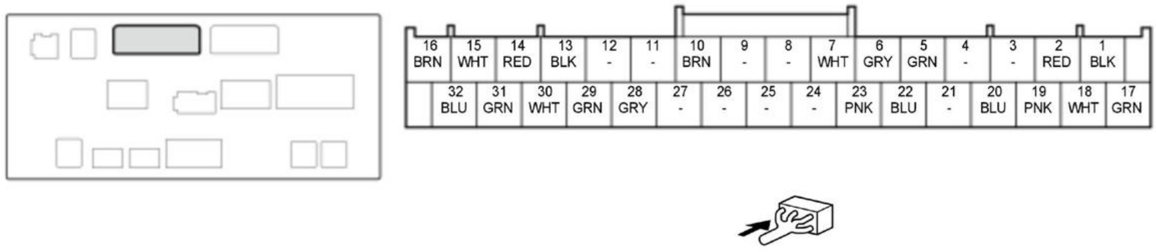


Cavity	Terminal Name	Description
B1* 1	AUX NAVI SH	Shield for terminals No. 2, No. 13, and No. 14
B2* 1	AUX BEEP	Outputs system beep signal
B3	---	Not used
B4	---	Not used
B5	---	Not used
B6* 2	LWC SW	Detects LaneWatch switch signal
B7	---	Not used
B8* 2	LWC CAM VCC	Power source for LaneWatch camera
B9* 2	SH LWC CAM	Shield for terminals No. 8, No. 20, No. 21, and No. 22
B10	---	Not used
B11	---	Not used
B12	---	Not used
B13* 1	AUX NAVI	Outputs sound signal for voice guidance and Voice Recognition (VR) prompts
B14* 1	AUX NAVI GND	Basis ground for terminals No. 2 and No. 13
B15	---	Not used
B16	---	Not used
B17	---	Not used
B18	---	Not used
B19	---	Not used
B20* 2	LWC CAM VID	Inputs video signal from LaneWatch camera
B21* 2	LWC CAM VGND	Ground for LaneWatch camera
B22* 2	LWC UART	Communication signal
B23	---	Not used
B24	---	Not used

*1: With stereo amplifier

*2: With LaneWatch

Audio-Navigation Unit Connector C (32P) (female terminals)



Cavity	Terminal Name	Description
C1*	ANC R+	Inputs noise cancelling signal from ANC/active sound control unit
C2*	ANC R-	Inputs noise cancelling signal from ANC/active sound control unit
C3	---	Not used
C4	---	Not used
C5	HFT MUTE	Outputs HFL microphone directivity switching signal
C6	SH MIC	Shield for terminals No. 22 and No. 23
C7	MIC PWR	Power source for HFL microphone
C8	---	Not used
C9	---	Not used
C10	IG1 METER	IG1 power source
C11	---	Not used
C12	---	Not used
C13	CAMERA VCC	Power source for rearview camera
C14	CAMERA GND	Ground for rearview camera
C15	BACK LT	Detects reverse signal
C16	CAMERA ADPT	Detects connection for rearview camera
C17*	ANC F+	Inputs noise cancelling signal from ANC/active sound control unit
C18*	ANC F-	Inputs noise cancelling signal from ANC/active sound control unit
C19*	AUD F MIX	Inputs noise cancelling mixing signal from ANC/active sound control unit
C20*	AUD F MIX GND	Basis ground for terminals No. 19
C21	---	Not used
C22	MIC+	Inputs sound signal from HFL microphone
C23	MIC GND	Ground for HFL microphone
C24	---	Not used
C25	---	Not used
C26	---	Not used
C27	---	Not used
C28	SH CAMERA	Shield for terminals No. 13, No. 14, No. 29, and No. 30
C29	CAMERA V	Inputs NTSC video signal from rearview camera
C30	CAMERA V GND	Ground for NTSC video signal from rearview camera
C31	CAMERA BIT0	Outputs mode select signal for rearview camera
C32	CAMERA BIT1	Outputs mode select signal for rearview camera

*: Without stereo amplifier

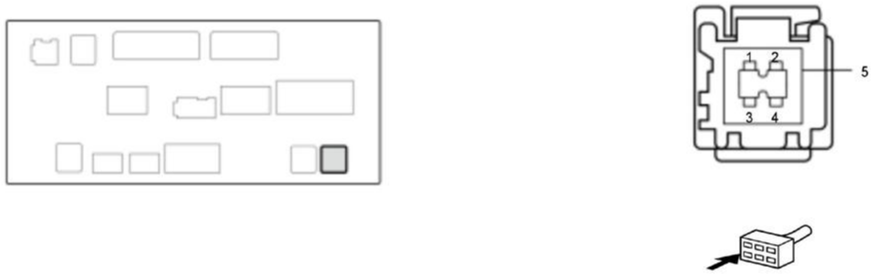
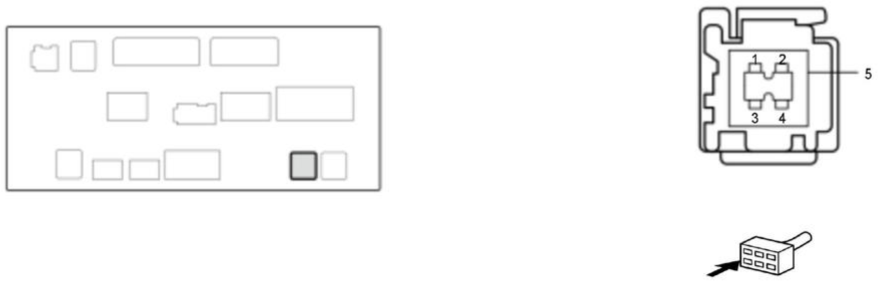
E16	TUNER RS485-	Communication signal

Audio-Navigation Unit Connector F (5P) (female terminals)



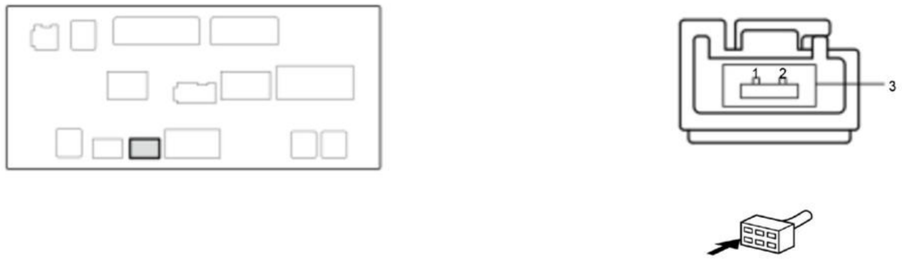
Cavity	Terminal Name	Description
F1	USB1 GND	Ground for USB port A
F2	USB1 VBUS	Outputs power source for USB port A
F3	USB1 DATA+	Communication signal
F4	USB1 DATA-	Communication signal
F5	USB1 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

Audio-Navigation Unit Connector G (5P) (female terminals)



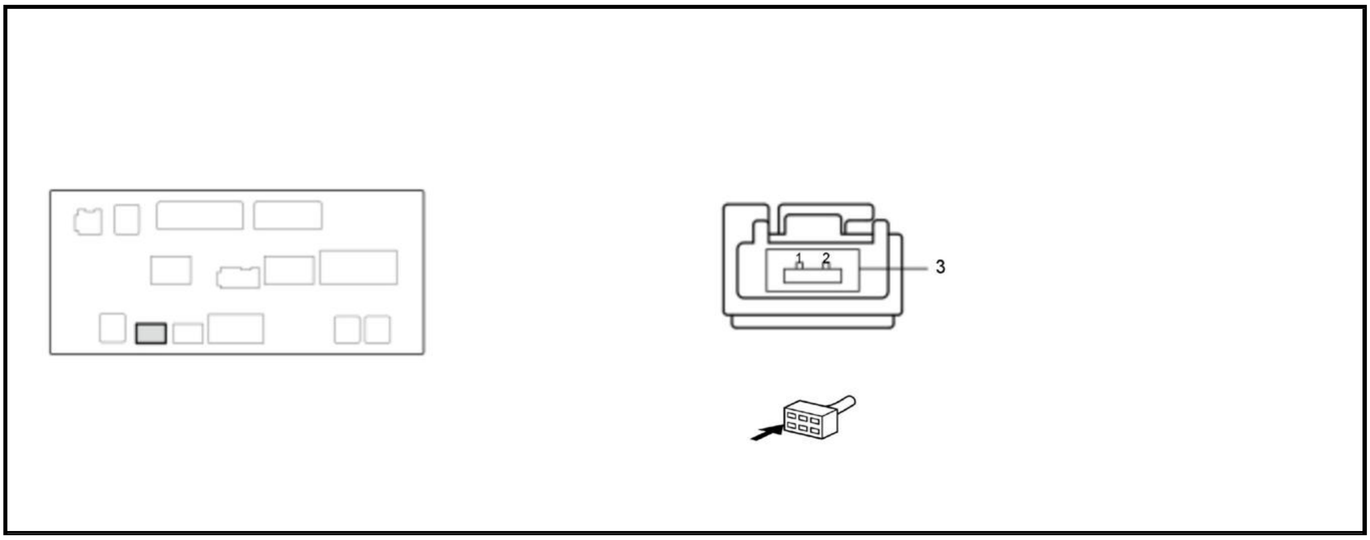
Cavity	Terminal Name	Description
G1	USB2 GND	Ground for USB port B
G2	USB2 VBUS	Outputs power source for USB port B
G3	USB2 DATA+	Communication signal
G4	USB2 DATA-	Communication signal
G5	USB2 SH	Shield for terminals No. 1, No. 2, No. 3, and No. 4

Audio-Navigation Unit Connector H (3P) (female terminals)



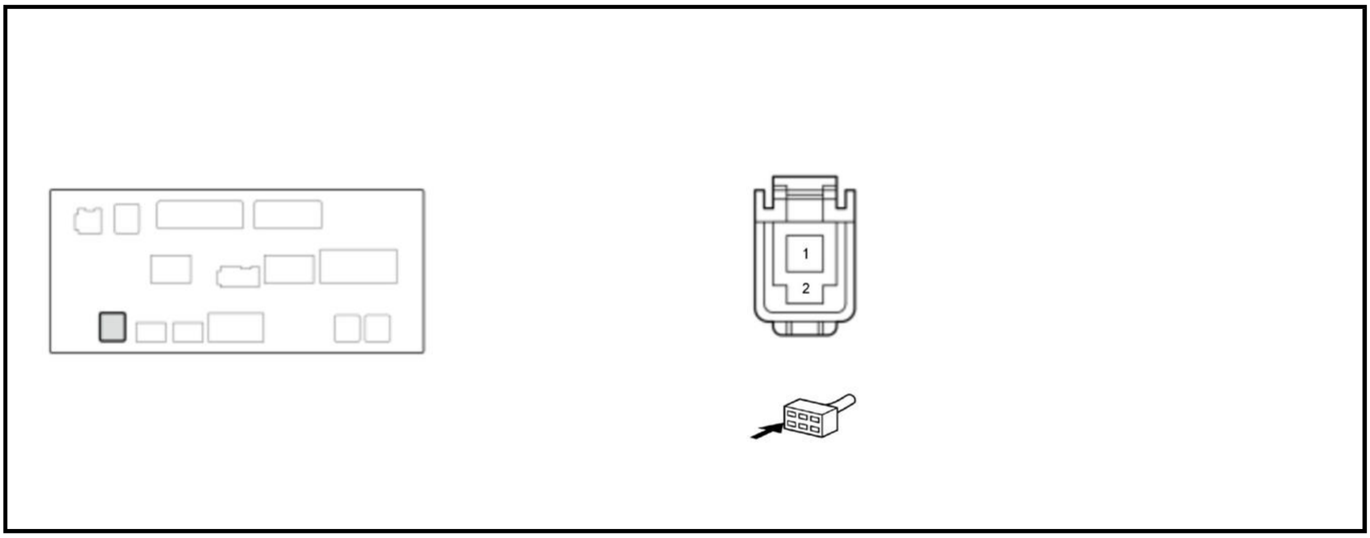
Cavity	Terminal Name	Description
H1	LVDS1+	Communication signal
H2	LVDS1-	Communication signal
H3	LVDS1 SH	Shield for terminals No. 1 and No. 2

Audio-Navigation Unit Connector J (3P) (female terminals)



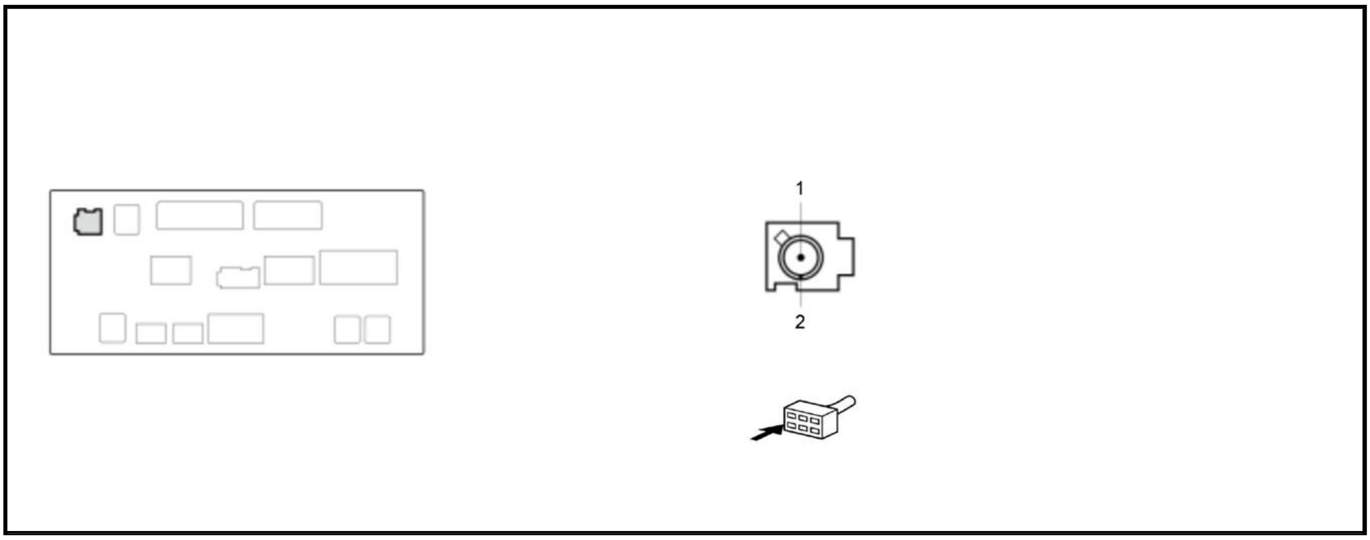
Cavity	Terminal Name	Description
J1	LVDS2+	Communication signal
J2	LVDS2-	Communication signal
J3	LVDS2 SH	Shield for terminals No. 1 and No. 2

Audio-Navigation Unit Connector K (2P) (female terminals)



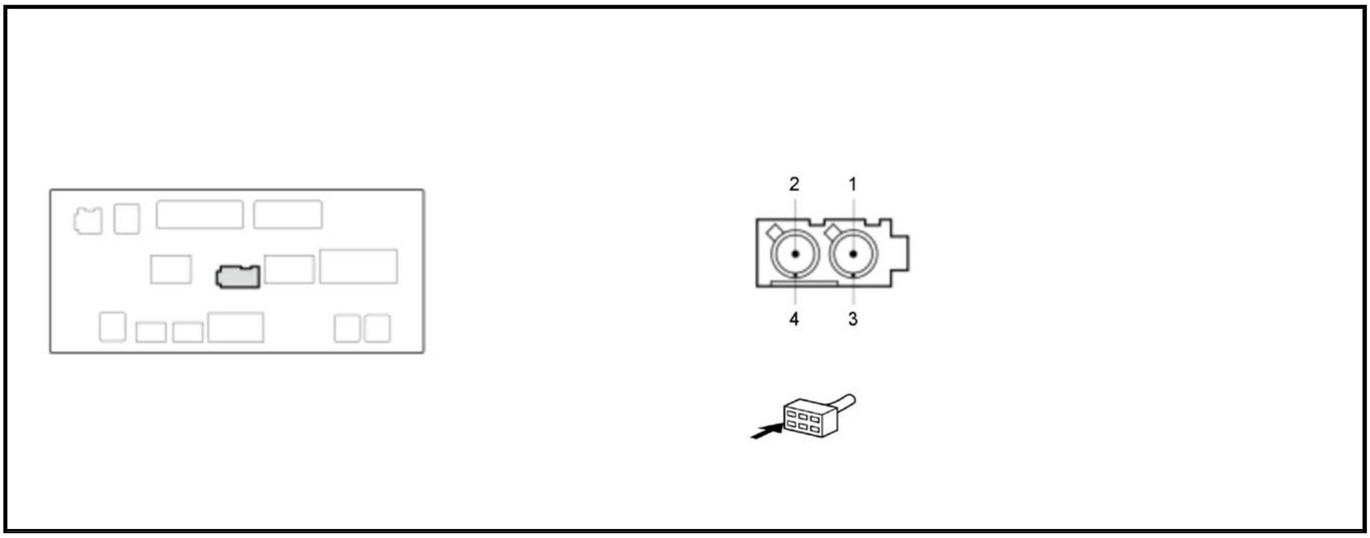
Cavity	Terminal Name	Description
K1	GPS ANT	Inputs GPS signal
K2	GPS SH	Shield for terminal No. 1

Audio-Navigation Unit Connector L (2P) (female terminals)



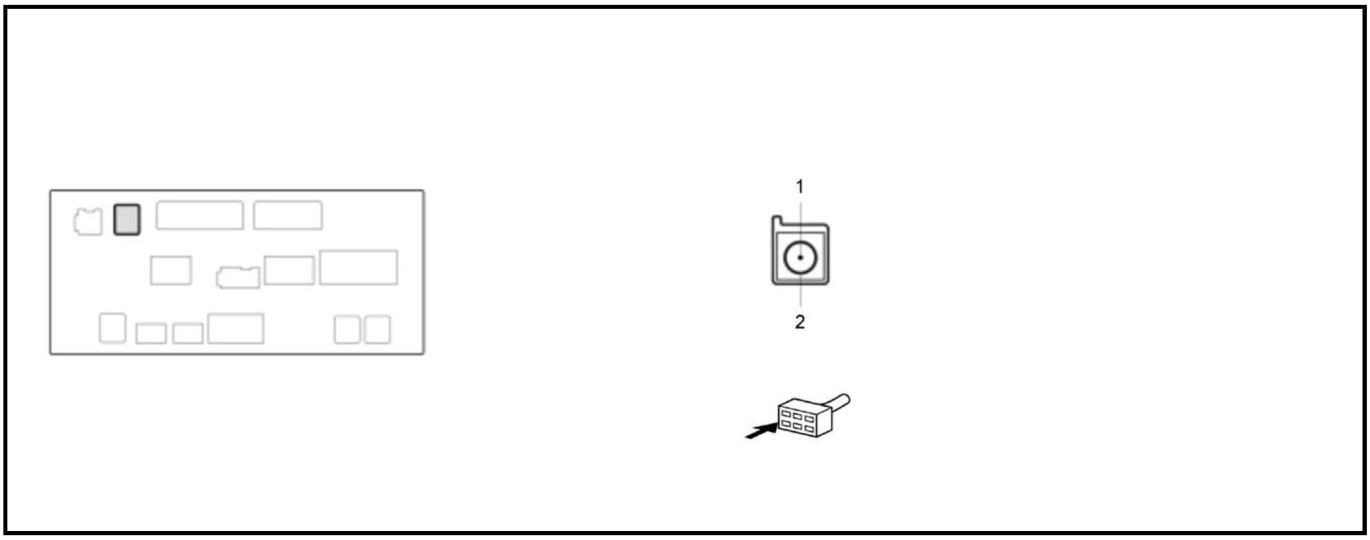
Cavity	Terminal Name	Description
L1	SPDIF1 SIG	Communication signal for tuner unit
L2	SPDIF1 SH	Shield for terminal No. 1

Audio-Navigation Unit Connector M (4P) (female terminals) (with stereo amplifier)



Cavity	Terminal Name	Description
M1	SPDIF2 SIG	Communication signal
M2	---	Not used
M3	SPDIF2 SH	Shield for terminal No. 1
M4	---	Not used

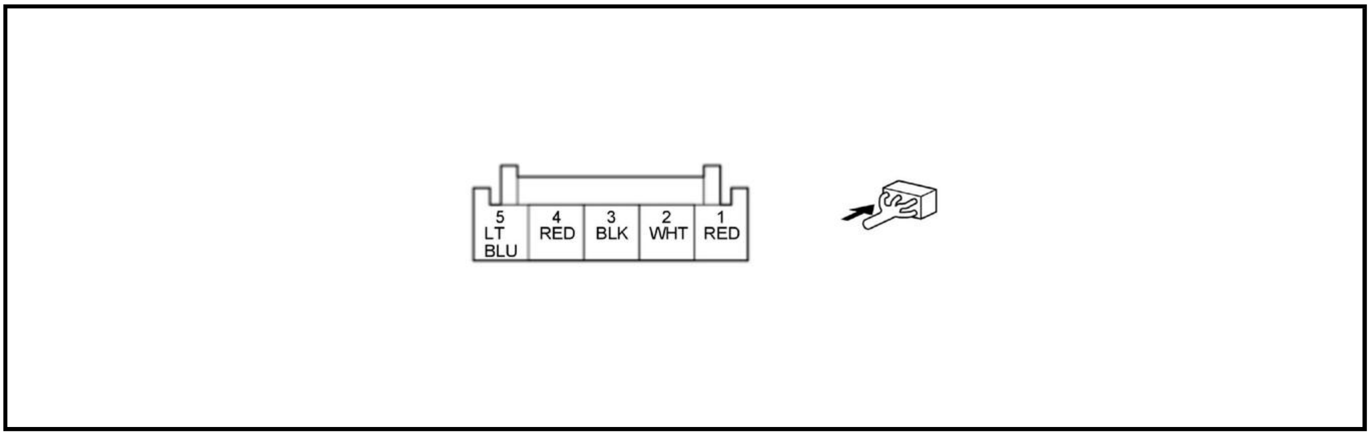
Audio-Navigation Unit Connector N (2P) (female terminals) (with XM)



Cavity	Terminal Name	Description
N1	SAT/TER	Inputs satellite/terrestrial signal
N2	SH (SAT/TER)	Shield for terminal No. 1

AUXILIARY JACK ASSEMBLY CONNECTOR FOR INPUTS AND OUTPUTS

Auxiliary Jack Assembly 5P Connector (female terminals)

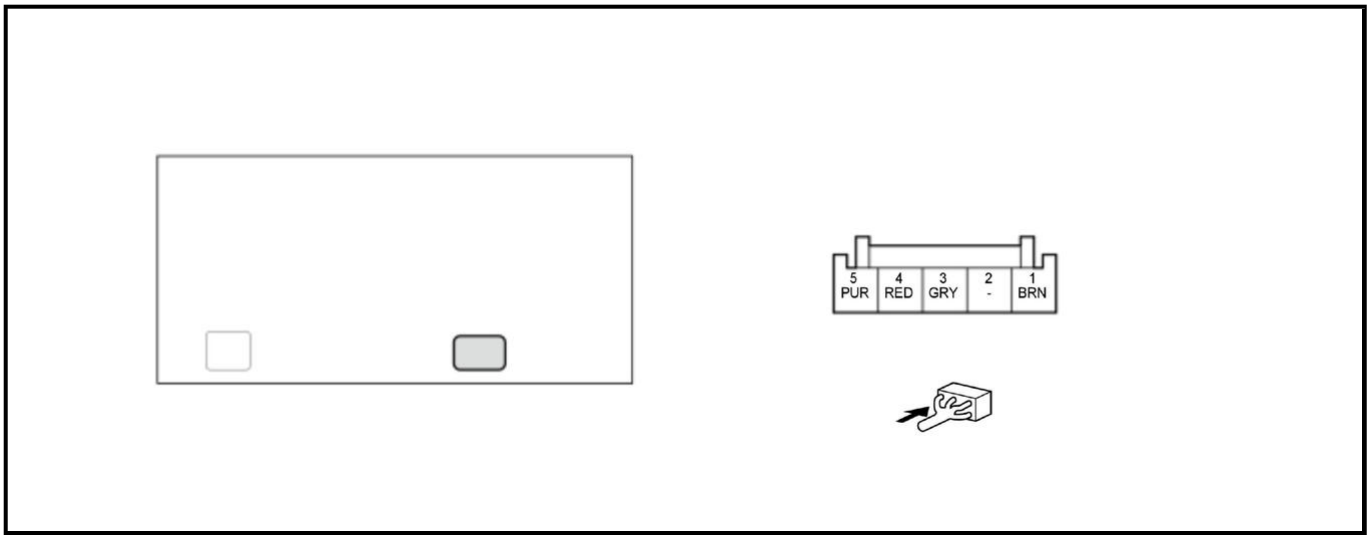


Cavity	Terminal Name	Description
1	AUX R CH	Outputs auxiliary sound signal
2	AUX L CH	Outputs auxiliary sound signal
3	AUX SGND	Ground for auxiliary sound signal
4	AUX GND	Ground for auxiliary jack assembly connection signal
5	AUX DET	Inputs connection signal for auxiliary jack assembly

CENTER DISPLAY UNIT CONNECTOR FOR INPUTS AND OUTPUTS

Connector Index
Center Display Unit Connector A (5P)
Center Display Unit Connector B (3P)

Center Display Unit Connector A (5P) (female terminals)

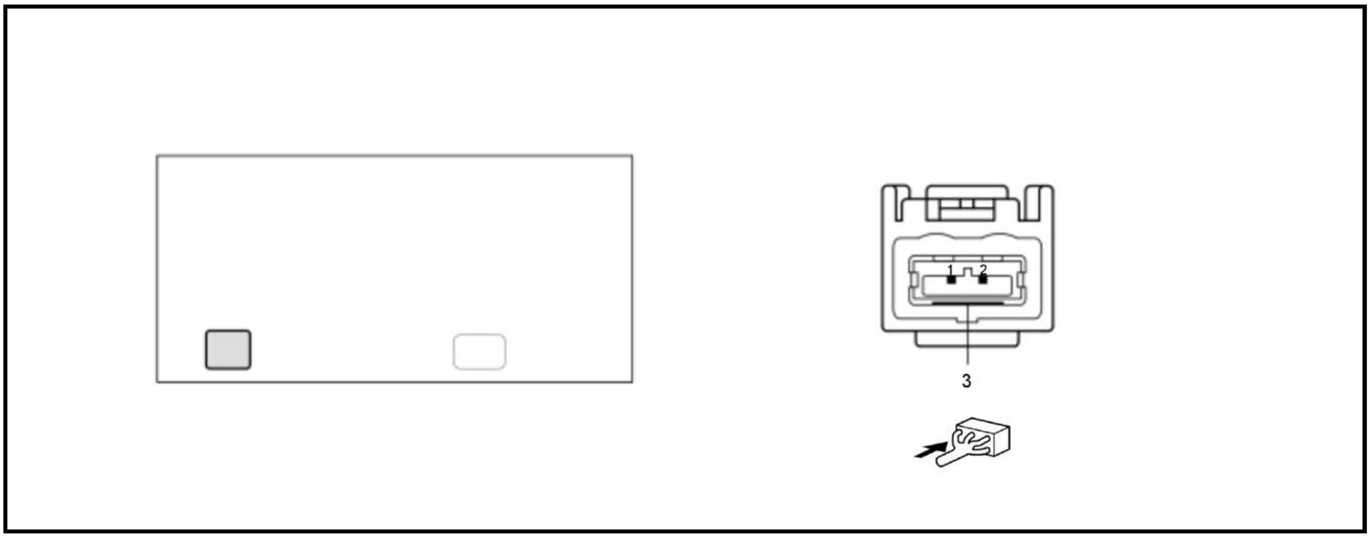


Cavity	Terminal Name	Description
A1	+B BACKUP2 SUB* 1+B AUDIO* 2	+B power source
A2	---	Not used
A3	ILLUMI+	Detects illumination on signal
A4	DISP CONT	Inputs signal for center display unit switching ON/OFF
A5	GND	Ground for center display unit

*1: With auto idle stop system

*2: Without auto idle stop system

Center Display Unit Connector B (3P) (female terminals)



Cavity	Terminal Name	Description
B1	LVDS1+	Communication signal
B2	LVDS1-	Communication signal
B3	LVDS1 SH	Shield for terminals No. 1 and No. 2

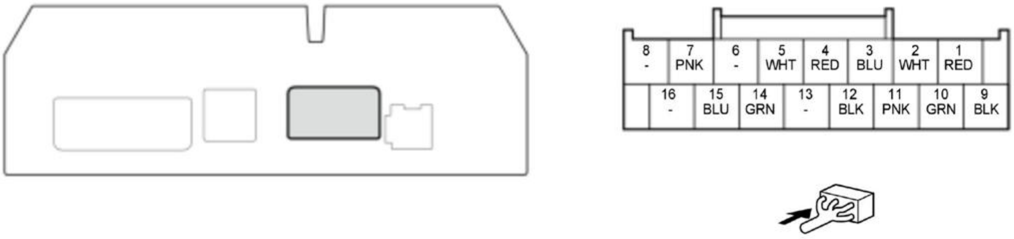
A3	+B AUDIO AMP	+B power source
A4	SUB WOOFER-	Outputs sound signal for subwoofer
A5	FL SPKR+	Outputs sound signal for left front door speaker

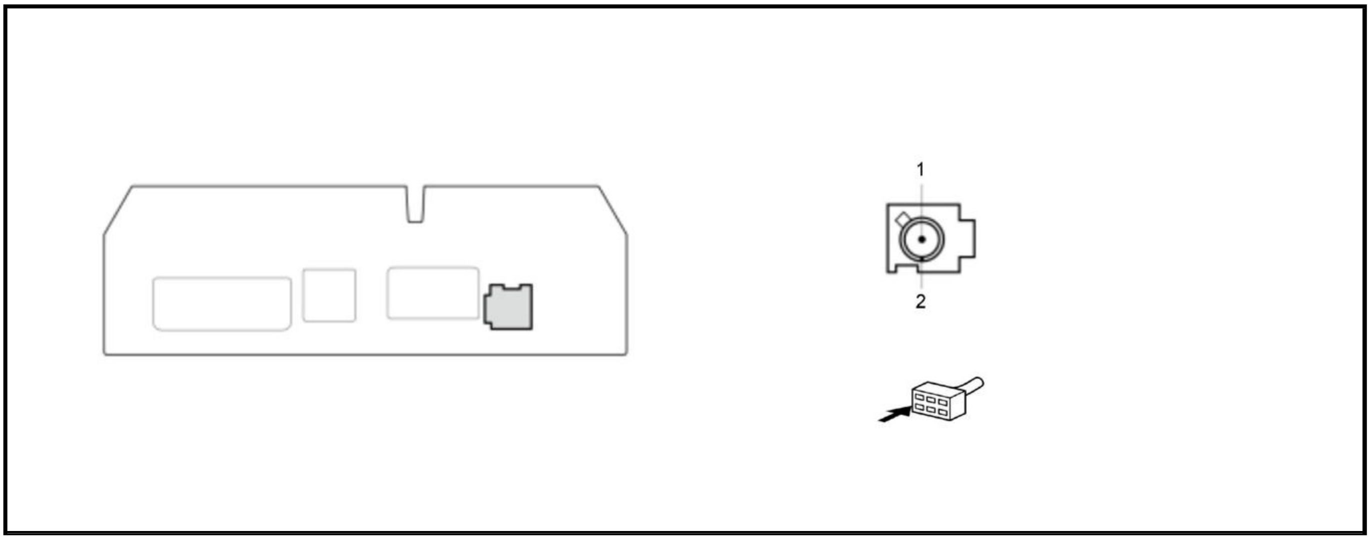
Cavity	Terminal Name	Description
A6	FL SPKR-	Outputs sound signal for left front door speaker
A7	RR SPKR-	Outputs sound signal for right rear speakers
A8	RR SPKR+	Outputs sound signal for right rear speakers
A9	RL SPKR-	Outputs sound signal for left rear speakers
A10	RL SPKR+	Outputs sound signal for left rear speaker
A11	---	Not used
A12	FR SPKR-	Outputs sound signal for right front door speaker
A13	FR SPKR+	Outputs sound signal for right front door speaker
A14	FL TWEETER+	Outputs sound signal for left front tweeter
A15	FL TWEETER-	Outputs sound signal for left front tweeter
A16	FR TWEETER+	Outputs sound signal for right front tweeter
A17	FR TWEETER-	Outputs sound signal for right front tweeter
A18	---	Not used

Stereo Amplifier Connector C (16P) (female terminals)



Cavity	Terminal Name	Description
C1	ANC R-	Inputs noise cancelling signal from ANC/active sound control unit
C2	ANC F-	Inputs noise cancelling signal from ANC/active sound control unit
C3	AUD F MIX GND	Basis ground for terminals No. 11
C4	AUX BEEP	Inputs system beep signal
C5	AUX NAVI GND	Basis ground for terminals No. 4 and No. 12
C6	---	Not used
C7	RS485-	Communication signal
C8	---	Not used
C9	ANC R+	Inputs noise cancelling signal from ANC/active sound control unit
C10	ANC F+	Inputs noise cancelling signal from ANC/active sound control unit
C11	AUD F MIX	Inputs noise cancelling mixing signal from ANC/active sound control unit
C12	AUX NAVI	Inputs sound signal for voice guidance and Voice Recognition (VR) prompts
C13	---	Not used
C14	SWD+B	Inputs signal for stereo amplifier switching on/off
C15	RS485+	Communication signal
C16	---	Not used

Stereo Amplifier Connector D (2P) (female terminals)



Cavity	Terminal Name	Description
D1	SPDIF2 SIG	Communication signal
D2	SPDIF2 SH	Shield for terminal No. 1

TUNER UNIT CONNECTOR FOR INPUTS AND OUTPUTS

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

AM RADIO RECEPTION CHANGES AT NIGHT (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- This is a system characteristic. AM radio stations are required by the government (FCC) to lower their power at night

AM/FM RADIO DISPLAY IS BLANK OR NO STATION INFORMATION IS DISPLAYED (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

AM/FM RADIO PRESET MEMORY IS LOST (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Replace the audio unit**

Also Check for

Internal error

AM/FM RADIO PRESET MEMORY IS LOST (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Replace the tuner unit**

Also Check for

Internal error

AUDIO REMOTE-HFL SWITCH DOES NOT WORK PROPERLY (AUDIO UNIT BUTTONS WORK) (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

AUDIO REMOTE-HFL SWITCH DOES NOT WORK PROPERLY (AUDIO UNIT BUTTONS WORK) (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

AUDIO SYSTEM SOUND IS WEAK OR DISTORTED (DISPLAY IS NORMAL) (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- Fader and balance positions
- Aftermarket amplifier or speakers

AUDIO SYSTEM SOUND IS WEAK OR DISTORTED (DISPLAY IS NORMAL) (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- Fader and balance positions
- Aftermarket amplifier or speakers

AUDIO UNIT BUTTON DOES NOT WORK (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Do the Knob Check in the System Diagnostic Mode**

Also Check for

Check the connector for poor connections or loose terminals between the audio unit and the audio panel

AUDIO UNIT BUTTON ILLUMINATION DOES NOT WORK (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

AUDIO UNIT DOES NOT EXIT ANTI-THEFT MODE (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Anti-Theft Feature**

AUDIO UNIT DOES NOT EXIT ANTI-THEFT MODE (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Anti-Theft Feature**

AUDIO UNIT WILL NOT TURN ON (NO INFORMATION DISPLAY) (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

AUDIO UNIT WILL NOT TURN ON (NO INFORMATION DISPLAY) (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

AUDIO-NAVIGATION UNIT POWER WILL NOT TURN ON (NO INFORMATION DISPLAY)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- Blown fuses
- Screen settings
- **Error Messages**
- Software not up to date

AUXILIARY INPUT SOUND IS LOW OR CANNOT BE HEARD (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- Auxiliary audio device volume is too low
- Auxiliary stereo cables compatibility

BLUETOOTH AUDIO DOES NOT WORK

Diagnostic Procedure

Check the Bluetooth module:

- With navigation: **Do the HFL/Mic in the System Diagnostic Mode**
- Display audio type without navigation: **Do the HFL/Mic in the System Diagnostic Mode**
- Color audio type: **Do the Version Display in the System Diagnostic Mode**

Also Check for

Bluetooth audio device compatibility (see the Owner's Manual)

BLUETOOTH AUDIO DOES NOT WORK (COLOR AUDIO TYPE)

Also Check for

Bluetooth phone compatibility (see the Owner's Manual)

BLUETOOTH AUDIO DOES NOT WORK (DISPLAY AUDIO TYPE)

Also Check for

Bluetooth phone compatibility (see the Owner's Manual)

BOOMING SOUND WHILE DRIVING WITH AUDIO SYSTEM ON OR OFF (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

BOOMING SOUND WHILE DRIVING WITH AUDIO SYSTEM ON OR OFF (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

Powertrain vibration or judder

CENTER DISPLAY UNIT BUTTON DOES NOT WORK (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Do the Hard Key in the System Diagnostic Mode**

Also Check for

Check the Touch Panel Sensitivity in the System Settings

CENTER DISPLAY UNIT DOES NOT DIM (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

CLOCK WILL NOT SET TO CORRECT TIME

Also Check for

Check the GPS signal

EXCESSIVE TRANSITION BETWEEN ANALOG BROADCAST AND DIGITAL HD RADIO (TM) BROADCAST (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Receiver is located near the edge of the digital HD Radio (TM) coverage area. Refer to www.hdradio.com to verify radio stations in your coverage area

HD RADIO (TM) CHANGES HD CHANNEL ON ITS OWN (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- This is intended behavior. HD Radio (TM) is set to revert to main channel after extended loss of HD2/HD3 broadcast

HFL DOES NOT WORK PROPERLY

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

Bluetooth phone compatibility (see the Owner's Manual)

LANEWATCH CAMERA IMAGE DOES NOT COME ON

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

Navigation DTCs

LANEWATCH CAMERA IMAGE DOES NOT COME ON (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

Audio DTCs

NAVIGATION SYSTEM STAYS ON THE CSF SCREEN

Diagnostic Procedure

- Navigation DTCs

Also Check for

- GPS Initialization
- Aftermarket metallic window tint on the front window or electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit

- Disconnected or defective GPS antenna

NAVIGATION TOUCH PANEL DOES NOT WORK

Diagnostic Procedure

- Do the Touch Panel Check in the System Diagnostic Mode

Also Check for

Forced Rebooting of Audio-Navigation Unit

NO HD TRAFFIC INFORMATION

Diagnostic Procedure

- Go to AM/FM radio display is blank or no station information is displayed troubleshooting

Also Check for

Local outage or no local broadcast. Compare to a known-good vehicle of the same year and trim.

NO SOUND IS HEARD FROM ALL THE SPEAKERS (DISPLAY IS NORMAL) (COLOR AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

Aftermarket amplifier or speakers

NO SOUND IS HEARD FROM ALL THE SPEAKERS (DISPLAY IS NORMAL) (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

Aftermarket amplifier or speakers

PANDORA IS NOT IS DISPLAYED AS AN AUDIO SOURCE (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Do the PANDORA in the System Diagnostic Mode to check the Pandora settings is abled

POOR AM OR FM RADIO RECEPTION OR INTERFERENCE (COLOR AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

- Check radio reception: Do the FM or AM in the System Diagnostic Mode
- Aftermarket FM modulator

- Loose antenna amplifier mounting bolt

POOR GPS RECEPTION OR INTERFERENCE

Diagnostic Procedure

- **Do the GPS Information in the System Diagnostic Mode**

Also Check for

- **Global Positioning System (GPS) Limitations**
- Aftermarket metallic window tint on the front window or electronic aftermarket accessories (possibly hidden) mounted near the GPS antenna or the audio-navigation unit

POOR OR NO SOUND WITH AM/FM RADIO (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- Check radio reception: **Do the Remote Tuner in the System Diagnostic Mode**
- Aftermarket FM modulator
- Loose antenna amplifier mounting bolt

REARVIEW CAMERA IMAGE DOES NOT CHANGE WHEN SELECTING DIFFERENT VIEWS (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

REARVIEW CAMERA IMAGE DOES NOT CHANGE WHEN SELECTING DIFFERENT VIEWS (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

REARVIEW CAMERA IMAGE DOES NOT COME ON (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

REARVIEW CAMERA IMAGE DOES NOT COME ON (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

SYSTEM ALWAYS COMES UP IN-LINE DIAGNOSTIC MODE

Diagnostic Procedure

- **Factory diagnostic screen In Line Diagnostic mode**

SYSTEM ALWAYS COMES UP IN-LINE DIAGNOSTIC MODE (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Factory diagnostic screen In Line Diag

THE HONDA APPROVED BLUETOOTH CELL PHONE CANNOT USE ALL ITS FUNCTIONS

Diagnostic Procedure

- HFL System Troubleshooting

THE HONDA APPROVED BLUETOOTH CELL PHONE DOES NOT PLACE OR RECEIVE CALLS USING THE HFL SYSTEM

Diagnostic Procedure

- HFL System Troubleshooting

THE HONDA APPROVED BLUETOOTH CELL PHONE IS HAVING PROBLEMS PAIRING TO THE VEHICLE

Diagnostic Procedure

- HFL System Troubleshooting

THE MID DOES NOT DISPLAY THE AUDIO UNIT INFORMATION (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

THE MID DOES NOT DISPLAY THE AUDIO-NAVIGATION UNIT INFORMATION

Diagnostic Procedure

- Symptom Troubleshooting

USB CHARGER DOES NOT WORK (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

USB DEVICE DOES NOT FUNCTION (COLOR AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

- Error Messages
- USB device compatibility (see the Owner's Manual)

USB DEVICE DOES NOT FUNCTION (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

- **Error messages**
- USB device compatibility (see the Owner's Manual)

VEHICLE POSITION ICON WANDERS ACROSS THE MAP WHEN DRIVING (DOES NOT FOLLOW A DISPLAYED ROAD) OR MAP VEHICLE ICON SPINS

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- **Global Positioning System (GPS) Limitations**
- **Map Matching**
- **Sensor Calibration**
- VSP missing
- Poor or no GPS reception
- Check for any related service bulletin software updates

VOICE CONTROL DOES NOT WORK/RESPOND

Also Check for

Check for any related service bulletin software updates

VOICE GUIDANCE CANNOT BE HEARD, IS BROKEN UP, OR THERE IS STATIC

Also Check for

Volume or voice feedback setting (see the Navigation System Manual)

VOLUME DOES NOT INCREASE WITH SPEED (COLOR AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

Speed-sensitive Volume Control settings (see the Owner's Manual)

VOLUME DOES NOT INCREASE WITH SPEED (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

Speed-sensitive Volume Control settings (see the Owner's Manual)

VOLUME IS TOO HIGH OR TOO LOW WHEN DRIVING AT FREEWAY SPEEDS (COLOR AUDIO TYPE)

Also Check for

Speed-sensitive Volume Control settings (see the Owner's Manual)

VOLUME IS TOO HIGH OR TOO LOW WHEN DRIVING AT FREEWAY SPEEDS (DISPLAY AUDIO TYPE)

Also Check for

Speed-sensitive Volume Control settings (see the Owner's Manual)

XM RADIO DISPLAY IS BLANK AND NO STATION INFORMATION IS DISPLAYED (DISPLAY AUDIO TYPE)

Diagnostic Procedure

- With navigation: **Navigation DTCs**
- Without navigation: **Audio DTCs**

Also Check for

Error messages

TROUBLESHOOTING

DTC 1102 (AUDIO UNIT)

DTC 1102 : USB Diag

NOTE:

- Check the vehicle 12 volt battery condition first .
- This audio DTC sets when a problem is detected with the USB device that is connected to the USB port.
- Before you troubleshoot, make sure to follow the General Troubleshooting Information .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

    -1. Clear the hard error codes .

    -2. Turn the vehicle to the OFF (LOCK) mode.

    -3. Wait for at least 6 seconds.

    -4. Connect the USB device to the USB port A or B.

    -5. Check for hard error codes .

    Is DTC 1102 indicated?

    YES

    The failure is duplicated, go to step 2.

    NO

    Intermittent failure, the system is OK at this time.

2. Audio unit check

    -1. Clear the hard error codes .

    -2. Turn the vehicle to the OFF (LOCK) mode.

    -3. Wait for at least 6 seconds.

    -4. Disconnect the USB device, then connect a known-good USB device to the USB port A or B.

    -5. Check for hard error codes .

    Is DTC 1102 indicated?

    YES

    Replace the audio unit .

    NO

Original USB device is faulty.

DTC 1301 (AUDIO UNIT)

DTC 1301 : GPS Antenna Error

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when there is poor connectors or loose terminals at the GPS antenna connector or an open in GPS antenna lead.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Turn the vehicle to the ON mode, and wait at least 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1301 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. DTC check

   -1. **Check for hard error codes** .

   Is DTC 2701 indicated?

   YES

   Go to DTC 2701 troubleshooting.

   NO

   Replace the audio unit .

DTC 1302 (AUDIO UNIT)

DTC 1302 : GPS Receiver Error 1

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when there is an internal GPS receiver problem (freeze error).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Turn the vehicle to the ON mode, and wait at least 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1302 indicated?

   YES

   Replace the audio unit .

   NO

   Intermittent failure, the system is OK at this time.

DTC 1306 (AUDIO UNIT)

DTC 1306 : Vehicle Speed Pulse

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when there is a problem with the VSP circuit.
- Check for aftermarket accessories that may interfere with the navigation system.
- Check the GPS reception in an open area (vehicle position should be detected in three dimensions).
- Aftermarket metallic window tint or electronic devices located near the audio unit or GPS antenna can potentially interfere with the operation of the audio system.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Wait for at least 6 seconds.

   -3. Turn the vehicle to the ON mode.

   -4. Test-drive the vehicle at steady speed more than 12 mph (20 km/h) for about 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1306 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Determine possible failure area (audio unit, others)

   -1. **Go into the System Diagnostic Mode, and select the Vehicle status in the Unit Check** .

   -2. With the help of an assistant test-drive the vehicle, and watch the VSP status.

   Does the VSP change from [0] (stopped) to [1] (driving) as you drive?

   YES

   Replace the audio unit .

   NO

   Go to step 3.

3. Determine possible failure area (VSP line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS.

   -3. Disconnect the following connector.

PCM connector A (50P) (1.5 L engine)PCM connector A (51P) (2.4 L engine)

   -4. Turn the vehicle to the ON mode.

   -5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P) (1.5 L engine): disconnectedPCM connector A (51P) (2.4 L engine): disconnected
Test point 1	**PCM connector A (50P) (1.5 L engine) No. 35**
B	**PCM connector A (51P) (2.4 L engine) No. 25**
Test point 2	Body ground

   Is there about 5.0 V?

   YES

   The VSP wire is OK. Go to step 4.

   NO

   Go to step 5.

4. Determine possible failure area (audio unit, PCM)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Reconnect PCM connector A (50P) (1.5 L engine).

   -3. Reconnect PCM connector A (51P) (2.4 L engine).

   -4. Raise the vehicle on a lift.

   -5. Turn the vehicle to the ON mode.

-6. Block the front tire of one side, and rotate the front tire slowly that is not blocked.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode, with the front tire slowly rotating
Test point 1	**Audio unit connector A (24P) No. 22**
Test point 2	Body ground

Does the voltage pulse between 0 V and 5 V as you rotate the tire?

YES

Replace the audio unit .

NO

Replace the PCM .

5. Open wire check (VSP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P) (1.5 L engine): disconnectedPCM connector A (51P) (2.4 L engine): disconnected
Test point 1	**Audio unit connector A (24P) No. 22**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

The VSP wire is not open. Go to step 6.

6. Shorted wire check (VSP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector A (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P) (1.5 L engine): disconnectedPCM connector A (51P) (2.4 L engine): disconnected
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 22**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire.

NO

Replace the audio unit .

DTC 1702 (AUDIO UNIT)

DTC 1702 : XM Antenna Error

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when there is poor connectors or loose terminals at the XM antenna connector or an open or short in the antenna lead.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. Turn the vehicle to the ON mode.

-5. Turn on the audio system, and select the XM radio.

-6. **Check for hard error codes** .

Is DTC 1702 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (XM antenna, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

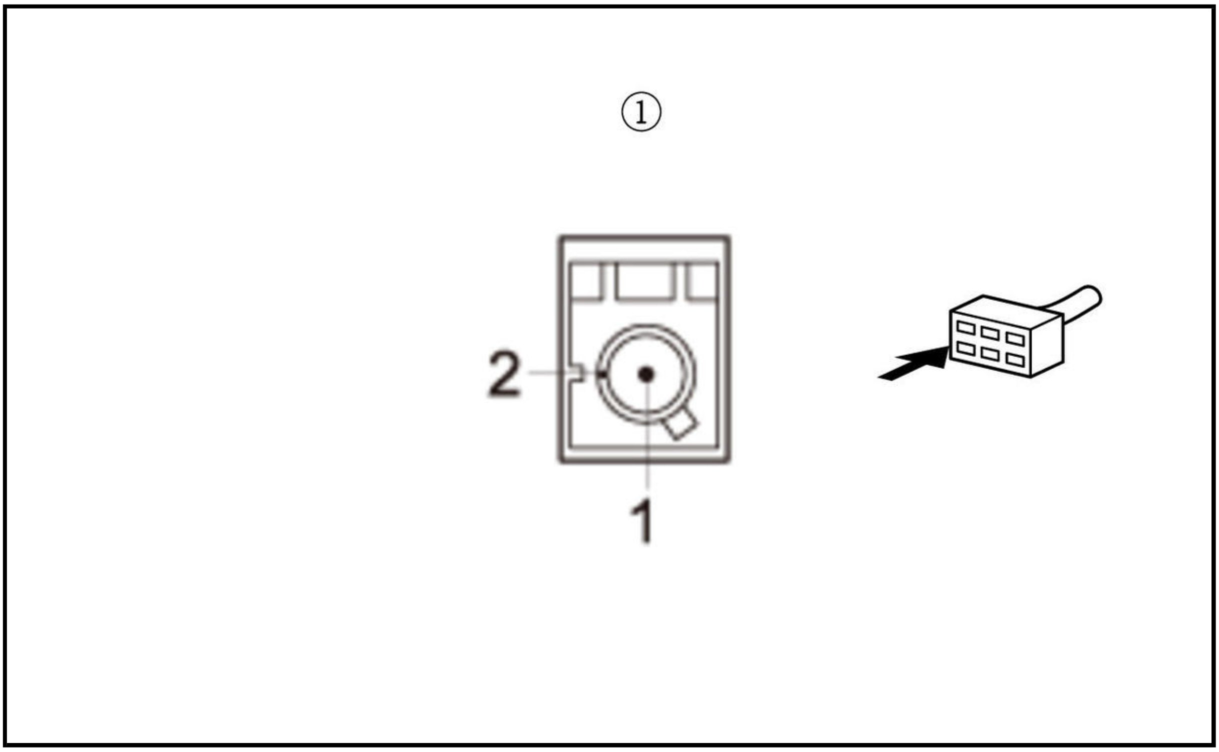
Roof antenna connector B (2P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Roof antenna connector B (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①

Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the roof antenna .

NO

Go to step 3.

3. Shorted wire check (SAT/TER line)

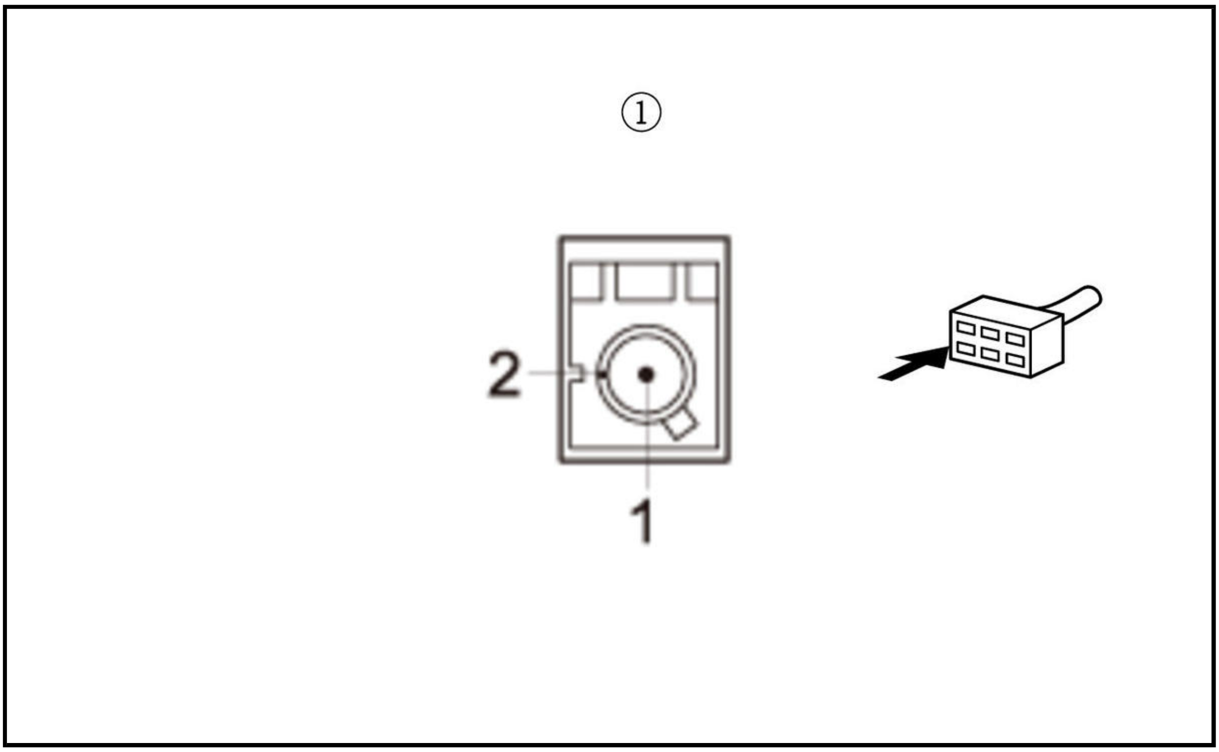
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector N (2P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio unit connector N (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected antenna lead.

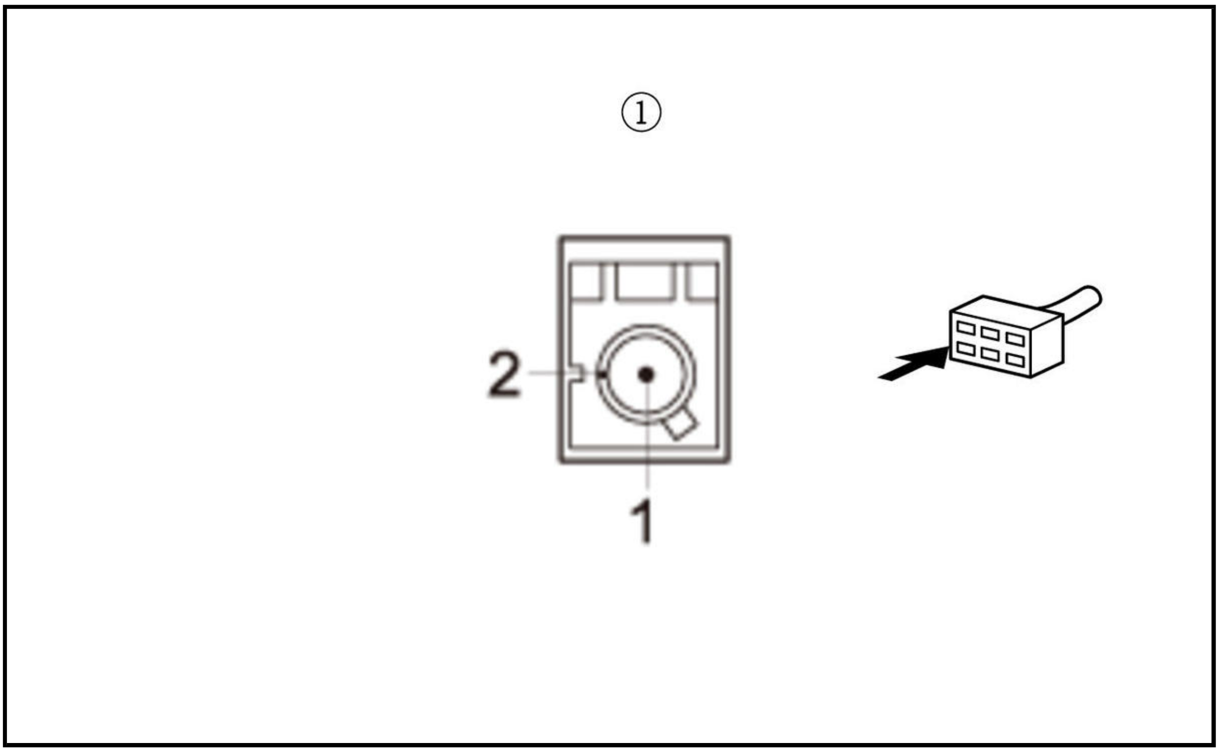
NO

The SAT/TER wire is not shorted to ground. Go to step 4.

4. Shorted wire check (SAT/TER line to SH(SAT/TER) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio unit connector N (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Roof antenna connector B (2P) (male terminals) No. 2: ①



Is there continuity?

YES

There is a short in the wire. Replace the affected antenna lead.

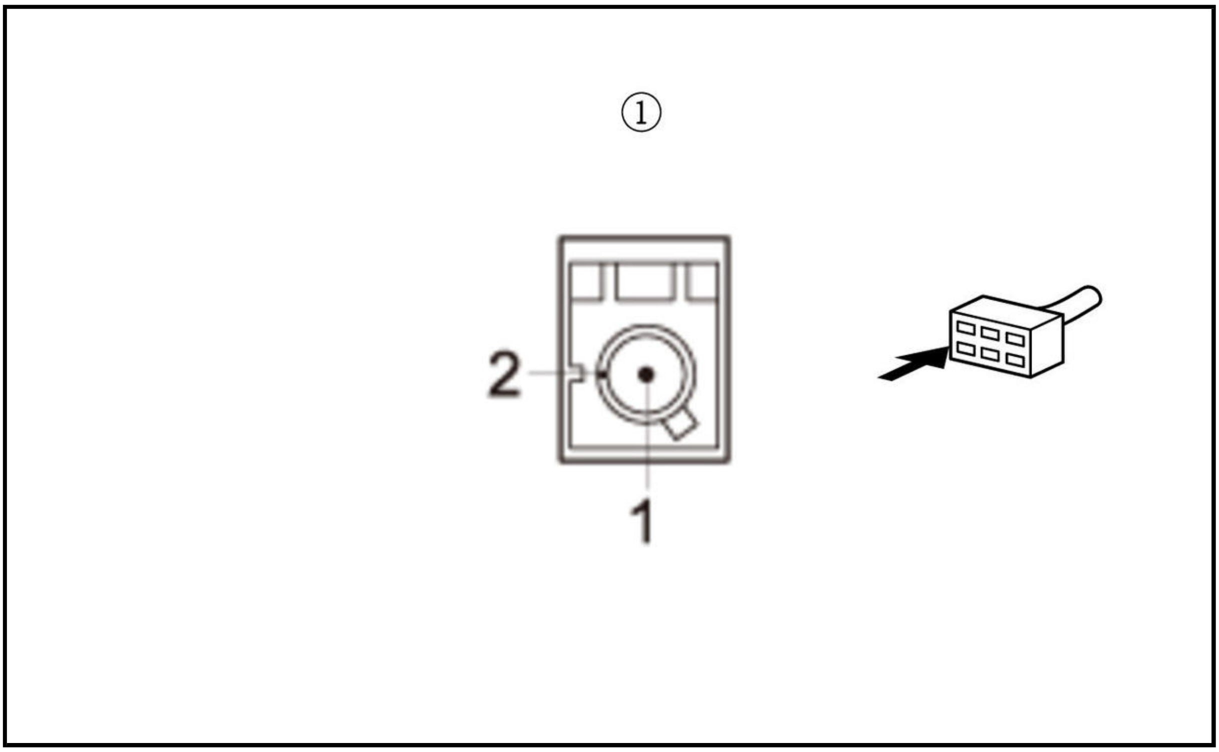
NO

The SAT/TER wire is not shorted to SH(SAT/TER) wire. Go to step 5.

5. Open wire check (SAT/TER line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio unit connector N (2P): disconnected
Test point 1	**Audio unit connector N (2P) No. 1**
Test point 2	Roof antenna connector B (2P) (male terminals) No. 1: ①



Is there continuity?

YES

Replace the audio unit .

NO

There is an open in the wire. Replace the affected antenna lead.

DTC 2608 (AUDIO UNIT)

DTC 2608 : R-Camera Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when NG is indicated in the Rear wide camera diagnosis (the Rear wide camera icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. **Check for hard error codes** .

Is DTC 2608 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (CAMERA ADPT line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rearview camera 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Rearview camera 8P connector No. 6**
Test point 2	Body ground

Is there about 5.0 V?

YES

The CAMERA ADPT wire is OK. Go to step 4.

NO

Go to step 3.

3. Open wire check (CAMERA ADPT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio unit connector C (32P) No. 16**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

Replace the audio unit .

4. Determine possible failure area (rearview camera, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rearview camera 8P connector: disconnected

Test point 1	**Rearview camera 8P connector No. 5**
Test point 2	Body ground

Is there continuity?

YES

Replace the rearview camera .

NO

Go to step 5.

5. Open wire check (SH CAMERA line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Rearview camera 8P connector: disconnected
Test point 1	**Audio unit connector C (32P) No. 28**
Test point 2	Body ground

Is there continuity?

YES

There is an open in the wire(s). Replace the affected shielded harness.

NO

Replace the audio unit .

DTC 2610 (AUDIO UNIT)

DTC 2610 : DRAM Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when a problem with the internal DRAM is detected (the HMI Unit icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. **Check for hard error codes** .

Is DTC 2610 indicated?

YES

Replace the audio unit .

NO

Intermittent failure, the system is OK at this time.

DTC 2618 (AUDIO UNIT)

DTC 2618 : LaneWatch Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when Connection NG is indicated in the LaneWatch diagnosis (the LaneWatch icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. **Check for hard error codes** .

Is DTC 2618 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (LWC CAM VCC line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

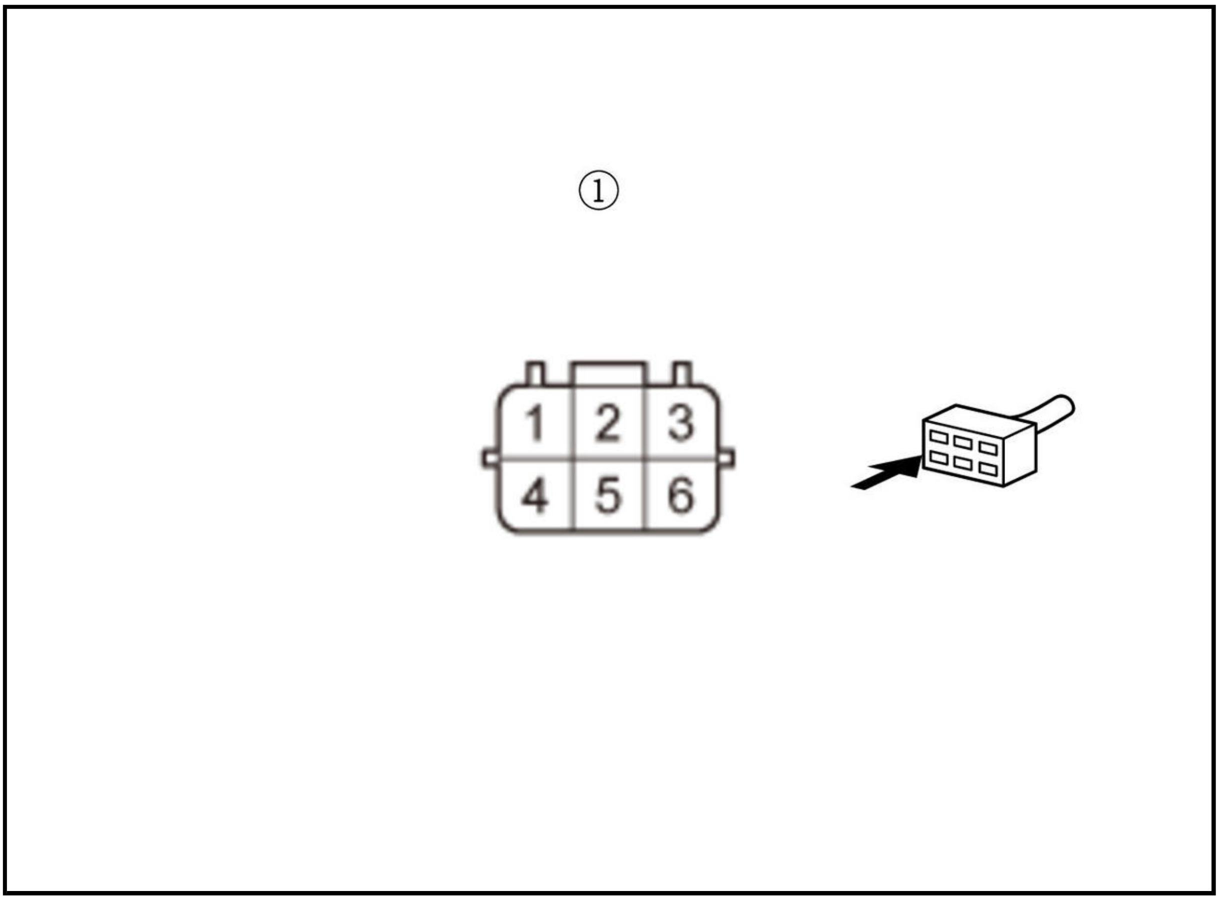
-2. Disconnect the following connector.

LaneWatch camera 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	LaneWatch camera 6P connector: disconnected
Test point 1	LaneWatch camera 6P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 8.0 V?

YES

The LWC CAM VCC wire is OK. Go to step 5.

NO

Go to step 3.

3. Open wire check (LWC CAM VCC line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	LaneWatch camera 6P connector: disconnected
Test point 1	**Audio unit connector B (24P) No. 8**
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

The LWC CAM VCC wire is not open. Go to step 4.

4. Shorted wire check (LWC CAM VCC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
B	Audio unit connector B (24P): disconnected
Test point 1	**Audio unit connector B (24P) No. 8**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected shielded harness.

NO

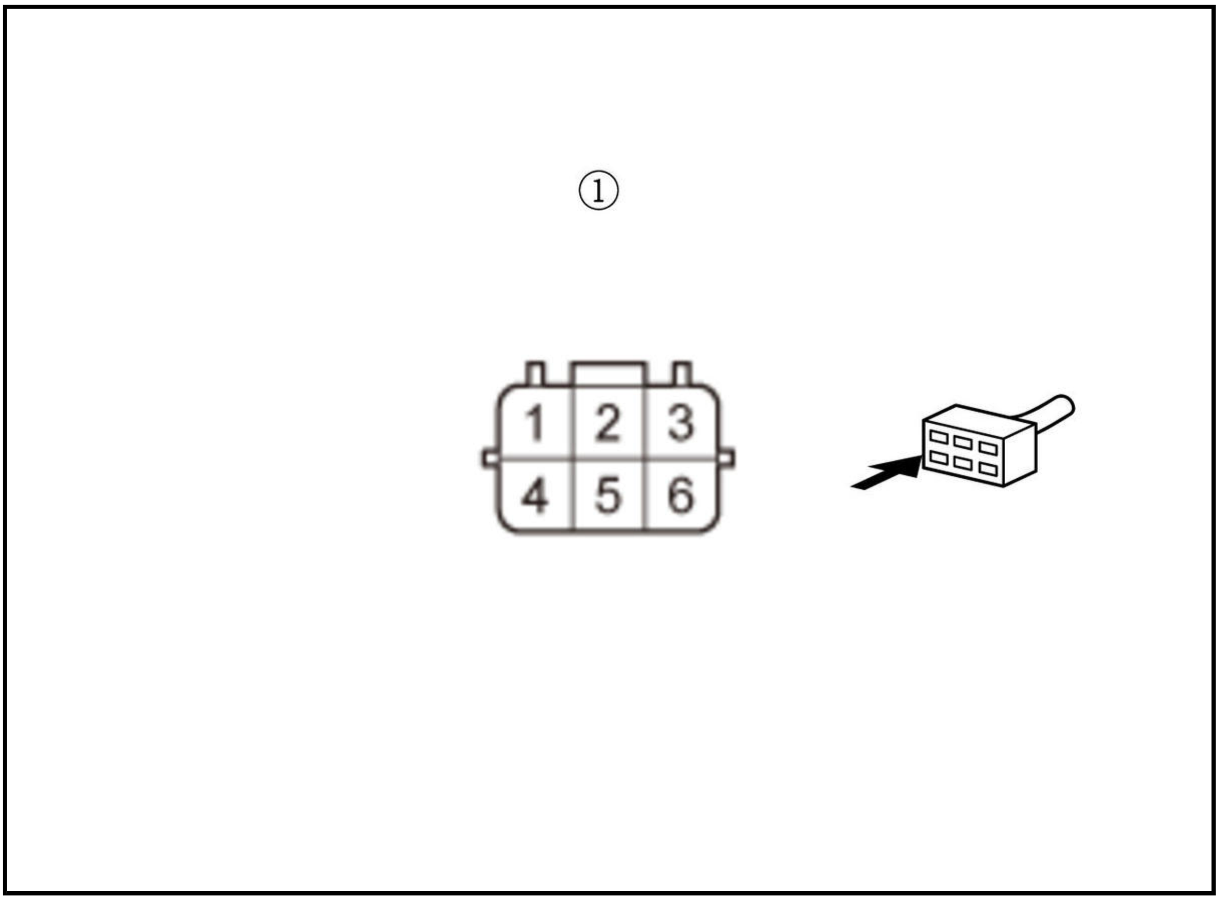
Replace the audio unit .

5. Determine possible failure area (SH LWC CAM line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
Test point 1	LaneWatch camera 6P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

The SH LWC CAM wire is OK. Go to step 7.

NO

Go to step 6.

6. Open wire check (SH LWC CAM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
Test point 1	**Audio unit connector B (24P) No. 9**
Test point 2	Body ground

Is there continuity?

YES

There is an open in the wire(s). Replace the affected shielded harness.

NO

Replace the audio unit .

7. Shorted wire check (LWC UART line)

-1. Disconnect the following connector.

Audio unit connector B (24P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
B	Audio unit connector B (24P): disconnected
Test point 1	**Audio unit connector B (24P) No. 22**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire(s). Replace the affected shielded harness.

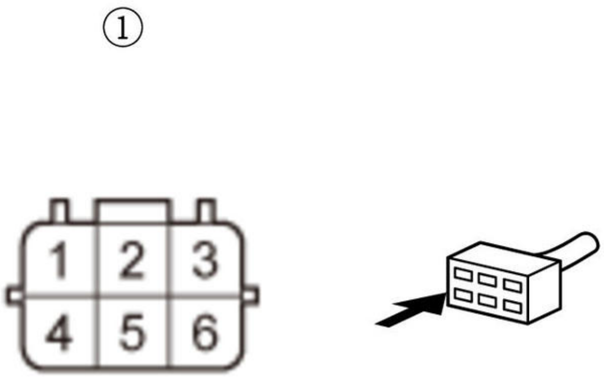
NO

The LWC UART wire is not shorted to ground. Go to step 8.

8. Open wire check (LWC UART line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
B	Audio unit connector B (24P): disconnected
Test point 1	**Audio unit connector B (24P) No. 22**
Test point 2	LaneWatch camera 6P connector (female terminals) No. 6: ①



Is there continuity?

YES

Replace the LaneWatch camera .

NO

There is an open in the wire(s). Replace the affected shielded harness.

DTC 2701 (AUDIO UNIT)

DTC 2701 : GPS Diag: Antenna

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when Connection NG is indicated in the GPS antenna diagnosis (the GPS antenna icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. **Check for hard error codes** .

   Is DTC 2701 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. GPS antenna check (substitution)

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. **Substitute a known-good GPS antenna** .

   -4. **Check for hard error codes** .

   Is DTC 1301 indicated?

   YES

   Replace the audio unit .

   NO

   Replace the original GPS antenna .

DTC 2703 (AUDIO UNIT)

DTC 2703 : Aircon Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when Connection NG is indicated in the A/C diagnosis (the A/C icon is red in the System Links).
- Check for B-CAN DTCs and resolve them before troubleshooting.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. **Check for hard error codes** .

   Is DTC 2703 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Audio unit connector A (24P)
Climate control unit connector A (32P)

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector A (24P): disconnected
B	Climate control unit connector A (32P): disconnected
Test point 1	**Audio unit connector A (24P) No. 14**
Test point 2	**Climate control unit connector A (32P) No. 25**

Test point 1	**Audio unit connector A (24P) No. 24**

Test point 2	**Climate control unit connector A (32P) No. 8**

   Is there continuity?

   YES

Replace the climate control unit .

NO

Repair an open in the wire(s).

DTC 1102 (NAVIGATION UNIT)

DTC 1102 : USB Diag

NOTE:

- Check the vehicle 12 volt battery condition first .
- This navigation DTC sets when a problem is detected with the USB device that is connected to the USB port.
- Before you troubleshoot, make sure to follow the General Troubleshooting Information .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Clear the hard error codes .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Connect the USB device to the USB port A or B.

   -5. Check for hard error codes .

   Is DTC 1102 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Audio-navigation unit check

   -1. Clear the hard error codes .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Disconnect the USB device, then connect a known-good USB device to the USB port A or B.

   -5. Check for hard error codes .

   Is DTC 1102 indicated?

   YES

   Replace the audio-navigation unit .

   NO

Original USB device is faulty.

DTC 1301 (NAVIGATION UNIT)

DTC 1301 : GPS Antenna Error

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when there is poor connectors or loose terminals at the GPS antenna connector or an open in GPS antenna lead.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Turn the vehicle to the ON mode, and wait at least 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1301 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. DTC check

   -1. **Check for hard error codes** .

   Is DTC 2701 indicated?

   YES

   Go to DTC 2701 troubleshooting.

   NO

   Replace the audio-navigation unit .

DTC 1302 (NAVIGATION UNIT)

DTC 1302 : GPS Receiver Error 1

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when there is an internal GPS receiver problem (freeze error).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Turn the vehicle to the ON mode, and wait at least 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1302 indicated?

   YES

   Replace the audio-navigation unit .

   NO

   Intermittent failure, the system is OK at this time.

DTC 1304 (NAVIGATION UNIT)

DTC 1304 : Gyro Error 1

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when there is a problem with the output voltage of the internal gyro sensor
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Turn the vehicle to the ON mode, and wait at least 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1304 indicated?

   YES

   Replace the audio-navigation unit .

   NO

   Intermittent failure, the system is OK at this time.

DTC 1306 (NAVIGATION UNIT)

DTC 1306 : Vehicle Speed Pulse

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when there is a problem with the VSP circuit.
- Check for aftermarket accessories that may interfere with the navigation system.
- Check the GPS reception in an open area (vehicle position should be detected in three dimensions).
- Aftermarket metallic window tint or electronic devices located near the audio-navigation unit or GPS antenna can potentially interfere with the operation of the navigation system.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Wait for at least 6 seconds.

   -3. Turn the vehicle to the ON mode.

   -4. Test-drive the vehicle at steady speed more than 12 mph (20 km/h) for about 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1306 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Determine possible failure area (audio-navigation unit, others)

   -1. **Go into the System Diagnostic Mode, and select the Vehicle status in the Unit Check** .

   -2. With the help of an assistant test-drive the vehicle, and watch the VSP status.

   Does the VSP change from [0] (stopped) to [1] (driving) as you drive?

   YES

   Replace the audio-navigation unit .

   NO

   Go to step 3.

3. Determine possible failure area (VSP line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS.

   -3. Disconnect the following connector.

PCM connector A (50P) (1.5 L engine)PCM connector A (51P) (2.4 L engine)

   -4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P) (1.5 L engine): disconnectedPCM connector A (51P) (2.4 L engine): disconnected
Test point 1	**PCM connector A (50P) (1.5 L engine) No. 35**
B	**PCM connector A (51P) (2.4 L engine) No. 25**
Test point 2	Body ground

Is there about 5.0 V?

YES

The VSP wire is OK. Go to step 4.

NO

Go to step 5.

4. Determine possible failure area (audio-navigation unit, PCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect PCM connector A (50P) (1.5 L engine).

-3. Reconnect PCM connector A (51P) (2.4 L engine).

-4. Raise the vehicle on a lift.

-5. Turn the vehicle to the ON mode.

-6. Block the front tire of one side, and rotate the front tire slowly that is not blocked.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode, with the front tire slowly rotating
Test point 1	**Audio-navigation unit connector A (24P) No. 22**
Test point 2	Body ground

Does the voltage pulse between 0 V and 5 V as you rotate the tire?

YES

Replace the audio-navigation unit .

NO

Replace the PCM .

5. Open wire check (VSP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P) (1.5 L engine): disconnectedPCM connector A (51P) (except 1.5 L engine): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 22**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

The VSP wire is not open. Go to step 6.

6. Shorted wire check (VSP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P) (1.5 L engine): disconnectedPCM connector A (51P) (except 1.5 L engine): disconnected
B	Audio-navigation unit connector A (24P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 22**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire.

NO

Replace the audio-navigation unit .

DTC 1702 (NAVIGATION UNIT)

DTC 1702 : XM Antenna Error

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when there is poor connectors or loose terminals at the XM antenna connector or an open or short in the antenna lead.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. Turn the vehicle to the ON mode.

-5. Turn on the audio system, and select the XM radio.

-6. Check for hard error codes .

Is DTC 1702 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (XM antenna, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

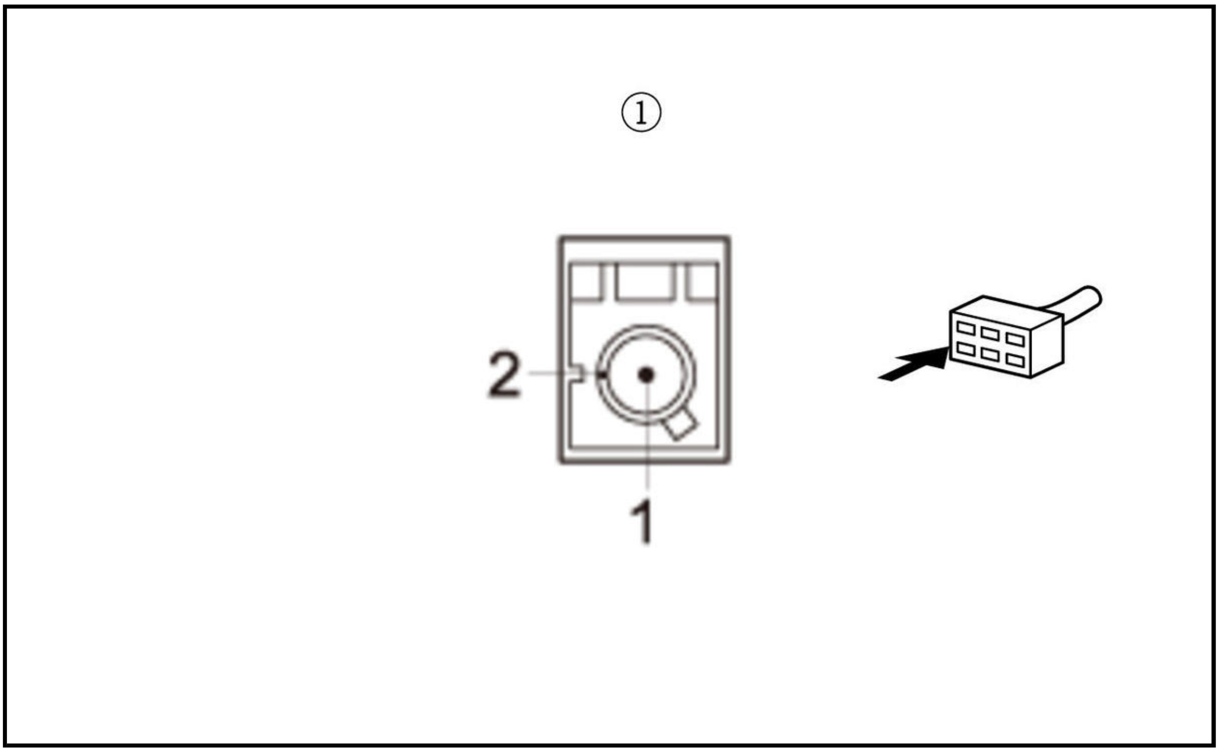
-2. Disconnect the following connector.

Roof antenna connector B (2P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Roof antenna connector B (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the roof antenna .

NO

Go to step 3.

3. Shorted wire check (SAT/TER line)

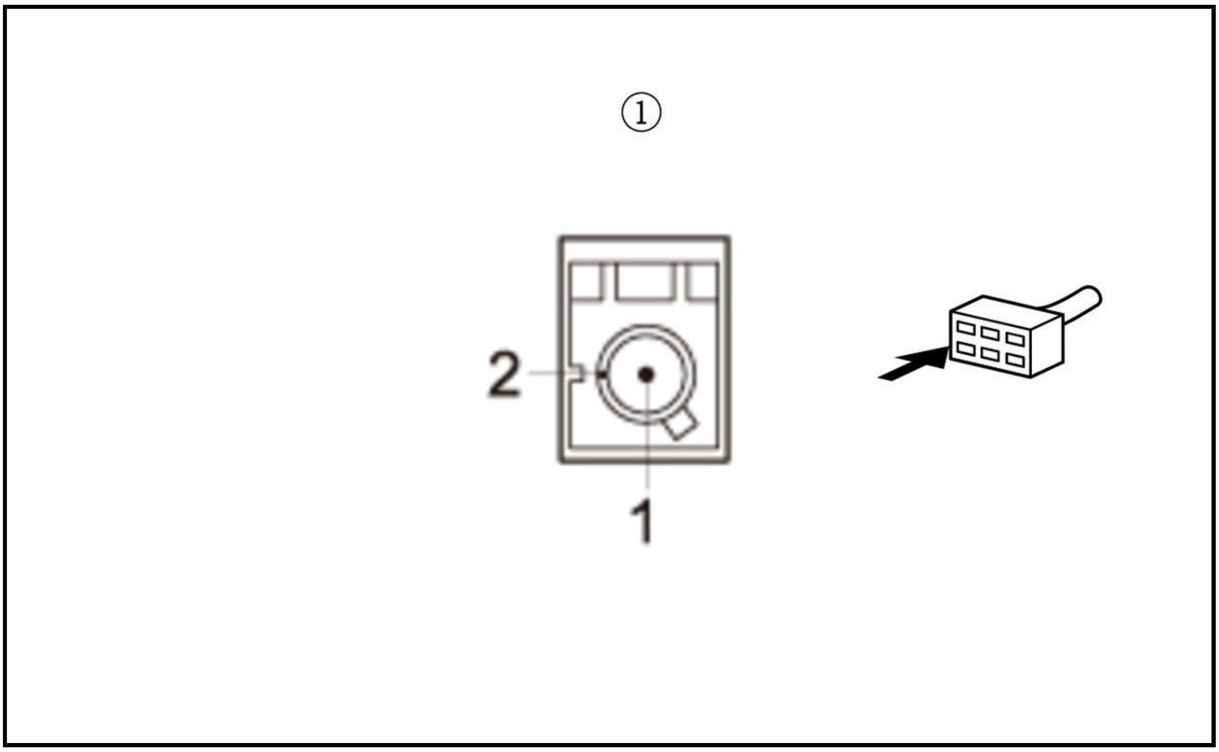
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector N (2P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio-navigation unit connector N (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected antenna lead.

NO

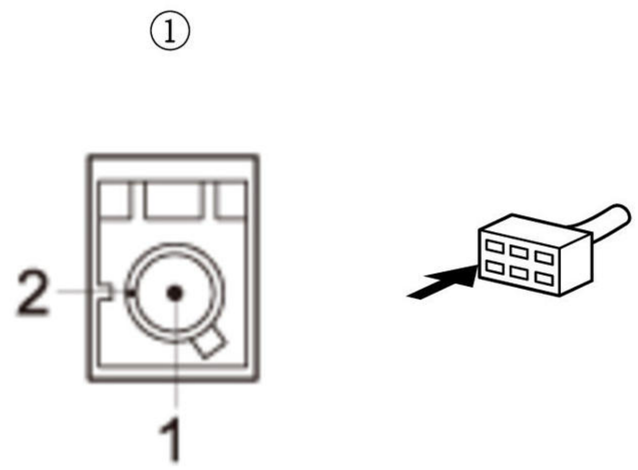
The SAT/TER wire is not shorted to ground. Go to step 4.

4. Shorted wire check (SAT/TER line to SH(SAT/TER) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected

B	Audio-navigation unit connector N (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Roof antenna connector B (2P) (male terminals) No. 2: ①



Is there continuity?

YES

There is a short in the wire. Replace the affected antenna lead.

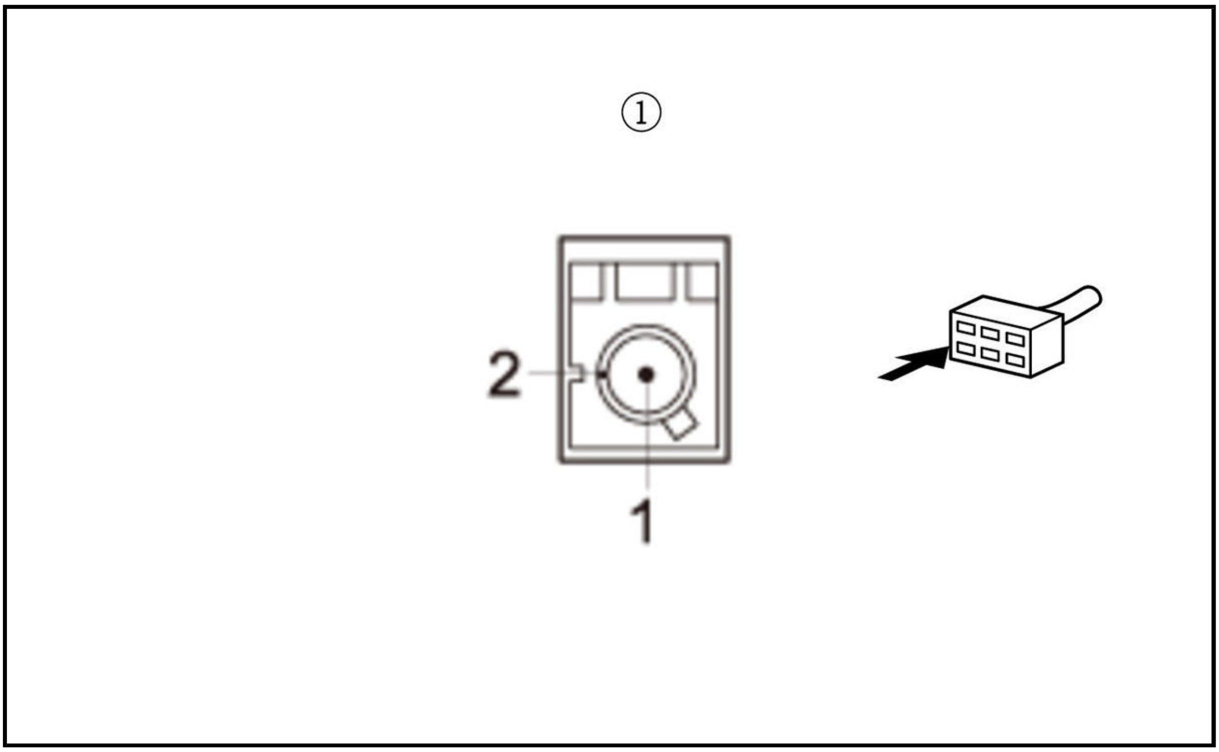
NO

The SAT/TER wire is not shorted to SH(SAT/TER) wire. Go to step 5.

5. Open wire check (SAT/TER line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio-navigation unit connector N (2P): disconnected
Test point 1	**Audio-navigation unit connector N (2P) No. 1**
Test point 2	Roof antenna connector B (2P) (male terminals) No. 1: ①



Is there continuity?

YES

Replace the audio-navigation unit .

NO

There is an open in the wire. Replace the affected antenna lead.

DTC 2608 (NAVIGATION UNIT)

DTC 2608 : R-Camera Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when NG is indicated in the Rear wide camera diagnosis (the Rear wide camera icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. **Check for hard error codes** .

Is DTC 2608 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (CAMERA ADPT line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rearview camera 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Rearview camera 8P connector No. 6**
Test point 2	Body ground

Is there about 5.0 V?

YES

The CAMERA ADPT wire is OK. Go to step 4.

NO

Go to step 3.

3. Open wire check (CAMERA ADPT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) No. 16**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

Replace the audio-navigation unit .

4. Determine possible failure area (rearview camera, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rearview camera 8P connector: disconnected

Test point 1	**Rearview camera 8P connector No. 5**
Test point 2	Body ground

Is there continuity?

YES

Replace the rearview camera .

NO

Go to step 5.

5. Open wire check (SH CAMERA line)

   -1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Rearview camera 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) No. 28**
Test point 2	Body ground

Is there continuity?

YES

There is an open in the wire(s). Replace the affected shielded harness.

NO

Replace the audio-navigation unit .

DTC 2610 (NAVIGATION UNIT)

DTC 2610 : DRAM Diag

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when a problem with the internal DRAM is detected (the HMI Unit icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. **Check for hard error codes** .

Is DTC 2610 indicated?

YES

Replace the audio-navigation unit .

NO

Intermittent failure, the system is OK at this time.

DTC 2618 (NAVIGATION UNIT)

DTC 2618 : LaneWatch Diag

NOTE:

- Check the vehicle 12 volt battery condition first .
- This navigation DTC sets when Connection NG is indicated in the LaneWatch diagnosis (the LaneWatch icon is red in the System Links).
- Before you troubleshoot, make sure to follow the General Troubleshooting Information .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. Clear the hard error codes .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. Check for hard error codes .

Is DTC 2618 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (LWC CAM VCC line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

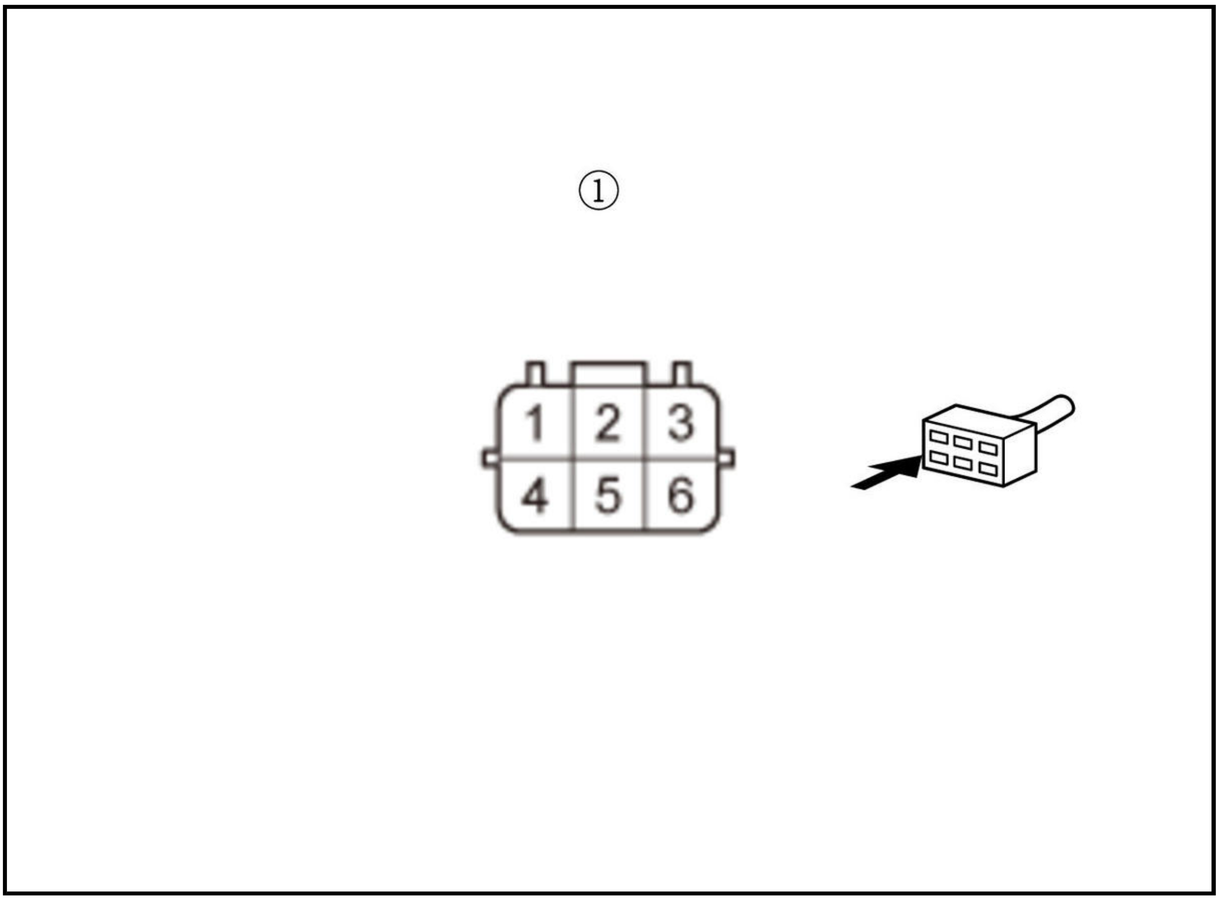
-2. Disconnect the following connector.

LaneWatch camera 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	LaneWatch camera 6P connector: disconnected
Test point 1	LaneWatch camera 6P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 8.0 V?

YES

The LWC CAM VCC wire is OK. Go to step 5.

NO

Go to step 3.

3. Open wire check (LWC CAM VCC line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	LaneWatch camera 6P connector: disconnected
Test point 1	**Audio-navigation unit connector B (24P) No. 8**
Test point 2	Body ground

Is there about 8.0 V?

YES

There is an open in the wire. Replace the affected shielded harness.

NO

The LWC CAM VCC wire is not open. Go to step 4.

4. Shorted wire check (LWC CAM VCC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
B	Audio-navigation unit connector B (24P): disconnected
Test point 1	**Audio-navigation unit connector B (24P) No. 8**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire. Replace the affected shielded harness.

NO

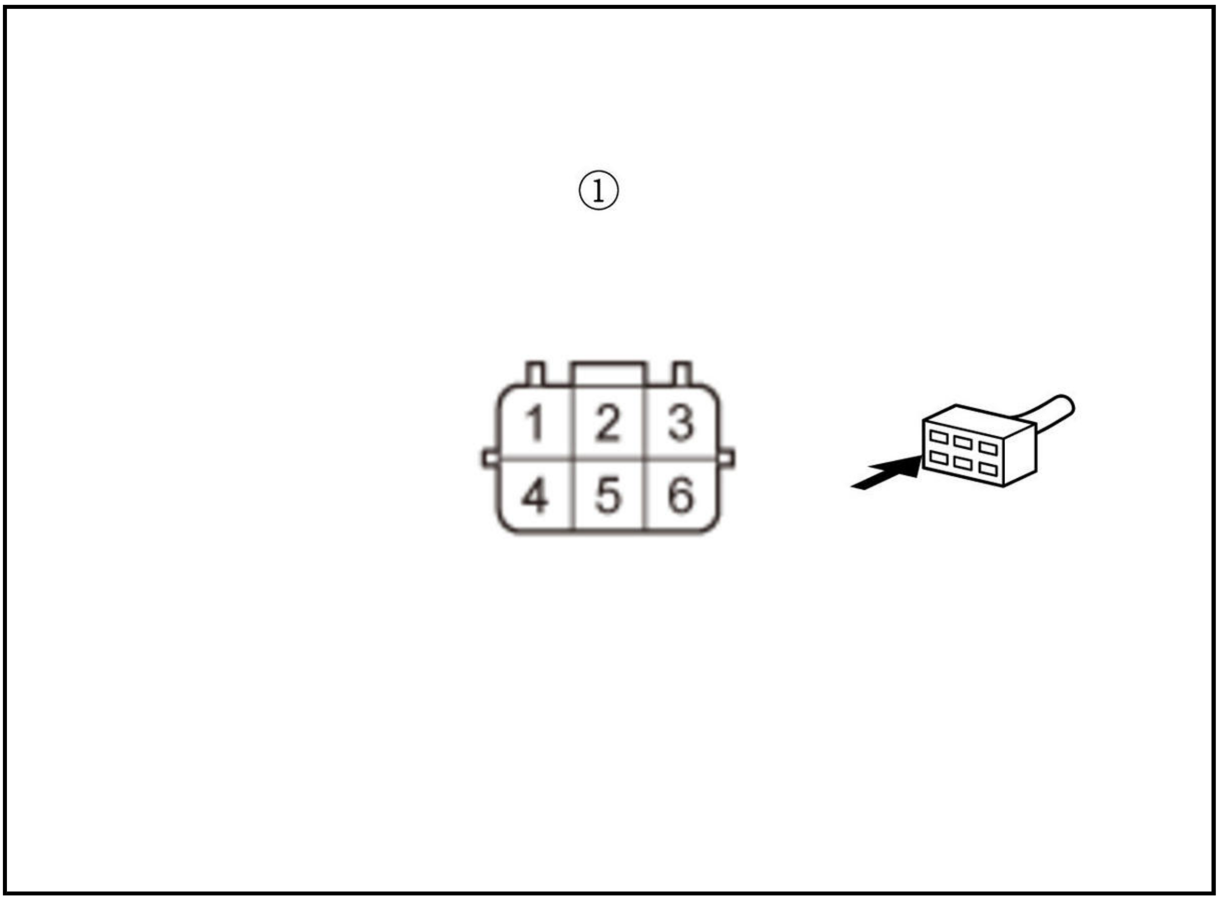
Replace the audio-navigation unit .

5. Determine possible failure area (SH LWC CAM line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
Test point 1	LaneWatch camera 6P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

The SH LWC CAM wire is OK. Go to step 7.

NO

Go to step 6.

6. Open wire check (SH LWC CAM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
Test point 1	**Audio-navigation unit connector B (24P) No. 9**
Test point 2	Body ground

Is there continuity?

YES

There is an open in the wire(s). Replace the affected shielded harness.

NO

Replace the audio-navigation unit .

7. Shorted wire check (LWC UART line)

-1. Disconnect the following connector.

Audio-navigation unit connector B (24P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
B	Audio-navigation unit connector B (24P): disconnected
Test point 1	**Audio-navigation unit connector B (24P) No. 22**
Test point 2	Body ground

Is there continuity?

YES

There is a short to body ground in the wire(s). Replace the affected shielded harness.

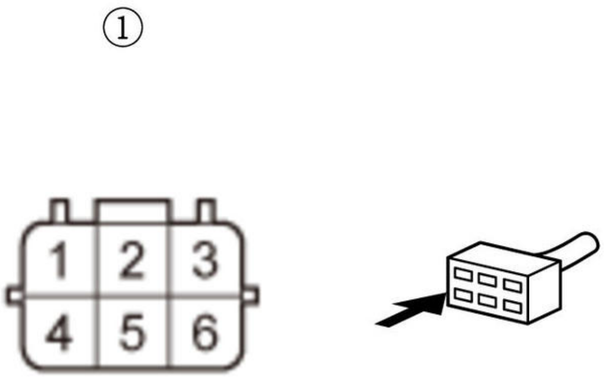
NO

The LWC UART wire is not shorted to ground. Go to step 8.

8. Open wire check (LWC UART line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	LaneWatch camera 6P connector: disconnected
B	Audio-navigation unit connector B (24P): disconnected
Test point 1	**Audio-navigation unit connector B (24P) No. 22**
Test point 2	LaneWatch camera 6P connector (female terminals) No. 6: ①



Is there continuity?

YES

Replace the LaneWatch camera .

NO

There is an open in the wire(s). Replace the affected shielded harness.

DTC 2701 (NAVIGATION UNIT)

DTC 2701 : GPS Diag: Antenna

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when Connection NG is indicated in the GPS antenna diagnosis (the GPS antenna icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. **Check for hard error codes** .

   Is DTC 2701 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. GPS antenna check (substitution)

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. **Substitute a known-good GPS antenna** .

   -4. **Check for hard error codes** .

   Is DTC 1301 indicated?

   YES

   Replace the audio-navigation unit .

   NO

   Replace the original GPS antenna .

DTC 2703 (NAVIGATION UNIT)

DTC 2703 : Aircon Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when Connection NG is indicated in the A/C diagnosis (the A/C icon is red in the System Links).
- Check for B-CAN DTCs and resolve them before troubleshooting.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. **Check for hard error codes** .

Is DTC 2703 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Audio-navigation unit connector A (24P)
Climate control unit connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector A (24P): disconnected
B	Climate control unit connector A (32P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 14**
Test point 2	**Climate control unit connector A (32P) No. 25**

Test point 1	**Audio-navigation unit connector A (24P) No. 24**

Test point 2	**Climate control unit connector A (32P) No. 8**

Is there continuity?

YES

Replace the climate control unit .

NO

Repair an open in the wire(s).

DTC 2706 (NAVIGATION UNIT)

DTC 2706 : Gyro Diag: ECU Temp XX deg.C

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when NG is indicated in the GYRO sensor diagnosis (the Gyro Sensor icon is red in the System Links), and indicates the gyro sensor temperature when the DTC is detected.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. **Check for hard error codes** .

   Is DTC 2706 indicated?

   YES

   Replace the audio-navigation unit .

   NO

   Intermittent failure, the system is OK at this time.

DTC TROUBLESHOOTING

AUDIO SYSTEM DTC 1102 (AUDIO UNIT)

DTC 1102 : USB Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when a problem is detected with the USB device that is connected to the USB port.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Connect the USB device to the USB port A or B.

   -5. **Check for hard error codes** .

   Is DTC 1102 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Audio unit check

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Disconnect the USB device, then connect a known-good USB device to the USB port A or B.

   -5. **Check for hard error codes** .

   Is DTC 1102 indicated?

   YES

   Replace the audio unit .

   NO

Original USB device is faulty.

AUDIO SYSTEM DTC 1301 (AUDIO UNIT)

DTC 1301 : GPS Antenna Error

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when there is poor connectors or loose terminals at the GPS antenna connector or an open in GPS antenna lead.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. Turn the vehicle to the ON mode, and wait at least 1 minute.

-5. **Check for hard error codes** .

Is DTC 1301 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. DTC check

-1. **Check for hard error codes** .

Is DTC 2701 indicated?

YES

Go to DTC 2701 troubleshooting.

NO

Replace the audio unit .

AUDIO SYSTEM DTC 1302 (AUDIO UNIT)

DTC 1302 : GPS Receiver Error 1

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when there is an internal GPS receiver problem (freeze error).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Turn the vehicle to the ON mode, and wait at least 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1302 indicated?

   YES

   Replace the audio unit .

   NO

   Intermittent failure, the system is OK at this time.

AUDIO SYSTEM DTC 1306 (AUDIO UNIT)

DTC 1306 : Vehicle Speed Pulse

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when there is a problem with the VSP circuit.
- Check for aftermarket accessories that may interfere with the navigation system.
- Check the GPS reception in an open area (vehicle position should be detected in three dimensions).
- Aftermarket metallic window tint or electronic devices located near the audio unit or GPS antenna can potentially interfere with the operation of the audio system.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Wait for at least 6 seconds.

   -3. Turn the vehicle to the ON mode.

   -4. Test-drive the vehicle at steady speed more than 12 mph (20 km/h) for about 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1306 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Determine possible failure area (audio unit, others)

-1. **Go into the System Diagnostic Mode, and select the Vehicle status in the Unit Check** .

-2. With the help of an assistant test-drive the vehicle, and watch the VSP status.

Does the VSP change from [0] (stopped) to [1] (driving) as you drive?

YES

Replace the audio unit .

NO

Go to step 3.

3. Determine possible failure area (VSP line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 35**
Test point 2	Body ground

Is there about 5.0 V?

YES

The VSP wire is OK. Go to step 4.

NO

Go to step 5.

4. Determine possible failure area (audio unit, PCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect PCM connector A (50P).

-3. Raise the vehicle on a lift.

-4. Turn the vehicle to the ON mode.

-5. Block the front tire of one side, and rotate the front tire slowly that is not blocked.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode, with the front tire slowly rotating
Test point 1	**Audio unit connector A (24P) No. 22**
Test point 2	Body ground

Does the voltage pulse between 0 V and 5 V as you rotate the tire?

YES

Replace the audio unit .

NO

Replace the PCM .

5. Open wire check (VSP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
Test point 1	**Audio unit connector A (24P) No. 22**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

The VSP wire is not open. Go to step 6.

6. Shorted wire check (VSP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector A (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Audio unit connector A (24P): disconnected
Test point 1	**Audio unit connector A (24P) No. 22**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the audio unit .

NO

Repair a short to body ground in the wire.

AUDIO SYSTEM DTC 1702 (AUDIO UNIT)

DTC 1702 : XM Antenna Error

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when there is poor connectors or loose terminals at the XM antenna connector or an open or short in the antenna lead.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Turn the vehicle to the ON mode.

   -5. Turn on the audio system, and select the XM radio.

   -6. **Check for hard error codes** .

   Is DTC 1702 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Determine possible failure area (XM antenna, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

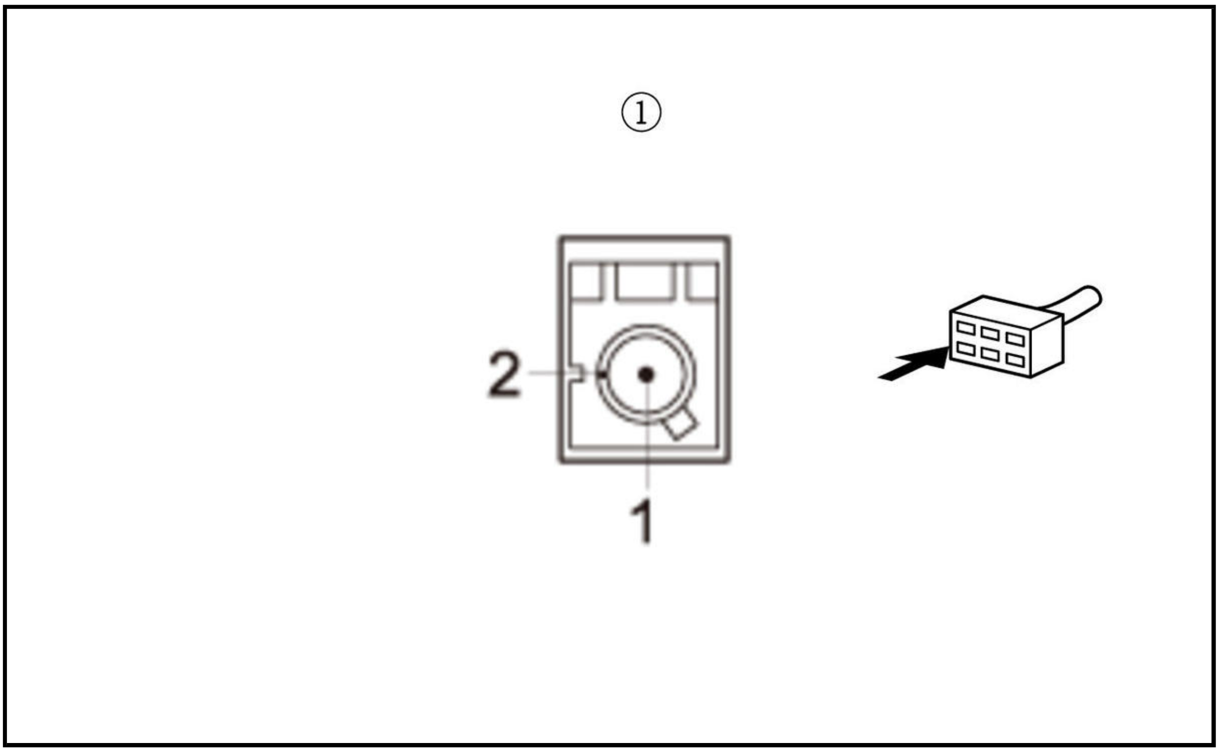
   -2. Disconnect the following connector.

Roof antenna connector B (2P)

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Roof antenna connector B (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the roof antenna .

NO

Go to step 3.

3. Shorted wire check (SAT/TER line)

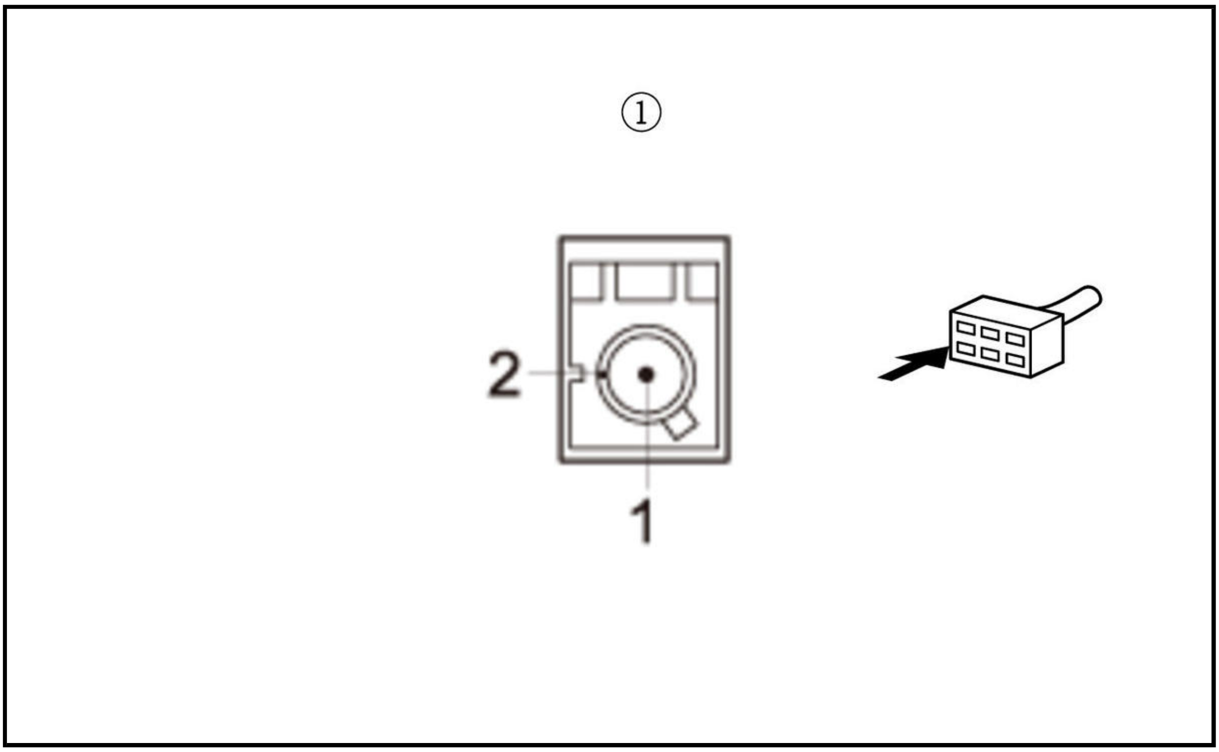
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio unit connector N (2P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio unit connector N (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The SAT/TER wire is not shorted to ground. Go to step 4.

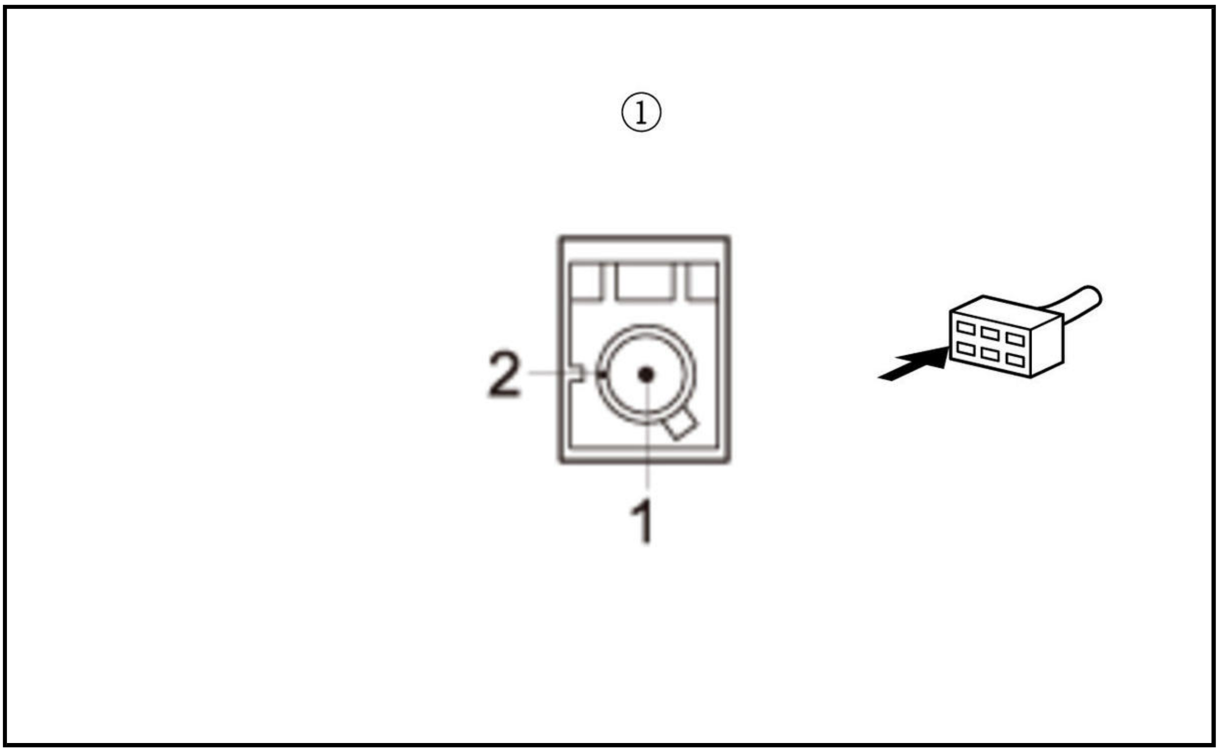
NO

There is a short to body ground in the wire. Replace the affected antenna lead.

4. Shorted wire check (SAT/TER line to SH (SAT/TER) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio unit connector N (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Roof antenna connector B (2P) (male terminals) No. 2: ①



Is there 1.0 MΩ or more?

YES

The SAT/TER wire is not shorted to SH (SAT/TER) wire. Go to step 5.

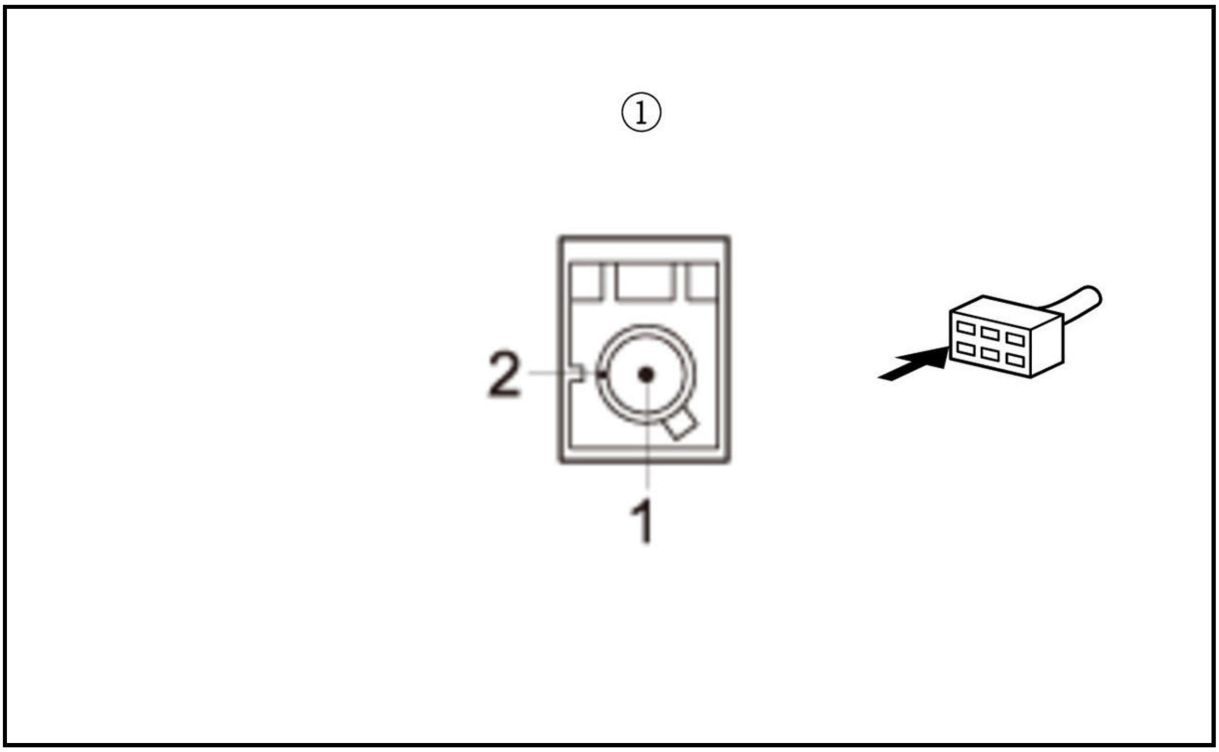
NO

There is a short in the wire. Replace the affected antenna lead.

5. Open wire check (SAT/TER line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio unit connector N (2P): disconnected
Test point 1	**Audio unit connector N (2P) No. 1**
Test point 2	Roof antenna connector B (2P) (male terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Replace the audio unit .

NO

There is an open in the wire. Replace the affected antenna lead.

AUDIO SYSTEM DTC 2608 (AUDIO UNIT)

DTC 2608 : R-Camera Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when NG is indicated in the Rear wide camera diagnosis (the Rear wide camera icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. **Check for hard error codes** .

Is DTC 2608 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (CAMERA_ADPT line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rearview camera 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Rearview camera 8P connector No. 6**
Test point 2	Body ground

Is there about 5.0 V?

YES

The CAMERA_ADPT wire is OK. Go to step 4.

NO

Go to step 3.

3. Open wire check (CAMERA_ADPT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio unit connector C (32P) No. 16**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

Replace the audio unit .

4. Determine possible failure area (rearview camera, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rearview camera 8P connector: disconnected

Test point 1	**Rearview camera 8P connector No. 5**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Replace the rearview camera .

NO

Go to step 5.

5. Open wire check (SH_CAMERA line)

   -1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Rearview camera 8P connector: disconnected
Test point 1	**Audio unit connector C (32P) No. 28**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the audio unit .

NO

There is an open in the wire(s). Replace the affected shielded harness.

AUDIO SYSTEM DTC 2610 (AUDIO UNIT)

DTC 2610 : DRAM Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when a problem with the internal DRAM is detected (the HMI Unit icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. **Check for hard error codes** .

Is DTC 2610 indicated?

YES

Replace the audio unit .

NO

Intermittent failure, the system is OK at this time.

AUDIO SYSTEM DTC 2701 (AUDIO UNIT)

DTC 2701 : GPS Diag: Antenna

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when Connection NG is indicated in the GPS antenna diagnosis (the GPS antenna icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. **Check for hard error codes** .

Is DTC 2701 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. GPS antenna check (substitution)

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. **Substitute a known-good GPS antenna** .

-4. **Check for hard error codes** .

Is DTC 1301 indicated?

YES

Replace the audio unit .

NO

Replace the original GPS antenna .

AUDIO SYSTEM DTC 2703 (AUDIO UNIT)

DTC 2703 : Aircon Diag

NOTE:

- Check the vehicle 12 volt battery condition first .
- This audio DTC sets when Connection NG is indicated in the A/C diagnosis (the A/C icon is red in the System Links).
- Check for B-CAN DTCs and resolve them before troubleshooting.
- Before you troubleshoot, make sure to follow the General Troubleshooting Information .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Clear the hard error codes .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Check for hard error codes .

   Is DTC 2703 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Audio unit connector A (24P)
Climate control unit connector A (32P)

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio unit connector A (24P): disconnected
B	Climate control unit connector A (32P): disconnected
Test point 1	Audio unit connector A (24P) No. 14
Test point 2	Climate control unit connector A (32P) No. 25

Test point 1	Audio unit connector A (24P) No. 24

Test point 2	Climate control unit connector A (32P) No. 8

   Is there 1.0 Ω or less?

   YES

   Replace the climate control unit .

   NO

   Repair an open in the wire(s).

AUDIO-NAVIGATION SYSTEM DTC 1102 (NAVIGATION UNIT)

DTC 1102 : USB Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when a problem is detected with the USB device that is connected to the USB port.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Connect the USB device to the USB port A or B.

   -5. **Check for hard error codes** .

   Is DTC 1102 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Audio-navigation unit check

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Disconnect the USB device, then connect a known-good USB device to the USB port A or B.

   -5. **Check for hard error codes** .

   Is DTC 1102 indicated?

   YES

   Replace the audio-navigation unit .

   NO

   Original USB device is faulty.

AUDIO-NAVIGATION SYSTEM DTC 1301 (NAVIGATION UNIT)

DTC 1301 : GPS Antenna Error

NOTE:

- Check the vehicle 12 volt battery condition first .
- This navigation DTC sets when there is poor connectors or loose terminals at the GPS antenna connector or an open in GPS antenna lead.
- Before you troubleshoot, make sure to follow the General Troubleshooting Information .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. Clear the hard error codes .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. Turn the vehicle to the ON mode, and wait at least 1 minute.

   -5. Check for hard error codes .

   Is DTC 1301 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. DTC check

   -1. Check for hard error codes .

   Is DTC 2701 indicated?

   YES

   Go to DTC 2701 troubleshooting.

   NO

   Replace the audio-navigation unit .

AUDIO-NAVIGATION SYSTEM DTC 1302 (NAVIGATION UNIT)

DTC 1302 : GPS Receiver Error 1

NOTE:

- Check the vehicle 12 volt battery condition first .
- This navigation DTC sets when there is an internal GPS receiver problem (freeze error).
- Before you troubleshoot, make sure to follow the General Troubleshooting Information .

1. Problem verification

   -1. Clear the hard error codes .

   -2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. Turn the vehicle to the ON mode, and wait at least 1 minute.

-5. Check for hard error codes .

Is DTC 1302 indicated?

YES

Replace the audio-navigation unit .

NO

Intermittent failure, the system is OK at this time.

AUDIO-NAVIGATION SYSTEM DTC 1304 (NAVIGATION UNIT)

DTC 1304 : Gyro Error 1

NOTE:

- Check the vehicle 12 volt battery condition first .
- This navigation DTC sets when there is a problem with the output voltage of the internal gyro sensor
- Before you troubleshoot, make sure to follow the General Troubleshooting Information .

1. Problem verification

-1. Clear the hard error codes .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. Turn the vehicle to the ON mode, and wait at least 1 minute.

-5. Check for hard error codes .

Is DTC 1304 indicated?

YES

Replace the audio-navigation unit .

NO

Intermittent failure, the system is OK at this time.

AUDIO-NAVIGATION SYSTEM DTC 1306 (NAVIGATION UNIT)

DTC 1306 : Vehicle Speed Pulse

NOTE:

- Check the vehicle 12 volt battery condition first .
- This navigation DTC sets when there is a problem with the VSP circuit.
- Check for aftermarket accessories that may interfere with the navigation system.
- Check the GPS reception in an open area (vehicle position should be detected in three dimensions).

- Aftermarket metallic window tint or electronic devices located near the audio-navigation unit or GPS antenna can potentially interfere with the operation of the navigation system.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Wait for at least 6 seconds.

   -3. Turn the vehicle to the ON mode.

   -4. Test-drive the vehicle at steady speed more than 12 mph (20 km/h) for about 1 minute.

   -5. **Check for hard error codes** .

   Is DTC 1306 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Determine possible failure area (audio-navigation unit, others)

   -1. **Go into the System Diagnostic Mode, and select the Vehicle status in the Unit Check** .

   -2. With the help of an assistant test-drive the vehicle, and watch the VSP status.

   Does the VSP change from [0] (stopped) to [1] (driving) as you drive?

   YES

   Replace the audio-navigation unit .

   NO

   Go to step 3.

3. Determine possible failure area (VSP line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS.

   -3. Disconnect the following connector.

PCM connector A (50P)

   -4. Turn the vehicle to the ON mode.

   -5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected

Test point 1	**PCM connector A (50P) No. 35**
Test point 2	Body ground

Is there about 5.0 V?

YES

The VSP wire is OK. Go to step 4.

NO

Go to step 5.

4. Determine possible failure area (audio-navigation unit, PCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect PCM connector A (50P).

-3. Raise the vehicle on a lift.

-4. Turn the vehicle to the ON mode.

-5. Block the front tire of one side, and rotate the front tire slowly that is not blocked.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode, with the front tire slowly rotating
Test point 1	**Audio-navigation unit connector A (24P) No. 22**
Test point 2	Body ground

Does the voltage pulse between 0 V and 5 V as you rotate the tire?

YES

Replace the audio-navigation unit .

NO

Replace the PCM .

5. Open wire check (VSP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	PCM connector A (50P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 22**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

The VSP wire is not open. Go to step 6.

6. Shorted wire check (VSP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector A (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Audio-navigation unit connector A (24P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 22**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the audio-navigation unit .

NO

Repair a short to body ground in the wire.

AUDIO-NAVIGATION SYSTEM DTC 1702 (NAVIGATION UNIT)

DTC 1702 : XM Antenna Error

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This audio DTC sets when there is poor connectors or loose terminals at the XM antenna connector or an open or short in the antenna lead.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. Turn the vehicle to the ON mode.

-5. Turn on the audio system, and select the XM radio.

-6. **Check for hard error codes** .

Is DTC 1702 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (XM antenna, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

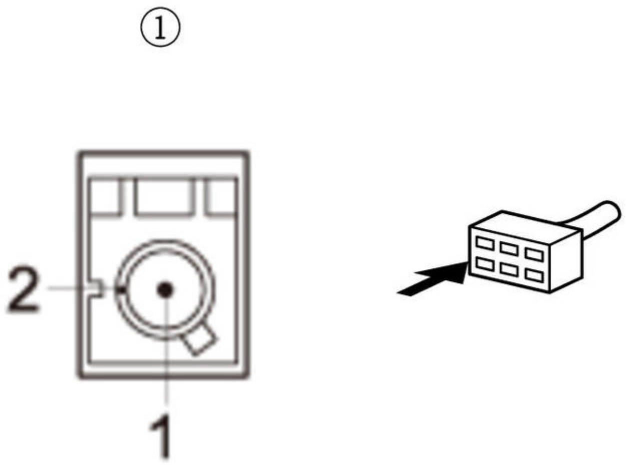
-2. Disconnect the following connector.

Roof antenna connector B (2P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Roof antenna connector B (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the roof antenna .

NO

Go to step 3.

3. Shorted wire check (SAT/TER line)

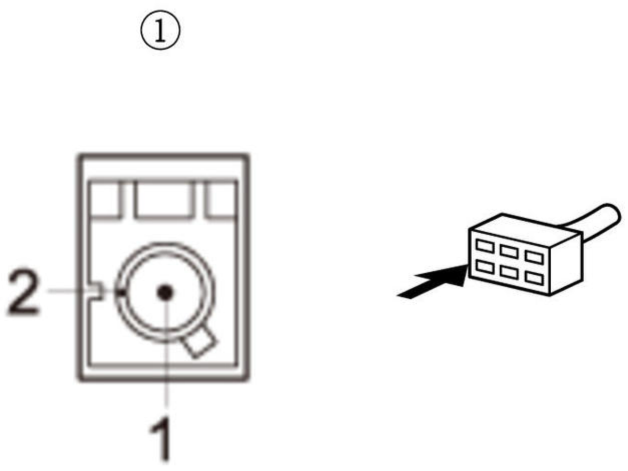
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit connector N (2P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio-navigation unit connector N (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The SAT/TER wire is not shorted to ground. Go to step 4.

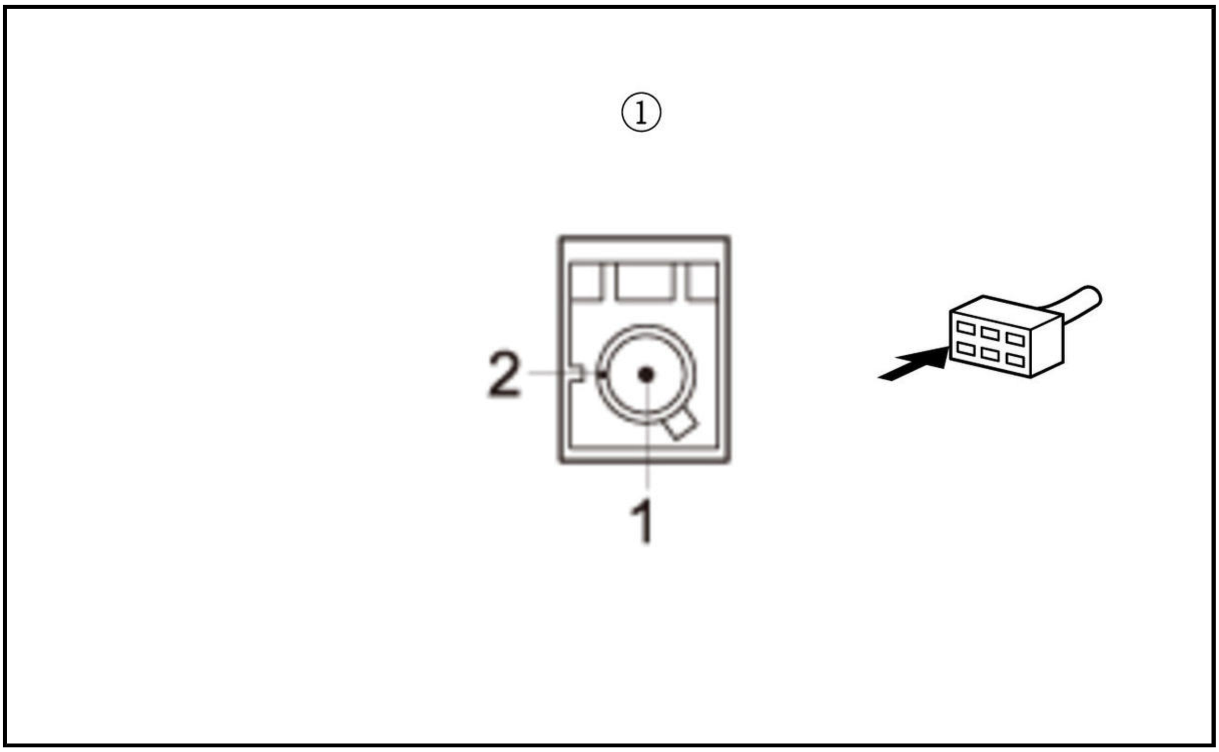
NO

There is a short to body ground in the wire. Replace the affected antenna lead.

4. Shorted wire check (SAT/TER line to SH (SAT/TER) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio-navigation unit connector N (2P): disconnected
Test point 1	Roof antenna connector B (2P) (male terminals) No. 1: ①
Test point 2	Roof antenna connector B (2P) (male terminals) No. 2: ①



Is there 1.0 MΩ or more?

YES

The SAT/TER wire is not shorted to SH (SAT/TER) wire. Go to step 5.

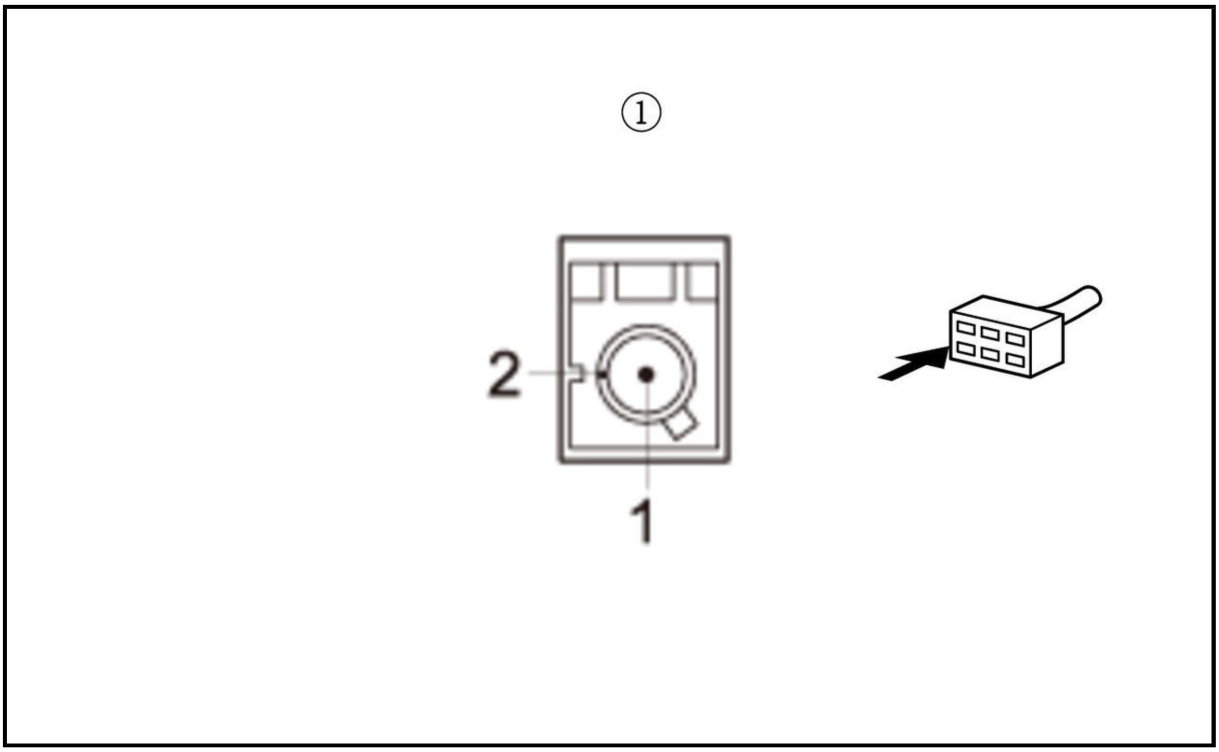
NO

There is a short in the wire. Replace the affected antenna lead.

5. Open wire check (SAT/TER line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Roof antenna connector B (2P): disconnected
B	Audio-navigation unit connector N (2P): disconnected
Test point 1	**Audio-navigation unit connector N (2P) No. 1**
Test point 2	Roof antenna connector B (2P) (male terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Replace the audio-navigation unit .

NO

There is an open in the wire. Replace the affected antenna lead.

AUDIO-NAVIGATION SYSTEM DTC 2608 (NAVIGATION UNIT)

DTC 2608 : R-Camera Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when NG is indicated in the Rear wide camera diagnosis (the Rear wide camera icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

-1. **Clear the hard error codes** .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. **Check for hard error codes** .

Is DTC 2608 indicated?

YES

The failure is duplicated, go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Determine possible failure area (CAMERA_ADPT line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rearview camera 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Rearview camera 8P connector No. 6**
Test point 2	Body ground

Is there about 5.0 V?

YES

The CAMERA_ADPT wire is OK. Go to step 4.

NO

Go to step 3.

3. Open wire check (CAMERA_ADPT line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rearview camera 8P connector: disconnected
Test point 1	**Audio-navigation unit connector C (32P) No. 16**
Test point 2	Body ground

Is there about 5.0 V?

YES

Repair an open in the wire.

NO

Replace the audio-navigation unit .

4. Determine possible failure area (rearview camera, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rearview camera 8P connector: disconnected

Test point 1	Rearview camera 8P connector No. 5
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Replace the rearview camera .

NO

Go to step 5.

5. Open wire check (SH_CAMERA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Rearview camera 8P connector: disconnected
Test point 1	Audio-navigation unit connector C (32P) No. 28
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the audio-navigation unit .

NO

There is an open in the wire(s). Replace the affected shielded harness.

AUDIO-NAVIGATION SYSTEM DTC 2610 (NAVIGATION UNIT)

DTC 2610 : DRAM Diag

- Check the vehicle 12 volt battery condition first .
- This navigation DTC sets when a problem with the internal DRAM is detected (the HMI Unit icon is red in the System Links).
- Before you troubleshoot, make sure to follow the General Troubleshooting Information .

1. Problem verification

-1. Clear the hard error codes .

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Wait for at least 6 seconds.

-4. Check for hard error codes .

Is DTC 2610 indicated?

YES

Replace the audio-navigation unit .

NO

Intermittent failure, the system is OK at this time.

AUDIO-NAVIGATION SYSTEM DTC 2701 (NAVIGATION UNIT)

DTC 2701 : GPS Diag: Antenna

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when Connection NG is indicated in the GPS antenna diagnosis (the GPS antenna icon is red in the System Links).
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. **Check for hard error codes** .

   Is DTC 2701 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. GPS antenna check (substitution)

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. **Substitute a known-good GPS antenna** .

   -4. **Check for hard error codes** .

   Is DTC 1301 indicated?

   YES

   Replace the audio-navigation unit .

   NO

   Replace the original GPS antenna .

AUDIO-NAVIGATION SYSTEM DTC 2703 (NAVIGATION UNIT)

DTC 2703 : Aircon Diag

NOTE:

- **Check the vehicle 12 volt battery condition first** .

- This navigation DTC sets when Connection NG is indicated in the A/C diagnosis (the A/C icon is red in the System Links).
- Check for B-CAN DTCs and resolve them before troubleshooting.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .
- Check the connectors for poor connections or loose terminals.

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. **Check for hard error codes** .

   Is DTC 2703 indicated?

   YES

   The failure is duplicated, go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Audio-navigation unit connector A (24P)
Climate control unit connector A (32P)

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Audio-navigation unit connector A (24P): disconnected
B	Climate control unit connector A (32P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 14**
Test point 2	**Climate control unit connector A (32P) No. 25**

Test point 1	**Audio-navigation unit connector A (24P) No. 24**

Test point 2	**Climate control unit connector A (32P) No. 8**

   Is there 1.0 Ω or less?

   YES

   Replace the climate control unit .

   NO

   Repair an open in the wire(s).

AUDIO-NAVIGATION SYSTEM DTC 2706 (NAVIGATION UNIT)

DTC 2706 : Gyro Diag: ECU Temp XX B°C

NOTE:

- **Check the vehicle 12 volt battery condition first** .
- This navigation DTC sets when NG is indicated in the GYRO sensor diagnosis (the Gyro Sensor icon is red in the System Links), and indicates the gyro sensor temperature when the DTC is detected.
- **Before you troubleshoot, make sure to follow the General Troubleshooting Information** .

1. Problem verification

   -1. **Clear the hard error codes** .

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Wait for at least 6 seconds.

   -4. **Check for hard error codes** .

   Is DTC 2706 indicated?

   YES

   Replace the audio-navigation unit .

   NO

   Intermittent failure, the system is OK at this time.

TROUBLESHOOTING

DTC B1575

DTC B1575 : Auto light sensor error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1575 Auto light sensor error	B

DTC (Automatic Lighting Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1575 Auto light sensor error	B

   Is DTC B1575 indicated?

   YES

   Replace the automatic lighting control unit-sensor .

   NO

   Intermittent failure, the system is OK at this time.

DTC U1280 (AUTOMATIC LIGHTING CONTROL UNIT)

DTC U1280 : BUS OFF state is detected by CAN controller

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 BUS OFF state is detected by CAN controller	B

DTC (Automatic Lighting Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 BUS OFF state is detected by CAN controller	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time.

DTC U1281, U128D (AUTOMATIC LIGHTING CONTROL UNIT)

DTC U1281 : Auto light control unit lost communication with MICU **DTC U128D** : Auto light control unit lost communication with gauge control module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the chart below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Auto light control unit lost communication with MICU	B
U128D Auto light control unit lost communication with gauge control module	B

DTC (Automatic Lighting Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Auto light control unit lost communication with MICU	B
U128D Auto light control unit lost communication with gauge control module	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Automatic lighting control unit-sensor 5P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see chart below).

DTC	Connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Automatic lighting control unit-sensor 5P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	Automatic lighting control unit-sensor 5P connector	No. 1	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 2		No. 21
U128D	B-CAN_H	Automatic lighting control unit-sensor 5P connector	No. 1	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 2		No. 31

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see chart below).

DTC	Operation for transmitting control unit
U1281	Body control module
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B1575

DTC B1575 : Auto light sensor error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1575 Auto light sensor error	B

DTC (Automatic Lighting Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1575 Auto light sensor error	B

Is DTC B1575 indicated?

YES

Replace the automatic lighting control unit-sensor .

NO

Intermittent failure, the system is OK at this time.

DTC U1280 (AUTOMATIC LIGHTING CONTROL UNIT)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Automatic Lighting Control Unit)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time.

DTC U1281, U128D (AUTOMATIC LIGHTING CONTROL UNIT)

DTC U1281 : Auto Light Control Unit lost communication with MICU (body control module)

DTC U128D : Auto light control unit lost communication with gauge control module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Auto Light Control Unit lost communication with MICU (body control module)	B
U128D Auto light control unit lost communication with gauge control module	B

DTC (Automatic Lighting Control Unit)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Auto Light Control Unit lost communication with MICU (body control module)	B

DTC Description	DTC
U128D Auto light control unit lost communication with gauge control module	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Automatic lighting control unit-sensor 5P connector

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Automatic lighting control unit-sensor 5P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	Automatic lighting control unit-sensor 5P connector	No. 1	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 2		No. 21
U128D	B-CAN_H	Automatic lighting control unit-sensor 5P connector	No. 1	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 2		No. 31

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.

Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	Body control module
U128D	Gauge control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING INDEX

BLIND SPOT INFORMATION (BSI) SYSTEM DTC TROUBLESHOOTING INDEX

Left Side BSI Radar Unit DTC

DTC	Detection Item
B18A1	Left Side BSI Radar Unit Internal Circuit Error
B18A5	Left Side BSI Radar Unit Temperature High
B18B4	Left Side BSI Radar Unit Dirty
B18B8	Left Side BSI Radar Unit Azimuth Off Alignment
B18BA	Different Version in the Left and Right Side BSI Radar Unit
B18C5	Short to GND in the Left Side BSI Radar Unit Indicator Circuit
B18C6	Short to Power in the Left Side BSI Radar Unit Indicator Circuit
B18C7	Open in the Left Side BSI Radar Unit Indicator Circuit
B18DB	Left Side BSI Radar Unit Received The Audio/Navigation Unit Failure Information
B18EA	(Left Side BSI Radar Unit Received PCM (A/T System) Failure Information)
U1280	Communication Bus Line Error (Bus-Off)
U1281	Left Side BSI Radar Unit Lost Communication With MICU or BCM
U128D	Left Side BSI Radar Unit Lost Communication With Gauge Control Module
U1297	Left Side BSI Radar Unit Lost Communication With Right Side BSI Radar Unit

Right Side BSI Radar Unit DTC

DTC	Detection Item
B1E51	Right Side BSI Radar Unit Internal Circuit Error
B1E55	Right Side BSI Radar Unit Temperature High
B1E64	Right Side BSI Radar Unit Dirty
B1E68	Right Side BSI Radar Unit Azimuth Off Alignment
B1E6A	Different Version in the Left and Right Side BSI Radar Unit
B1E75	Short to GND in the Right Side BSI Radar Unit Indicator Circuit
B1E76	Short to Power in the Right Side BSI Radar Unit Indicator Circuit
B1E77	Open in the Right Side BSI Radar Unit Indicator Circuit
B1E9A	(Right Side BSI Radar Unit Received PCM (A/T System) Failure Information)
U1280	Communication Bus Line Error (Bus-Off)
U1281	Right Side BSI Radar Unit Lost Communication With MICU or BCM
U128D	Right Side BSI Radar Unit Lost Communication With Gauge Control Module
U128F	Right Side BSI Radar Unit Lost Communication With Left Side BSI Radar Unit

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE BLIND SPOT INFORMATION (BSI) SYSTEM

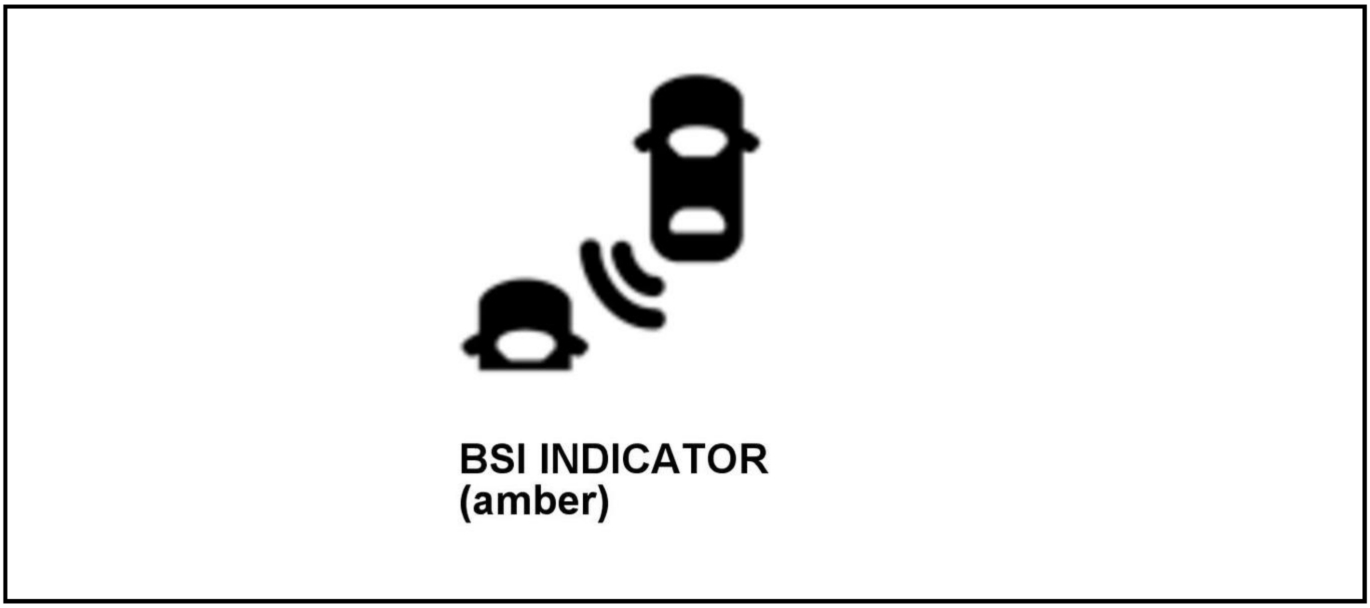
NOTE: Do not make any bumper repairs in the areas over or near the two radar units on vehicles equipped with the Blind Spot Information (BSI) System. The composition of the repair materials, and/or increased material thickness in the repaired area, may interfere with the BSI radar unit operation.

BSI Indicator (Amber)

When the BSI system detects a problem, the BSI system stops operating, then the BSI indicator (amber) turns on.

NOTE:

- For locations of the indicator, refer to System Warning/Indicator Index .
- For BSI system function, review the Blind Spot Information System Description .
- The BSI communicates with other control units via B-CAN. For BSI system diagram, review the Blind Spot Information (BSI) System Diagram .

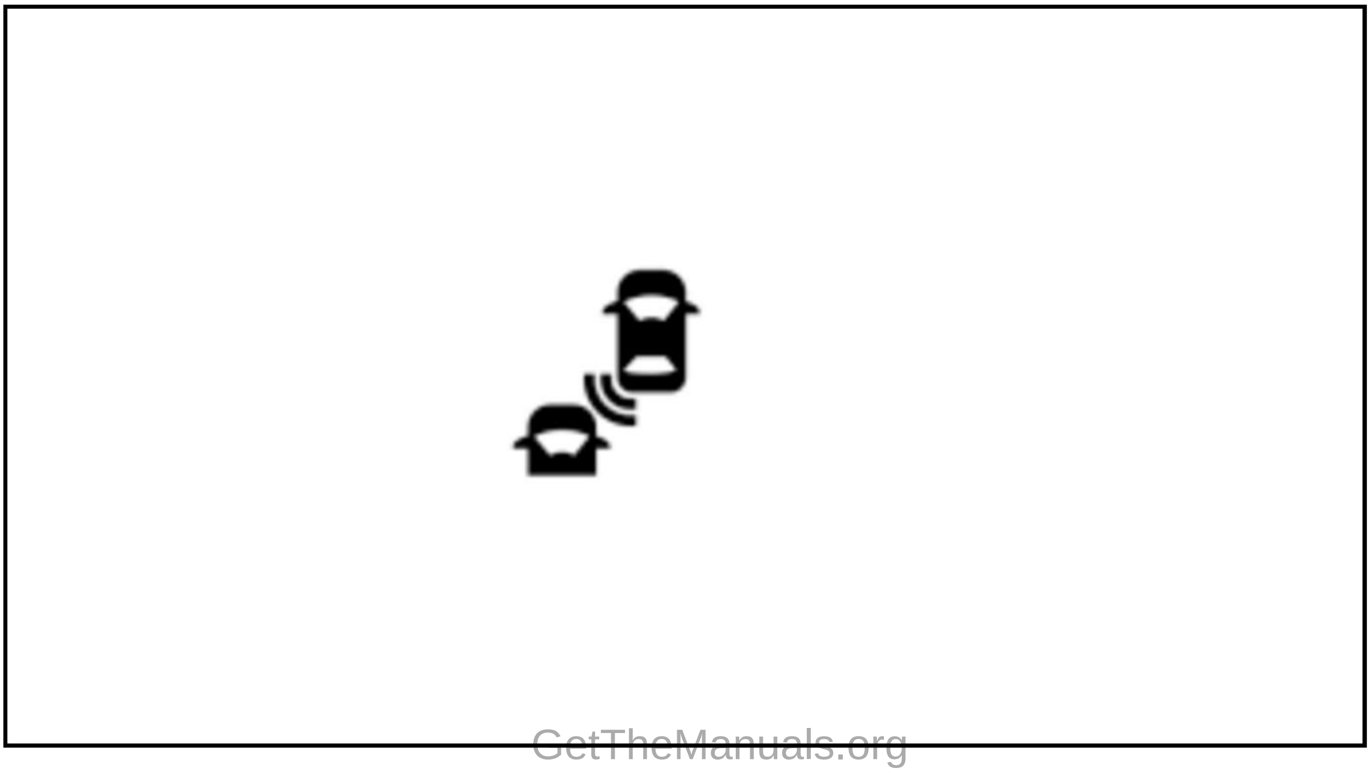


BSI Alert Indicator

While the BSI system is working, the system turns on/blinks * the appropriate BSI alert indicator (right or left) when it detects another vehicle on either side of the rear.

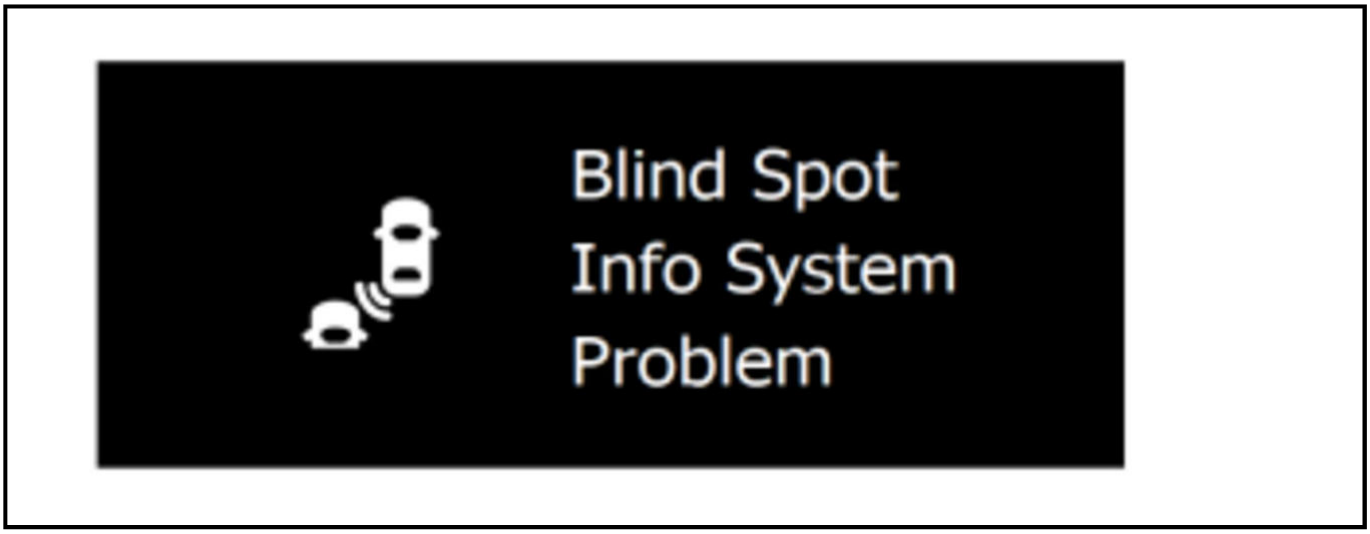
*: When the driver moves the turn signal lever toward the side with the BSI alert indicator on, the alert indicator blinks to alert the driver.

NOTE: For locations of each indicator, refer to Component Location Index .



Self-Diagnostic Function

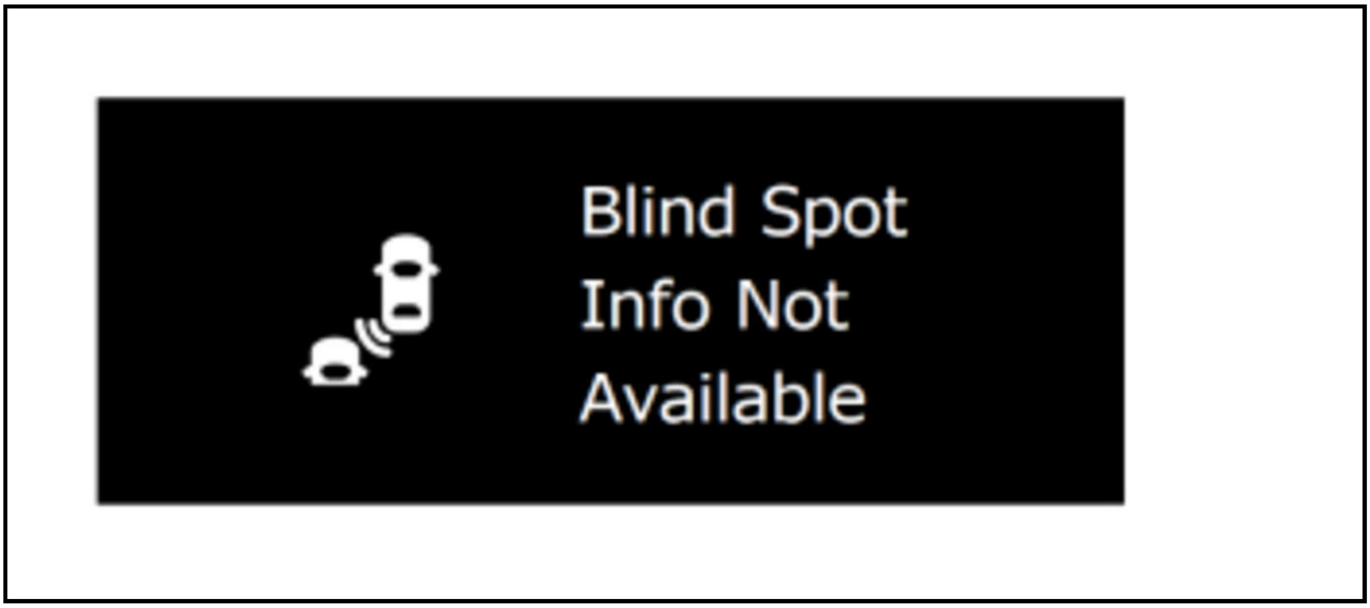
When a problem is detected by the self-diagnostic function, the BSI stops operating, the BSI unit is display the warning information on the MID.



Blind Spot
Info System
Problem

When mud, dirt, wet snow, leaves, or other foreign material sticks to the side of the rear bumper, the BSI system stops operating and the message on the MID indicates that the BSI radar units must be cleaned. It also turns on the BSI indicator at the same time, and stores the DTC(s).

When the obstruction or contamination is removed, the indicator on the MID goes off and the BSI system automatically returns to ON.



Blind Spot
Info Not
Available

BSI Radar Units

The BSI radar units are installed behind the rear bumper on both sides of the vehicle, and they have a control unit. Each BSI radar unit communicates with the other BSI radar unit. The BSI radar units detect other vehicles as they approach your vehicle from the rear sides, and the BSI radar units send this information to the BSI alert indicator.

CAN Communications

B-CAN

The BSI radar units are on the B-CAN system, and they communicate with other units (gauge control module, MICU) via B-CAN.

If the BSI radar units detect a communication error or a malfunction in another connected unit, the BSI system will not operate even though it is OK.

In this case, the BSI indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check the DTCs with the HDS.

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the BSI indicator does not come on.
- The BSI system sometimes stops operating because of the environment (weather, road conditions, driving conditions, etc.). A DTC may be stored in these cases.

Some DTCs may be stored even when the system is OK. For example, the BSI indicator may come on with one or more of these DTCs:

B18A5:	Left Side BSI Radar Unit Temperature High
B1E55:	Right Side BSI Radar Unit Temperature High
B18B4:	Left Side BSI Radar Unit Dirty
B1E64:	Right Side BSI Radar Unit Dirty

How to Retrieve DTCs

1. Connect the HDS

2. Use the HDS to check for BSI system DTCs.

3. Read and record the DTC:4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS from the DLC.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

1. Connect the HDS

2. Clear the DTC(s) by following the screen prompts on the HDS.

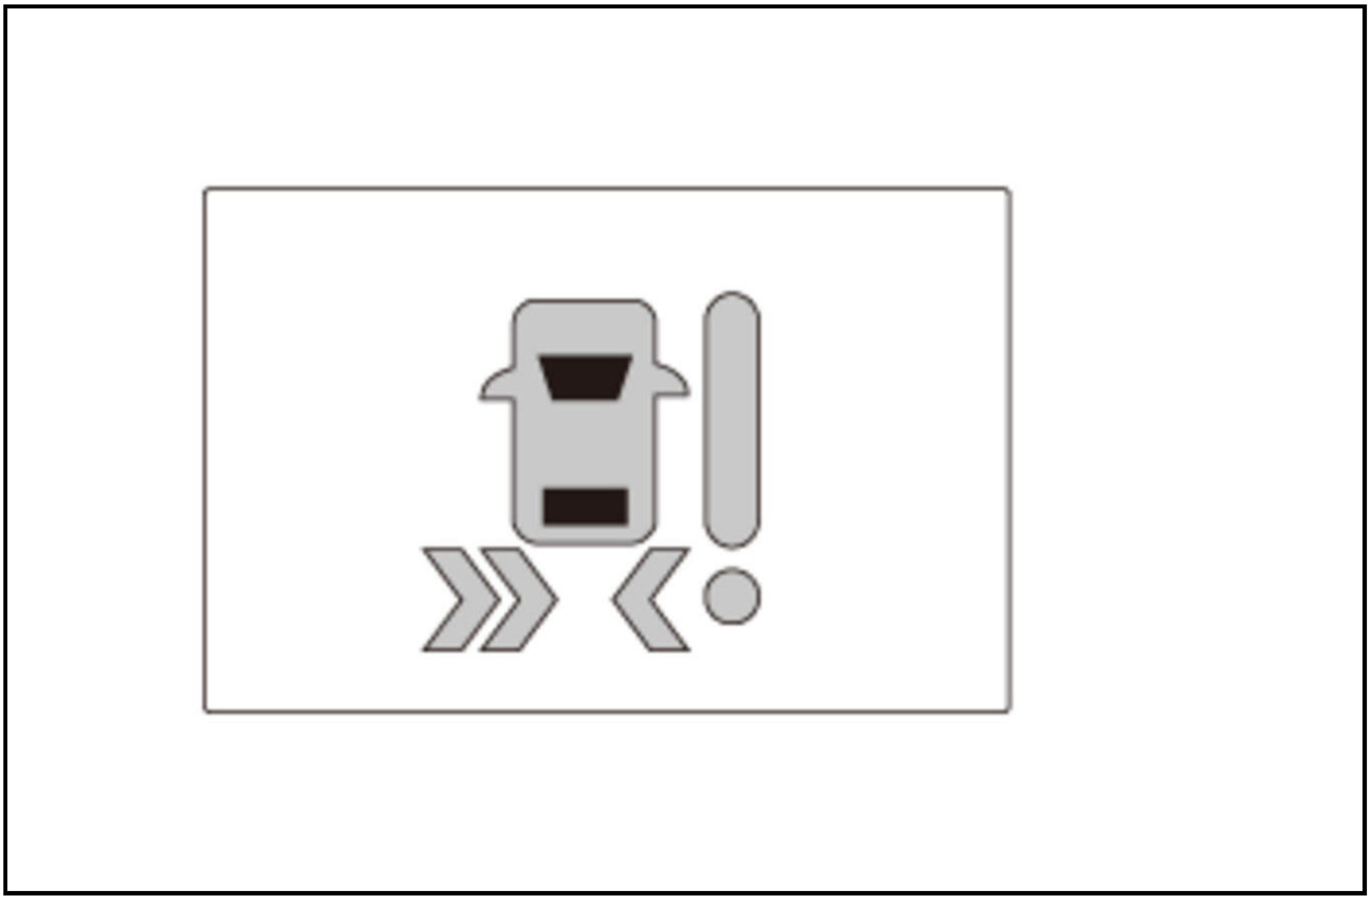
3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS from the DLC.

HOW TO TROUBLESHOOT THE CROSS TRAFFIC MONITOR

Cross Traffic Monitor Indicator

When the cross traffic monitor system fails, the cross traffic monitor indicator comes on on the center display unit.



Control Units

The cross traffic monitor system is controlled by BSI radar units. If the BSI radar unit malfunctions, the cross traffic monitor system stops operating.

CAN Communications

B-CAN

The cross traffic monitor system is controlled by the BSI radar units. The BSI radar units are on the B-CAN system, and they communicate with other units via B-CAN.

If the BSI radar units detect a communication error or a malfunction in another connected unit, the cross traffic monitor system will not operate even though it is OK.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check the DTCs with the HDS.

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the cross traffic monitor indicator does not

come on.

How to Retrieve DTCs

1. Connect the HDS

2. Use the HDS to check for BSI system DTCs.

3. Read and record the DTC:4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS from the DLC.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

1. Connect the HDS

2. Clear the DTC(s) by following the screen prompts on the HDS.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS from the DLC.

DTC TROUBLESHOOTING

DTC B18A1, B1E51

DTC B18A1 : Left Side BSI Radar Unit Internal Circuit Error

DTC B1E51 : Right Side BSI Radar Unit Internal Circuit Error

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18A1 Left side BSI radar unit internal circuit error	B
B1E51 Right side BSI radar unit internal circuit error	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 5 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B18A1 Left side BSI radar unit internal circuit error	B
B1E51 Right side BSI radar unit internal circuit error	B

Are any DTCs indicated?

YES

Replace the appropriate BSI radar unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

DTC B18A5, B1E55

DTC B18A5 : Left Side BSI Radar Unit Temperature High

DTC B1E55 : Right Side BSI Radar Unit Temperature High

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18A5 Left side BSI radar unit temperature high	B
B1E55 Right side BSI radar unit temperature high	B

DTC (BSI)

1. Problem verification

   -1. Check the exhaust system and the heat shields for modifications or damage.

   Are all parts OK?

   YES

   Intermittent failure due to temporary high temperature around the appropriate BSI radar unit, the system is OK at this time. Refer to intermittent failures troubleshooting.

   NO

   Repair or replace the faulty part.

DTC B18B4, B1E64

DTC B18B4 : Left Side BSI Radar Unit Dirty

DTC B1E64 : Right Side BSI Radar Unit Dirty

NOTE:

- Before you troubleshoot, review the general troubleshooting information.
- DTC B18B4 or DTC B1E64 may be stored due to environment (including weather, a traffic condition, and the drive situation) or temporary contamination around the rear bumper.

DTC Description	DTC
B18B4 Left side BSI radar unit dirty	B
B1E64 Right side BSI radar unit dirty	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 5 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B18B4 Left side BSI radar unit dirty	B
B1E64 Right side BSI radar unit dirty	B

Is DTC B18B4 or B1E64 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Outside rear bumper check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the outside of rear bumper for snow, ice, dirt, contaminants, or stickers.

Is it OK?

YES

Go to step 3.

NO

Completely wipe off any dirt or contaminants from the rear bumper.

3. Inside rear bumper check

-1. **From the rear wheel arch, remove the appropriate side of the rear bumper** .

-2. Check the inside of the rear bumper for snow, ice, dirt, or contaminants. Also, check the appropriate BSI radar unit surface for dirt or contaminants.

Is it OK?

YES

Replace the appropriate BSI radar unit .

NO

Clean the inside of the rear bumper for dirt or contaminations around the BSI radar unit.

DTC B18B8, B1E68

DTC B18B8 : Left Side BSI Radar Unit Azimuth Off Alignment

DTC B1E68 : Right Side BSI Radar Unit Azimuth Off Alignment

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
B18B8 Left side BSI radar unit azimuth off alignment	B
B1E68 Right side BSI radar unit azimuth off alignment	B

DTC (BSI)

1. Vehicle condition check:

   Check the vehicle condition.

   NOTE: The BSI system cannot work properly in the following vehicle conditions:

   - Make sure the suspension is not modified.
   - Make sure all the tires are the correct size.
   - Set the tire pressures to the specifications shown on the doorjamb label.

   Is it OK?

   YES

   Go to step 2.

   NO

   Explain to the customer that the system sometimes cannot detect under certain vehicle conditions.

2. BSI radar unit installation check

   -1. Check the installation of the appropriate BSI radar unit .

   Is it OK?

   YES

   Go to the BSI radar unit mounting area check .

   NO

   Install the BSI radar unit assembly properly. If damaged, replace the appropriate BSI radar unit assembly .

DTC B18BA, B1E6A

DTC B18BA : Different Version in the Left and Right Side BSI Radar Unit

DTC B1E6A : Different Version in the Left and Right Side BSI Radar Unit

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18BA Different version in the left and right side BSI radar unit	B
B1E6A Different version in the left and right side BSI radar unit	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 5 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B18BA Different version in the left and right side BSI radar unit	B
B1E6A Different version in the left and right side BSI radar unit	B

Is DTC B18BA or B1E6A indicated?

YES

An incorrect BSI radar unit is installed. **Replace the appropriate BSI radar unit** with the proper part.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B18C5, B1E75

DTC B18C5 : Short to GND in the Left Side BSI Radar Unit Indicator Circuit

DTC B1E75 : Short to GND in the Right Side BSI Radar Unit Indicator Circuit

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
B18C5 Short to GND in the left side BSI radar unit indicator circuit	B
B1E75 Short to GND in the right side BSI radar unit indicator circuit	B

DTC (BSI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B18C5 Short to GND in the left side BSI radar unit indicator circuit	B
B1E75 Short to GND in the right side BSI radar unit indicator circuit	B

Is DTC B18C5 or B1E75 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. DTC check

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connector(s) related to the DTC.

Left BSI alert indicator 2P connector
Right BSI alert indicator 2P connector

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B18C5 Short to GND in the left side BSI radar unit indicator circuit	B
B1E75 Short to GND in the right side BSI radar unit indicator circuit	B
B18C7 Open in the left side BSI radar unit indicator circuit	B
B1E77 Open in the right side BSI radar unit indicator circuit	B

Does DTC B18C5 change to DTC B18C7, or B1E75 change to DTC B1E77?

YES

Replace the appropriate BSI alert indicator .

NO

Go to step 3.

3. Shorted wire check (BSI_L_IND, BSI_R_IND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

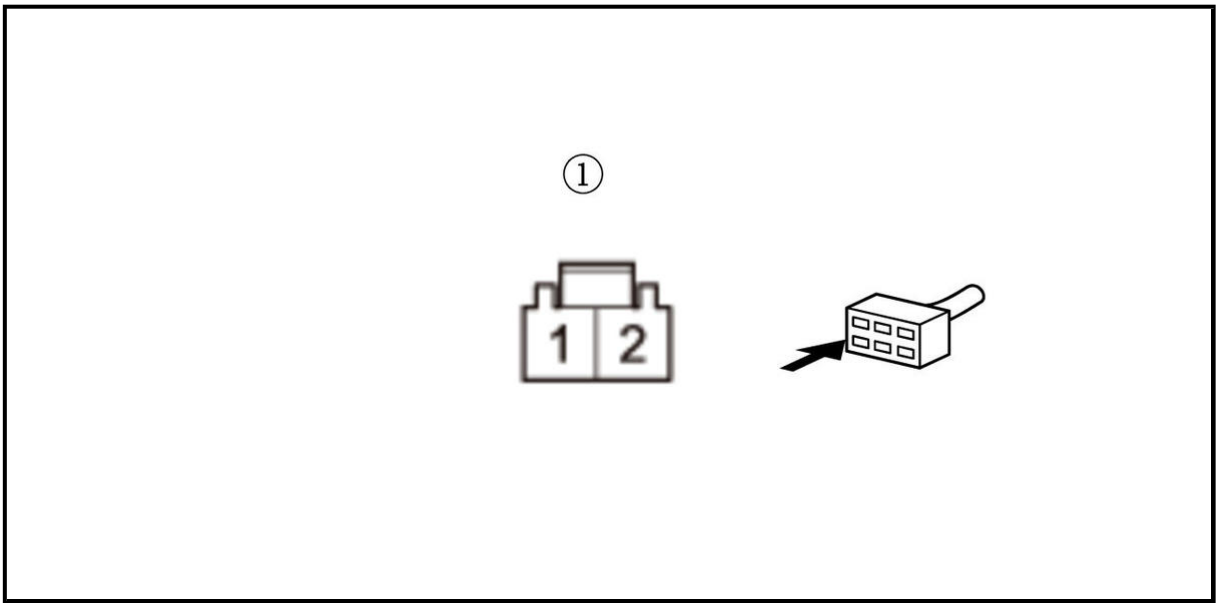
-2. Disconnect the following connector(s) related to the DTC.

Left side BSI radar unit 6P connector
Right side BSI radar unit 6P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
B	Left BSI alert indicator 2P connector: disconnected
B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground

Test point 1	Right BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire between the BSI alert indicator and the BSI radar unit.

NO

Replace the appropriate BSI radar unit .

DTC B18C6, B1E76

DTC B18C6 : Short to Power in the Left Side BSI Radar Unit Indicator Circuit

DTC B1E76 : Short to Power in the Right Side BSI Radar Unit Indicator Circuit

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
B18C6 Short to power in the left side BSI radar unit indicator circuit	B
B1E76 Short to power in the right side BSI radar unit indicator circuit	B

DTC (BSI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B18C6 Short to power in the left side BSI radar unit indicator circuit	B
B1E76 Short to power in the right side BSI radar unit indicator circuit	B

Is DTC B18C6 or B1E76 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Disconnect the following connector(s) related to the DTC.

Left BSI alert indicator 2P connector
Right BSI alert indicator 2P connector

-5. Turn the vehicle to the ON mode.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B18C6 Short to power in the left side BSI radar unit indicator circuit	B
B1E76 Short to power in the right side BSI radar unit indicator circuit	B
B18C7 Open in the left side BSI radar unit indicator circuit	B
B1E77 Open in the right side BSI radar unit indicator circuit	B

Does DTC B18C6 change to DTC B18C7, or B1E76 change to DTC B1E77?

YES

Replace the appropriate BSI alert indicator .

NO

Go to step 3.

3. Shorted wire check (BSI_L_IND, BSI_R_IND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector(s) related to the DTC.

Left side BSI radar unit 6P connector
Right side BSI radar unit 6P connector

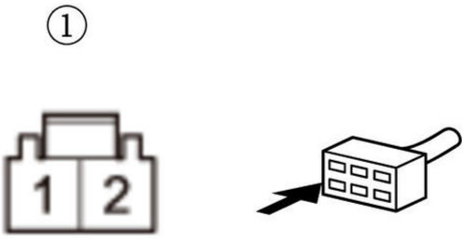
-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
B	Left BSI alert indicator 2P connector: disconnected

B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground

Test point 1	Right BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair a short to power in the wire between the BSI alert indicator and the BSI radar unit.

NO

Replace the appropriate BSI radar unit .

DTC B18C7, B1E77

DTC B18C7 : Open in the Left Side BSI Radar Unit Indicator Circuit

DTC B1E77 : Open in the Right Side BSI Radar Unit Indicator Circuit

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
B18C7 Open in the left side BSI radar unit indicator circuit	B
B1E77 Open in the right side BSI radar unit indicator circuit	B

DTC (BSI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

-5. Check for DTCs with the HDS.

DTC Description	**DTC**
B18C7 Open in the left side BSI radar unit indicator circuit	B

DTC Description	**DTC**
B1E77 Open in the right side BSI radar unit indicator circuit	B

Is DTC B18C7 or B1E77 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. BSI alert indicator check

-1. Turn the vehicle to the OFF (LOCK) mode.

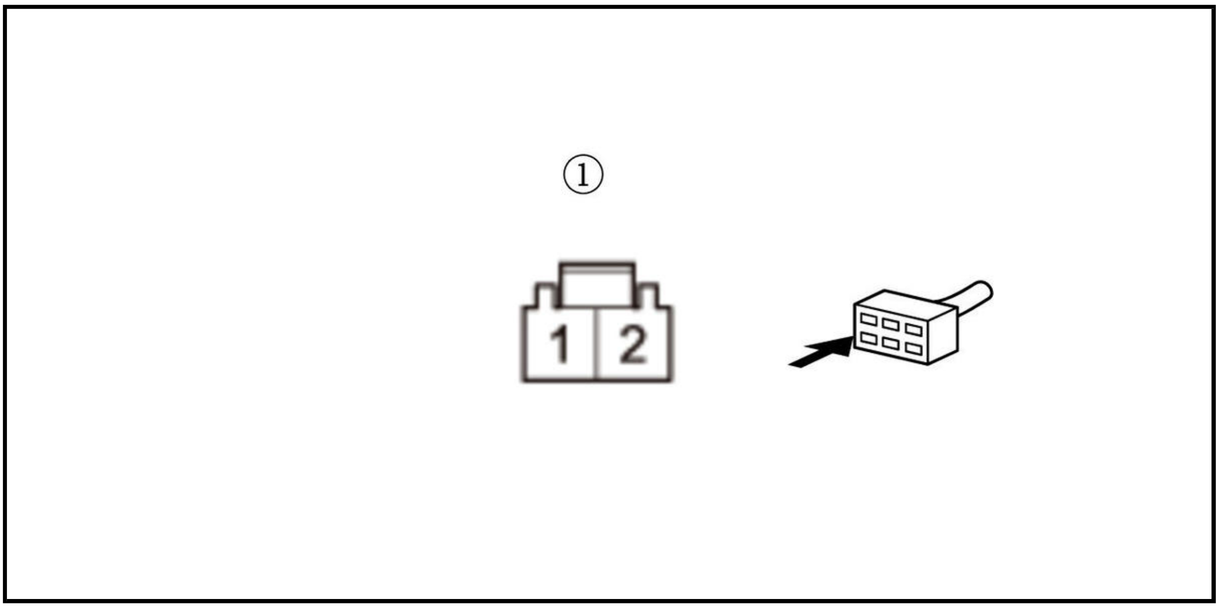
-2. Disconnect the following connector(s) related to the DTC.

Left BSI alert indicator 2P connector
Right BSI alert indicator 2P connector

-3. Connect terminals 1 and body ground with a jumper wire.

Test condition	Vehicle OFF (LOCK) mode
B	Left BSI alert indicator 2P connector: disconnected
B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground

Test point 1	Right BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B18C7 Open in the left side BSI radar unit indicator circuit	B
B1E77 Open in the right side BSI radar unit indicator circuit	B
B18C5 Short to GND in the left side BSI radar unit indicator circuit	B
B1E75 Short to GND in the right side BSI radar unit indicator circuit	B

Does DTC B18C7 change to DTC B18C5, or DTC B1E77 change to B1E75?

YES

Go to step 3.

NO

Go to step 4.

3. Open wire check (GND line)

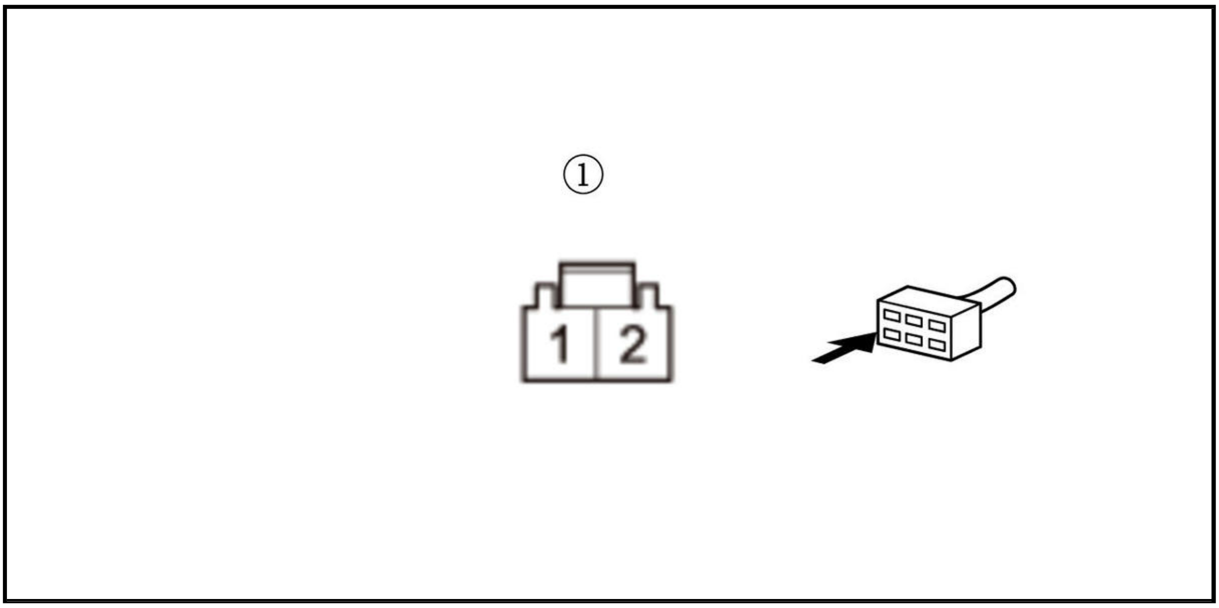
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the BSI alert indicator 2P connector.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Left BSI alert indicator 2P connector: disconnected
B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left BSI alert indicator 2P connector (female terminals) No. 2: ①
Test point 2	Body ground

Test point 1	Right BSI alert indicator 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the appropriate BSI alert indicator .

NO

Repair an open in the wire between the BSI alert indicator and the body ground at G401 (left BSI alert indicator), G402 (right BSI alert indicator).

4. Open wire check (BSI_L_IND, BSI_R_IND lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the BSI alert indicator 2P connector.

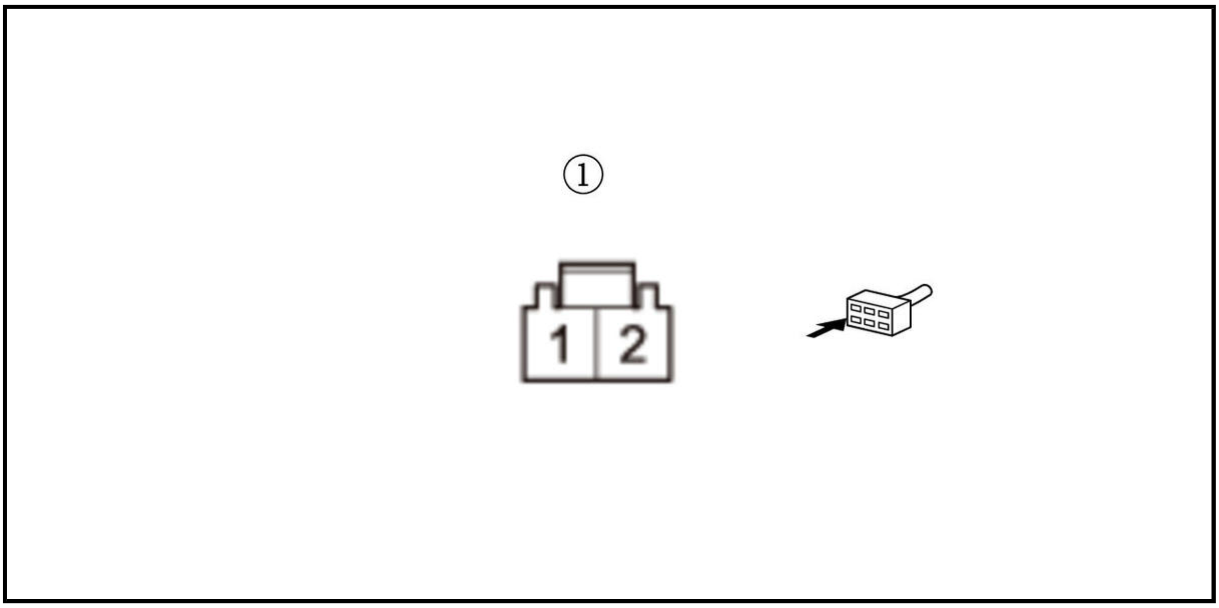
-3. Disconnect the following connector(s) related to the DTC.

Left side BSI radar unit 6P connector
Right side BSI radar unit 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
B	Left BSI alert indicator 2P connector: disconnected
B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left side BSI radar unit 6P connector No. 2
Test point 2	Left BSI alert indicator 2P connector (female terminals) No. 1: ①

Test point 1	Right side BSI radar unit 6P connector No. 2
Test point 2	Right BSI alert indicator 2P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Replace the appropriate BSI radar unit .

NO

Repair an open in the wire between the BSI radar unit and the BSI alert indicator.

DTC B18DB

DTC B18DB : Left Side BSI Radar Unit Received The Audio/Navigation Unit Failure Information

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18DB Left Side BSI Radar Unit Received The Audio/Navigation Unit Failure Information	B

DTC (BSI)

1. BSI radar unit connector check

   -1. Check for poor connections or loose terminals at the BSI radar unit 6P connector.

   Is the BSI radar unit 6P connector OK?

   YES

   Go to step 2.

   NO

   Repair or reconnect the connector securely.

2. BSI radar unit check

   -1. Turn the vehicle to the ON mode, and read the HDS.

DTC Description	DTC
B18DB Left Side BSI Radar Unit Received The Audio/Navigation Unit Failure Information	B

Is DTC B18DB indicated?

YES

Go to the **audio system** or **navigation system** general troubleshooting information. If the symptom is still present, **replace the appropriate BSI radar unit.**

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B18EA, B1E9A

DTC B18EA : (Left Side BSI Radar Unit Received PCM (A/T System) Failure Information)

DTC B1E9A : (Right Side BSI Radar Unit Received PCM (A/T System) Failure Information)

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
B18EA (Left Side BSI Radar Unit Received PCM (A/T System) Failure Information)	B
B1E9A (Right Side BSI Radar Unit Received PCM (A/T System) Failure Information)	B

DTC (BSI)

1. BSI radar unit check

-1. Turn the vehicle to the ON mode, and read the HDS.

DTC Description	DTC
B18EA (Left Side BSI Radar Unit Received PCM (A/T System) Failure Information)	B
B1E9A (Right Side BSI Radar Unit Received PCM (A/T System) Failure Information)	B

Is DTC B18EA or B1E9A indicated?

YES

Go to the gear system general troubleshooting . If the symptom is still present, **replace the appropriate BSI radar unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U1280 (BSI RADAR UNIT)

DTC U1280 : Communication Bus Line Error (Bus-Off)

NOTE:

- Before you troubleshoot, review the general troubleshooting information.
- If the B-CAN lines problem or BSI radar unit internal circuit malfunction, HDS does not communicate with the BSI radar unit. If DTC U1280 is indicated HDS, the system is OK at this time.

DTC Description	DTC
U1280 Communication Bus Line Error (Bus-Off)	B
U1280 Communication bus line error (BUS-OFF)	B

DTC (BSI)

1. BSI radar unit connector check

   -1. Check for poor connections or loose terminals at the BSI radar unit 6P connector.

   Is the BSI radar unit 6P connector OK?

   YES

   Go to step 2.

   NO

   Repair or reconnect the connector securely.

2. BSI radar unit check

   -1. Turn the vehicle to the ON mode, and read the HDS.

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B
U1280 Communication bus line error (BUS-OFF)	B

   Does the HDS communicate with the BSI radar unit?

   YES

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

   NO

   Go to the multiplex integrated control system general troubleshooting . If the symptom is still present, replace the appropriate BSI radar unit .

DTC U1281 (BSI RADAR UNIT)

DTC U1281 : Left Side BSI Radar Unit Lost Communication With MICU or BCM

DTC U1281 : Right Side BSI Radar Unit Lost Communication With MICU or BCM

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
U1281 Left Side BSI Radar Unit Lost Communication With MICU or BCM	B
U1281 Right Side BSI Radar Unit Lost Communication With MICU or BCM	B

DTC (BSI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Left Side BSI Radar Unit Lost Communication With MICU or BCM	B
U1281 Right Side BSI Radar Unit Lost Communication With MICU or BCM	B

Is DTC U1281 indicated?

YES

Go to the multiplex integrated control system general troubleshooting . If the symptom is still present, **replace the appropriate BSI radar unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U128D (BSI RADAR UNIT)

DTC U128D : Left Side BSI Radar Unit Lost Communication With Gauge Control Module

DTC U128D : Right Side BSI Radar Unit Lost Communication With Gauge Control Module

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
U128D Left side BSI radar unit lost communication with gauge control module	B
U128D Right side BSI radar unit lost communication with gauge control module	B

DTC (BSI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U128D Left side BSI radar unit lost communication with gauge control module	B
U128D Right side BSI radar unit lost communication with gauge control module	B

Is DTC U128D indicated?

YES

Go to the multiplex integrated control system general troubleshooting . If the symptom is still present, replace the appropriate BSI radar unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

DTC U1297, U128F (BSI RADAR UNIT)

DTC U1297 : Left Side BSI Radar Unit Lost Communication With Right Side BSI Radar Unit

DTC U128F : Right Side BSI Radar Unit Lost Communication With Left Side BSI Radar Unit

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
U1297 Left side BSI radar unit lost communication with right side BSI radar unit	B
U128F Right side BSI radar unit lost communication with left side BSI control unit	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U1297 Left side BSI radar unit lost communication with right side BSI radar unit	B
U128F Right side BSI radar unit lost communication with left side BSI control unit	B

Is DTC U1297 or U128F indicated?

YES

Go to the multiplex integrated control system general troubleshooting . If the symptom is still present, replace the appropriate BSI radar unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

DTC TROUBLESHOOTING

DTC B18A1, B1E51

DTC B18A1 : Left Side BSI Radar Unit Internal Circuit Error **DTC B1E51** : Right Side BSI Radar Unit Internal Circuit Error

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18A1 Left side BSI radar unit internal circuit error	B
B1E51 Right side BSI radar unit internal circuit error	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 5 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B18A1 Left side BSI radar unit internal circuit error	B
B1E51 Right side BSI radar unit internal circuit error	B

Are any DTCs indicated?

YES

Replace the appropriate BSI radar unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

DTC B18A5, B1E55

DTC B18A5 : Left Side BSI Radar Unit Temperature High **DTC B1E55** : Right Side BSI Radar Unit Temperature High

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18A5 Left side BSI radar unit temperature high	B
B1E55 Right side BSI radar unit temperature high	B

DTC (BSI)

1. Problem verification

   -1. Check the exhaust system and the heat shields for modifications or damage.

   Are all parts OK?

   YES

   Intermittent failure due to temporary high temperature around the appropriate BSI radar unit, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

   NO

   Repair or replace the faulty part.

DTC B18B4, B1E64

DTC B18B4 : Left Side BSI Radar Unit Dirty **DTC B1E64** : Right Side BSI Radar Unit Dirty

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- DTC B18B4 or DTC B1E64 may be stored due to environment (including weather, a traffic condition, and the drive situation) or temporary contamination around the rear bumper.

DTC Description	DTC
B18B4 Left side BSI radar unit dirty	B
B1E64 Right side BSI radar unit dirty	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 5 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B18B4 Left side BSI radar unit dirty	B
B1E64 Right side BSI radar unit dirty	B

   Are any DTCs indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Outside rear bumper check

-1. Check the outside of rear bumper for snow, ice, dirt, contaminants, or stickers.

Is it OK?

YES

Go to step 3.

NO

Completely wipe off any dirt or contaminants from the rear bumper.

3. Inside rear bumper check

   -1. From the rear wheel arch, remove the appropriate side of the rear bumper .

   -2. Check the inside of the rear bumper for snow, ice, dirt, or contaminants. Also, check the appropriate BSI radar unit surface for dirt or contaminants.

   Is it OK?

   YES

   Replace the appropriate BSI radar unit .

   NO

   Clean the inside of the rear bumper for dirt or contaminations around the BSI radar unit.

DTC B18B8, B1E68

DTC B18B8 : Left Side BSI Radar Unit Azimuth Off Alignment **DTC B1E68** : Right Side BSI Radar Unit Azimuth Off Alignment

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18B8 Left side BSI radar unit azimuth off alignment	B
B1E68 Right side BSI radar unit azimuth off alignment	B

DTC (BSI)

1. Vehicle condition check:

   Check the vehicle condition.

   NOTE: The BSI system cannot work properly in the following vehicle conditions:

   - Make sure the vehicle does not have aftermarket suspension.
   - Make sure all the tires are the correct size.
   - Set the tire pressures to the specifications shown on the doorjamb label.

   Is it OK?

   YES

   Go to step 2.

   NO

Explain to the customer that the system sometimes cannot detect under certain vehicle conditions.

2. BSI radar unit installation check

-1. Check the installation of the appropriate BSI radar unit .

Is it OK?

YES

Go to the BSI radar unit mounting area check .

NO

Install the BSI radar unit assembly properly. If damaged, replace the appropriate BSI radar unit assembly .

DTC B18BA, B1E6A

DTC B18BA : Different Version in the Left and Right Side BSI Radar Unit **DTC B1E6A** : Different Version in the Left and Right Side BSI Radar Unit

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18BA Different version in the left and right side BSI radar unit	B
B1E6A Different version in the left and right side BSI radar unit	B

DTC (BSI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 5 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B18BA Different version in the left and right side BSI radar unit	B
B1E6A Different version in the left and right side BSI radar unit	B

Is DTC B18BA or B1E6A indicated?

YES

An incorrect BSI radar unit is installed. Replace the appropriate BSI radar unit with the proper part.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

DTC B18C5, B1E75

DTC B18C5 : Short to GND in the Left Side BSI Radar Unit Indicator Circuit **DTC B1E75** : Short to GND in the Right Side BSI Radar Unit Indicator Circuit

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
B18C5 Short to GND in the left side BSI radar unit indicator circuit	B
B1E75 Short to GND in the right side BSI radar unit indicator circuit	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B18C5 Short to GND in the left side BSI radar unit indicator circuit	B
B1E75 Short to GND in the right side BSI radar unit indicator circuit	B

   Is DTC B18C5 or B1E75 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. DTC check

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Disconnect the following connectors.

Left BSI alert indicator 2P connector
Right BSI alert indicator 2P connector

   -4. Turn the vehicle to the ON mode.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B18C5 Short to GND in the left side BSI radar unit indicator circuit	B
B1E75 Short to GND in the right side BSI radar unit indicator circuit	B
B18C7 Open in the left side BSI radar unit indicator circuit	B
B1E77 Open in the right side BSI radar unit indicator circuit	B

   Is DTC B18C5 change to DTC B18C7, or B1E75 change to DTC B1E77?

YES

Replace the appropriate BSI alert indicator .

NO

Go to step 3.

3. Shorted wire check (BSI L IND, BSI R IND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

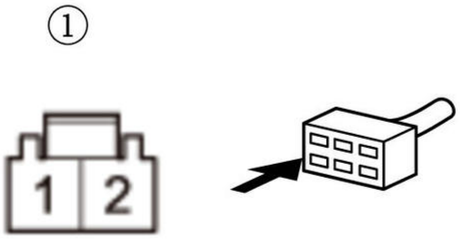
-2. Disconnect the following connectors.

Left side BSI radar unit 6P connector
Right side BSI radar unit 6P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
B	Left BSI alert indicator 2P connector: disconnected
B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground

Test point 1	Right BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire between the BSI alert indicator and the BSI radar unit.

NO

Replace the appropriate BSI radar unit .

DTC B18C6, B1E76

DTC B18C6 : Short to Power in the Left Side BSI Radar Unit Indicator Circuit **DTC B1E76** : Short to Power in the Right Side BSI Radar Unit Indicator Circuit

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18C6 Short to power in the left side BSI radar unit indicator circuit	B
B1E76 Short to power in the right side BSI radar unit indicator circuit	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B18C6 Short to power in the left side BSI radar unit indicator circuit	B
B1E76 Short to power in the right side BSI radar unit indicator circuit	B

   Is DTC B18C6 or B1E76 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

2. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Disconnect the following connector.

Left BSI alert indicator 2P connector	
Right BSI alert indicator 2P connector	

   -5. Turn the vehicle to the ON mode.

   -6. Check for DTCs with the HDS.

DTC Description	DTC
B18C6 Short to power in the left side BSI radar unit indicator circuit	B
B1E76 Short to power in the right side BSI radar unit indicator circuit	B
B18C7 Open in the left side BSI radar unit indicator circuit	B
B1E77 Open in the right side BSI radar unit indicator circuit	B

Is DTC B18C6 change to DTC B18C7, or B1E76 change to DTC B1E77?

YES

Replace the appropriate BSI alert indicator .

NO

Go to step 3.

3. Shorted wire check (BSI L IND, BSI R IND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

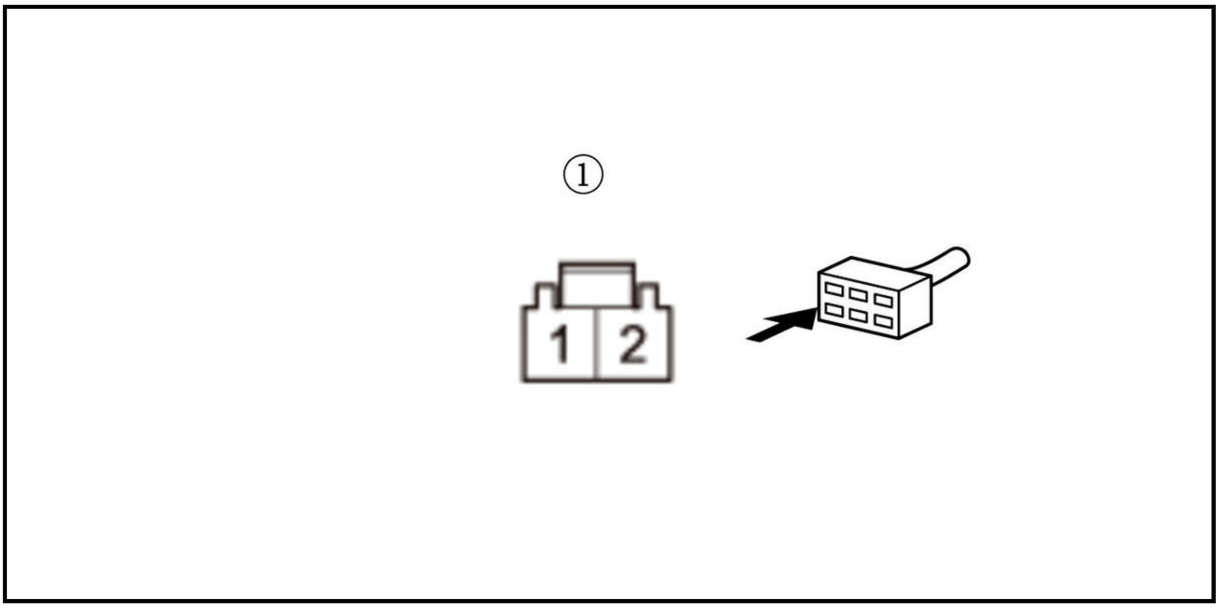
Left side BSI radar unit 6P connector
Right side BSI radar unit 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
B	Left BSI alert indicator 2P connector: disconnected
B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground

Test point 1	Right BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair a short to power between the BSI alert indicator and the BSI radar unit.

NO

Replace the appropriate BSI radar unit .

DTC B18C7, B1E77

DTC B18C7 : Open in the Left Side BSI Radar Unit Indicator Circuit **DTC B1E77** : Open in the Right Side BSI Radar Unit Indicator Circuit

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
B18C7 Open in the left side BSI radar unit indicator circuit	B
B1E77 Open in the right side BSI radar unit indicator circuit	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B18C7 Open in the left side BSI radar unit indicator circuit	B
B1E77 Open in the right side BSI radar unit indicator circuit	B

Is DTC B18C7 or B1E77 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. BSI alert indicator check

-1. Turn the vehicle to the OFF (LOCK) mode.

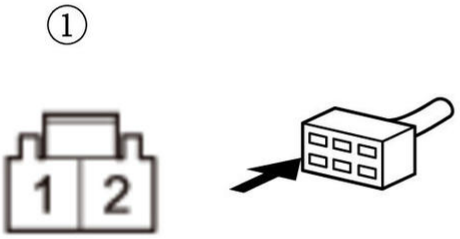
-2. Disconnect the following connector.

Left BSI alert indicator 2P connector
Right BSI alert indicator 2P connector

-3. Connect terminals 1 and body ground with a jumper wire.

Test condition	Vehicle OFF (LOCK) mode
B	Left BSI alert indicator 2P connector: disconnected
B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground

Test point 1	Right BSI alert indicator 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B18C7 Open in the left side BSI radar unit indicator circuit	B
B1E77 Open in the right side BSI radar unit indicator circuit	B
B18C5 Short to GND in the left side BSI radar unit indicator circuit	B
B1E75 Short to GND in the right side BSI radar unit indicator circuit	B

Is DTC B18C7 change to DTC B18C5, or DTC B1E77 change to B1E75?

YES

Go to step 3.

NO

Go to step 4.

3. Open wire check (GND line)

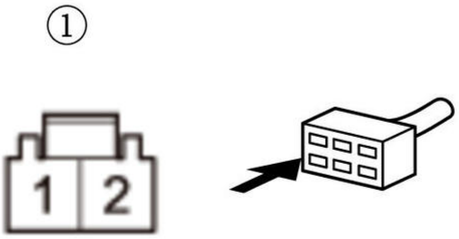
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the BSI alert indicator 2P connector.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
B	Left BSI alert indicator 2P connector: disconnected
B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left BSI alert indicator 2P connector (female terminals) No. 2: ①
Test point 2	Body ground

Test point 1	Right BSI alert indicator 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Replace the appropriate BSI alert indicator .

NO

Repair an open in the wire between the BSI alert indicator and the body ground at G401 (left BSI alert indicator), G402 (right BSI alert indicator).

4. Open wire check (BSI L IND, BSI R IND lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the BSI alert indicator 2P connector.

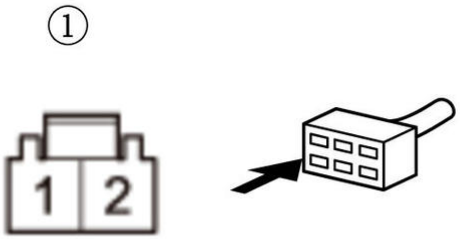
-3. Disconnect the following connector.

Left side BSI radar unit 6P connector
Right side BSI radar unit 6P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
B	Left BSI alert indicator 2P connector: disconnected
B	Right BSI alert indicator 2P connector: disconnected
Test point 1	Left side BSI radar unit 6P connector No. 2
Test point 2	Left BSI alert indicator 2P connector (female terminals) No. 1: ①

Test point 1	Right side BSI radar unit 6P connector No. 2
Test point 2	Right BSI alert indicator 2P connector (female terminals) No. 1: ①



Is there continuity?

YES

Replace the appropriate BSI radar unit .

NO

Repair an open in the wire between the BSI radar unit and the BSI alert indicator.

DTC B18DB

DTC B18DB : Left Side BSI Radar Unit Received The Audio/Navigation Unit Failure Information

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
B18DB Left Side BSI Radar Unit Received The Audio/Navigation Unit Failure Information	B

DTC (BSI)

1. BSI radar unit connector check

   -1. Check for poor connections or loose terminals at the BSI radar unit 6P connector.

   Is the BSI radar unit 6P connector OK?

   YES

   Go to step 2.

   NO

   Repair or reconnect the connector securely.

2. BSI radar unit check

   -1. Turn the vehicle to the ON mode, and read the HDS.

DTC Description	DTC
B18DB Left Side BSI Radar Unit Received The Audio/Navigation Unit Failure Information	B

   Is DTC B18DB indicated?

   YES

   Go to the **audio system** or **navigation system** general troubleshooting information. If the symptom is still present, **replace the appropriate BSI radar unit.**

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B18EA, B1E9A

DTC B18EA : Left Side BSI Radar Unit received PCM (A/T System) Failure information **DTC B1E9A** : Right Side BSI Radar Unit received PCM (A/T System) Failure information

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
B18EA Left Side BSI Radar Unit received PCM (A/T System) Failure information	B
B1E9A Right Side BSI Radar Unit received PCM (A/T System) Failure information	B

DTC (BSI)

1. BSI radar unit connector check

   -1. Check for poor connections or loose terminals at the BSI radar unit 6P connector.

Is the BSI radar unit 6P connector OK?

YES

Go to step 2.

NO

Repair or reconnect the connector securely.

2. BSI radar unit check

-1. Turn the vehicle to the ON mode, and read the HDS.

DTC Description	DTC
B18EA Left Side BSI Radar Unit received PCM (A/T System) Failure information	B
B1E9A Right Side BSI Radar Unit received PCM (A/T System) Failure information	B

Is DTC B18EA or B1E9A indicated?

YES

Go to the CVT System general troubleshooting . If the symptom is still present, **replace the appropriate BSI radar unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U1280 (BSI RADAR UNIT)

DTC U1280 : Communication Bus Line Error (Bus-Off)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- If the B-CAN lines problem or BSI radar unit internal circuit malfunction, HDS does not communicate with the BSI radar unit. If DTC U1280 is indicated HDS, the system is OK at this time.

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B
U1280 Communication bus line error (BUS-OFF)	B

DTC (BSI)

1. BSI radar unit connector check

-1. Check for poor connections or loose terminals at the BSI radar unit 6P connector.

Is the BSI radar unit 6P connector OK?

YES

Go to step 2.

NO

Repair or reconnect the connector securely.

2. BSI radar unit check

   -1. Turn the vehicle to the ON mode, and read the HDS.

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B
U1280 Communication bus line error (BUS-OFF)	B

   Does the HDS communicate with the BSI radar unit?

   YES

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

   NO

   Go to the multiplex integrated control system general troubleshooting . If the symptom is still present, **replace the appropriate BSI radar unit** .

DTC U1281 (BSI RADAR UNIT)

DTC U1281 : Left Side BSI Radar Unit Lost Communication With MICU or BCM **DTC U1281** : Right Side BSI Radar Unit Lost Communication With MICU or BCM

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC
U1281 Left Side BSI Radar Unit Lost Communication With MICU or BCM	B
U1281 Right Side BSI Radar Unit Lost Communication With MICU or BCM	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Left Side BSI Radar Unit Lost Communication With MICU or BCM	B
U1281 Right Side BSI Radar Unit Lost Communication With MICU or BCM	B

   Is DTC U1281 indicated?

   YES

   Go to the multiplex integrated control system general troubleshooting . If the symptom is still present, **replace the appropriate BSI radar unit** .

   NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

DTC U128D (BSI RADAR UNIT)

DTC U128D : Left Side BSI Radar Unit Lost Communication With Gauge Control Module **DTC U128D** : Right Side BSI Radar Unit Lost Communication With Gauge Control Module

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
U128D Left side BSI radar unit lost communication with gauge control module	B
U128D Right side BSI radar unit lost communication with gauge control module	B

DTC (BSI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U128D Left side BSI radar unit lost communication with gauge control module	B
U128D Right side BSI radar unit lost communication with gauge control module	B

Is DTC U128D indicated?

YES

Go to the multiplex integrated control system general troubleshooting . If the symptom is still present, replace the appropriate BSI radar unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

DTC U1297, U128F (BSI RADAR UNIT)

DTC U1297 : Left Side BSI Radar Unit Lost Communication With Right Side BSI Radar Unit **DTC U128F** : Right Side BSI Radar Unit Lost Communication With Left Side BSI Radar Unit

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC
U1297 Left side BSI radar unit lost communication with right side BSI radar unit	B
U128F Right side BSI radar unit lost communication with left side BSI control unit	B

DTC (BSI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 2 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U1297 Left side BSI radar unit lost communication with right side BSI radar unit	B
U128F Right side BSI radar unit lost communication with left side BSI control unit	B

Is DTC U1297 or U128F indicated?

YES

Go to the multiplex integrated control system general troubleshooting . If the symptom is still present, **replace the appropriate BSI radar unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

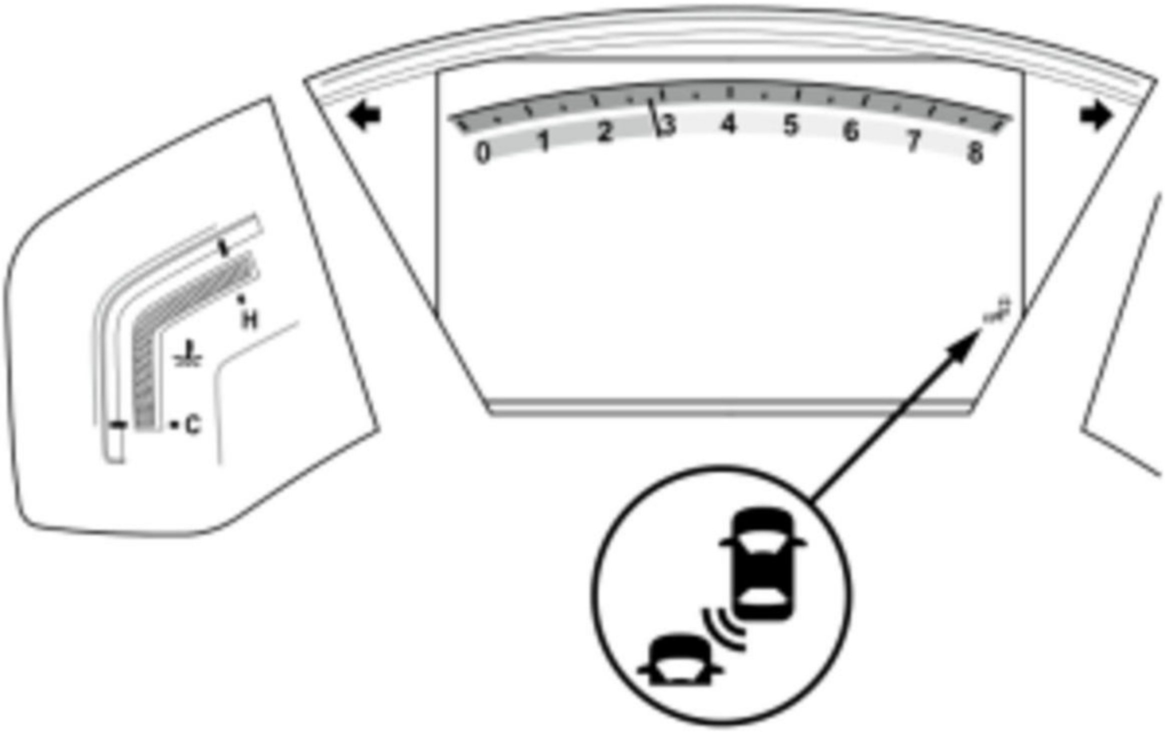
HOW TO INFORMATION

HOW TO TROUBLESHOOT THE BLIND SPOT INFORMATION (BSI) SYSTEM

NOTE: Do not make any bumper repairs in the areas over or near the two radar units on vehicles equipped with the Blind Spot Information (BSI) System. The composition of the repair materials, and/or increased material thickness in the repaired area, may interfere with BSI radar unit operation.

BSI Indicator (Amber)

When the BSI system is OK, the BSI indicator comes on for a few seconds after the vehicle is turned to the ON mode, then it goes off.

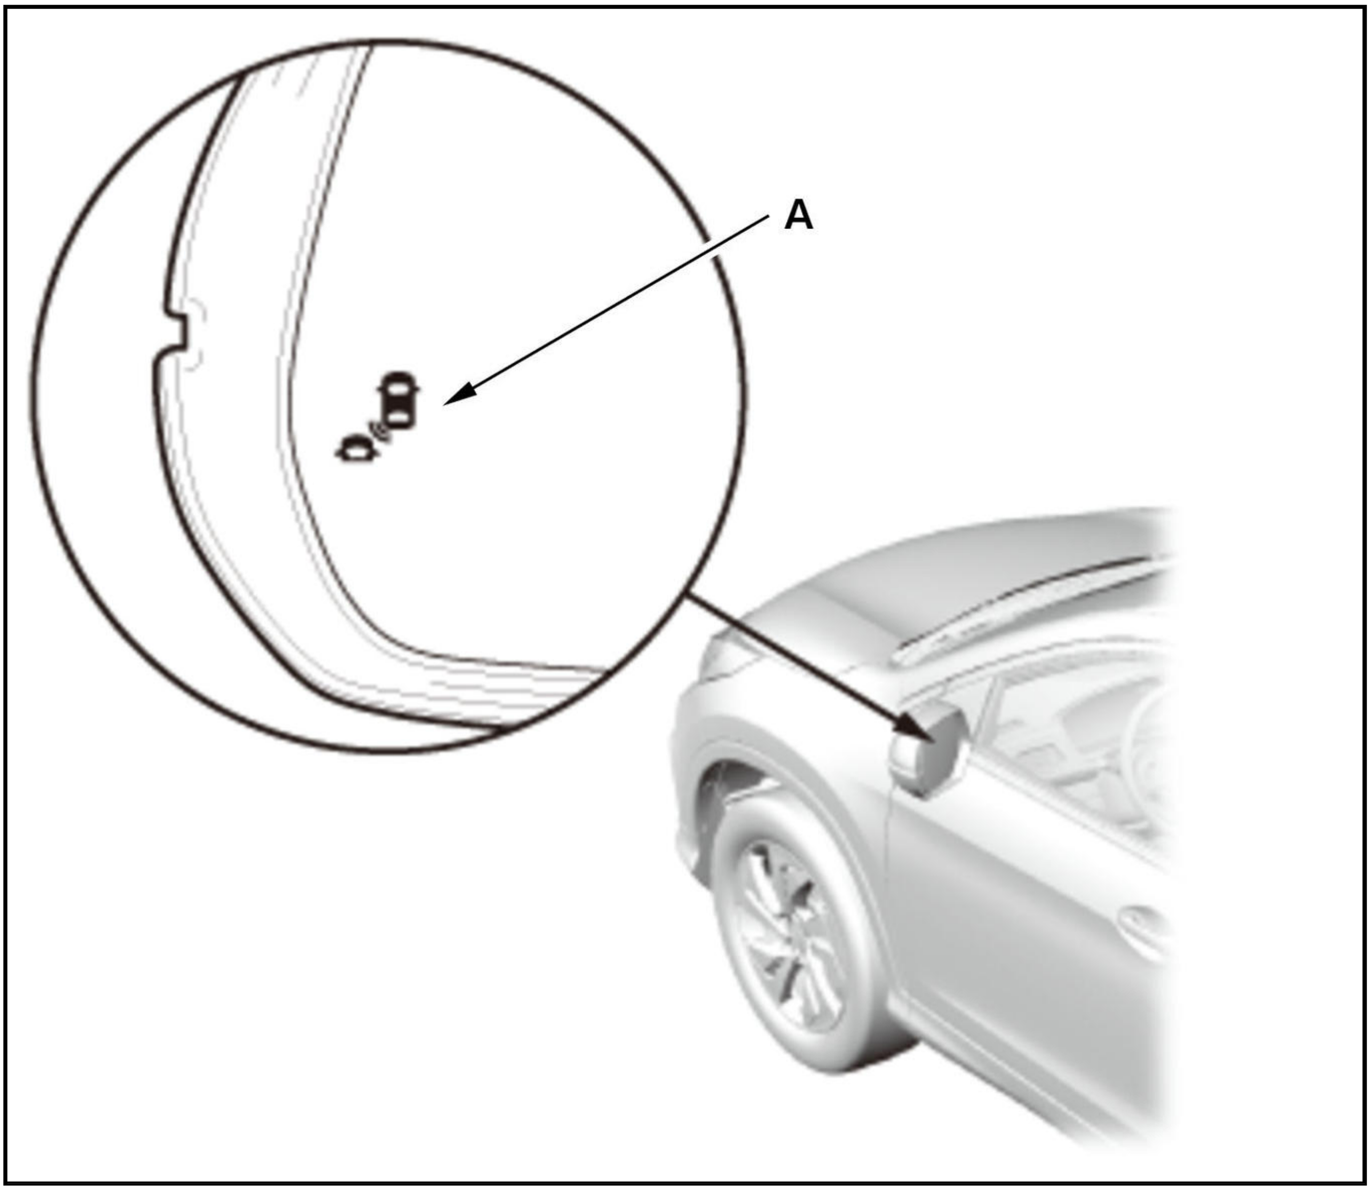


BSI INDICATOR (amber)

BSI Alert Indicator

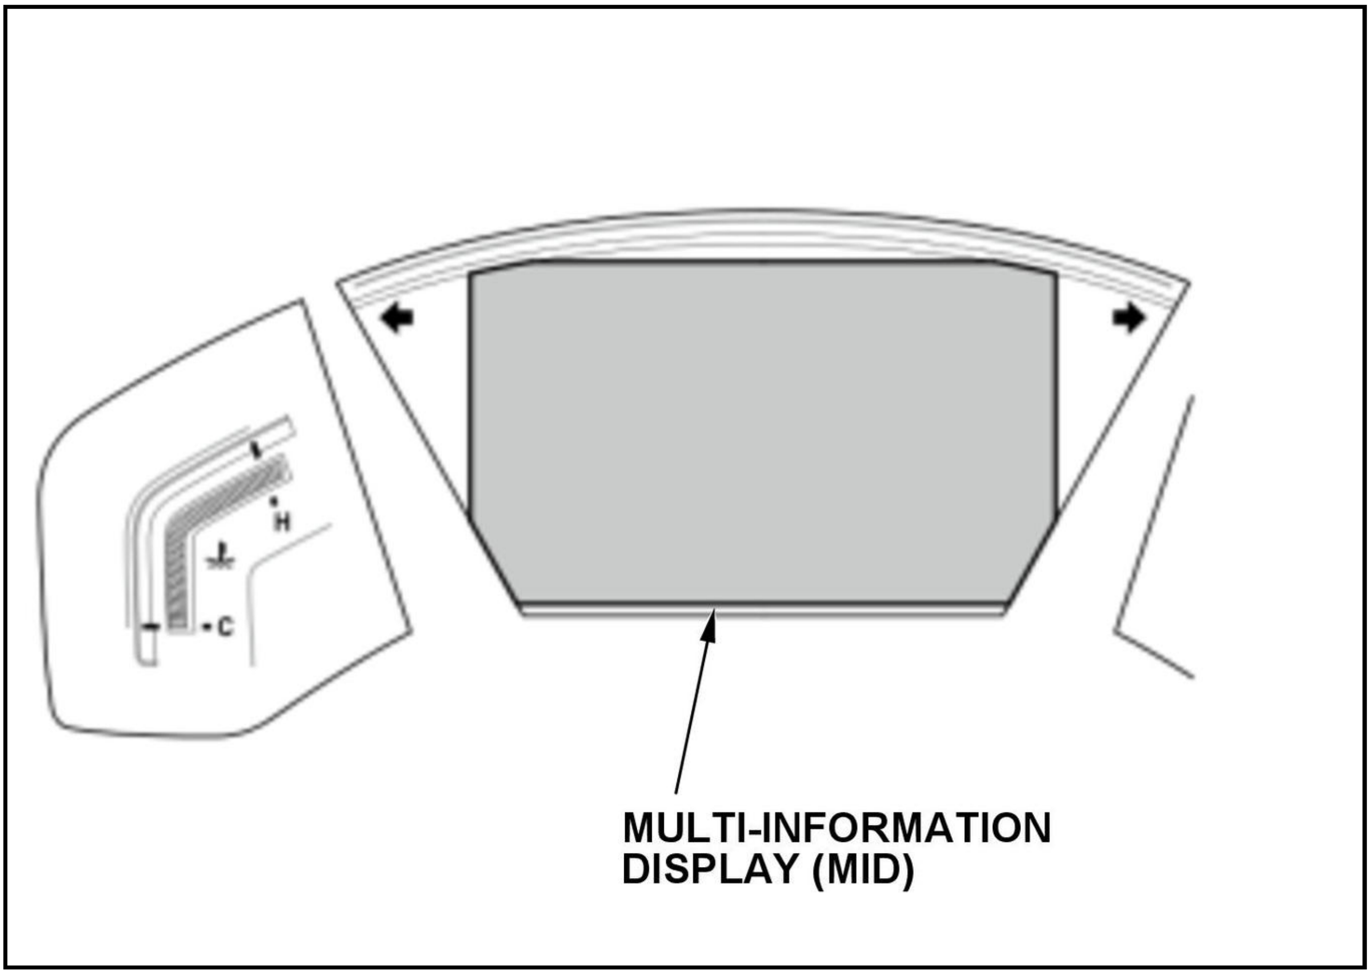
While the BSI system is working, the system turns on/blinks * the appropriate BSI alert indicator (right or left) when it detects another vehicle on either side of the rear.

*: When the driver moves the turn signal lever toward the side with the BSI alert indicator on, the alert indicator blinks to alert the driver.



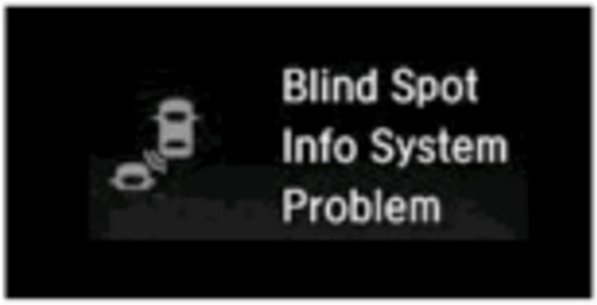
Multi-Information Display (MID) Indication

When the BSI system is OK, the BSI indicates its operation on the MID in the gauge control module as below.



Self-Diagnostic Function

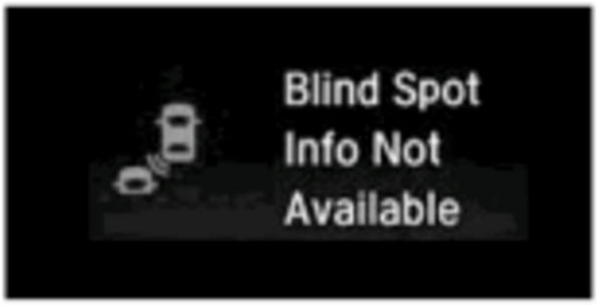
The BSI system has a self-diagnostic function. If the self-diagnostic function detects a malfunction, the BSI system stops operating. The BSI indicator comes on, and the BSI system indicates "Blind Spot Info System Problem" on the MID.



Blind Spot
Info System
Problem

When mud, dirt, wet snow, leaves, or other foreign material sticks to the side of the rear bumper, the BSI system stops operating and the message on the MID indicates that the BSI radar units must be cleaned. It also turns on the BSI indicator at the same time, and stores the DTC (s).

When the obstruction or contamination is removed, the indicator on the MID goes off and the BSI system automatically returns to ON.



Blind Spot
Info Not
Available

BSI Radar Units

The BSI radar units are installed behind the rear bumper on both sides of the vehicle, and they have a control unit. Each BSI radar unit communicates with the other BSI radar unit. The BSI radar units detect other vehicles as they approach your vehicle from the rear sides, and the BSI radar units send this information to the BSI alert indicator.

CAN Communications

B-CAN

The BSI radar units are on the B-CAN system, and they communicate with other units (gauge control module, MICU) via B-CAN.

If the BSI radar units detect a communication error or a malfunction in another connected unit, the BSI system will not operate even though it is OK.

In this case, the BSI indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check the DTCs with the HDS.

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the BSI indicator does not come on.
- The BSI system sometimes stops operating because of the environment (weather, road conditions, driving conditions, etc.). A DTC may be stored in these cases.

Some DTCs may be stored even when the system is OK. For example, the BSI indicator may come on with one or more of these DTCs:

B18A5:	Left Side BSI Radar Unit Temperature High
B1E55:	Right Side BSI Radar Unit Temperature High
B18B4:	Left Side BSI Radar Unit Dirty
B1E64:	Right Side BSI Radar Unit Dirty

How to Retrieve DTCs

1. Turn the vehicle to the OFF (LOCK) mode.

2. **Connect the HDS**

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the vehicle and the BSI radar unit. If it does not communicate **go to the DTC troubleshooting index**

5. Use the HDS to check for BSI system DTCs.

6. Read and record the DTC:7. Turn the vehicle to the OFF (LOCK) mode.

8. Disconnect the HDS from the DLC.

9. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

1. Turn the vehicle to the OFF (LOCK) mode.

2. **Connect the HDS**

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the vehicle and the BSI radar unit. If it does not communicate **go to the DTC troubleshooting index**

5. Clear the DTC (s) by following the screen prompts on the HDS.

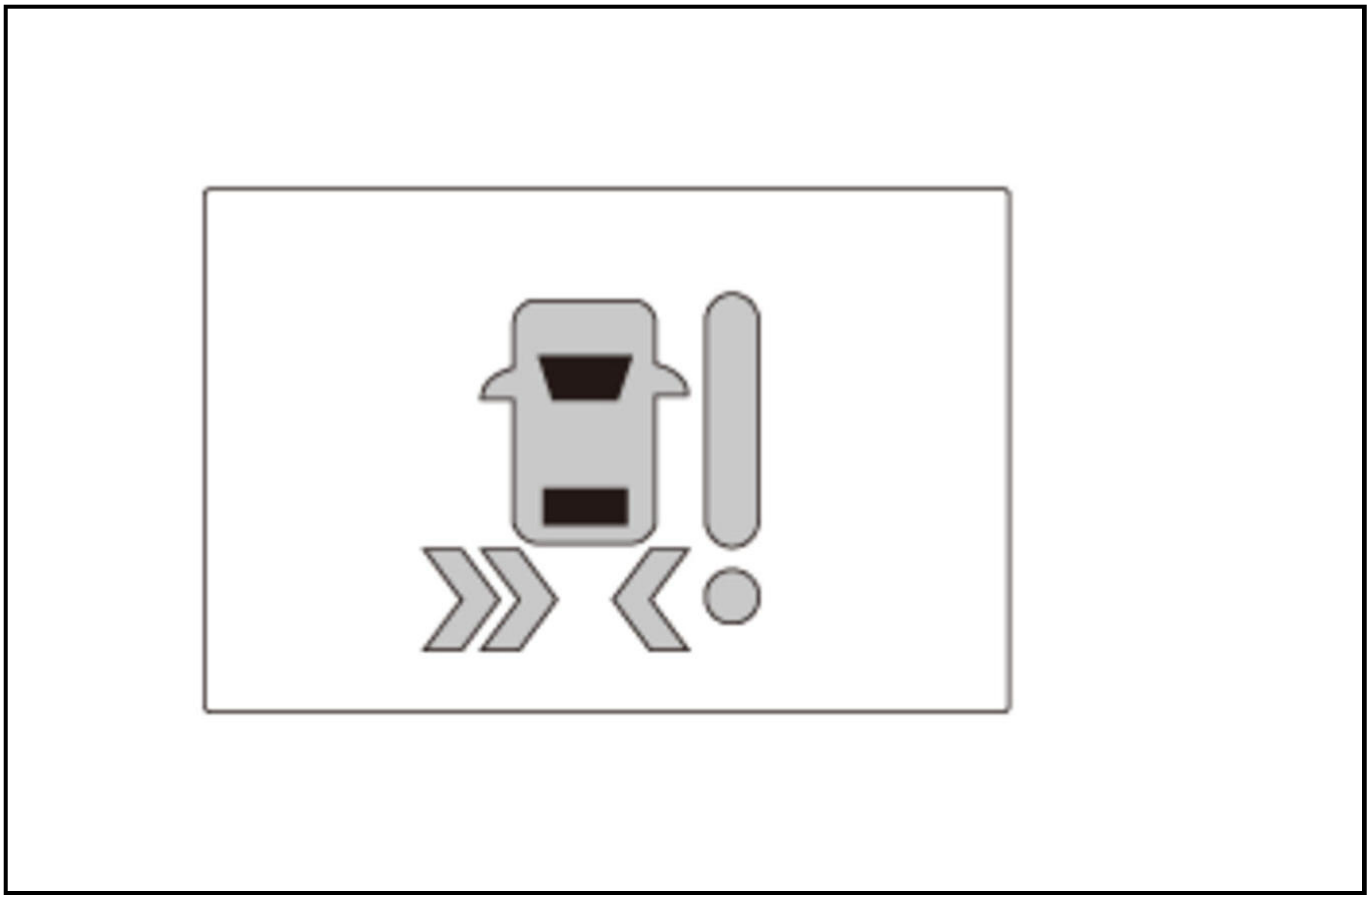
6. Turn the vehicle to the OFF (LOCK) mode.

7. Disconnect the HDS from the DLC.

HOW TO TROUBLESHOOT THE CROSS TRAFFIC MONITOR

Cross Traffic Monitor Indicator

When the cross traffic monitor system fails, the cross traffic monitor indicator comes on on the center display unit.



Control Units

The cross traffic monitor system is controlled by BSI radar units. If the BSI radar unit malfunctions, the cross traffic monitor system stops operating.

CAN Communications

B-CAN

The cross traffic monitor system is controlled by the BSI radar units. The BSI radar units are on the B-CAN system, and they communicate with other units via B-CAN.

If the BSI radar units detect a communication error or a malfunction in another connected unit, the cross traffic monitor system will not operate even though it is OK.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check the DTCs with the HDS.

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the cross traffic monitor indicator does not come on.

How to Retrieve DTCs

1. Turn the vehicle to the OFF (LOCK) mode.

2. **Connect the HDS**

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the vehicle and the BSI radar unit. If it does not communicate **go to the DTC troubleshooting index**

5. Use the HDS to check for BSI system DTCs.

6. Read and record the DTC:7. Turn the vehicle to the OFF (LOCK) mode.

8. Disconnect the HDS from the DLC.

9. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

1. Turn the vehicle to the OFF (LOCK) mode.

2. **Connect the HDS**

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the vehicle and the BSI radar unit. If it does not communicate **go to the DTC troubleshooting index**

5. Clear the DTC (s) by following the screen prompts on the HDS.

6. Turn the vehicle to the OFF (LOCK) mode.

7. Disconnect the HDS from the DLC.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

THE BSI ALERT INDICATOR COMES ON WHEN NO OTHER VEHICLE IS IN THE DETECTABLE AREA (WRONG INDICATION) (BSI)

Diagnostic procedure

- Symptom troubleshooting.

THE BSI DOES NOT COME ON WHEN OTHER VEHICLES ARE IN THE DETECTABLE AREA (NO INDICATION) (BSI)

Diagnostic procedure

- Symptom troubleshooting.

THE BSI INDICATOR DOES NOT COME ON (BSI)

Diagnostic procedure

- Symptom troubleshooting.

THE BSI INDICATOR DOES NOT GO OFF (BSI)

Diagnostic procedure

NOTE: If any of the CAN communication failure DTCs are indicated in other systems, troubleshoot the DTC first.

- Check for open wire or shorted wire in the B-CAN circuit;
-
    - -

      Between the gauge control module and BSI radar unit (B-CAN_H, B-CAN _L)
- Check the left and/or right side BSI radar unit power circuit (IG1_OPTION)
- Check the left and/or right side BSI radar unit ground circuit (GND)
- Do the gauge control module self-diagnostic function .

Also check for

DESCRIPTION & OPERATION

BLIND SPOT INFORMATION (BSI) SYSTEM DESCRIPTION

The BSI radar unit emits radar waves from the left and right BSI radar and detects other vehicles in the blind spot. BSI system function uses the BSI radar unit. The BSI alert indicators warn the driver when a vehicle enters the driver's side or the passenger's side blind spot alert zone. If the driver turns on the turn signal while the BSI alert is on, the BSI alert flashes and an audible alarm sounds to warn the driver.

If the BSI radar unit malfunctions, the BSI system stops operating. The vehicle alerts the driver that there is a problem by turning on a warning indicator on the gauge control module.

Radar Zone Definition

The BSI radars are installed on the left and right sides of the rear side outer panel and covered by the rear bumper. The mounting positions are symmetrical on the left and the right.

The radar wave emission range and the vehicle detection range of the BSI radar unit are shown. They are symmetrical. The vehicle detection range makes up only a part of the radar wave emission range.

RADAR WAVE EMISSION RANGE
VEHICLE DETECTION RANGE and BLIND SPOT ALERT ZONE

Blind Spot Information (BSI) system

The BSI system alerts the driver by the BSI alert indicator when a vehicle enters the blind spot alert zone. See Warning Conditions for more information.

Warning Conditions

Under normal conditions, the BSI system generally does not alert stationary objects like highway infrastructure, guardrails, posts, walls, foliage, parked vehicles, etc. The system also does not notify when vehicles are traveling in the opposite direction.

B	Vehicle operation speed:	Relative speed: Less than
Passing from the rear	20-99 mph (32-160 km/h)	31 mph (50 km/h)
Lane changes		12 mph (20 km/h)
Passing a vehicle		12 mph (20 km/h)

RIGHT SIDE BSI RADAR UNIT
RIGHT BSI ALERT INDICATOR
BODY CONTROL MODULE
COMBINATION LIGHT SWITCH

CROSS TRAFFIC MONITOR SYSTEM DESCRIPTION

The BSI radar unit emits radar waves from the left and right BSI radar and detects other vehicles in the blind spot. Cross traffic monitor system function uses the BSI radar unit.

The cross traffic monitor system's alerting arrows are displayed on the rearview camera image of the center display unit when the vehicle is in reverse. When an approaching vehicle enters the cross traffic monitor alert zone, the cross traffic monitor warns the driver with a warning indicator and an audible alarm.

If the BSI radar unit malfunctions, the cross traffic monitor system stops operating. The vehicle alerts the driver that there is a problem by turning on the BSI indicator on the gauge control module, and the cross traffic monitor indicator is shown on the rearview camera image when the vehicle is in reverse gear.

Radar Zone Definition

The BSI radars are installed on the left and right sides of the rear side outer panel and covered by the bumper. The mounting positions are symmetrical on the left and the right.

When the BSI radar has a clear view of the environment around it, the cross traffic monitor system will warn of detected approaching vehicles.

The cross traffic monitor system evaluates the approaching target's speed, time to potential collision and location in the cross traffic monitor system's alert zone to decide if the system should warn or not warn the driver.

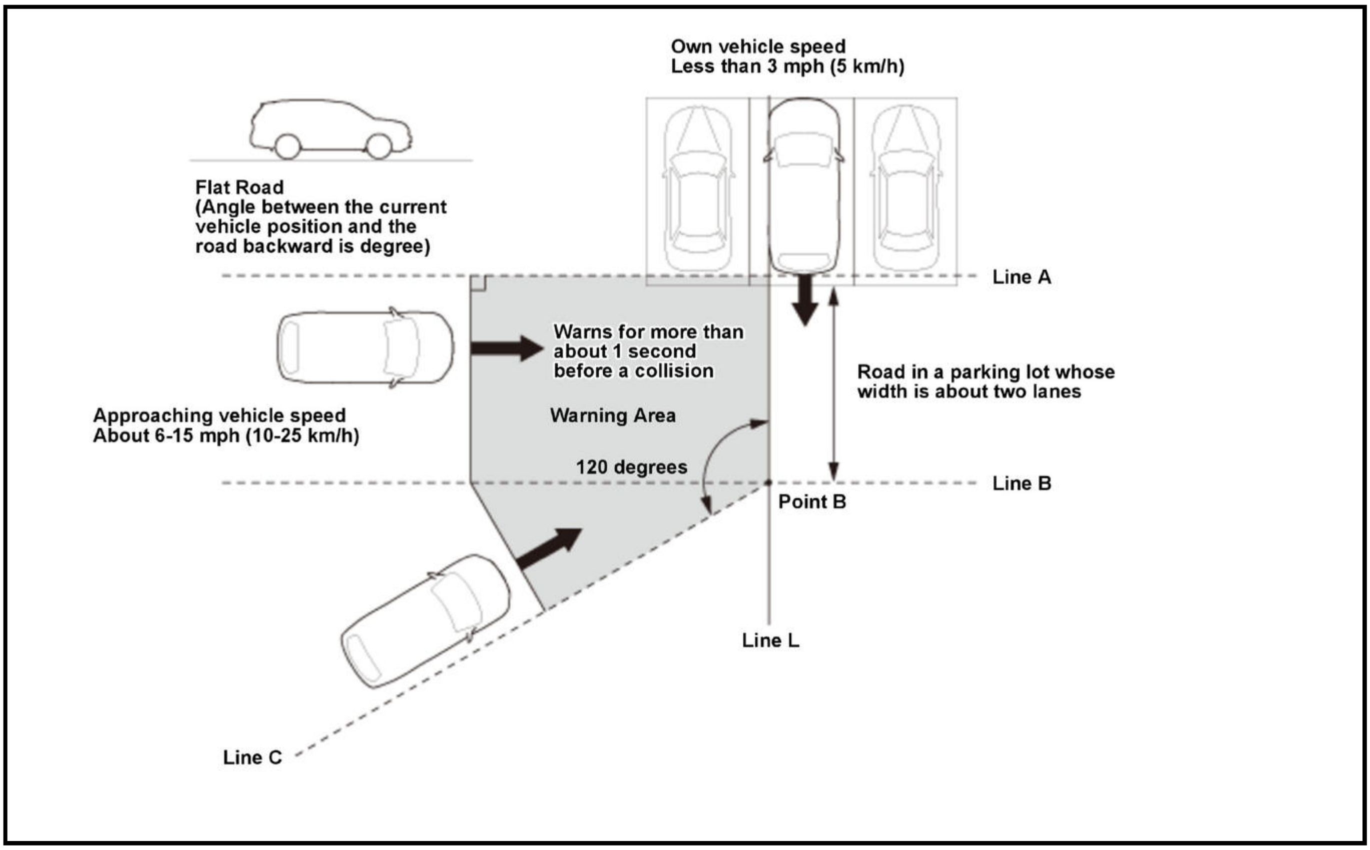
Detection Conditions

Parameter	Warn
Your vehicle speed	Less than 3 mph (5 km/h)*
Time to collision	1.2 to 3.2 seconds*
Target closing speed	Greater than 6 mph (10 km/h) and less than 16 mph (25 km/h)*
Detection range	More than 10.8 ft (3.3 m) (example: Target vehicle speed 6 mph (10 km/h) and time to collision is estimated as 1.2 seconds)*

*: Warnings may be issued outside of these conditions listed above.

The system defines the time to collision, measured in seconds, that it takes for the target vehicle traveling at its current speed to reach line L when the target vehicle is approaching perpendicular (between line A and B) to the customer's vehicle. If the target vehicle is approaching from a wider angle (between line B and C), the time to collision is measured by how long it takes the target vehicle traveling at its current speed to reach point B.

Detection Range



Own vehicle speed
Less than 3 mph (5 km/h)
Flat Road
(Angle between the current vehicle position and the road backward is degree)
Line A
Warns for more than about 1 second before a collision
Road in a parking lot whose width is about two lanes
Approaching vehicle speed
About 6-15 mph (10-25 km/h)
Warning Area
120 degrees
Line B
Point B
Line L
Line C

Cross Traffic Monitor System

When driving in reverse, the BSI radar unit monitors vehicles approaching from behind your vehicle. When detecting a vehicle approaching from behind, the unit sends the information to the center display unit via B-CAN line. When receiving the information, the center display unit gives the warning to the driver by displaying "<<" (a warning arrow) on the rearview camera image. An audible alarm is generated by the gauge control module. The warning indicates left, right or both. The cross traffic monitor system gives a warning depending on the position, speed of the target vehicle in the detection range and the time remaining to the collision.

Restriction Factors	Warning Conditions
Your Vehicle Speed	Less than 3 mph (5 km/h)*
Remaining Time to Collision	Greater than 1.2 seconds to less than 3.2 seconds*
Target Vehicle Speed	Greater than 6 mph (10 km/h) and less than 16 mph (25 km/h)*
Distance to Target Vehicle	Less than 27.2 ft (8.3m) or based on time to collision (up to 82 ft (25m))

*: Warnings may be issued out side of these conditions listed above.

INSPECTION

BSI RADAR UNIT AIMING INSPECTION

Special Tools Required

Image	Description/Tool Number
	Stand 07AAJ-TK8A100*
	Rim Frame 07AAJ-TK8A150

Image	Description/Tool Number
	Target Set 07AAJ-STKA160
	Angle Gauge 07AAJ-STKA170
	Stand Set 07AAJ-STKA220*

*: Use Stand 07AAJ-TK8A100 or Stand Set 07AAJ-STKA220 for aiming.

Adjustment

NOTE: Inspect the BSI radar unit aiming in these instances:

- After replacing or removing and reinstalling one or both of the BSI radar units.
- After repairing the body panel(s) where the BSI radar unit(s) mount.
- For any of the following DTCs:
-

- -

  B18B8: **Left Side BSI Radar Unit Azimuth Off Alignment**

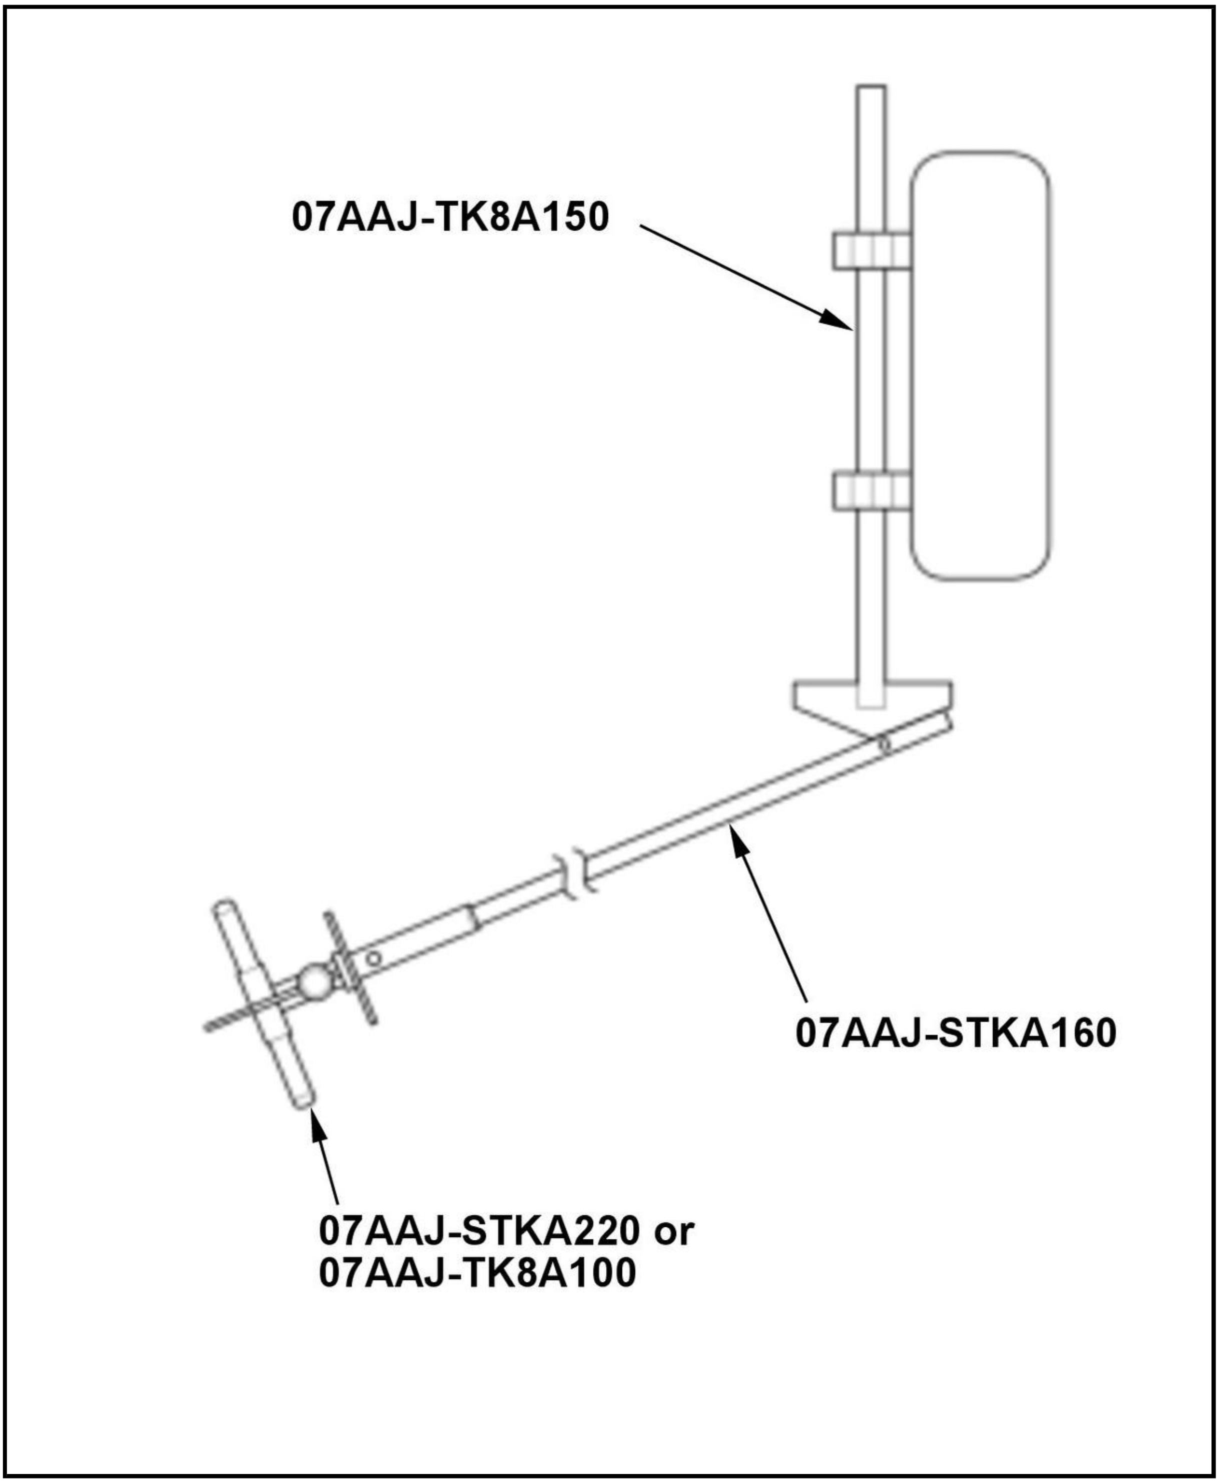
- -

  B1E68: **Right Side BSI Radar Unit Azimuth Off Alignment**

- Park the vehicle on level ground (within 1 degree of slope) with at least 4 m (13 ft) of space on both sides and behind the vehicle. Do not do this procedure with the vehicle on a lift or with the tires on steel plates or rollers.
- Keep the front wheels in the straight ahead position.
- Unless otherwise indicated, illustration shows left of the vehicle; right of the vehicle is symmetrical.

- When marking on the floor, use suitable tape to mark the exact locations.

1. **Rear Bumper - Remove**
2. BSI Radar Unit Aiming - Inspect



Prepare the items shown:

- Felt-tip pen
- Tape

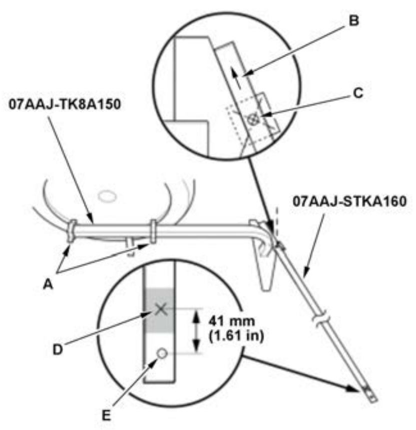
Before Inspection:

- Do not make any bumper repairs in the areas over or near the two radar units on vehicles equipped with the Blind Spot Information (BSI) system. The composition of the repair materials, and/or increased material thickness in the repaired area, may interfere with BSI radar unit operation.
- Clean the surface of the BSI radar unit.
- If the vehicle you are aiming was involved in a collision or if you suspect the alignment is out of specifications, you must perform a wheel alignment prior to aiming the BSI radar unit.
- Make sure the vehicle does not have aftermarket suspension.
- Make sure that all of the tires are the correct size and inflated to the proper pressure.

- Make sure the fuel tank is full.
- Remove all cargo from the vehicle except the tool kit and the spare tire.
- Make sure the steering wheel is pointed straight ahead, and do not turn it after setting the vehicle.
- Shift the transmission to P position/mode, and apply the parking brake.

 A B 07AAJ-STKA160 07AAJ-STKA220 or 07AAJ-TK8A100	1. Set the target on the stand. 2. Set the tip (A) of the target at the same height as the center (B).

	3. Set the angle gauge (A) against the radar unit, and align the cutout of the angle gauge with the center (B) on the radar unit. **NOTE:** The angle gauge can be set at any of the 3 angle settings for this procedure. 4. Hang the plumb bob from the angle gauge, and mark a point (C) on the floor where the tip of the plumb bob touches the floor.



B
C
07AAJ-TK8A150
07AAJ-STKA160
A
41 mm
(1.61 in)
D
E

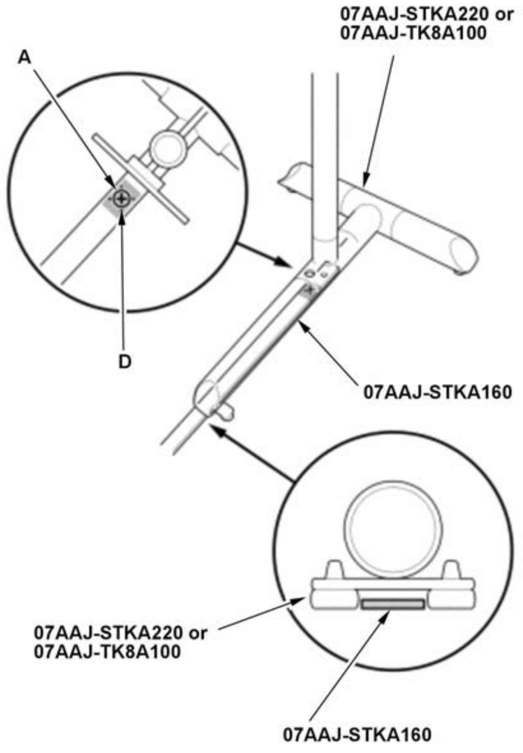
5. Place the rim frame by the rear wheel on the side of the vehicle you are aiming. Adjust the spacers (A) to fit against the wheel rim to make the rim frame parallel with the wheel.

NOTE: Make sure the spacers are touching the wheel rim.

6. Assemble the two sections of the straightedge, then place the hole on the end of the straightedge over the point (C) that you made on the floor in the previous step. Slide the rim frame rearward until the rim frame and the straightedge meet.

NOTE: Set the straightedge according to the arrow (B).

7. Mark a point (D) that is 41 mm (1.61 in) from the hole (E) on the end of the straightedge.



07AAJ-STKA220 or
07AAJ-TK8A100
A

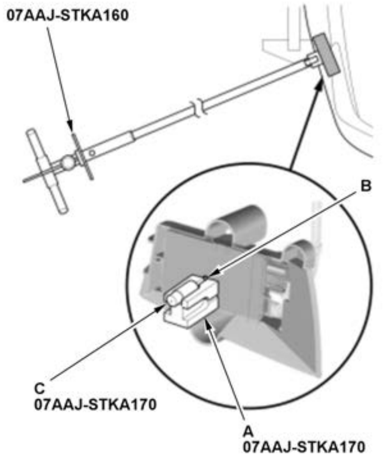
07AAJ-STKA160
07AAJ-STKA220 or
07AAJ-TK8A100
07AAJ-STKA160

8. Place the target over the other end of the straight edge, and align the hole (A) at the base of the target with the point (D) on the straightedge.



07AAJ-STKA160
B
C
07AAJ-STKA170
A
07AAJ-STKA170

9. With the angle gauge (A) facing up at the 0 degree setting (indicated on the angle gauge), set the angle gauge against the BSI radar unit. Align the cutout in the angle gauge with the center (B) on the radar unit.

WARNING: Do not aim the laser beam at anyone's eyes.

10. Turn on the laser pointer (C), and set it on the angle gauge so that the beam hits on the target.

 OK A NG 07AAJ-STKA160 07AAJ-STKA220 or 07AAJ-TK8A100	11. Check the point (A) where the laser beam hits the target: - If the laser beam is within the inner square of the target, the BSI radar unit is aimed properly. - If the laser beam is out of the inner square of the target, **check the BSI radar unit mounting area**.

3. **Rear Bumper - Install**

SYMPTOM TROUBLESHOOTING

BLIND SPOT INFORMATION (BSI) SYSTEM SYMPTOM TROUBLESHOOTING - THE BSI ALERT INDICATOR COMES ON WHEN NO OTHER VEHICLE IS IN THE DETECTABLE AREA (WRONG INDICATION)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

DTC (BSI)

Are any DTCs indicated?

YES

Go to the indicated DTC troubleshooting .

NO

Go to step 2.

2. Vehicle settings check

-1. Check the BSI system is ON status, and make sure the BSI system customizing operation.

Is the BSI system ON?

YES

Go to step 3.

NO

Cancel the OFF status by operating the BSI customization.

3. Driving condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

Interview the customer about when the symptom occurred to determine if an inspection is needed.

NOTE: The BSI system cannot work properly in the following driving situations:

- In rainy, snowy, or foggy weather.
- When receiving a jamming signal from outside.
- When followed by other vehicles at a curve in a road.
- When another vehicle is getting close to yours when turning right or left.
- When the rear bumper is deformed.
- When the sensor is out of place.
- In places where there is a guardrail, pole, or tree.
- When an area of bumper around the installed sensor is soiled.

Is an inspection required?

YES

Go to step 4.

NO

Explain to the customer that the system sometimes cannot detect under certain driving conditions.

4. Rear bumper installation check

-1. Make sure that the rear bumper is correctly installed, and check the rear bumper for alteration or deformation.

NOTE: Do not make any bumper repairs in the areas over or near the two radar units on vehicles equipped with the Blind Spot Information (BSI) System. The composition of the repair materials, and/or increased material thickness in the repaired area, may interfere with BSI radar unit operation.

Is the rear bumper OK?

YES

Go to step 5.

NO

If the rear bumper is incorrectly installed, reinstall it correctly. If it is damaged or deformed, replace it. If it is modified, explain to the customer that modifying rear bumper may lead to improper BSI system operation.

5. BSI radar visual check

-1. **Remove the rear bumper** .

-2. Check the inside and outside of the rear bumper for dirt, contaminants, or stickers. Also, check the BSI radar unit surface for dirt or contaminants.

Are the BSI radar unit and the rear bumper OK?

YES

Go to step 6.

NO

Completely wipe off any dirt or contaminants from the BSI radar unit surface or rear bumper.

6. BSI radar installation check

-1. Check the body surface where the BSI radar unit is mounted for deformation.

Is the body surface OK?

YES

Replace the appropriate BSI radar unit .

NO

Go to the BSI radar unit mounting area check.

BLIND SPOT INFORMATION (BSI) SYSTEM SYMPTOM TROUBLESHOOTING - THE BSI DOES NOT COME ON WHEN OTHER VEHICLES ARE IN THE DETECTABLE AREA (NO INDICATION)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

DTC (BSI)

Are any DTCs indicated?

YES

Go to the indicated DTC troubleshooting .

NO

Go to step 2.

2. Vehicle settings check

-1. Check the BSI system is ON status, and make sure the BSI system customizing operation.

Is the BSI system ON?

YES

Go to step 3.

NO

Cancel the OFF status by operating the BSI customization.

3. Driving condition check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   Interview the customer about when the symptom occurred to determine if an inspection is needed.

   NOTE: The BSI system cannot work properly in the following driving situations:

   - In rainy, snowy, or foggy weather.
   - When small targets in the detectable area cannot reflect radar; for example, a motor bike.
   - When there is ice, snow, or dirt is stuck to the rear bumper.
   - When driving in a traffic lane divided with road marking ramps.
   - When a vehicle comes over in the lane next to yours from a far lane.
   - When the temperature around the sensor is high.
   - When the rear bumper is deformed.
   - When the sensor is out of place.
   - When an area of bumper around the installed sensor is soiled.

   Is an inspection required?

   YES

   Go to step 4.

   NO

   The system is OK at this time. Check the rear bumper for dirt contamination. If everything looks OK, explain BSI system precautions to the customer.

4. Rear bumper installation check

   -1. Make sure that the rear bumper is correctly installed, and check the rear bumper for alteration or deformation.

   NOTE: Do not make any bumper repairs in the areas over or near the two radar units on vehicles equipped with the Blind Spot Information (BSI) System. The composition of the repair materials, and/or increased material thickness in the repaired area, may interfere with BSI radar unit operation.

   Is the rear bumper OK?

   YES

   Go to step 5.

   NO

   If the rear bumper is incorrectly installed, reinstall it correctly. If it is damaged or deformed, replace it. If it is modified, explain to the customer that modifying rear bumper may lead to improper BSI system operation.

5. BSI radar visual check

   -1. **Remove the rear bumper** .

   -2. Check the inside and outside of the rear bumper for dirt, contaminants, or stickers. Also, check the BSI radar unit surface for dirt or contaminants.

   Are the BSI radar unit surface and the rear bumper surface dirty OK?

   YES

   Go to step 6.

   NO

   Completely wipe off any dirt or contaminants from the BSI radar unit surface or the rear bumper.

6. BSI radar installation check

   -1. Check the body surface where the BSI radar unit is mounted for deformation.

   Is the body surface OK?

   YES

   Replace the appropriate BSI radar unit .

   NO

   Go to the BSI radar unit mounting area check.

BLIND SPOT INFORMATION (BSI) SYSTEM SYMPTOM TROUBLESHOOTING - THE BSI INDICATOR DOES NOT COME ON

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

   DTC (BSI)

   Are any DTCs indicated?

   YES

   Go to the indicated DTC troubleshooting .

   NO

   Go to step 2.

2. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-2. Check the BSI indicator comes on, and then goes off.

Does the BSI indicator come on, then go off?

YES

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

NO

Go to step 3.

3. Vehicle settings check

-1. Check the BSI system is ON status, and make sure the BSI system customizing operation.

Is the BSI system ON?

YES

Go to step 4.

NO

Cancel the OFF status by operating the BSI customization.

4. Gauge control module check

-1. **Do the gauge control module self-diagnostic function** .

Is the gauge control module OK?

YES

Replace the appropriate BSI radar unit .

NO

Replace the gauge control module .

BLIND SPOT INFORMATION (BSI) SYSTEM SYMPTOM TROUBLESHOOTING - THE HDS DOES NOT COMMUNICATE WITH THE BSI SYSTEM

1. 12 volt battery check

-1. **Test the 12 volt battery** .

Is the 12 volt battery OK?

YES

Go to step 2.

NO

Charge or replace the 12 volt battery .

2. Body electrical system communication check

-1. **Connect the HDS** .

-2. Check that the HDS can communicate with the body electrical system.

Is the communication possible?

YES

Go to step 3.

NO

Go to the DLC Circuit Troubleshooting .

3. Body electrical system check

-1. **Check for body electrical system DTCs** .

Are any DTCs indicated?

YES

Go to the indicated DTC troubleshooting .

NO

Go to step 4.

4. Determine possible failure area (B-CAN_H line, B-CAN_L line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Left side BSI radar unit 6P connector
Right side BSI radar unit 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
Test point 1	**Left side BSI radar unit 6P connector No. 1**
Test point 2	**Left side BSI radar unit 6P connector No. 6**

Test point 1	**Right side BSI radar unit 6P connector No. 1**
Test point 2	**Right side BSI radar unit 6P connector No. 4/No. 6**

Is there battery voltage?

YES

Go to step 5.

NO

Go to step 6.

5. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
B	Body control module connector B (36P): disconnected

Left side BSI radar unit

Circuit name	Test point 1		Test point 2	
	Connector	Terminal	Connector	Terminal
B-CAN_H	Left side BSI radar unit 6P connector	No. 3	Body control module connector B (36P)	No. 20
B-CAN_L		No. 5		No. 21

Right side BSI radar unit

Circuit name	Test point 1		Test point 2	
	Connector	Terminal	Connector	Terminal
B-CAN_H	Right side BSI radar unit 6P connector	No. 3	Body control module connector B (36P)	No. 20
B-CAN_L		No. 5		No. 21

Is there 1.0 Ω or less?

YES

Replace the appropriate BSI radar unit .

NO

Repair an open in the B-CAN_H wire or B-CAN_L wire between the appropriate BSI radar unit and the body control module.

6. Open wire check (IG1_OPTION line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Left side BSI radar unit 6P connector: disconnected
B	Right side BSI radar unit 6P connector: disconnected
Test point 1	Left side BSI radar unit 6P connector No. 1
Test point 2	Body ground

Test point 1	Right side BSI radar unit 6P connector No. 1
Test point 2	Body ground

Is there battery voltage?

1. **YES**

- Left side BSI radar unit: Repair an open in the GND wire between the left side BSI radar unit and body ground (G505).
- Right side BSI radar unit: Repair an open in the GND wire between the right side BSI radar unit and body ground (G504).

NO

Repair an open in the wire between the appropriate BSI radar unit and **No. D5** fuse.

BLIND SPOT INFORMATION (BSI) SYSTEM SYMPTOM TROUBLESHOOTING - THE BUZZER DOES NOT SOUND

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

DTC (BSI)

Are any DTCs indicated?

YES

Go to the indicated DTC troubleshooting .

NO

Go to step 2.

2. Vehicle settings check

-1. Check the BSI system is ON status, and make sure the BSI system customizing operation.

Is the BSI system ON?

YES

Go to step 3.

NO

Cancel the OFF status by operating the BSI customization.

3. Gauge control module check

-1. **Do the gauge control module self-diagnostic function** .

Does the buzzer sound?

YES

Replace the appropriate BSI radar unit .

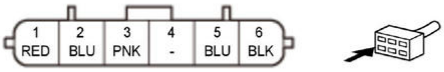
NO

Replace the gauge control module .

CONNECTOR VIEW

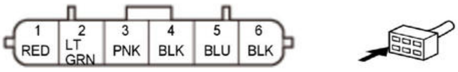
BSI RADAR UNIT CONNECTOR FOR INPUTS AND OUTPUTS

Left Side BSI Radar Unit 6P Connector (female terminals)



Terminal number	Terminal name	Description
1	IG1_OPTION	Detects ignition signal
2	BSI_L_IND	Drives the left BSI alert indicator
3	B-CAN_H	B-CAN communication (high) circuit
4	Not used	-
5	B-CAN_L	B-CAN communication (low) circuit
6	GND	Ground circuit for the BSI radar unit

Right Side BSI Radar Unit 6P Connector (female terminals)



Terminal number	Terminal name	Description
1	IG1_OPTION	Detects ignition signal
2	BSI_R_IND	Drives the right BSI alert indicator
3	B-CAN_H	B-CAN communication (high) circuit
4	GND	Ground circuit for the BSI radar unit
5	B-CAN_L	B-CAN communication (low) circuit
6	GND	Ground circuit for the BSI radar unit

CHECK

BSI RADAR UNIT MOUNTING AREA CHECK

NOTE: Electronic 3-dimensional measuring equipment can be used with this procedure.

Special Tools Required

Image	Description/Tool Number
	Target Set 07AAJ-STKA160

NOTE: Electronic 3-dimensional measuring equipment can be used with this procedure.

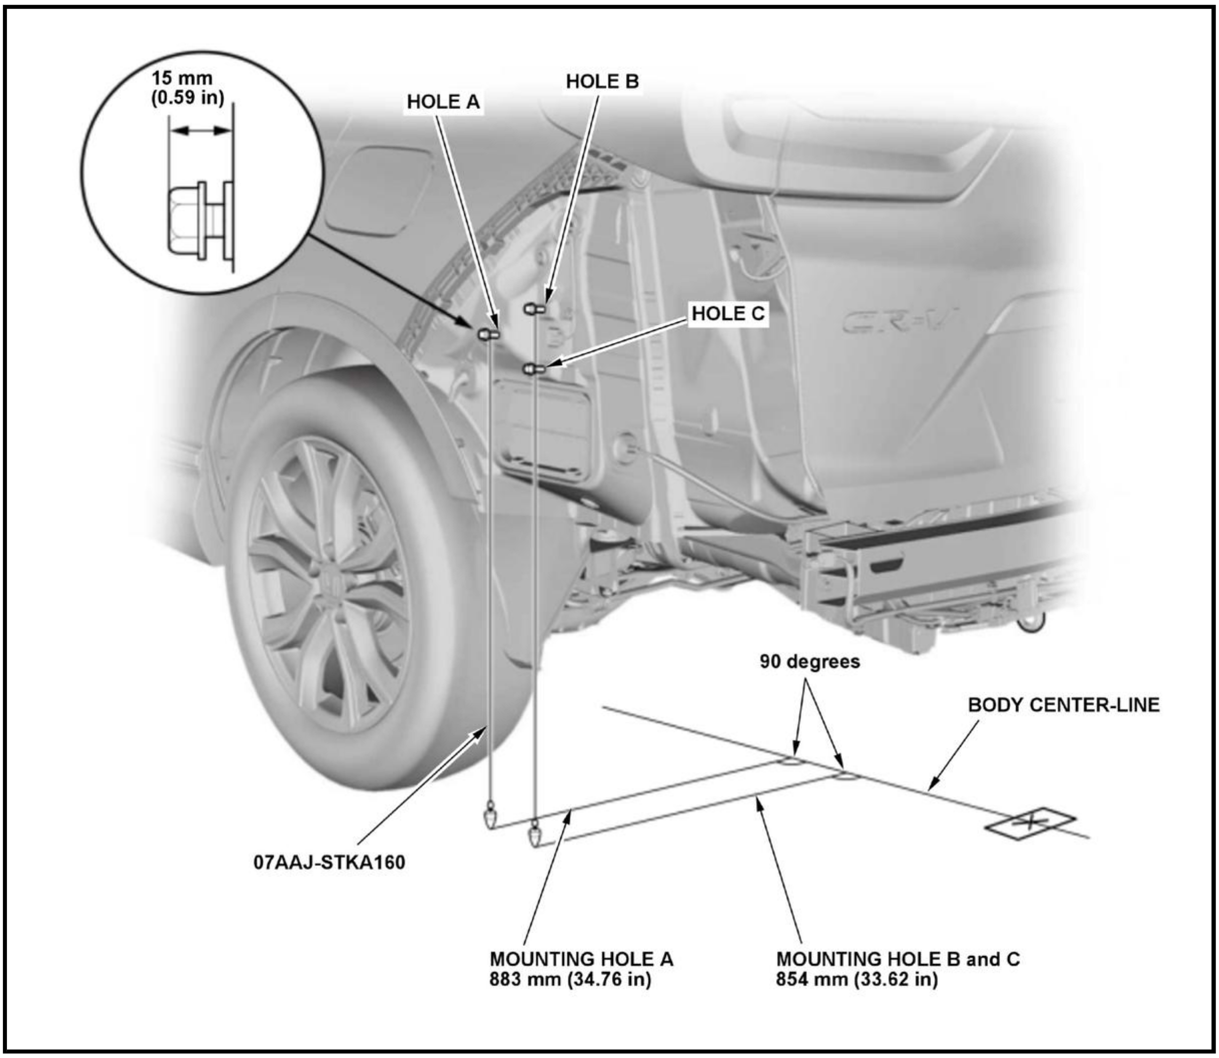
Adjustment

1. **Center Line - Set**
2. **BSI Radar Unit - Remove**
3. Upper Body Measuring Dimensions - BSI Radar Unit Mounting Positions

    1. Install bolts on each hole of the body panel.

    2. Measure the length from the tip of the bolt installed to each hole A, B, and C to the body center line.

    NOTE: If the measured lengths between the body center line and hole A to C are different from the standard, take the vehicle to a body repair shop to have the panel adjusted to standard.



15 mm

TROUBLESHOOTING

DTC B1002

DTC B1002 : MICU internal error (EEPROM error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1002 MICU internal error (EEPROM error)	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1002 MICU internal error (EEPROM error)	B

   Is DTC B1002 indicated?

   YES

   Replace the body control module .

   NO

   Intermittent failure, the body control module is OK at this time.

DTC B1003

DTC B1003 : MICU Update Error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- This DTC is indicated when a body control module update is not completed properly.
- Before updating the body control module, make sure the 12 volt battery in the vehicle is fully charged, and connect a 12 volt jumper battery (not a 12 volt battery charger) to maintain system voltage.
- Never turn the vehicle to the ACCESSORY mode or OFF (LOCK) mode, during the reprogramming. If there is a problem with the reprogramming, turn the vehicle to the ON mode.

DTC Description	DTC
B1003 MICU Update Error	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1003 MICU Update Error	B

   Is DTC B1003 indicated?

   YES

   Update the body control module .

   NO

   Intermittent failure, the system is OK at this time.

DTC B1028

DTC B1028 : Rear wiper motor(Park) signal error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1028 Rear wiper motor (Park) signal error	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Turn the rear window wiper switch to INT for 15 seconds or more, then turn the switch OFF.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1028 Rear wiper motor (Park) signal error	B

   Is DTC B1028 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Fuse check

-1. Check the following fuse.

Fuse	No. D4 (5 A) (with keyless access system) No. D17 (5 A) (without keyless access system)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 3.

NO

Replace the fuse. If the fuse blows again, repair the short to ground in the IG1 HAC wire.

3. Open wire check (IG1 HAC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

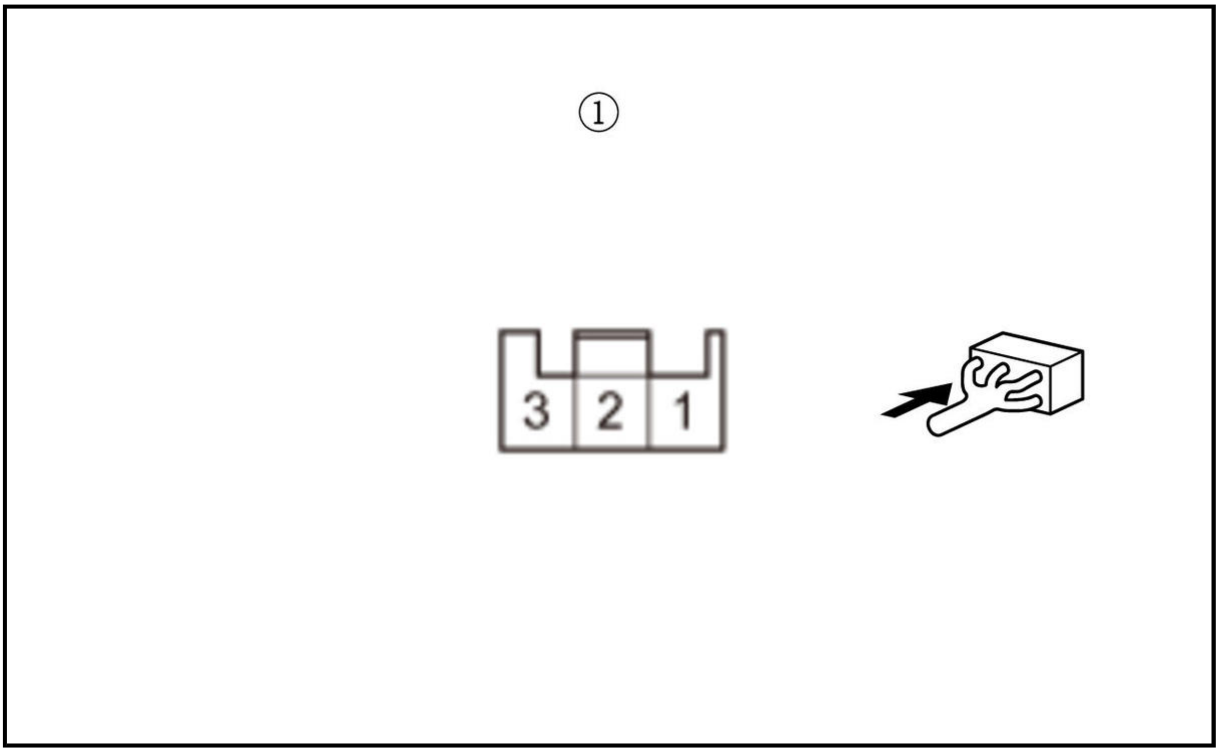
-2. Disconnect the following connector.

Rear window wiper motor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear window wiper motor 3P connector: disconnected
Test point 1	Rear window wiper motor 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 HAC wire is OK. Go to step 4.

NO

Repair an open or high resistance in the wire.

4. Rear window wiper motor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the rear window wiper motor test** .

Does the wiper motor run and does it pulse normally?

YES

Go to step 5.

NO

Replace the rear window wiper motor .

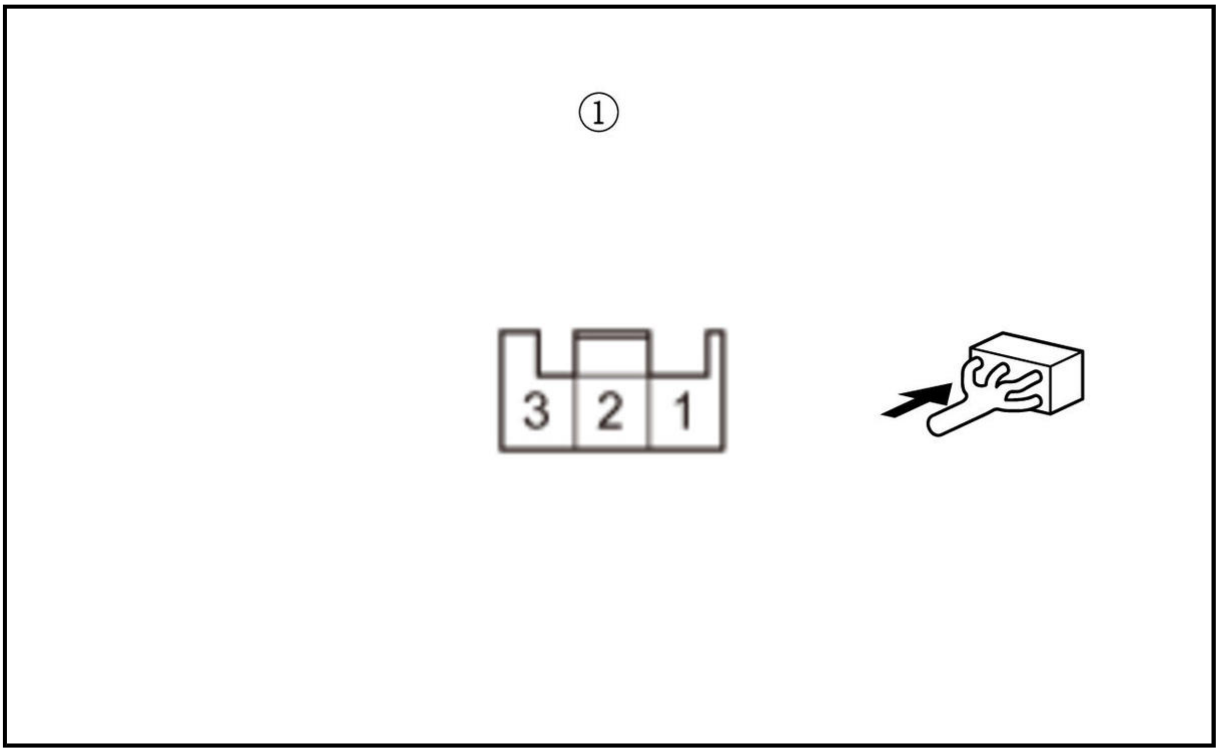
5. Shorted wire check (RR WIPER MTR line to power)

-1. Disconnect the following connector.

Body control module connector A (14P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear window wiper motor 3P connector: disconnected Body control module connector A (14P): disconnected
Test point 1	Rear window wiper motor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair a short to power in the wire to power.

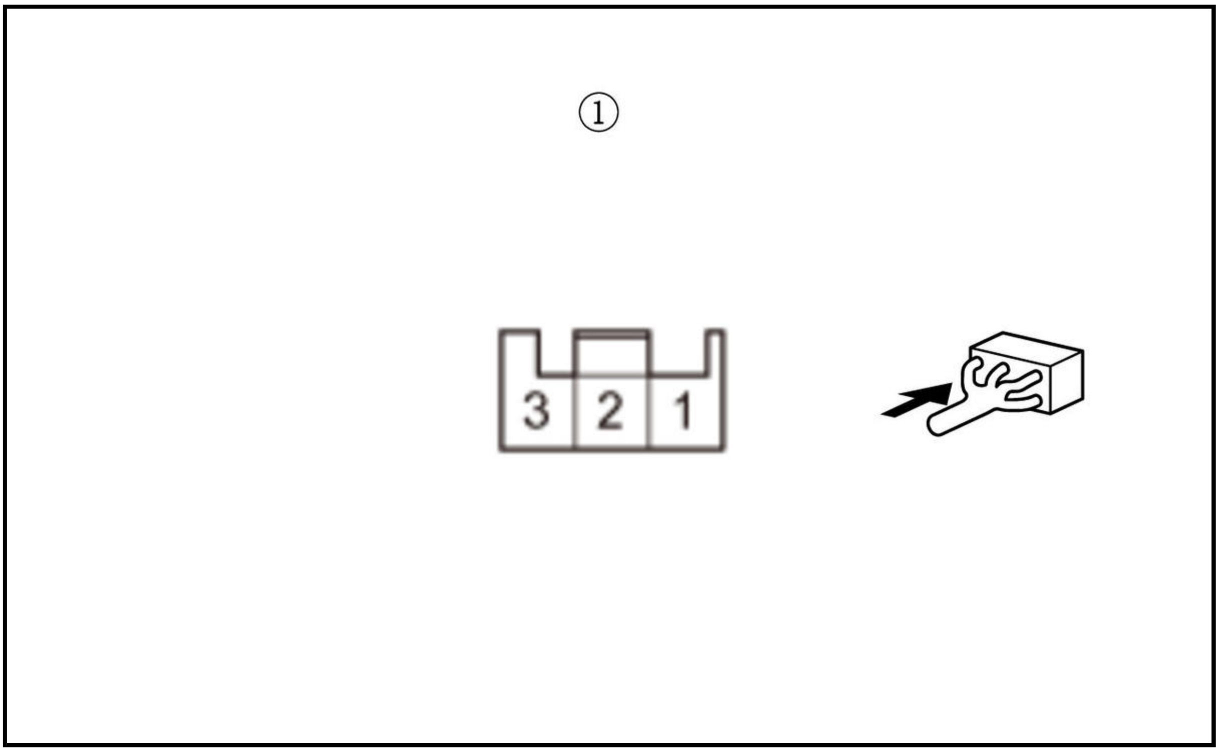
NO

The RR WIPER MTR wire is not shorted to power. Go to step 6

6. Shorted wire check (RR WIPER MTR line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear window wiper motor 3P connector: disconnected Body control module connector A (14P): disconnected
Test point 1	Rear window wiper motor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

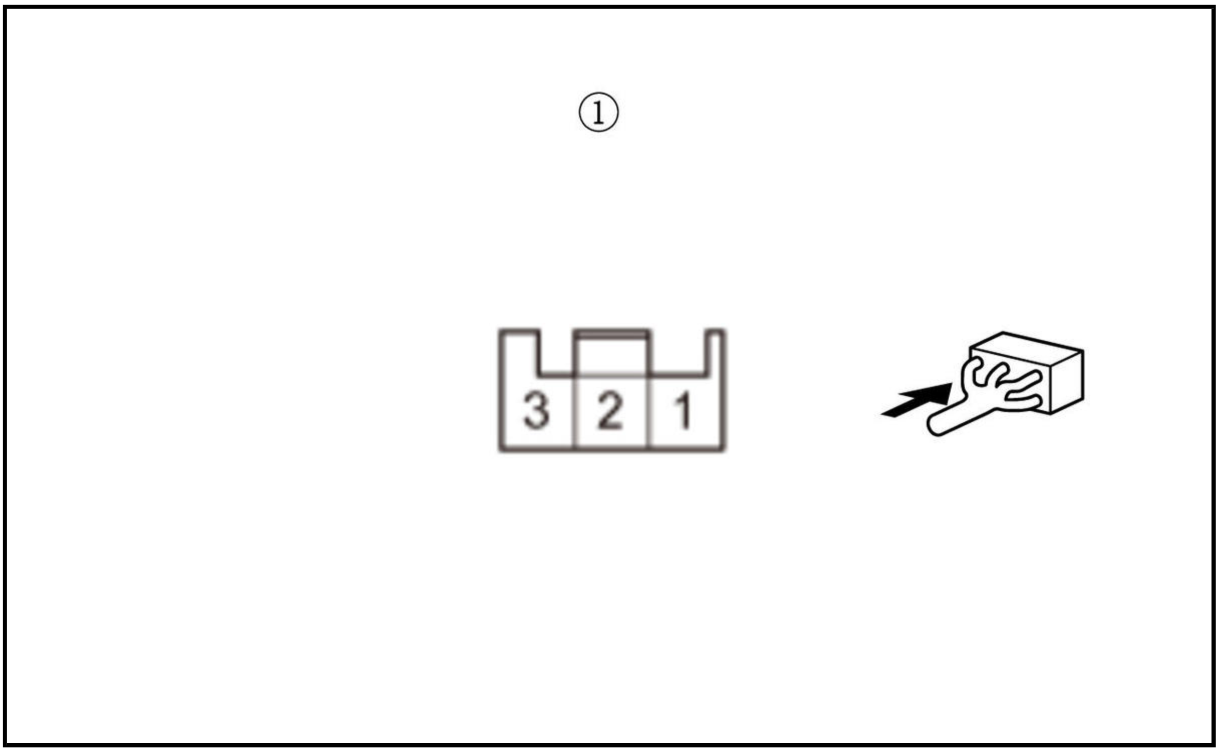
NO

The RR WIPER MTR wire is not shorted. Go to step 7.

7. Open wire check (RR WIPER MTR line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear window wiper motor 3P connector: disconnected Body control module connector A (14P): disconnected
Test point 1	**Body control module connector A (14P) No. 7**
Test point 2	Rear window wiper motor 3P connector (female terminals) No. 3: ①



Is there continuity?

YES

The RR WIPER MTR wire is OK. Go to step 8.

NO

Repair an open or high resistance in the wire.

8. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear window wiper motor 3P connector: disconnected Body control module connector A (14P): disconnected
Test point 1	**Body control module connector A (14P) No. 6**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

DTC B1032

DTC B1032 : MICU lost communication with SRS unit (CDS message)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1032 MICU lost communication with SRS unit (CDS message)	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1032 MICU lost communication with SRS unit (CDS message)	B

   Is DTC B1032 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Open wire check (CDS line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.

   -3. Disconnect the following connectors.

Body control module connector D (40P)SRS unit connector A (39P)

   -4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeBody control module connector D (40P): disconnectedSRS unit connector A (39P): disconnected
Test point 1	**Body control module connector D (40P) No. 34**
Test point 2	**SRS unit connector A (39P) No. 1**

   Is there continuity?

   YES

   Go to step 3.

   NO

   Repair an open or high resistance in the wire.

3. Shorted wire check (CDS line)

   -1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeBody control module connector D (40P): disconnectedSRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The CDS wire is OK. Go to step 4.

4. Body control module check

-1. Reconnect the following connector.

Body control module connector D (40P)

-2. **Do the 12 volt battery terminal reconnection procedure** .

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON modeSRS unit connector A (39P): disconnected
Test point 1	**Body control module connector D (40P) No. 34**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the SRS unit .

NO

Replace the body control module .

DTC B1036

DTC B1036 : IG1 Power Supply Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1036 IG1 Power supply Circuit Malfunction	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1036 IG1 Power supply Circuit Malfunction	B

Is DTC B1036 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Fuse check

-1. Check the following fuse.

Fuse	No. D8 (15 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Repair an open or high resistance in the wire.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the IG1 FUEL PUMP wire.

DTC B1038

DTC B1038 : IMMOBILIZER F-CAN Authentication ID Not Received

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If keyless access power control unit DTC U0073 is stored, troubleshoot DTC U0073 first.

DTC Description	DTC
B1038 IMMOBILIZER F-CAN Authentication ID Not Received	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1038 IMMOBILIZER F-CAN Authentication ID Not Received	B

Is DTC B1038 indicated?

YES: with CAN gateway

Go to step 2.

YES: without CAN gateway

Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. CAN gateway system DTC check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. Gauge control module DTC check

-1. Check for gauge control module DTCs with the HDS.

DTC Description	DTC
U0122 Gauge control module lost communication with VSA modulator-control unit	B

Is DTC U0122 indicated?

YES

Go to gauge control module DTC U0122 troubleshooting .

NO: with CAN gateway

Go to step 4.

NO: without CAN gateway

Go to step 9.

4. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the body control module detect the CAN gateway Bus channels A?

Bus A is Not Available

Go to step 5.

Bus A is Available

Go to step 6.

5. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

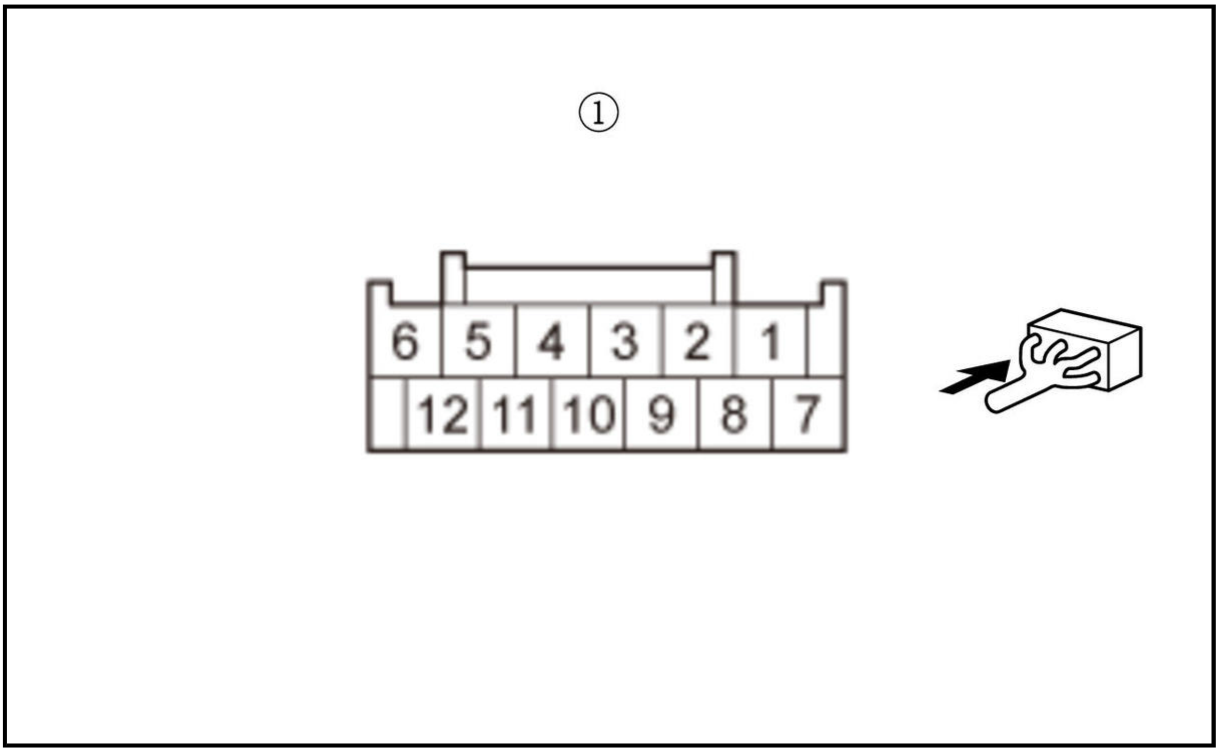
-2. Disconnect the following connectors.

CAN gateway 12P connector Body control module connector B (36P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector: disconnected Body control module connector B (36P): disconnected
Test point 1	CAN gateway 12P connector (female terminals) No. 3: ①
Test point 2	**Body control module connector B (36P) No. 22**

Test point 1	CAN gateway 12P connector (female terminals) No. 9: ①
Test point 2	**Body control module connector B (36P) No. 23**



Is there continuity?

YES

The F-CAN A_H and F-CAN A_L wires are OK. **Replace the body control module** .

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

6. F-CAN circuit communication check (Transmitting control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   According to the detected DTC on the following chart, make sure that the transmitting control unit detects the CAN gateway Bus channels normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channels at normal
B1038	VSA modulator-control unit	A, B

   Is it detected normally?

   Detected normal

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

   U0122: VSA modulator-control unit is Not Available for Bus A

   Go to step 7.

   U0122: VSA modulator-control unit is Not Available for Bus B

   Go to step 8.

7. Open wire check (F-CAN A lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

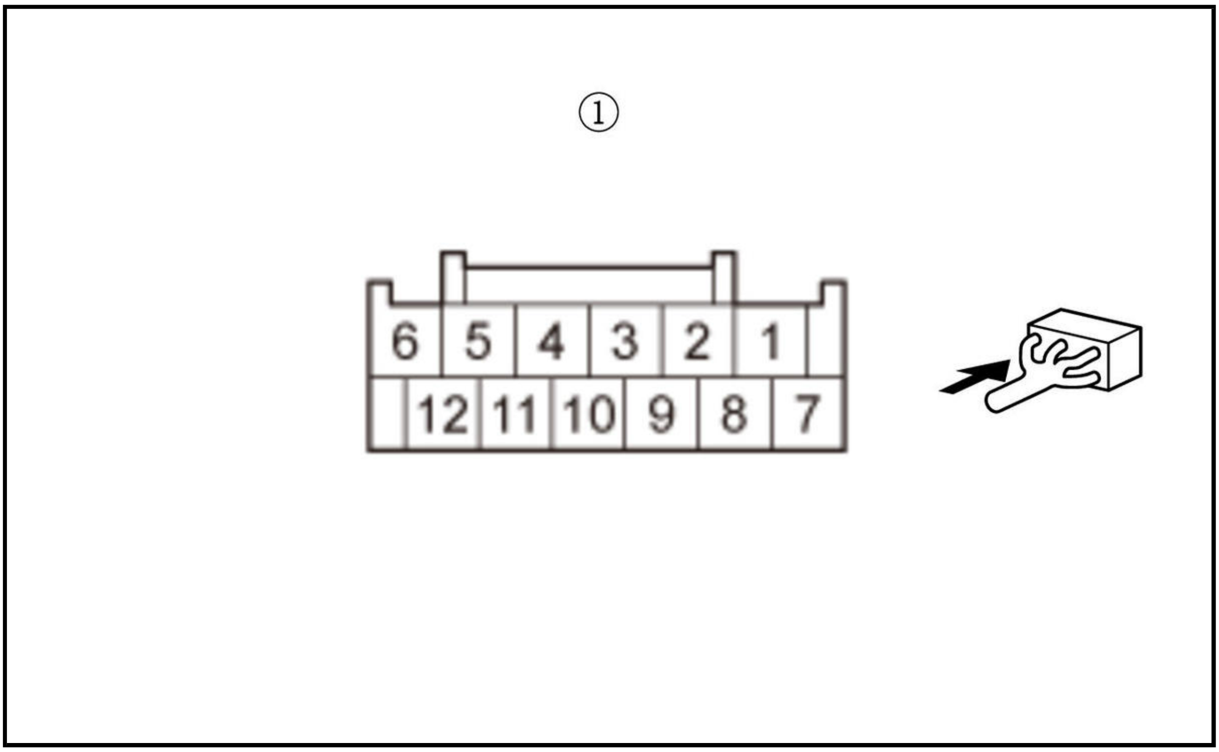
   -2. According to the detected DTC on the following chart, disconnect the transmitting control unit connectors.

DTC	Connector
-	CAN gateway 12P connector
B1038	VSA modulator-control unit 46P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector: disconnected Transmitting control unit connector for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
B1038	F-CAN A_H	CAN gateway 12P connector (female terminals): ①	No. 3	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN A_L		No. 9		No. 28



Is there continuity?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK.Refer to the DTC shown on the display, replace the control unit based on the instructions (see chart below).

DTC	Operation for transmitting control unit
B1038	VSA modulator-control unit

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

8. Open wire check (F-CAN B lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. According to the detected DTC on the following chart, disconnect the transmitting control unit connectors.

DTC	Connector
-	CAN gateway 12P connector
B1038	VSA modulator-control unit 46P connector

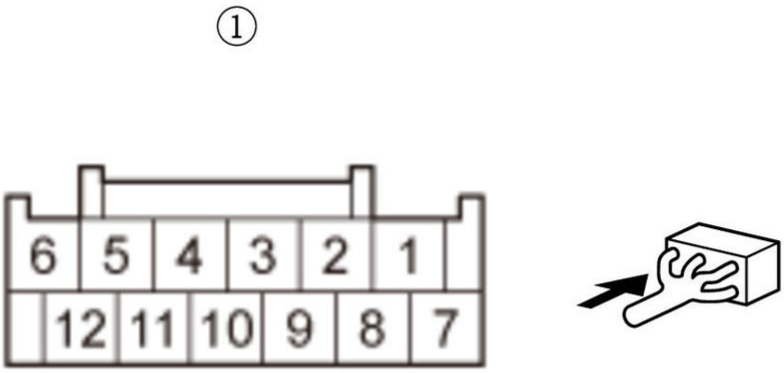
   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector: disconnected Transmitting control unit connector for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
B1038	F-CAN B_H	CAN gateway 12P connector (female	No. 12	VSA modulator-control unit 46P connector	No. 46
	F-CAN B_L		No. 5		No. 34

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal

terminals): ①



Is there continuity?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. Refer to the DTC shown on the display, replace the control unit based on the instructions (see chart below).

DTC	Operation for transmitting control unit
B1038	VSA modulator-control unit

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

9. Open wire check (F-CAN lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector B (36P) VSA modulator-control unit 46P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected VSA modulator-control unit 46P connector: disconnected

Test point 1	Body control module connector B (36P) No. 22
Test point 2	VSA modulator-control unit 46P connector No. 40

Test point 1	Body control module connector B (36P) No. 23

Test point 2	VSA modulator-control unit 46P connector No. 28

Is there continuity?

YES

Replace the body control module .

NO

An open or poor connection in the F-CAN_H and/or F-CAN_L wire.

DTC B1039

DTC B1039 : IMMOBILIZER F-CAN Authentication ID Unmatch

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1039 IMMOBILIZER F-CAN Authentication ID Unmatch	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
U1039 IMMOBILIZER F-CAN Authentication ID Unmatch	B

   Is DTC B1039 indicated?

   1. **YES**

      Register the body control module.

      - With keyless access system
      - Without keyless access system

      NO

      Intermittent failure, the system is OK at this time.

DTC B1040

DTC B1040 : BCM lost communication with Front wiper

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1040 BCM lost communication with Front wiper	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1040 BCM lost communication with Front wiper	B

   Is DTC B1040 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Fuse check

   -1. Check the following fuse.

Fuse	No. A2-5 (30 A)
Location	Under-hood fuse/relay box

   Is the fuse OK?

   YES

   Go to step 3.

   NO

   Replace the fuse. If the fuse blows again, repair a short to ground in the +B WIPER wire.

3. Determine possible failure area (windshield wiper control unit/motor power and ground, LIN (FR WIPER) line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Windshield wiper control unit/motor 6P connector

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	**Windshield wiper control unit/motor 6P connector No. 2**
Test point 2	**Windshield wiper control unit/motor 6P connector No. 1**

   Is there battery voltage?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (+B WIPER line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	**Windshield wiper control unit/motor 6P connector No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the ground wire or poor ground (G351).

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (LIN (FR WIPER) line)

-1. Disconnect the following connector.

Body control module connector C (28P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	**Windshield wiper control unit/motor 6P connector No. 4**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The LIN (FR WIPER) wire is not shorted. Go to step 6.

6. Open wire check (LIN (FR WIPER) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	**Body control module connector C (28P) No. 13**
Test point 2	**Windshield wiper control unit/motor 6P connector No. 4**

Is there continuity?

YES

The LIN (FR WIPER) wire is OK. **Replace the windshield wiper control unit/motor** . If the DTC is still present, **replace the body control module** .

NO

An open or poor connection in the wire.

DTC B1041

DTC B1041 : Front Wiper motor malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1041 Front Wiper motor malfunction	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1041 Front Wiper motor malfunction	B

Is DTC B1041 indicated?

YES

Replace the windshield wiper control unit/motor .

NO

Intermittent failure, the system is OK at this time.

DTC B1042

DTC B1042 : Front Wiper security line error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1042 Front Wiper security line error	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1042 Front Wiper security line error	B

Is DTC B1042 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (BACK UP (WIPER) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector B (36P) Windshield wiper control unit/motor 6P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	Windshield wiper control unit/motor 6P connector No. 3
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The BACK UP (WIPER) wire is not shorted. Go to step 3.

3. Open wire check (BACK UP (WIPER) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	Body control module connector B (36P) No. 10
Test point 2	Windshield wiper control unit/motor 6P connector No. 3

Is there continuity?

YES

The BACK UP(WIPER) wire is OK. Replace the windshield wiper control unit/motor . If the DTC is still present, replace the body control module .

NO

An open or poor connection in the wire.

DTC B1043

DTC B1043 : Front Wiper unit internal error (EEPROM error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1043 Front Wiper unit internal error (EEPROM error)	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1043 Front Wiper unit internal error (EEPROM error)	B

Is DTC B1043 indicated?

YES

Replace the windshield wiper control unit/motor .

NO

Intermittent failure, the system is OK at this time.

DTC B1077

DTC B1077 : Windshield wiper motor (Park) signal error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1077 Windshield wiper motor (Park) signal error	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1077 Windshield wiper motor (Park) signal error	B

Is DTC B1077 indicated?

YES

Replace the windshield wiper control unit/motor .

NO

Intermittent failure, the system is OK at this time.

DTC B1275, B1276, B1277, B1278

DTC B1275 : Head light OFF position Circuit Malfunction **DTC B1276** : Head light switch parking (small) position Circuit Malfunction **DTC B1277** : Head light AUTO position Circuit Malfunction **DTC B1278** : Head light ON position Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1275 Head light OFF position Circuit Malfunction	B
B1276 Head light switch parking (small) position Circuit Malfunction	B

DTC Description	DTC
B1277 Head light AUTO position Circuit Malfunction	B
B1278 Head light ON position Circuit Malfunction	B

DTC (Body Control Module)

1. Problem verification

-1. Check the parameter(s) below with the HDS.

When the combination light switch is turned OFF

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (OFF)	ON	B	B	B
Headlight Switch (PARKING)	OFF	B	B	B
Headlight Switch (AUTO)	OFF	B	B	B
Headlight Switch (HEADLIGHT)	OFF	B	B	B

When the combination light switch is turned to PARKING

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (OFF)	OFF	B	B	B
Headlight Switch (PARKING)	ON	B	B	B
Headlight Switch (AUTO)	OFF	B	B	B
Headlight Switch (HEADLIGHT)	OFF	B	B	B

When the combination light switch is turned to AUTO

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (OFF)	OFF	B	B	B
Headlight Switch (PARKING)	OFF	B	B	B

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (AUTO)	ON	B	B	B
Headlight Switch (HEADLIGHT)	OFF	B	B	B

When the combination light switch is turned ON (HEADLIGHT)

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (OFF)	OFF	B	B	B
Headlight Switch (PARKING)	ON	B	B	B
Headlight Switch (AUTO)	OFF	B	B	B
Headlight Switch (HEADLIGHT)	ON	B	B	B

Are all data list values correct?

YES

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

NO

Go to step 2.

2. Exterior lights system check

-1. Check the parameter(s) below with the HDS.

Cycle through all switch selections

Signal	Current conditions	
	Values	Unit
Headlight Switch (OFF)	B	B
Headlight Switch (PARKING)	B	B
Headlight Switch (AUTO)	B	B
Headlight Switch (HEADLIGHT)	B	B

Is any data list value OFF, not ON?

YES

Go to step 5.

NO

Go to step 3.

3. Determine possible failure area (combination light switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (OFF)	B	B
Headlight Switch (PARKING)	B	B
Headlight Switch (AUTO)	B	B
Headlight Switch (HEADLIGHT)	B	B

Are all data lists values OFF?

YES

Replace the combination light switch .

NO

Go to step 4.

4. Shorted wire check (H/L OFF SW, H/L ON SW, PARKING LT SW lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector C (28P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected Body control module connector C (28P): disconnected
Test point 1	**Body control module connector C (28P) No. 10**
Test point 2	Body ground

Test point 1	**Body control module connector C (28P) No. 9**
Test point 2	Body ground

Test point 1	**Body control module connector C (28P) No. 11**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The H/L OFF SW, H/L ON SW, and PARKING LT SW wires are OK. **Replace the body control module** .

5. Determine possible failure area (combination light switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

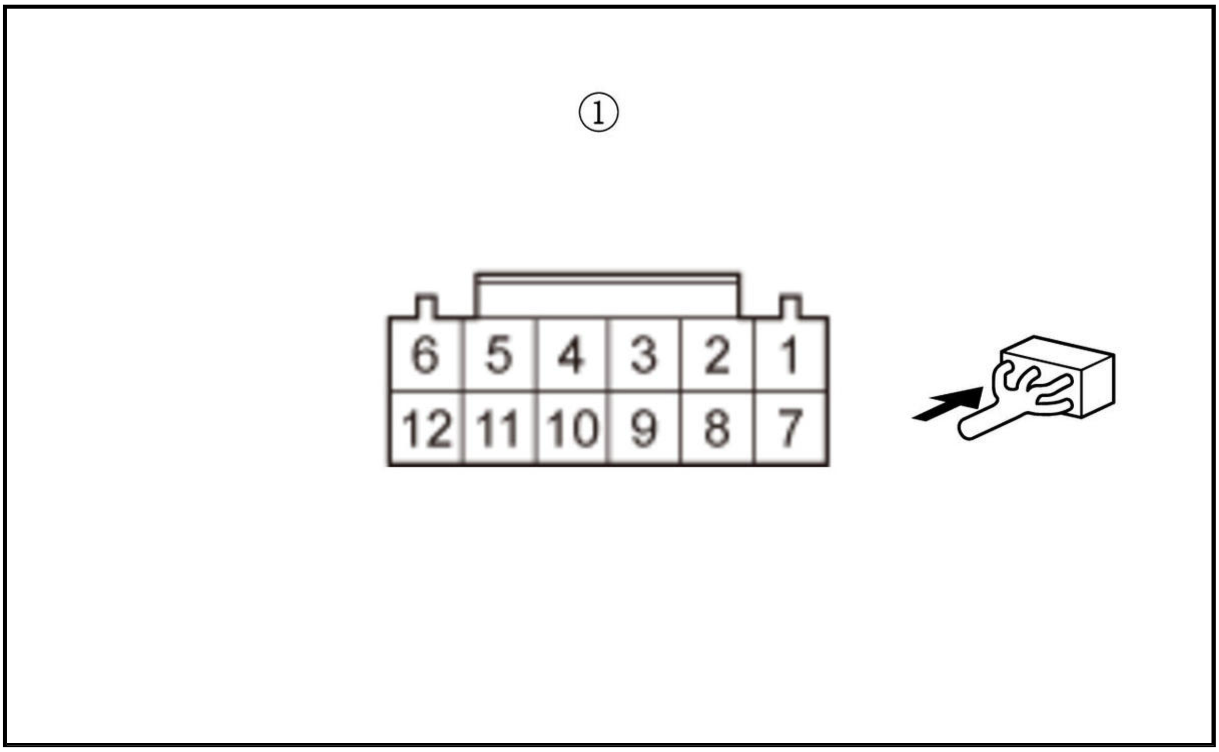
Combination light switch 12P connector

-3. Connect terminals A and B with jumper wires.

Terminal A	Combination light switch 12P connector (female terminals) No. 1: ①
Terminal B	Body ground

Terminal A	Combination light switch 12P connector (female terminals) No. 7: ①
Terminal B	Body ground

Terminal A	Combination light switch 12P connector (female terminals) No. 8: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (OFF)	B	B
Headlight Switch (PARKING)	B	B
Headlight Switch (AUTO)	B	B
Headlight Switch (HEADLIGHT)	B	B

Has the data list value changed from OFF to ON?

YES

Replace the combination light switch .

NO

Go to step 6.

6. Open wire check (H/L OFF SW, H/L ON SW, PARKING LT SW, COMBI SW GND (LT) lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector C (28P)

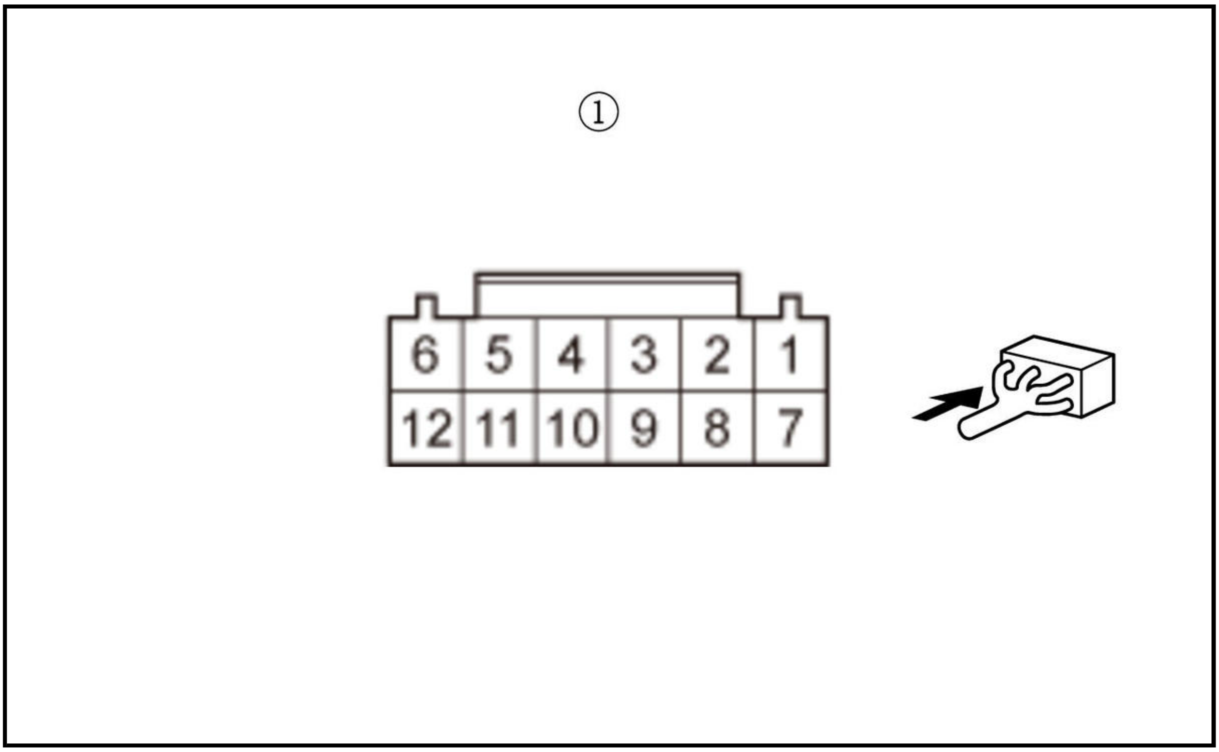
-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Combination light switch 12P connector: disconnected
Test point 1	**Body control module connector C (28P) No. 10**
Test point 2	Combination light switch 12P connector (female terminals) No. 1: ①

Test point 1	**Body control module connector C (28P) No. 9**
Test point 2	Combination light switch 12P connector (female terminals) No. 7: ①

Test point 1	**Body control module connector C (28P) No. 11**
Test point 2	Combination light switch 12P connector (female terminals) No. 8: ①

Test point 1	**Body control module connector C (28P) No. 3**
Test point 2	Combination light switch 12P connector (female terminals) No. 6: ①



Is there continuity?

YES

The H/L OFF SW, H/L ON SW, PARKING LT SW, and COMBI SW GND (LT) wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1279

DTC B1279 : Dimmer switch Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1279 Dimmer switch Circuit Malfunction	B

DTC (Body Control Module)

1. Exterior lights system check 1

   -1. With the headlight dimmer switch in the neutral position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (HIGH BEAM)	B	B
Headlight Switch (PASSING)	B	B

   Is either information indicator ON?

   YES

   Go to step 4.

   NO

   Go to step 2.

2. Exterior lights system check 2

   -1. With the headlight dimmer switch in the high beam position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (HIGH BEAM)	B	B
Headlight Switch (PASSING)	B	B

   Are both information indicators ON?

   YES

   Go to step 3.

   NO

   Intermittent failure, the system is OK at this time.

3. Shorted wire check (H/L HI SW to PASSING SW line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Combination light switch 12P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector C (28P) No. 8**
Terminal B	Body ground

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (HIGH BEAM)	B	B
Headlight Switch (PASSING)	B	B

Are both information indicators ON?

YES

Repair a short between the wires.

NO

The H/L HI SW to PASSING SW wire is OK. **Replace the combination light switch** .

4. Determine possible failure area (combination light switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (HIGH BEAM)	B	B
Headlight Switch (PASSING)	B	B

Is either information indicator ON?

YES

Go to step 5.

NO

Replace the combination light switch .

5. Shorted wire check (PASSING SW, H/L HI SW lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector C (28P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected Body control module connector C (28P): disconnected
Test point 1	**Body control module connector C (28P) No. 7**
Test point 2	Body ground

Test point 1	**Body control module connector C (28P) No. 8**
Test point 2	Body ground

Are there continuity?

YES

Repair a short to ground in the wire.

NO

The PASSING SW and H/L HI SW wires are OK. **Replace the body control module** .

DTC B1280

DTC B1280 : Turn signal switch Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1280 Turn signal switch Circuit Malfunction	B

DTC (Body Control Module)

1. Turn signal/hazard warning lights system check

   -1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (LEFT)	OFF	B	B	B
Turn Signal Switch (RIGHT)	OFF	B	B	B

   Are both data list values indicated OFF?

   YES

   Go to step 2.

   NO

   Go to step 4.

2. Turn signal/hazard warning lights system check 2

   -1. Operate the turn signal switch to the left or right position.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (LEFT)	ON	B	B	B
Turn Signal Switch (RIGHT)	ON	B	B	B

Are both data list values indicated ON?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time.

3. Shorted wire check (R TURN SW to L TURN SW line)

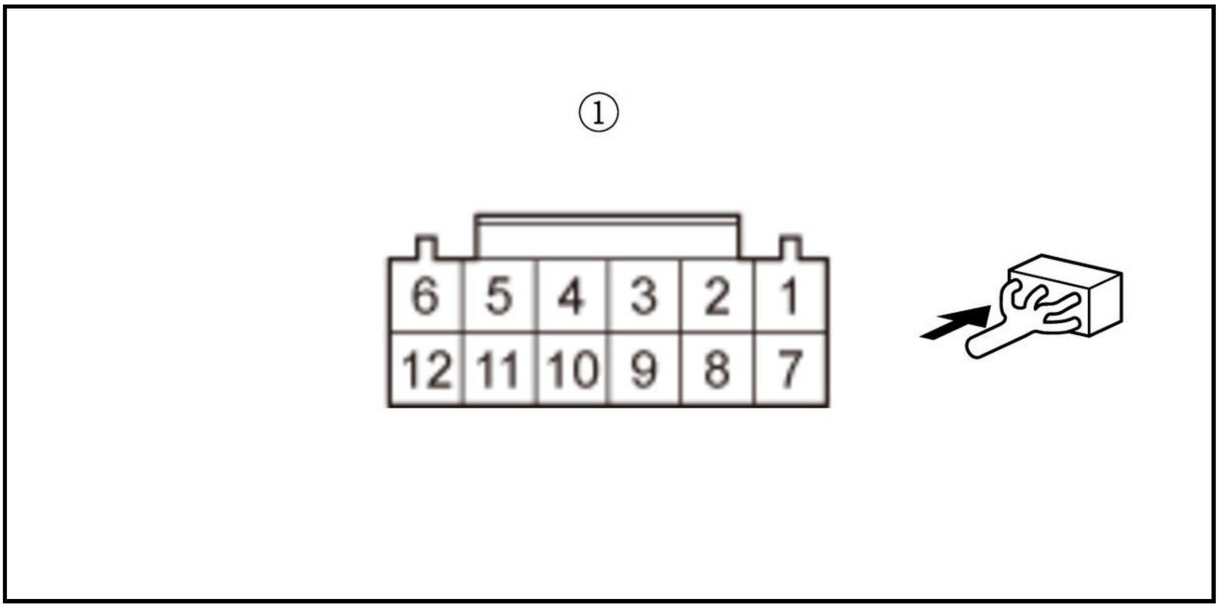
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Combination light switch 12P connector (female terminals) No. 10: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (LEFT)	OFF	B	B	B
Turn Signal Switch (RIGHT)	ON	B	B	B

Are both data list values correct?

YES

The R TURN SW wire and the L TURN SW wire is not shorted. **Replace the combination light switch** .

NO

Repair a short between the wires.

4. Shorted wire check (L TURN SW line or R TURN SW line)

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (LEFT)	ON	B	B	B
Turn Signal Switch (RIGHT)	OFF	B	B	B

Is TURN SIGNAL SWITCH (LEFT) value ON?

YES

Go to step 5.

NO

Go to step 6.

5. Shorted wire check (L TURN SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (LEFT)	ON	B	B	B

Is TURN SIGNAL SWITCH (LEFT) value ON?

YES

Repair a short to ground in the wire.

NO

The L TURN SW wire is OK. **Replace the combination light switch** .

6. Shorted wire check (R TURN SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (RIGHT)	ON	B	B	B

Is TURN SIGNAL SWITCH (RIGHT) value ON?

YES

Repair a short to ground in the wire.

NO

The R TURN SW wire is OK. Replace the combination light switch .

DTC B1281, B1282, B1283, B1284

DTC B1281 : Front wiper MIST position Circuit Malfunction **DTC B1282** : Front wiper INT(AUTO) position Circuit Malfunction **DTC B1283** : Front wiper LOW position Circuit Malfunction **DTC B1284** : Front wiper HIGH position Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1281 Front wiper MIST position Circuit Malfunction	B
B1282 Front wiper INT (AUTO) position Circuit Malfunction	B
B1283 Front wiper LOW position Circuit Malfunction	B

DTC Description	DTC
B1284 Front wiper HIGH position Circuit Malfunction	B

DTC (Body Control Module)

1. Wiper/washers system check

-1. Turn the windshield wiper switch to the OFF position, check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (LOW)	OFF	B	B	B

Are all data list values correct?

YES

Go to step 4.

NO

Go to step 2.

2. Determine possible failure area (windshield wiper/washer switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Windshield wiper/washer switch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (MIST)	OFF	B	B	B

Has the data list value changed from ON to OFF?

YES

Replace the windshield wiper/washer switch .

NO

Go to step 3.

3. Shorted wire check (FR WIPER INT SW, FR WIPER HI SW, FR WIPER MIST SW lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector D (40P) Body control module connector E (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Windshield wiper/washer switch 10P connector: disconnected Body control module connector D (40P): disconnected
Test point 1	**Body control module connector D (40P) No. 2**
Test point 2	Body ground

Test point 1	**Body control module connector D (40P) No. 3**
Test point 2	Body ground

Test point 1	**Body control module connector D (40P) No. 4**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The FR WIPER INT SW, FR WIPER HI SW, and FR WIPER MIST SW wires are OK. Faulty body control module; **replace the body control module** .

4. Shorted wire check (FR WIPER MIST SW to FR WIPER HI SW, FR WIPER HI SW to FR WIPER INT SW, FR WIPER MIST SW to FR WIPER INT SW lines)

-1. Check the parameter(s) below with the HDS.

When the windshield wiper switch is turned to HI

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	ON	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (MIST)	OFF	B	B	B

When the windshield wiper switch is turned to LO

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	ON	B	B	B
Windshield Wiper Switch (HIGH)	ON	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (MIST)	OFF	B	B	B

When the windshield wiper switch is turned to INT

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	ON	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B
Windshield Wiper Switch (INT)	ON	B	B	B
Windshield Wiper Switch (MIST)	OFF	B	B	B

When the windshield wiper switch is turned OFF

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (MIST)	OFF	B	B	B

When the windshield wiper switch is turned to MIST

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (MIST)	ON	B	B	B

Are all data list values correct?

YES

The FR WIPER MIST SW to FR WIPER HI SW, FR WIPER HI SW to FR WIPER INT SW, and FR WIPER MIST SW to FR WIPER INT SW wires are OK. Intermittent failure, the system is OK at this time. Check for loose or poor connections.

NO

Repair a short in the wires.

DTC B2352

DTC B2352 : Rain Light Sensor Unit Internal error (EEPROM error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B2352 Rain Light Sensor Unit Internal error (EEPROM error)	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2352 Rain Light Sensor Unit Internal error (EEPROM error)	B

   Is DTC B2352 indicated?

   YES

   Replace the automatic lighting/rain sensor .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2375

DTC B2375 : Rain Sensing malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B2375 Rain Sensing malfunction	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B2375 Rain Sensing malfunction	B

Is DTC B2375 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Connector check

-1. Check for loose or poor connections at the automatic lighting/rain sensor 5P connector.

Is the connection OK?

YES

Go to step 3.

NO

Reconnect or repair the connector.

3. Rain sensor visual check

-1. **Remove the automatic lighting/rain sensor** .

-2. Check for dirt and dust on the surface of the automatic lighting/rain sensor.

Is it dirty?

YES

Clean the rain sensor, and then recheck the system.

NO

Go to step 4.

4. Windshield glass visual check: Is it dirty or damaged?

YES

Clean the windshield and, if necessary, repair or replace the windshield glass.

NO

Replace the automatic lighting/rain sensor .

DTC B2376

DTC B2376 : Light sensing malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B2376 Light sensing malfunction	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2376 Light sensing malfunction	B

   Is DTC B2376 indicated?

   YES

   Replace the automatic lighting/rain sensor .

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U0073 (BODY CONTROL MODULE)

DTC U0073 : F-CAN communication bus line error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U0073 F-CAN communication bus line error	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0073 F-CAN communication bus line error	B

   Is DTC U0073 indicated?

   YES: with CAN gateway

Go to the troubleshooting for CAN gateway system DTC(s) .

YES: without CAN gateway

Go to F-CAN Circuit Troubleshooting .

NO

Intermittent failure, the system is OK at this time.

DTC U0100, U0122 (BODY CONTROL MODULE)

DTC U0100 : BCM lost communication with ECM/PCM **DTC U0122** : BCM lost communication with VSA/ABS

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the chart below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0100 BCM lost communication with ECM/PCM	B
U0122 BCM lost communication with VSA/ABS	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0100 BCM lost communication with ECM/PCM	B
U0122 BCM lost communication with VSA/ABS	B

Are any DTCs indicated?

YES: with CAN gateway

Go to step 2.

YES: without CAN gateway

Go to step 8.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. CAN gateway system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the body control module detect the CAN gateway Bus channels A?

Bus A is Not Available

Go to step 4.

Bus A is Available

Go to step 5.

4. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

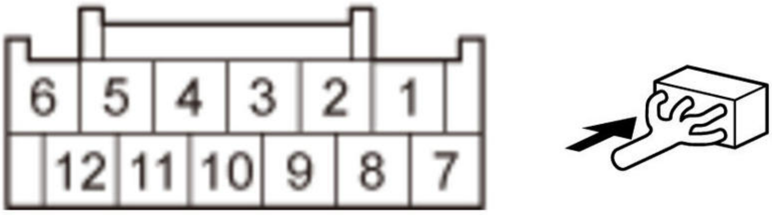
CAN gateway 12P connector (12P connector type) CAN gateway 16P connector (16P connector type) Body control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector (12P connector type): disconnected CAN gateway 16P connector (16P connector type): disconnected Body control module connector B (36P): disconnected
Test point 1	CAN gateway 12P connector (female terminals) (12P connector type) No. 3: ① CAN gateway 16P connector (female terminals) (16P connector type) No. 3: ②
Test point 2	**Body control module connector B (36P) No. 22**

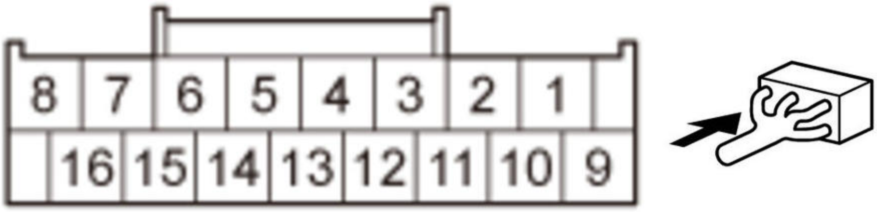
Test point 1	CAN gateway 12P connector (female terminals) (12P connector type) No. 9: ① CAN gateway 16P connector (female terminals) (16P connector type) No. 11: ②
Test point 2	**Body control module connector B (36P) No. 23**

①



6 5 4 3 2 1
12 11 10 9 8 7

②



8 7 6 5 4 3 2 1
16 15 14 13 12 11 10 9

Is there 1.0 Ω or less?

YES

The F-CAN A_H and F-CAN A_L wires are OK. **Replace the body control module** .

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

5. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following chart, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100	PCM	A, B
U0122	VSA modulator-control unit	A, B

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100: PCM is Not Available for Bus A

Go to step 6.

U0100: PCM is Not Available for Bus B

Go to step 7.

U0122: VSA modulator-control unit is Not Available for Bus A

Go to step 6.

U0122: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

6. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-3. According to the detected DTC on the following chart, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P connector (12P connector type) CAN gateway 16P connector (16P connector type)
U0100	PCM connector A (50P)
U0122	VSA modulator-control unit 46P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector (12P connector type): disconnected CAN gateway 16P connector (16P connector type): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

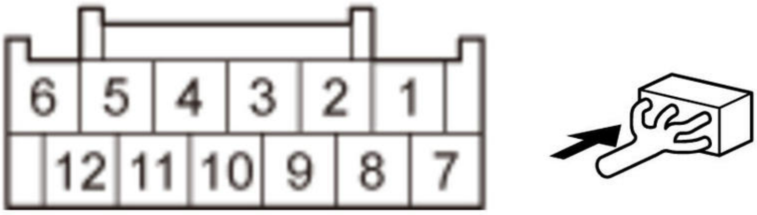
CAN gateway 12P connector type

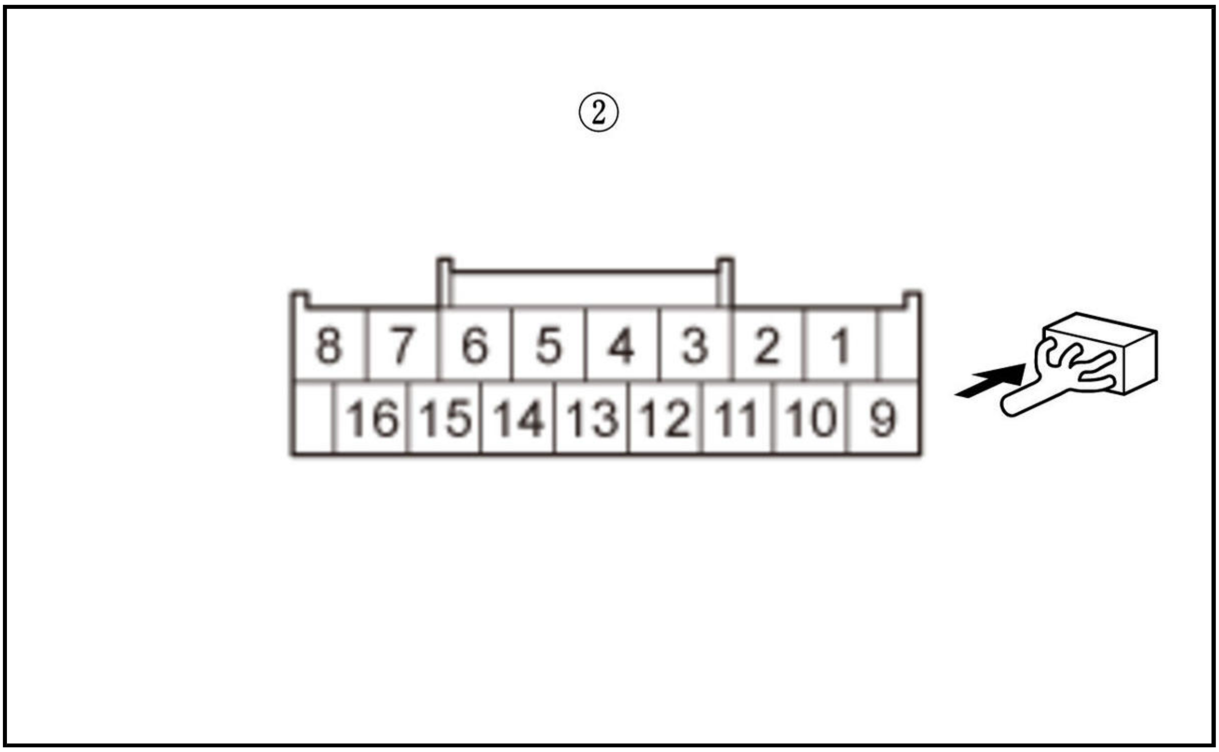
DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN A_H	CAN gateway 12P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 9		No. 36
U0122	F-CAN A_H	CAN gateway 12P connector (female terminals): ①	No. 3	VSA modulator-control unit 46P connector	No. 40
	F-CAN A_L		No. 9		No. 28

CAN gateway 16P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN A_H	CAN gateway 16P connector (female terminals): ②	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36
U0122	F-CAN A_H	CAN gateway 16P connector (female terminals): ②	No. 3	VSA modulator-control unit 46P connector	No. 40
	F-CAN A_L		No. 11		No. 28

①





Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. According to the detected DTC on the following chart below replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	PCM
U0122	VSA modulator-control unit

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

7. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-3. According to the detected DTC on the following chart, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P connector (12P connector type) CAN gateway 16P connector (16P connector type)
U0100	PCM connector A (50P)
U0122	VSA modulator-control unit 46P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 12P connector (12P connector type): disconnected CAN gateway 16P connector (16P connector type): disconnected

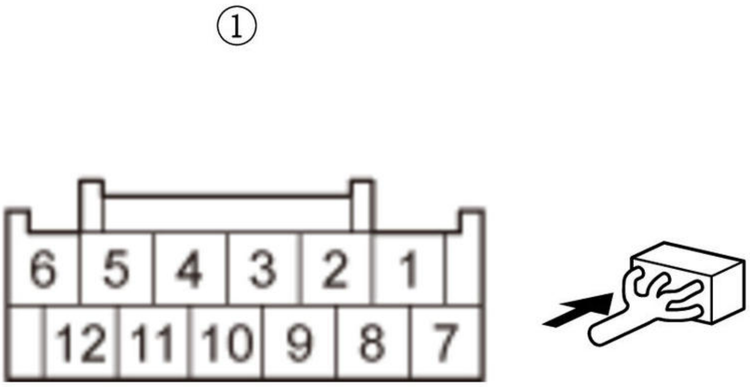
	Transmitting control unit connector(s) for indicated DTCs: disconnected

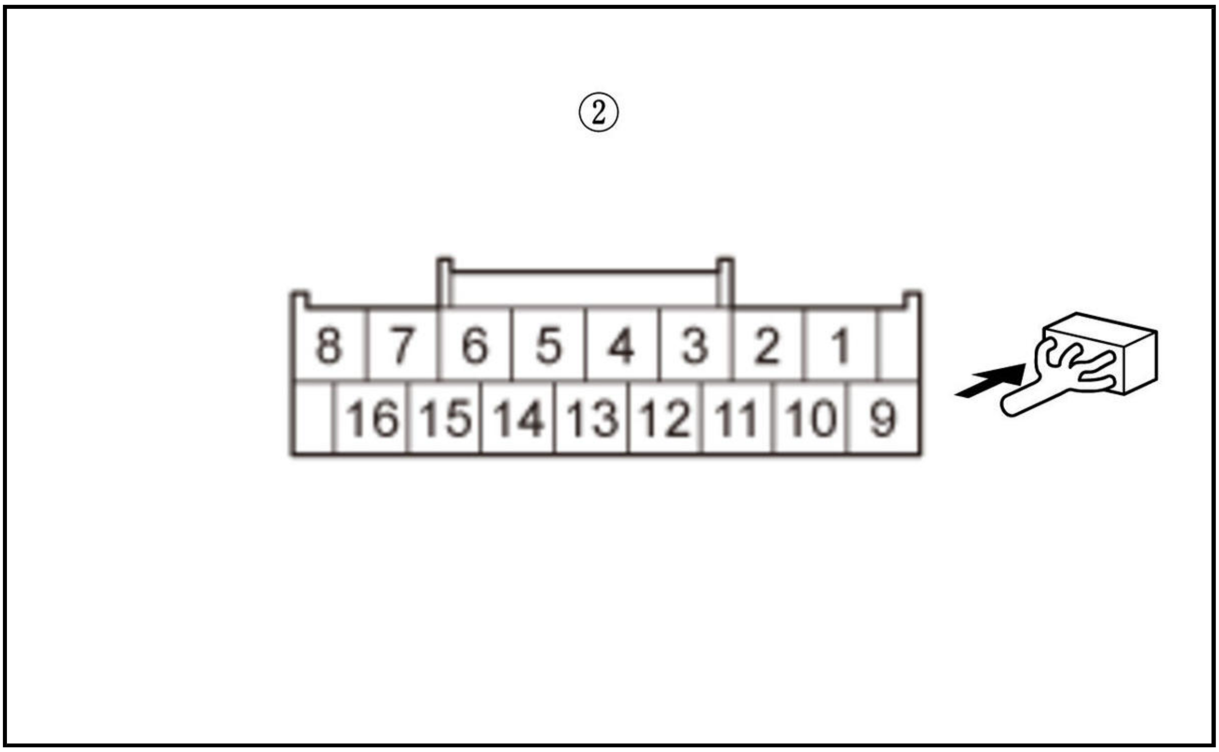
CAN gateway 12P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	PCM connector A (50P)	No. 39
	F-CAN B_L		No. 5		No. 38
U0122	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	VSA modulator-control unit 46P connector	No. 46
	F-CAN B_L		No. 5		No. 34

CAN gateway 16P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN B_H	CAN gateway 16P connector (female terminals): ②	No. 6	PCM connector A (50P)	No. 39
	F-CAN B_L		No. 14		No. 38
U0122	F-CAN B_H	CAN gateway 16P connector (female terminals): ②	No. 6	VSA modulator-control unit 46P connector	No. 46
	F-CAN B_L		No. 14		No. 34





Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. According to the detected DTC on the following chart replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	**PCM**
U0122	**VSA modulator-control unit**

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

8. Open wire check (F-CAN_H line, F-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector B (36P)

-3. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-4. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see chart below).

DTC	Connector
U0100	PCM connector A (51P)
U0122	VSA modulator-control unit 46P connector

-5. Measure the resistance between the receiving control unit and the transmitting control unit on the F-CAN_H circuit and the F-CAN_L circuit.

Test condition	Receiving control unit connector(s): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN_H	Body control module connector B (36P)	No. 22	PCM connector A (51P)	No. 2
	F-CAN_L		No. 23		No. 1
U0122	F-CAN_H	Body control module connector B (36P)	No. 22	VSA modulator-control unit 46P connector	No. 40
	F-CAN_L		No. 23		No. 28

Is there 1.0 Ω or less?

YES

The F-CAN_H wire and the F-CAN_L wire are OK. Refer to the DTC shown on the display, replace the control unit based on the instructions (see chart below).

DTC	Operation for transmitting control unit
U0100	PCM
U0122	VSA modulator-control unit

NO

Repair an open in the F-CAN_H wire and/or the F-CAN_L wire.

DTC U1280 (BODY CONTROL MODULE)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. B-CAN related units check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the appropriate connector at each control unit in the chart one at a time. Clear the DTC, then recheck for DTCs after each unit is disconnected.

Control Unit	Connector
Gauge control module	Connector A (32P)
Climate control unit / HVAC control unit	Connector A (32P)
Immobilizer-keyless control unit	7P connector
Power window master switch	37P connector
Automatic lighting control unit-sensor	5P connector
Audio unit / Audio-navigation unit	Connector A (24P)
Front seat heater control unit	24P connector
Power seat control unit	Connector A (20P)
Power tailgate control unit	Connector A (24P)
Relay control module	Connector A (6P)
Parking and back-up sensor control unit	16P connector
Wireless charger	7P connector
Left BSI radar unit	6P connector
Right BSI radar unit	6P connector

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated with each individual unit disconnected?

YES

Leave the connectors disconnected, and go to step 3.

NO

Replace the control unit that was disconnected when DTC U1280 did not reset.

3. Shorted wire check (B-CAN lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected
Test point 1	**Body control module connector B (36P) No. 20**
Test point 2	Body ground

Test point 1	**Body control module connector B (36P) No. 21**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Go to step 4.

NO

Repair a short to ground in the B-CAN wires.

4. Shorted wire check (B-CAN_L to B-CAN_H line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected
Test point 1	**Body control module connector B (36P) No. 20**
Test point 2	**Body control module connector B (36P) No. 21**

Is there 1.0 MΩ or more?

YES

The B-CAN_L to B-CAN_H wire is OK. **Replace the body control module** .

NO

Repair a short in the B-CAN_L to B-CAN_H wire.

DTC U128D, U1291 (BODY CONTROL MODULE)

DTC U128D : MICU lost communication with gauge control module **DTC U1291** : MICU lost communication with relay control module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the chart below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U128D MICU lost communication with gauge control module	B
U1291 MICU lost communication with relay control module	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U128D MICU lost communication with gauge control module	B
U1291 MICU lost communication with relay control module	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Body control module connector B (36P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see chart below).

DTC	Connector
U128D	Gauge control module connector A (32P)
U1291	Relay control module connector A (6P)

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128D	B-CAN_H	**Body control module connector B (36P)**	No. 20	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 21		No. 31
U1291	B-CAN_H	**Body control module connector B (36P)**	No. 20	**Relay control module connector A (6P)**	No. 2
	B-CAN_L		No. 21		No. 3

Is there continuity?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see chart below).

DTC	Operation for transmitting control unit
U128D	Gauge control module
U1291	Relay control module

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC TROUBLESHOOTING

DTC B1002

DTC B1002 : BCM internal error (EEPROM error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1002 BCM internal error (EEPROM error)	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1002 BCM internal error (EEPROM error)	B

   Is DTC B1002 indicated?

   YES

   Replace the body control module .

   NO

   Intermittent failure, the body control module is OK at this time.

DTC B1003

DTC B1003 : BCM Update error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- This DTC is indicated when a body control module update is not completed properly.
- Before updating the body control module, make sure the 12 volt battery in the vehicle is fully charged, and connect a 12 volt jumper battery (not a 12 volt battery charger) to maintain system voltage.
- Never turn the vehicle to the ACCESSORY mode or OFF (LOCK) mode, during the reprogramming. If there is a problem with the reprogramming, turn the vehicle to the ON mode.

DTC Description	DTC
B1003 BCM Update error	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1003 BCM Update error	B

Is DTC B1003 indicated?

YES

Update the body control module .

NO

Intermittent failure, the system is OK at this time.

DTC B1028

DTC B1028 : Rear wiper motor (park) signal error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before troubleshooting, make sure the fuses and **relays** associated with the system is OK.

DTC Description	DTC
B1028 Rear wiper motor (park) signal error	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Turn the rear window wiper switch to INT for 15 seconds or more, then turn the switch OFF.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1028 Rear wiper motor (park) signal error	B

Is DTC B1028 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Open wire check (IG1_HAC line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

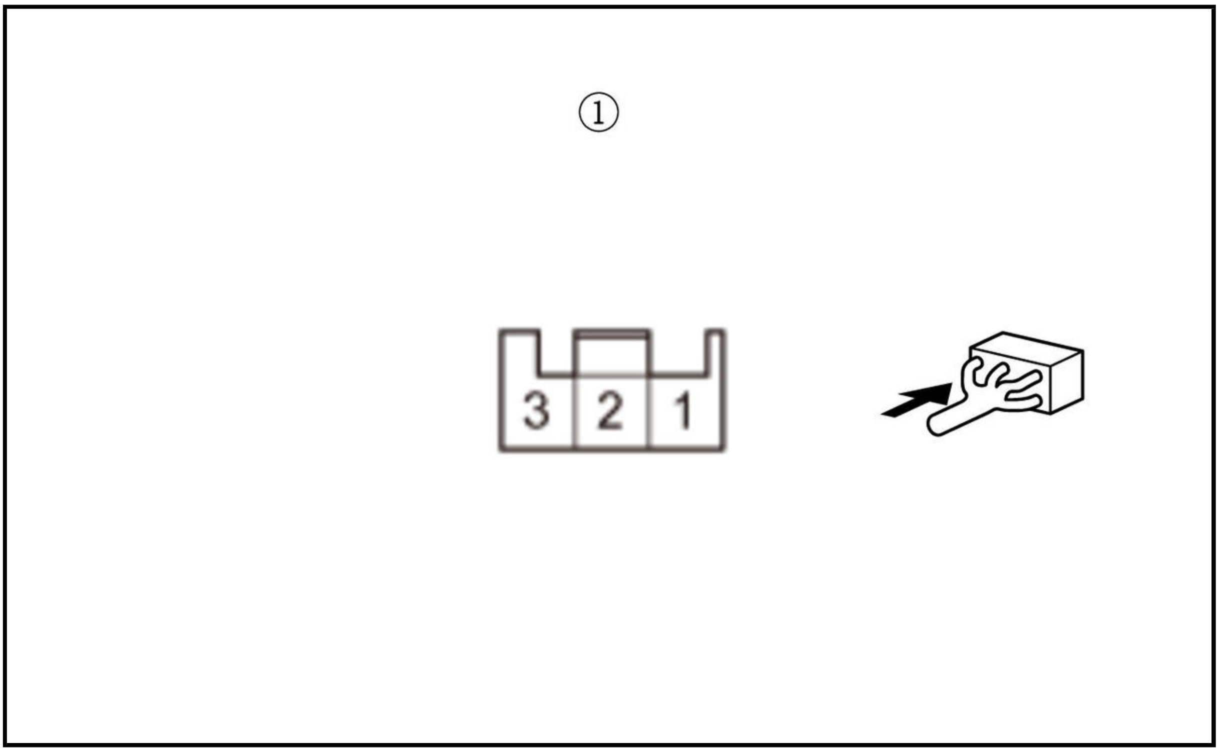
   -2. Disconnect the following connector.

Rear window wiper motor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Rear window wiper motor 3P connector: disconnected
Test point 1	Rear window wiper motor 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1_HAC wire is OK. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Rear window wiper motor check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Do the rear window wiper motor test** .

Does the wiper motor run and does it pulse normally?

YES

Go to step 4.

NO

Replace the rear window wiper motor .

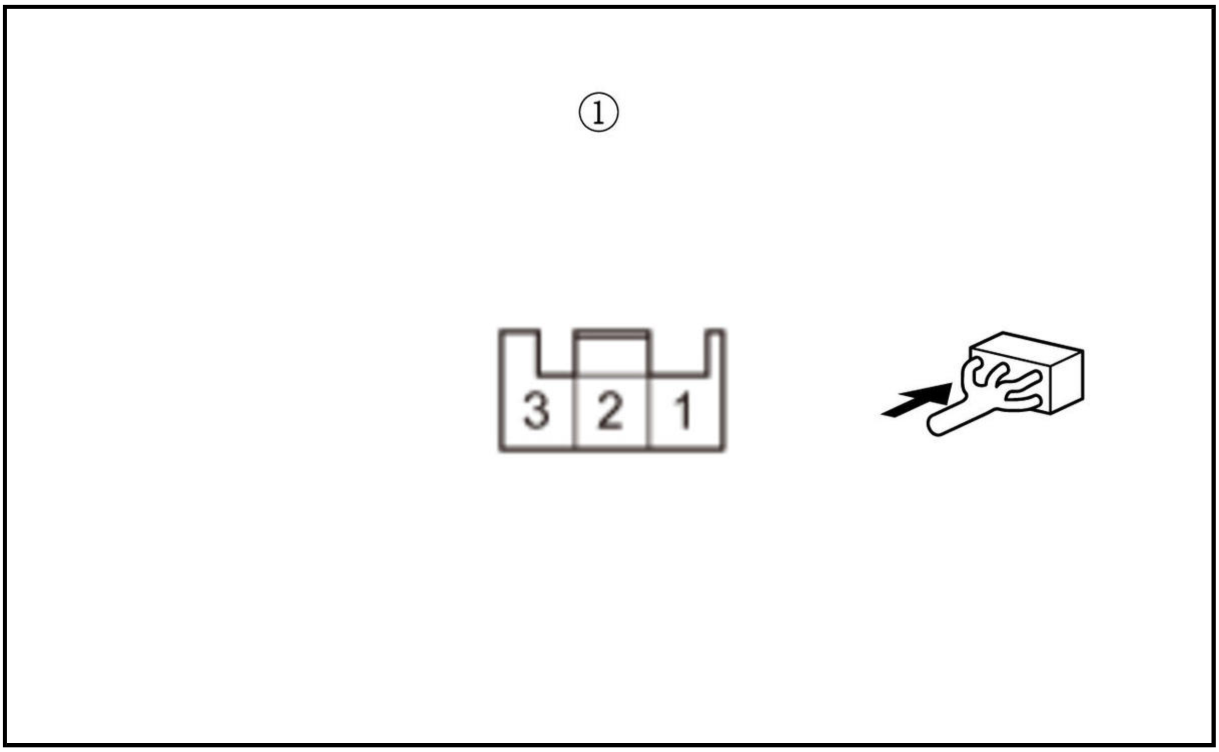
4. Shorted wire check (RR_WIPER_MTR line to power)

-1. Disconnect the following connector.

Body control module connector A (14P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear window wiper motor 3P connector: disconnected Body control module connector A (14P): disconnected
Test point 1	Rear window wiper motor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair a short to power in the wire to power.

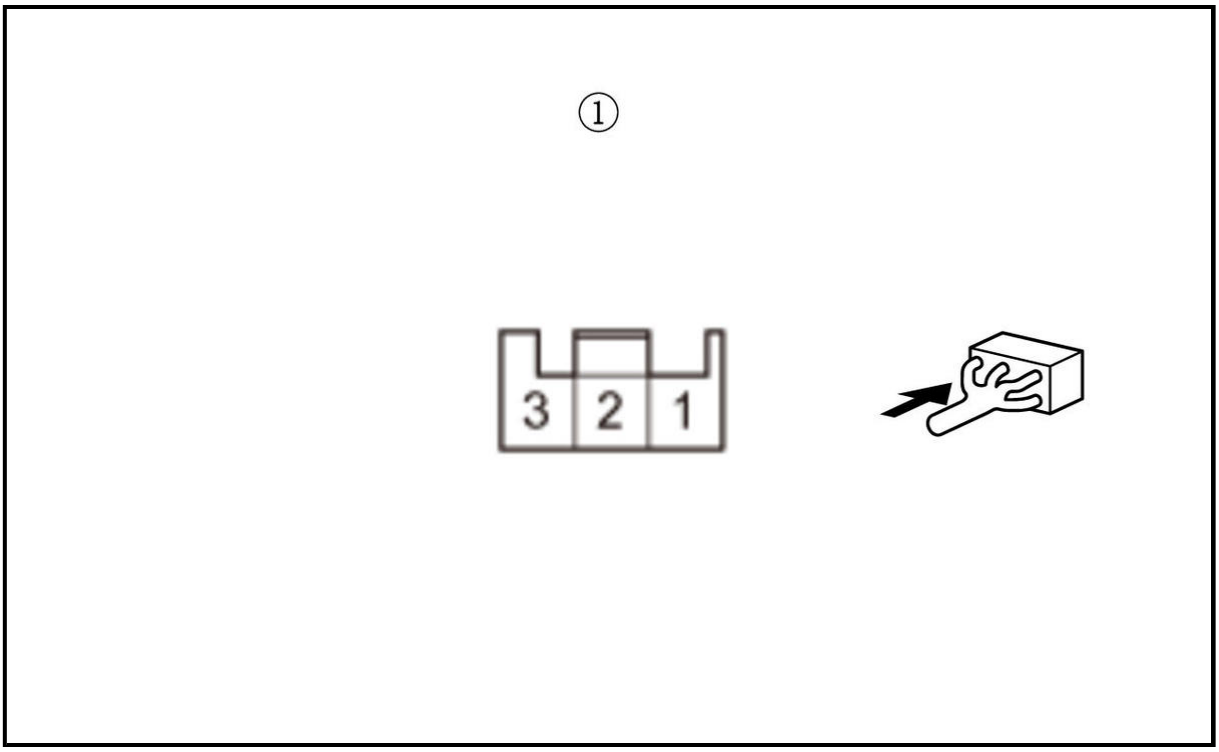
NO

The RR_WIPER_MTR wire is not shorted to power. Go to step 5

5. Shorted wire check (RR_WIPER_MTR line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear window wiper motor 3P connector: disconnected Body control module connector A (14P): disconnected
Test point 1	Rear window wiper motor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The RR_WIPER_MTR wire is not shorted. Go to step 6.

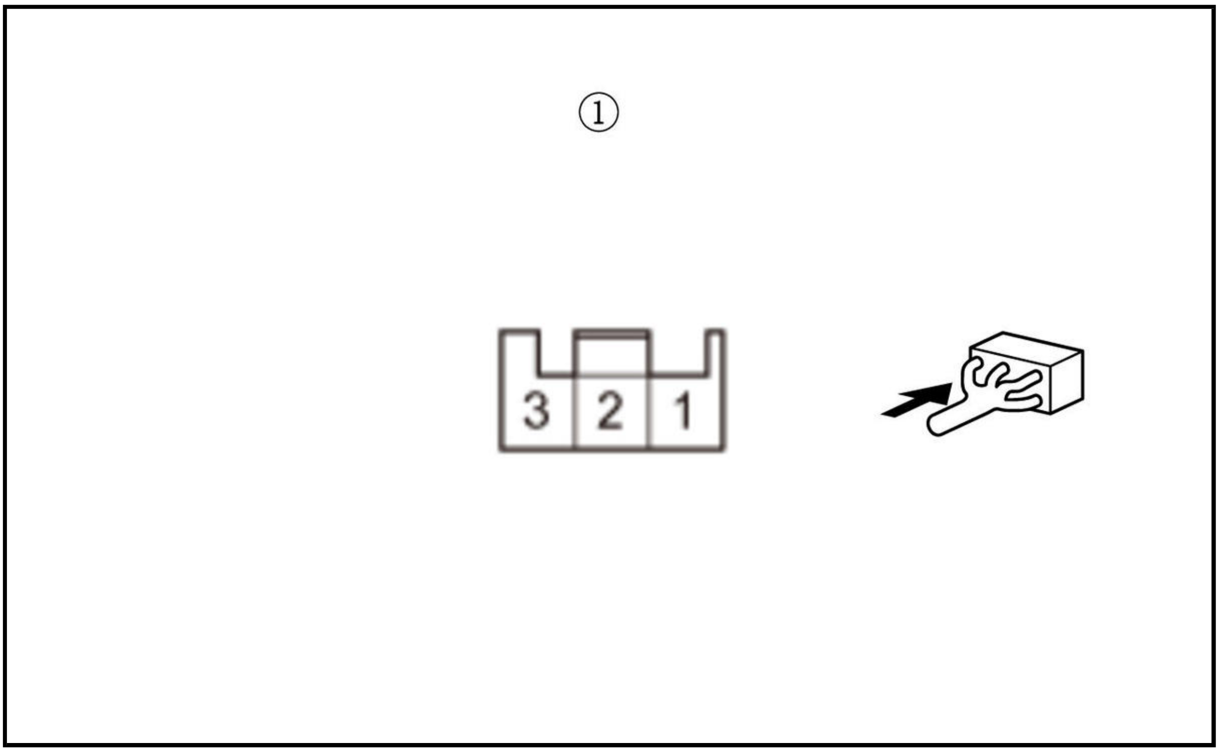
NO

Repair a short to ground in the wire.

6. Open wire check (RR_WIPER_MTR line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear window wiper motor 3P connector: disconnected Body control module connector A (14P): disconnected
Test point 1	**Body control module connector A (14P) No. 7**
Test point 2	Rear window wiper motor 3P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

The RR_WIPER_MTR wire is OK. Go to step 7.

NO

Repair an open or high resistance in the wire.

7. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Rear window wiper motor 3P connector: disconnected Body control module connector A (14P): disconnected
Test point 1	**Body control module connector A (14P) No. 6**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

DTC B1032

DTC B1032 : CDS (Collision detection signal) signal error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1032 CDS (Collision detection signal) signal error	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1032 CDS (Collision detection signal) signal error	B

Is DTC B1032 indicated?

YES: with power tailgate

Go to step 2.

YES: without power tailgate

Go to step 3.

NO

Intermittent failure, the system is OK at this time.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Body control module connector B (36P) Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Gauge control module connector A (32P): disconnected

Circuit name	Test points 1		Test points 2	
	Connector	Terminal	Connector	Terminal
B-CAN_H	**Body control module connector B (36P)**	No. 20	**Gauge control module connector A (32P)**	No. 30
B-CAN_L		No. 21		No. 31

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. **Replace the gauge control module**

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

3. Open wire check (CDS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Do the 12 volt battery terminal disconnection procedure , and wait for at least 3 minutes.

-3. Disconnect the following connectors.

Body control module connector D (40P)SRS unit connector A (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector D (40P): disconnected SRS unit connector A (39P): disconnected
Test point 1	Body control module connector D (40P) No. 34
Test point 2	SRS unit connector A (39P) No. 1

Is there 1.0 Ω or less?

YES

Go to step 4.

NO

Repair an open or high resistance in the wire.

4. Shorted wire check (CDS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector D (40P): disconnected SRS unit connector A (39P): disconnected
Test point 1	SRS unit connector A (39P) No. 1
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The CDS wire is OK. Go to step 5.

NO

Repair a short to ground in the wire.

5. Body control module check

-1. Reconnect the following connector.

Body control module connector D (40P)

-2. Do the 12 volt battery terminal reconnection procedure .

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode SRS unit connector A (39P): disconnected
Test point 1	**Body control module connector D (40P) No. 34**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the SRS unit .

NO

Replace the body control module .

DTC B1036

DTC B1036 : IG1 Power supply Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1036 IG1 Power supply Circuit Malfunction	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1036 IG1 Power supply Circuit Malfunction	B

Is DTC B1036 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Fuse check

-1. Check the following fuse.

Fuse	**No. D8**

Is the fuse OK?

YES

Repair an open or high resistance in the wire.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the IG1_FUEL_PUMP wire.

DTC B1038

DTC B1038 : IMMOBILIZER F-CAN Authentication ID Not Received

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- If keyless access power control unit DTC U0073 is stored, troubleshoot DTC U0073 first.

DTC Description	DTC
B1038 IMMOBILIZER F-CAN Authentication ID Not Received	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1038 IMMOBILIZER F-CAN Authentication ID Not Received	B

Is DTC B1038 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. CAN gateway system DTC check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U0056-00 CAN Gateway F-CAN ch C Bus Off	B
U0065-00 CAN Gateway F-CAN ch D Bus Off	B
U0038-00 CAN Gateway F-CAN ch E Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, U0056-00, U0038-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. Gauge control module DTC check

-1. Check for gauge control module DTCs with the HDS.

DTC Description	DTC
U0122 Gauge control module lost communication with VSA modulator-control unit	B

Is DTC U0122 indicated?

YES

Go to gauge control module DTC U0122 troubleshooting .

NO

Go to step 4.

4. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the body control module detect the CAN gateway Bus channels B?

Bus B is Not Available

Go to step 5.

Bus B is Available

Go to step 6.

5. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

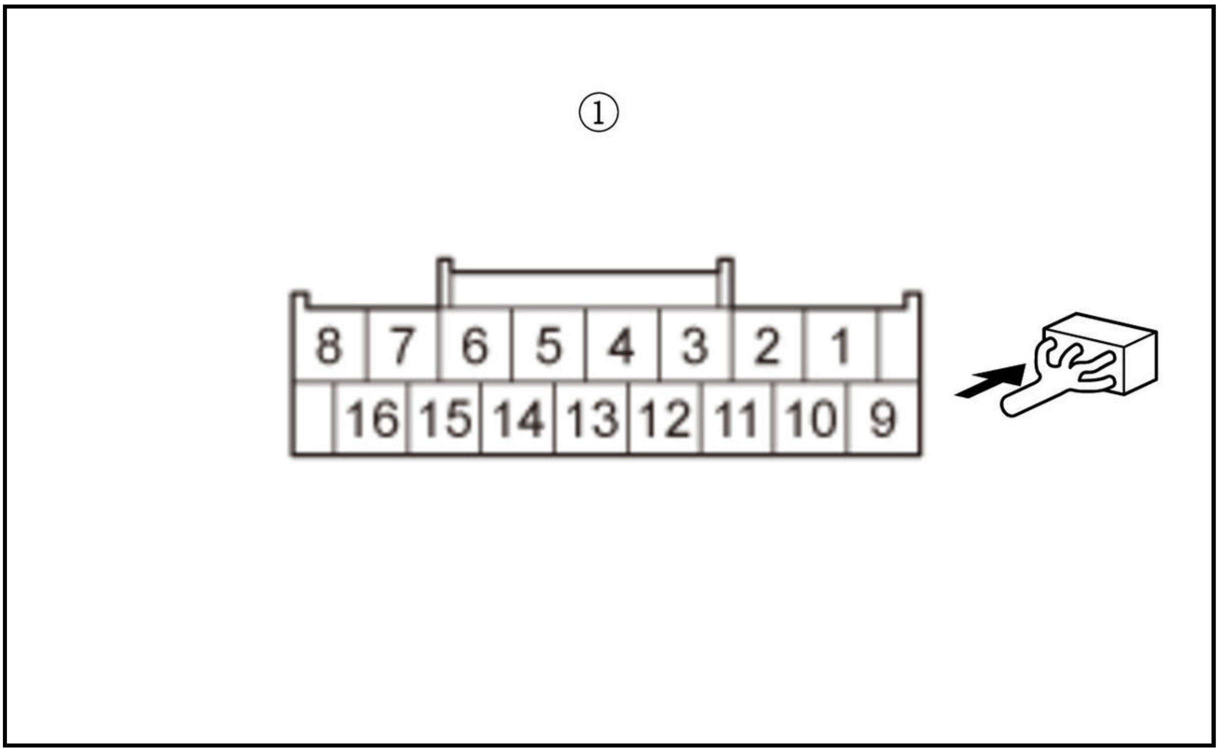
CAN gateway 16P connector Body control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Body control module connector B (36P): disconnected

Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**Body control module connector B (36P) No. 22**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**Body control module connector B (36P) No. 23**



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. **Replace the body control module** .

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

6. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channels normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channels at normal
B1038	VSA modulator-control unit	B, C

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

B1038: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

B1038: VSA modulator-control unit is Not Available for Bus C

Go to step 8.

7. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

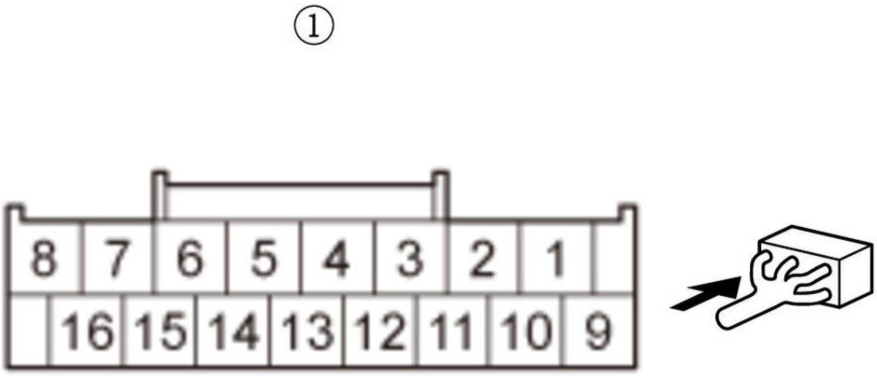
-2. According to the detected DTC on the following table, disconnect the transmitting control unit connectors.

DTC	Connector
-	CAN gateway 16P connector
B1038	VSA modulator-control unit 46P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
B1038	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	VSA modulator-control unit 46P connector	No. 40
	F-CAN B_L		No. 14		No. 28



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. Refer to the DTC shown on the display, replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
B1038	**VSA modulator-control unit**

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

8. Open wire check (F-CAN C lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

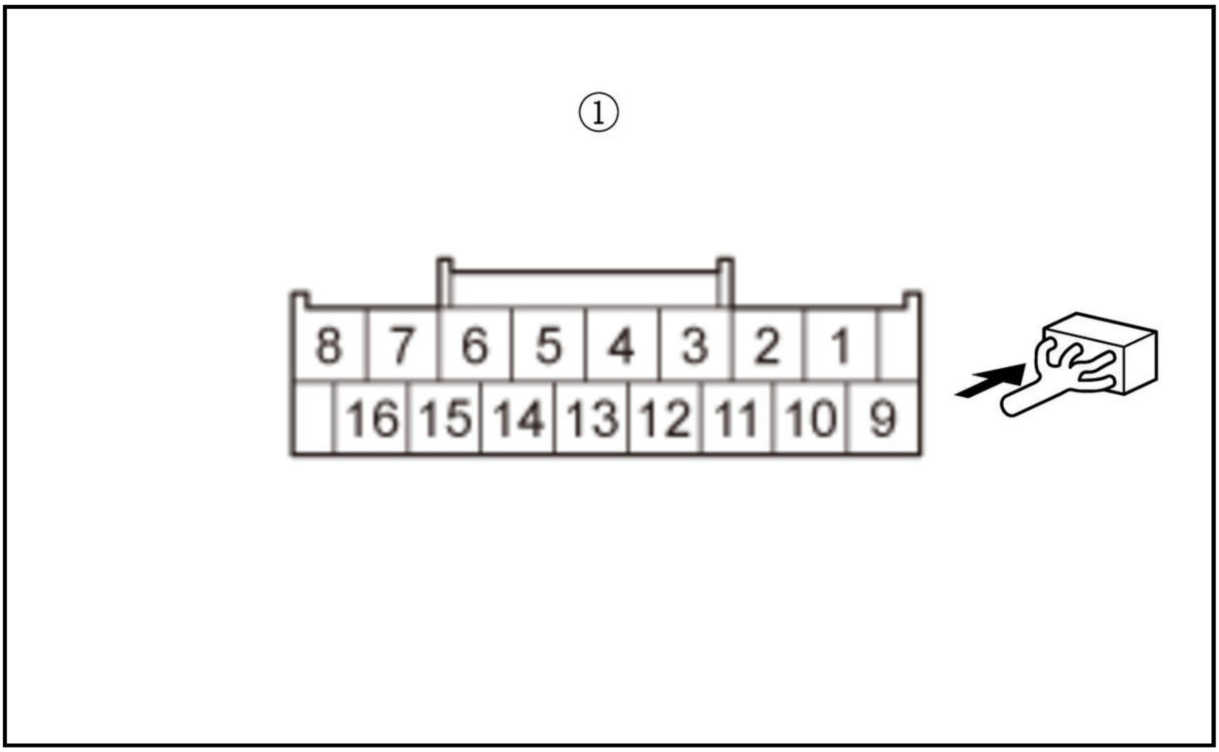
-2. According to the detected DTC on the following table, disconnect the transmitting control unit connectors.

DTC	Connector
-	CAN gateway 16P connector
B1038	VSA modulator-control unit 46P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	**Terminal**	**Connector**	**Terminal**
B1038	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**VSA modulator-control unit 46P connector**	No. 46
	F-CAN C_L		No. 13		No. 34



Is there 1.0 Ω or less?

YES

The F-CAN C_H wire and the F-CAN C_L wire are OK. Refer to the DTC shown on the display, replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
B1038	VSA modulator-control unit

NO

Repair an open in F-CAN C_H or F-CAN C_L wire.

DTC B1039

DTC B1039 : IMMOBILIZER F-CAN Authentication ID Unmatch

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1039 IMMOBILIZER F-CAN Authentication ID Unmatch	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1039 IMMOBILIZER F-CAN Authentication ID Unmatch	B

Is DTC B1039 indicated?

YES

Do the System Registration .

NO

Intermittent failure, the system is OK at this time.

DTC B1040

DTC B1040 : BCM lost communication with Front wiper

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before troubleshooting, make sure the fuses and relays associated with the system is OK.

DTC Description	DTC
B1040 BCM lost communication with Front wiper	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1040 BCM lost communication with Front wiper	B

   Is DTC B1040 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (windshield wiper control unit/motor power and ground, LIN(FR_WIPER) line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Windshield wiper control unit/motor 6P connector

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	Windshield wiper control unit/motor 6P connector No. 2
Test point 2	Windshield wiper control unit/motor 6P connector No. 1

Is there battery voltage?

YES

Go to step 4.

NO

Go to step 3.

3. Open wire check (+B_WIPER line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	Windshield wiper control unit/motor 6P connector No. 2
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the ground wire or poor ground (G351).

NO

Repair an open or high resistance in the wire.

4. Shorted wire check (LIN(FR_WIPER) line)

-1. Disconnect the following connector.

Body control module connector C (28P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Windshield wiper control unit/motor 6P connector: disconnected

Test point 1	Windshield wiper control unit/motor 6P connector No. 4
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The LIN(FR_WIPER) wire is not shorted. Go to step 5.

NO

Repair a short to ground in the wire.

5. Open wire check (LIN(FR_WIPER) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	**Body control module connector C (28P) No. 13**
Test point 2	**Windshield wiper control unit/motor 6P connector No. 4**

Is there 1.0 Ω or less?

YES

The LIN(FR_WIPER) wire is OK. **Replace the windshield wiper control unit/motor** . If the DTC is still present, **replace the body control module** .

NO

An open or poor connection in the wire.

DTC B1041

DTC B1041 : Front Wiper motor malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1041 Front Wiper motor malfunction	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1041 Front Wiper motor malfunction	B

Is DTC B1041 indicated?

YES

Replace the windshield wiper control unit/motor .

NO

Intermittent failure, the system is OK at this time.

DTC B1042

DTC B1042 : Front Wiper security line error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1042 Front Wiper security line error	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B1042 Front Wiper security line error	B

   Is DTC B1042 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Shorted wire check (BACK_UP(WIPER) line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Body control module connector B (36P) Windshield wiper control unit/motor 6P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	**Windshield wiper control unit/motor 6P connector No. 3**
Test point 2	Body ground

   Is there 1.0 MΩ or more?

   YES

   The BACK_UP(WIPER) wire is not shorted. Go to step 3.

   NO

   Repair a short to ground in the wire.

3. Open wire check (BACK_UP(WIPER) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Windshield wiper control unit/motor 6P connector: disconnected
Test point 1	**Body control module connector B (36P) No. 10**
Test point 2	**Windshield wiper control unit/motor 6P connector No. 3**

Is there 1.0 Ω or less?

YES

The BACK_UP(WIPER) wire is OK. **Replace the windshield wiper control unit/motor** . If the DTC is still present, **replace the body control module** .

NO

An open or poor connection in the wire.

DTC B1043

DTC B1043 : Front Wiper unit internal error (EEPROM error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1043 Front Wiper unit internal error (EEPROM error)	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1043 Front Wiper unit internal error (EEPROM error)	B

Is DTC B1043 indicated?

YES

Replace the windshield wiper control unit/motor .

NO

Intermittent failure, the system is OK at this time.

DTC B1077

DTC B1077 : Front wiper auto stop switch signal error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1077 Front wiper auto stop switch signal error	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B1077 Front wiper auto stop switch signal error	B

Is DTC B1077 indicated?

YES

Replace the windshield wiper control unit/motor .

NO

Intermittent failure, the system is OK at this time.

DTC B1275, B1276, B1277, B1278

DTC B1275 : Head light OFF position Circuit Malfunction

DTC B1276 : Headlight Switch Parking (Small) Position Circuit Malfunction

DTC B1277 : Head light AUTO position Circuit Malfunction

DTC B1278 : Head light ON position Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1275 Head light OFF position Circuit Malfunction	B
B1276 Headlight Switch Parking (Small) Position Circuit Malfunction	B
B1277 Head light AUTO position Circuit Malfunction	B
B1278 Head light ON position Circuit Malfunction	B

DTC (Body Control Module)

1. Problem verification

-1. Check the parameter(s) below with the HDS.

When the combination light switch is turned OFF

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (OFF)	ON	B	B	B
Headlight Switch (PARKING)	OFF	B	B	B

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (AUTO)	OFF	B	B	B
Headlight Switch (HEADLIGHT)	OFF	B	B	B

When the combination light switch is turned to PARKING

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (OFF)	OFF	B	B	B
Headlight Switch (PARKING)	ON	B	B	B
Headlight Switch (AUTO)	OFF	B	B	B
Headlight Switch (HEADLIGHT)	OFF	B	B	B

When the combination light switch is turned to AUTO

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (OFF)	OFF	B	B	B
Headlight Switch (PARKING)	OFF	B	B	B
Headlight Switch (AUTO)	ON	B	B	B
Headlight Switch (HEADLIGHT)	OFF	B	B	B

When the combination light switch is turned ON (HEADLIGHT)

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Headlight Switch (OFF)	OFF	B	B	B
Headlight Switch (PARKING)	ON	B	B	B
Headlight Switch (AUTO)	OFF	B	B	B
Headlight Switch (HEADLIGHT)	ON	B	B	B

Are all data list values correct?

YES

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

NO

Go to step 2.

2. Exterior lights system check

-1. Check the parameter(s) below with the HDS.

Cycle through all switch selections

Signal	Current conditions	
	Values	Unit
Headlight Switch (OFF)	B	B
Headlight Switch (PARKING)	B	B
Headlight Switch (AUTO)	B	B
Headlight Switch (HEADLIGHT)	B	B

Is any data list value OFF, not ON?

YES

Go to step 5.

NO

Go to step 3.

3. Determine possible failure area (combination light switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Headlight Switch (OFF)	B	B
Headlight Switch (PARKING)	B	B
Headlight Switch (AUTO)	B	B
Headlight Switch (HEADLIGHT)	B	B

Are all data lists values OFF?

YES

Replace the combination light switch .

NO

Go to step 4.

4. Shorted wire check (H/L_OFF_SW, H/L_ON_SW, PARKING_LT_SW lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector C (28P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected Body control module connector C (28P): disconnected
Test point 1	**Body control module connector C (28P) No. 10**
Test point 2	Body ground

Test point 1	**Body control module connector C (28P) No. 9**
Test point 2	Body ground

Test point 1	**Body control module connector C (28P) No. 11**

Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The H/L_OFF_SW, H/L_ON_SW, and PARKING_LT_SW wires are OK. **Replace the body control module** .

NO

Repair a short to ground in the wire.

5. Determine possible failure area (combination light switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

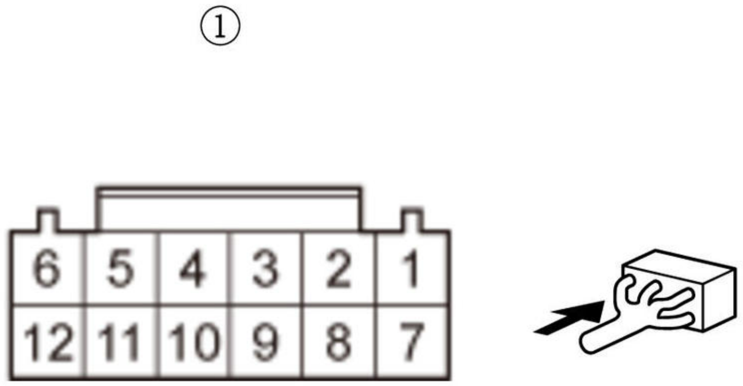
Combination light switch 12P connector

-3. Connect terminals A and B with jumper wires.

Terminal A	Combination light switch 12P connector (female terminals) No. 1: ①
Terminal B	Body ground

Terminal A	Combination light switch 12P connector (female terminals) No. 7: ①
Terminal B	Body ground

Terminal A	Combination light switch 12P connector (female terminals) No. 8: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (OFF)	B	B
Headlight Switch (PARKING)	B	B
Headlight Switch (AUTO)	B	B
Headlight Switch (HEADLIGHT)	B	B

Has the data list value changed from OFF to ON?

YES

Replace the combination light switch .

NO

Go to step 6.

6. Open wire check (H/L_OFF_SW, H/L_ON_SW, PARKING_LT_SW, COMBI_SW_GND(LT) lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector C (28P)

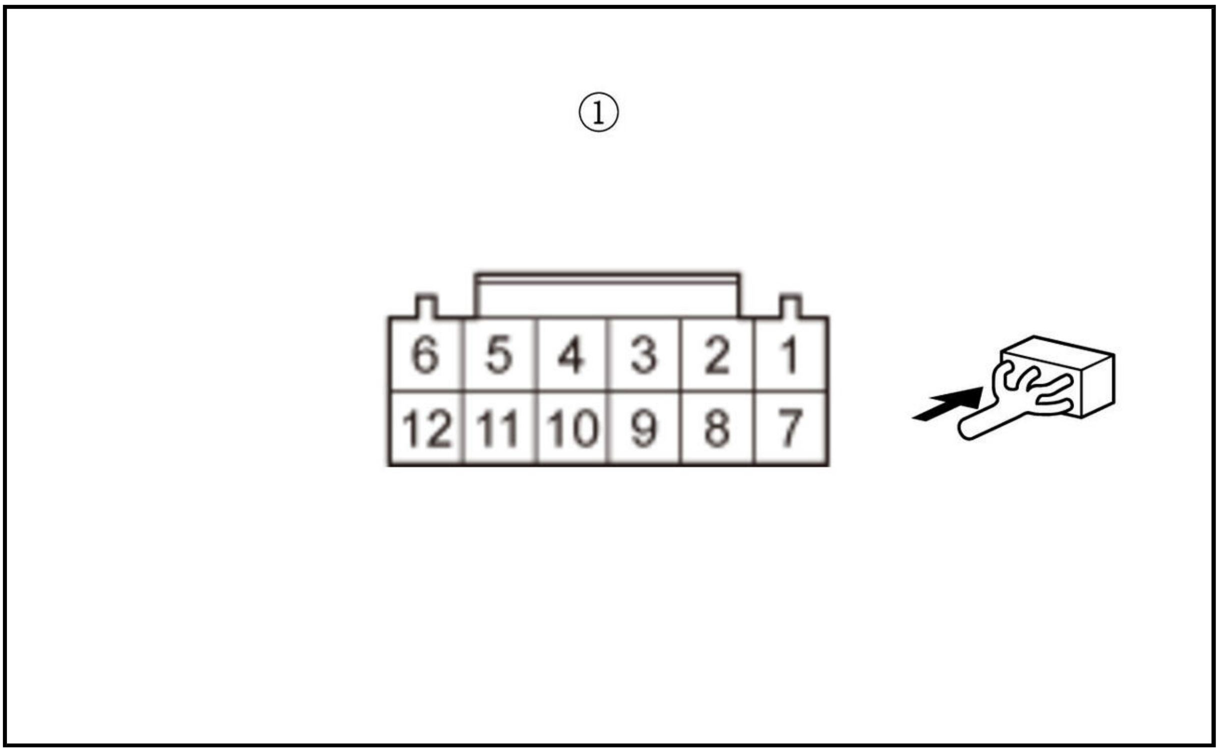
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Combination light switch 12P connector: disconnected
Test point 1	**Body control module connector C (28P) No. 10**
Test point 2	Combination light switch 12P connector (female terminals) No. 1: ①

Test point 1	**Body control module connector C (28P) No. 9**
Test point 2	Combination light switch 12P connector (female terminals) No. 7: ①

Test point 1	**Body control module connector C (28P) No. 11**
Test point 2	Combination light switch 12P connector (female terminals) No. 8: ①

Test point 1	**Body control module connector C (28P) No. 3**
Test point 2	Combination light switch 12P connector (female terminals) No. 6: ①



Is there 1.0 Ω or less?

YES

The H/L_OFF_SW, H/L_ON_SW, PARKING_LT_SW, and COMBI_SW_GND(LT) wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

DTC B1279

DTC B1279 : Dimmer switch Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1279 Dimmer switch Circuit Malfunction	B

DTC (Body Control Module)

1. Exterior lights system check 1

-1. With the headlight dimmer switch in the neutral position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (HIGH BEAM)	B	B
Headlight Switch (PASSING)	B	B

Is either information indicator ON?

YES

Go to step 4.

NO

Go to step 2.

2. Exterior lights system check 2

-1. With the headlight dimmer switch in the high beam position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Headlight Switch (HIGH BEAM)	B	B
Headlight Switch (PASSING)	B	B

Are both information indicators ON?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time.

3. Shorted wire check (H/L_HI_SW to PASSING_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Body control module connector C (28P) No. 8
Terminal B	Body ground

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Headlight Switch (HIGH BEAM)	B	B
Headlight Switch (PASSING)	B	B

Are both information indicators ON?

YES

Repair a short between the wires.

NO

The H/L_HI_SW to PASSING_SW wire is OK. Replace the combination light switch .

4. Determine possible failure area (combination light switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Headlight Switch (HIGH BEAM)	B	B
Headlight Switch (PASSING)	B	B

Is either information indicator ON?

YES

Go to step 5.

NO

Replace the combination light switch .

5. Shorted wire check (PASSING_SW, H/L_HI_SW lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector C (28P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected Body control module connector C (28P): disconnected
Test point 1	**Body control module connector C (28P) No. 7**
Test point 2	Body ground

Test point 1	**Body control module connector C (28P) No. 8**
Test point 2	Body ground

Are there 1.0 MΩ or more?

YES

The PASSING_SW and H/L_HI_SW wires are OK. **Replace the body control module** .

NO

Repair a short to ground in the wire.

DTC B1280

DTC B1280 : Turn signal switch Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1280 Turn signal switch Circuit Malfunction	B

DTC (Body Control Module)

1. Turn signal/hazard warning lights system check

   -1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (LEFT)	OFF	B	B	B
Turn Signal Switch (RIGHT)	OFF	B	B	B

Are both data list values indicated OFF?

YES

Go to step 2.

NO

Go to step 4.

2. Turn signal/hazard warning lights system check 2

   -1. Operate the turn signal switch to the left or right position.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (LEFT)	ON	B	B	B
Turn Signal Switch (RIGHT)	ON	B	B	B

Are both data list values indicated ON?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time.

3. Shorted wire check (R_TURN_SW to L_TURN_SW line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

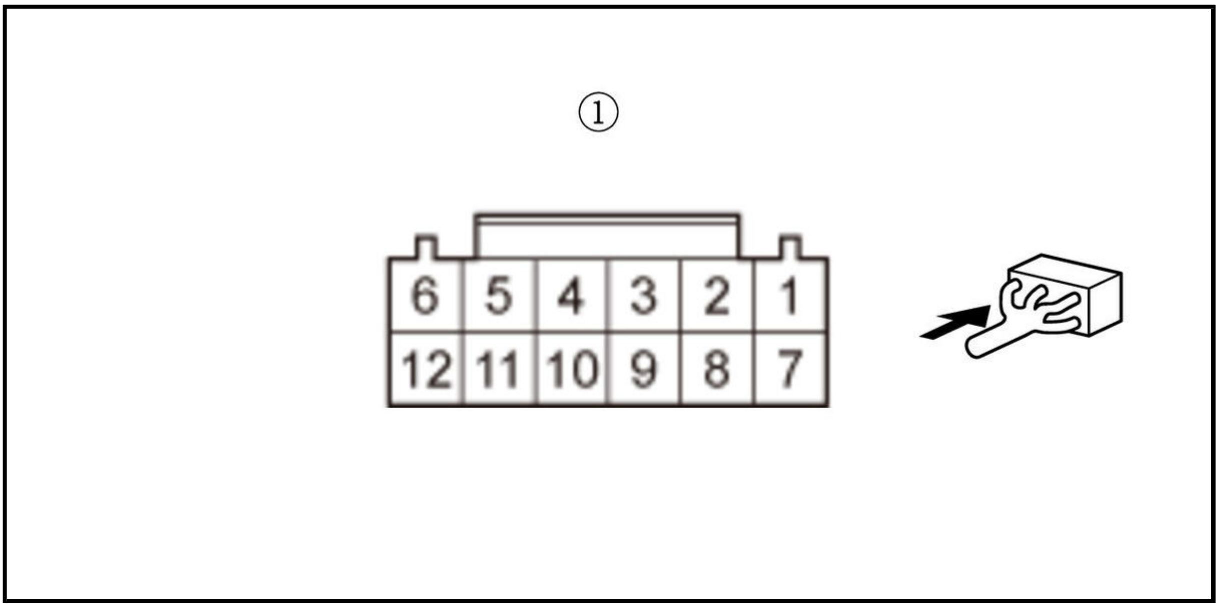
   -2. Disconnect the following connector.

Combination light switch 12P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Combination light switch 12P connector (female terminals) No. 10: ①

Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (LEFT)	OFF	B	B	B
Turn Signal Switch (RIGHT)	ON	B	B	B

Are both data list values correct?

YES

The R_TURN_SW wire and the L_TURN_SW wire is not shorted. **Replace the combination light switch** .

NO

Repair a short between the wires.

4. Shorted wire check (L_TURN_SW line or R_TURN_SW line)

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Turn Signal Switch (LEFT)	ON	B	B	B
Turn Signal Switch (RIGHT)	OFF	B	B	B

Is TURN SIGNAL SWITCH (LEFT) value ON?

YES

Go to step 5.

NO

Go to step 6.

5. Shorted wire check (L_TURN_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Check the parameter (s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Turn Signal Switch (LEFT)	ON	B	B	B

Is TURN SIGNAL SWITCH (LEFT) value ON?

YES

Repair a short to ground in the wire.

NO

The L_TURN_SW wire is OK. **Replace the combination light switch** .

6. Shorted wire check (R_TURN_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Combination light switch 12P connector

-3. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Turn Signal Switch (RIGHT)	ON	B	B	B

Is TURN SIGNAL SWITCH (RIGHT) value ON?

YES

Repair a short to ground in the wire.

NO

The R_TURN_SW wire is OK. **Replace the combination light switch** .

DTC B1281, B1282, B1283, B1284

DTC B1281 : Front wiper MIST position Circuit Malfunction

DTC B1282 : Front wiper INT (AUTO) position Circuit Malfunction

DTC B1283 : Front wiper LOW position Circuit Malfunction

DTC B1284 : Front wiper HIGH position Circuit Malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B1281 Front wiper MIST position Circuit Malfunction	B

DTC Description	DTC
B1282 Front wiper INT (AUTO) position Circuit Malfunction	B
B1283 Front wiper LOW position Circuit Malfunction	B
B1284 Front wiper HIGH position Circuit Malfunction	B

DTC (Body Control Module)

1. Wiper/washers system check

-1. Turn the windshield wiper switch to the OFF position, check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (LOW)	OFF	B	B	B

Are all data list values correct?

YES

Go to step 4.

NO

Go to step 2.

2. Determine possible failure area (windshield wiper/washer switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Windshield wiper/washer switch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (MIST)	OFF	B	B	B

Has the data list value changed from ON to OFF?

YES

Replace the windshield wiper/washer switch .

NO

Go to step 3.

3. Shorted wire check (FR_WIPER_INT_SW, FR_WIPER_HI_SW, FR_WIPER_MIST_SW lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector D (40P) Body control module connector E (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Windshield wiper/washer switch 10P connector: disconnected Body control module connector D (40P): disconnected
Test point 1	Body control module connector D (40P) No. 2
Test point 2	Body ground

Test point 1	Body control module connector D (40P) No. 3
Test point 2	Body ground

Test point 1	Body control module connector D (40P) No. 4
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The FR_WIPER_INT_SW, FR_WIPER_HI_SW, and FR_WIPER_MIST_SW wires are OK. Faulty body control module; replace the body control module .

NO

Repair a short to ground in the wire.

4. Shorted wire check (FR_WIPER_MIST_SW to FR_WIPER_HI_SW, FR_WIPER_HI_SW to FR_WIPER_INT_SW, FR_WIPER_MIST_SW to FR_WIPER_INT_SW lines)

-1. Check the parameter(s) below with the HDS.

When the windshield wiper switch is turned to HI

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	ON	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (MIST)	OFF	B	B	B

When the windshield wiper switch is turned to LO

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	ON	B	B	B
Windshield Wiper Switch (HIGH)	ON	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (MIST)	OFF	B	B	B

When the windshield wiper switch is turned to INT

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	ON	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B
Windshield Wiper Switch (INT)	ON	B	B	B
Windshield Wiper Switch (MIST)	OFF	B	B	B

When the windshield wiper switch is turned OFF

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (MIST)	OFF	B	B	B

When the windshield wiper switch is turned to MIST

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Windshield Wiper Switch (LOW)	OFF	B	B	B
Windshield Wiper Switch (HIGH)	OFF	B	B	B
Windshield Wiper Switch (INT)	OFF	B	B	B
Windshield Wiper Switch (MIST)	ON	B	B	B

Are all data list values correct?

YES

The FR_WIPER_MIST_SW to FR_WIPER_HI_SW, FR_WIPER_HI_SW to FR_WIPER_INT_SW, and FR_WIPER_MIST_SW to FR_WIPER_INT_SW wires are OK. Intermittent failure, the system is OK at this time. Check for loose or poor connections.

NO

Repair a short in the wires.

DTC B2352

DTC B2352 : Rain Light Sensor Unit Internal error (EEPROM error)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B2352 Rain Light Sensor Unit Internal error (EEPROM error)	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2352 Rain Light Sensor Unit Internal error (EEPROM error)	B

Is DTC B2352 indicated?

YES

Replace the automatic lighting/rain sensor .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC B2375

DTC B2375 : Rain Sensing malfunction in Rain/Light sensor

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B2375 Rain Sensing malfunction in Rain/Light sensor	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B2375 Rain Sensing malfunction in Rain/Light sensor	B

Is DTC B2375 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Connector check

   -1. Check for loose or poor connections at the automatic lighting/rain sensor 5P connector.

   Is the connection OK?

   YES

   Go to step 3.

   NO

   Reconnect or repair the connector.

3. Rain sensor visual check

   -1. **Remove the automatic lighting/rain sensor** .

   -2. Check for dirt and dust on the surface of the automatic lighting/rain sensor.

   Is it dirty?

   YES

   Clean the rain sensor, and then recheck the system.

   NO

   Go to step 4.

4. Windshield glass visual check:Is it dirty or damaged?

   YES

   Clean the windshield and, if necessary, repair or replace the windshield glass.

   NO

   Replace the automatic lighting/rain sensor .

DTC B2376

DTC B2376 : Light sensing malfunction in Rain/Light sensor

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
B2376 Light sensing malfunction in Rain/Light sensor	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2376 Light sensing malfunction in Rain/Light sensor	B

Is DTC B2376 indicated?

YES

Replace the automatic lighting/rain sensor .

NO

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

DTC U0073 (BODY CONTROL MODULE)

DTC U0073 : F-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U0073 F-CAN communication bus line error (BUS-OFF)	B

DTC (Body Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0073 F-CAN communication bus line error (BUS-OFF)	B

Is DTC U0073 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Intermittent failure, the system is OK at this time.

DTC U0100, U0122 (BODY CONTROL MODULE)

DTC U0100 : BCM lost communication with ECM/PCM

DTC U0122 : BCM lost communication with VSA/ABS

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0100 BCM lost communication with ECM/PCM	B
U0122 BCM lost communication with VSA/ABS	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U0100 BCM lost communication with ECM/PCM	B
U0122 BCM lost communication with VSA/ABS	B

   Are any DTCs indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. CAN gateway system DTC check

   -1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U0056-00 CAN Gateway F-CAN ch C Bus Off	B
U0065-00 CAN Gateway F-CAN ch D Bus Off	B
U0038-00 CAN Gateway F-CAN ch E Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

   Is DTC U0029-00, U0047-00, U0056-00, U0038-00, and/or U3000-49 indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the body control module detect the CAN gateway Bus channels B?

Bus B is Not Available

Go to step 4.

Bus B is Available

Go to step 5.

4. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

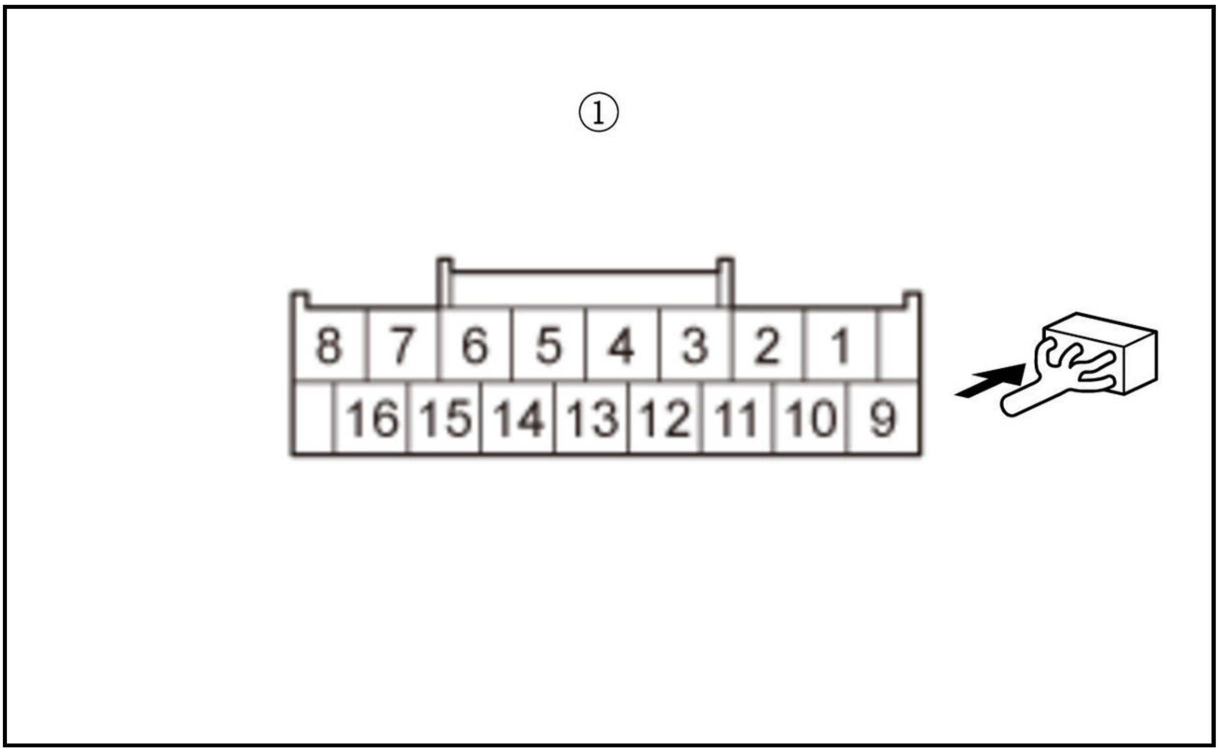
-2. Disconnect the following connectors.

CAN gateway 16P connector
Body control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Body control module connector B (36P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**Body control module connector B (36P) No. 22**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**Body control module connector B (36P) No. 23**



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. **Replace the body control module** .

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

5. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100	PCM	A, B, E
U0122	VSA modulator-control unit	B, C

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100: PCM is Not Available for Bus A

Go to step 6.

U0100: PCM is Not Available for Bus B

Go to step 7.

U0100: PCM is Not Available for Bus E

Go to step 9.

U0122: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0122: VSA modulator-control unit is Not Available for Bus C

Go to step 8.

6. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

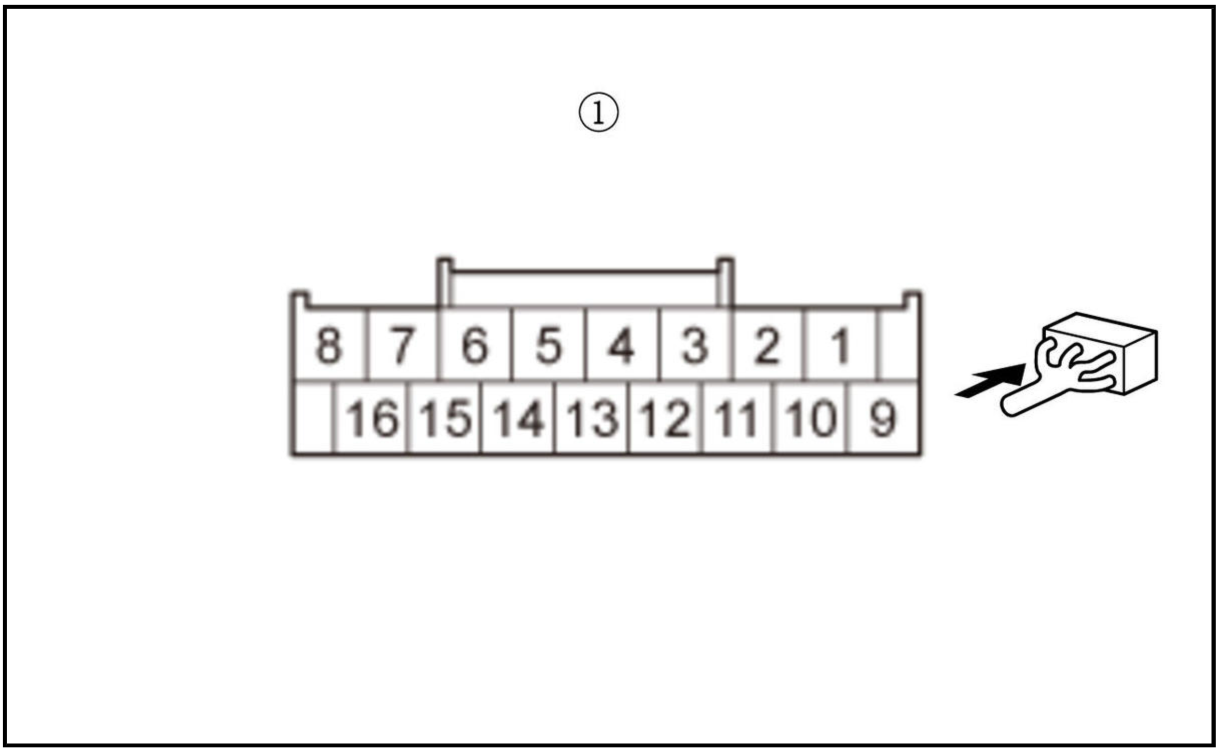
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0100	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	PCM

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

7. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

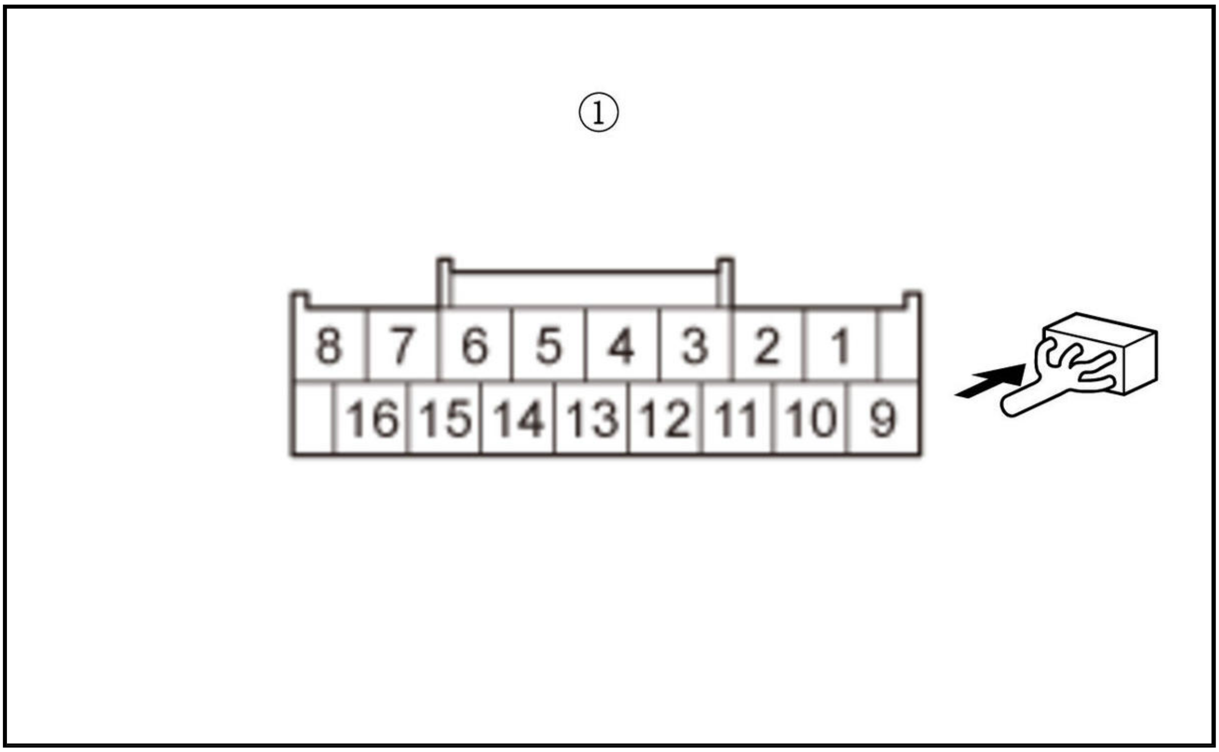
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0100	PCM connector A (50P)
U0122	VSA modulator-control unit 46P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38
U0122	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN B_L		No. 14		No. 28



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	**PCM**
U0122	**VSA modulator-control unit**

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

8. Open wire check (F-CAN C lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

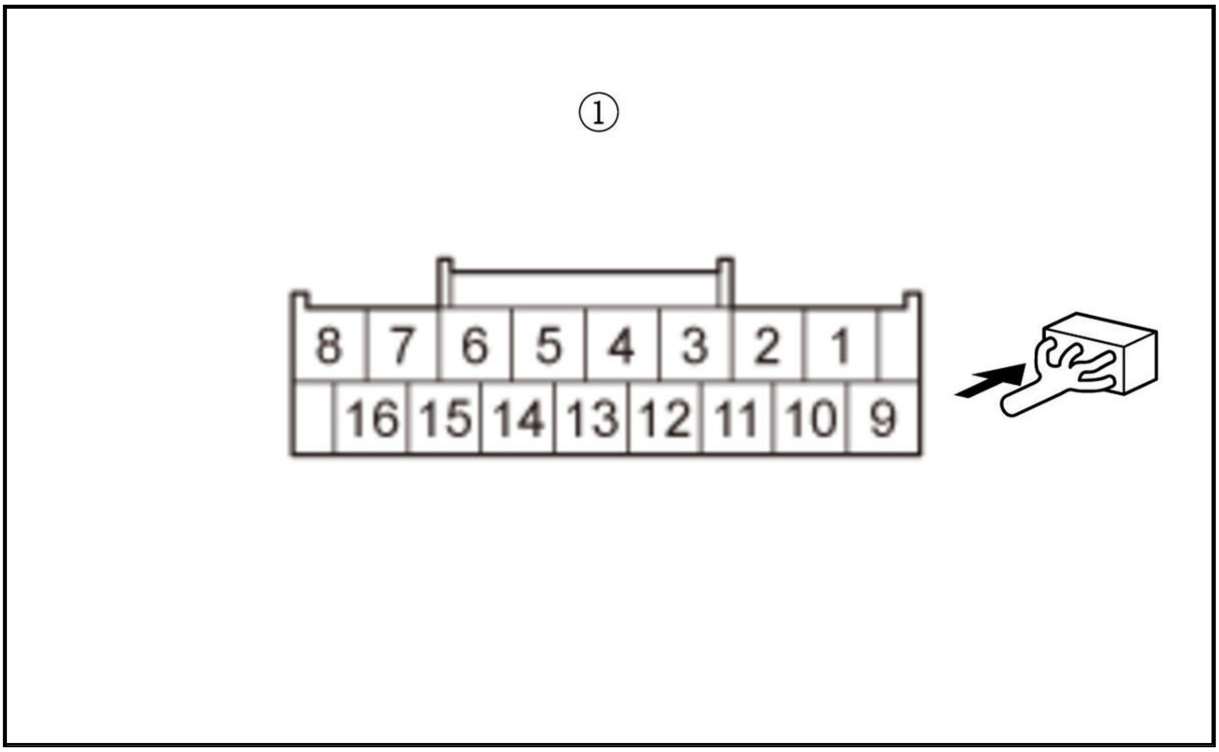
DTC	Connector
-	CAN gateway 16P connector

DTC	Connector
U0122	VSA modulator-control unit 46P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0122	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	VSA modulator-control unit 46P connector	No. 46
	F-CAN C_L		No. 13		No. 34



Is there 1.0 Ω or less?

YES

The F-CAN C_H wire and the F-CAN C_L wire are OK. According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0122	VSA modulator-control unit

NO

Repair an open in F-CAN C_H or F-CAN C_L wire.

9. Open wire check (EP-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

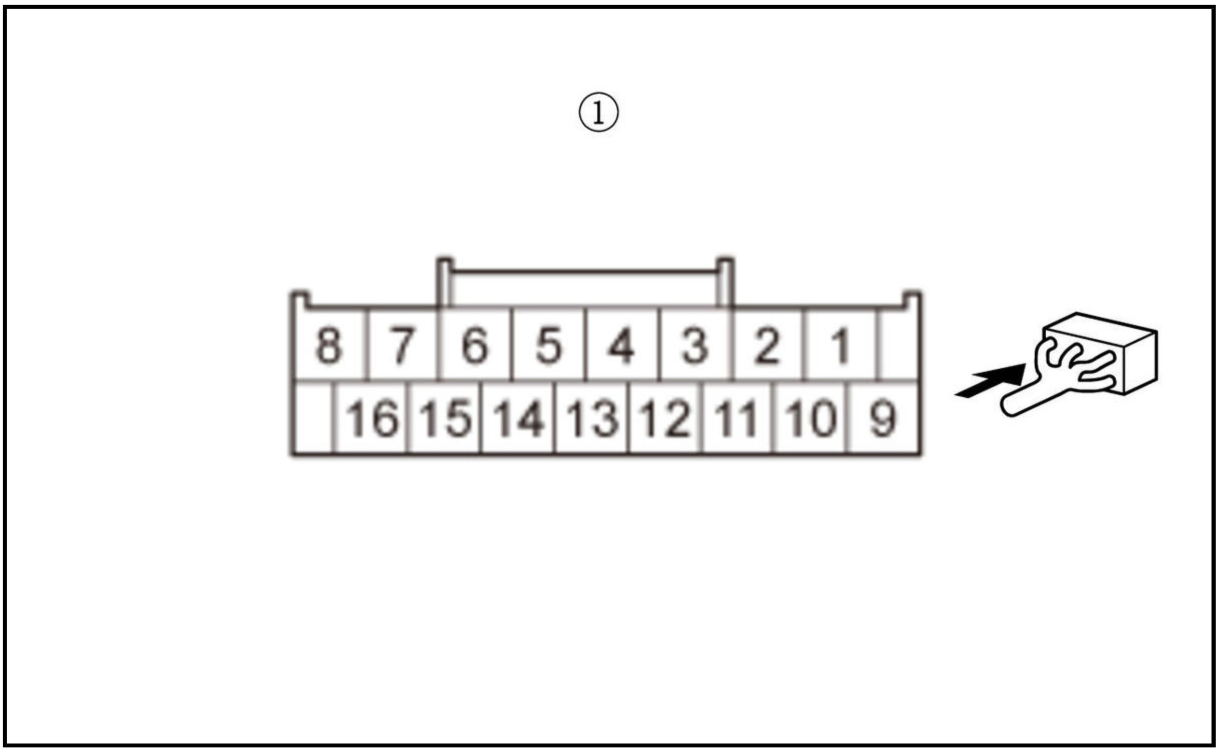
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0100	PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	PCM connector A (50P)	No. 21
	EP-CAN A_L		No. 8		No. 20



Is there 1.0 Ω or less?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK. According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	PCM

NO

Repair an open in EP-CAN A_H or EP-CAN A_L wire.

DTC U1280 (BODY CONTROL MODULE)

DTC U1280 : B-CAN communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

   Is DTC U1280 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. B-CAN related units check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the appropriate connector at each control unit in the table one at a time. Clear the DTC, then recheck for DTCs after each unit is disconnected.

Control Unit	Connector
Audio unit	Connector A (24P)
Audio-navigation unit	Connector A (24P)
Automatic lighting control unit-sensor	5P connector
BSI radar unit	6P connector
Climate control unit	Connector A (32P)
Front seat heater control unit	24P connector
Gauge control module	Connector A (32P)
Parking and back-up sensor control unit	16P connector
Power seat control unit	Connector A (20P)
Power tailgate control unit	Connector A (24P)
Power window master switch	37P connector
Relay control module	Connector A (6P)

Control Unit	Connector
Wireless charger	7P connector

DTC Description	DTC
U1280 B-CAN communication bus line error (BUS-OFF)	B

Is DTC U1280 indicated with each individual unit disconnected?

YES

Leave the connectors disconnected, and go to step 3.

NO

Replace the control unit that was disconnected when DTC U1280 did not reset.

3. Shorted wire check (B-CAN lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected
Test point 1	**Body control module connector B (36P) No. 20**
Test point 2	Body ground

Test point 1	**Body control module connector B (36P) No. 21**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Go to step 4.

NO

Repair a short to ground in the B-CAN wires.

4. Shorted wire check (B-CAN_L to B-CAN_H line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected
Test point 1	**Body control module connector B (36P) No. 20**
Test point 2	**Body control module connector B (36P) No. 21**

Is there 1.0 MΩ or more?

YES

The B-CAN_L to B-CAN_H wire is OK. **Replace the body control module** .

NO

Repair a short in the B-CAN_L to B-CAN_H wire.

DTC U128D, U1291 (BODY CONTROL MODULE)

DTC U128D : BCM lost communication with gauge control module

DTC U1291 : BCM lost communication with relay control module

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U128D BCM lost communication with gauge control module	B
U1291 BCM lost communication with relay control module	B

DTC (Body Control Module)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U128D BCM lost communication with gauge control module	B
U1291 BCM lost communication with relay control module	B

   Are any DTCs indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the receiving control unit connector.

Body control module connector B (36P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U128D	Gauge control module connector A (32P)
U1291	Relay control module connector A (6P)

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Body control module connector B (36P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U128D	B-CAN_H	**Body control module connector B (36P)**	No. 20	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 21		No. 31
U1291	B-CAN_H	**Body control module connector B (36P)**	No. 20	**Relay control module connector A (6P)**	No. 2
	B-CAN_L		No. 21		No. 3

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK. Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U128D	**Gauge control module**
U1291	**Relay control module**

NO

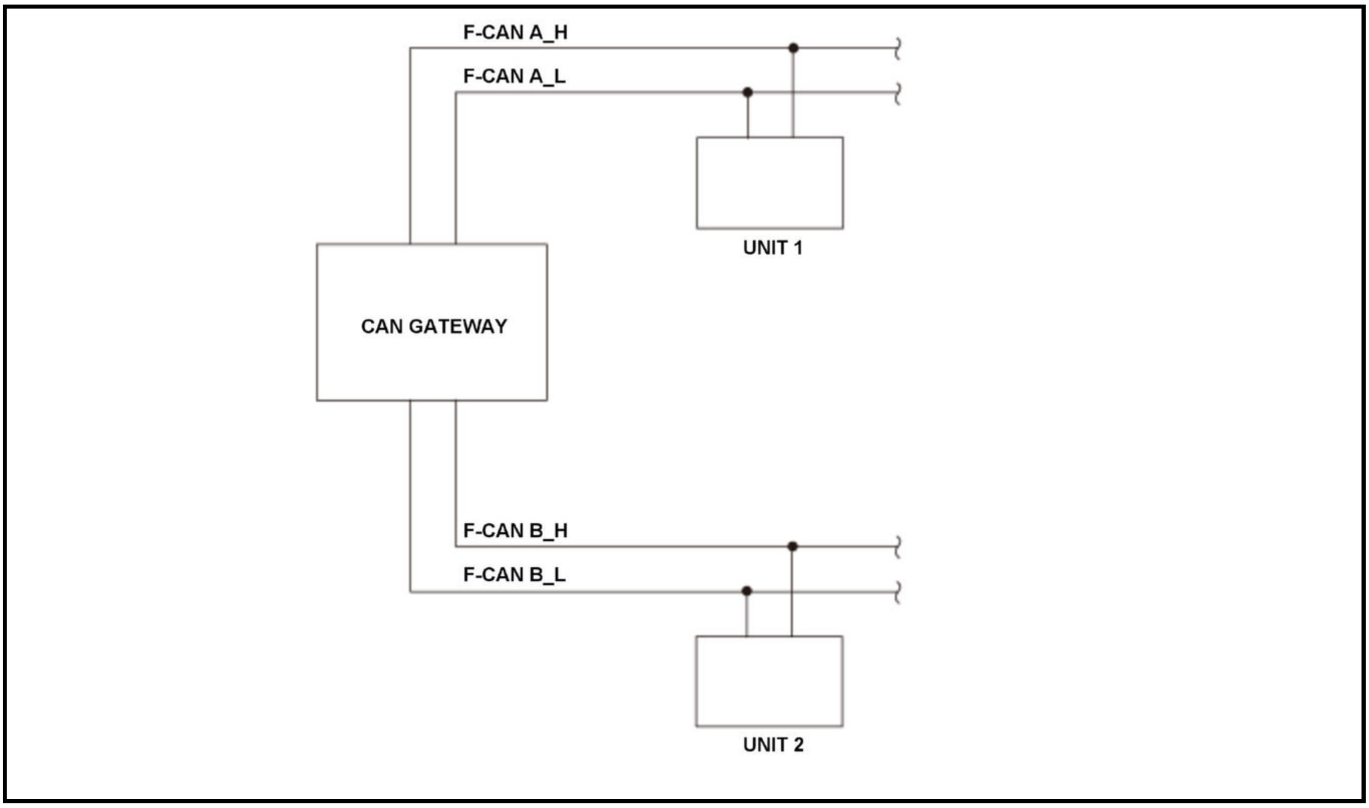
Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

ADVANCED DIAGNOSTICS

DTC U0029-00 (CAN GATEWAY)

DTC U0029-00: CAN Gateway F-CAN ch A Bus Off

General Description



The CAN gateway performs self-diagnosis to detect the state where the CAN frame cannot be sent due to failure in the F-CAN line. If the bus-off occurs due to open and short circuit in the F-CAN line is detected for a prescribed time, the CAN gateway detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 seconds or more
DTC Type	One drive cycle, MIL on or off (CAN gateway does not output MIL on/off request)

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage	10 V	-

Condition	Minimum	Maximum
[BATTERY]		

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The F-CAN A line bus-off continues for at least 1 seconds.
- The CAN frame transmission to the F-CAN A line does not complete within 1 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CAN gateway F-CAN A_H line open (include connector loose connection or disconnection)
- CAN gateway F-CAN A_L line open (include connector loose connection or disconnection)
- CAN gateway F-CAN A_H line short to CAN gateway F-CAN A_L line
- CAN gateway F-CAN A_H line short to ground
- CAN gateway F-CAN A_L line short to ground
- CAN gateway internal circuit short
- Unit communicating on F-CAN A failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the CAN gateway memory.

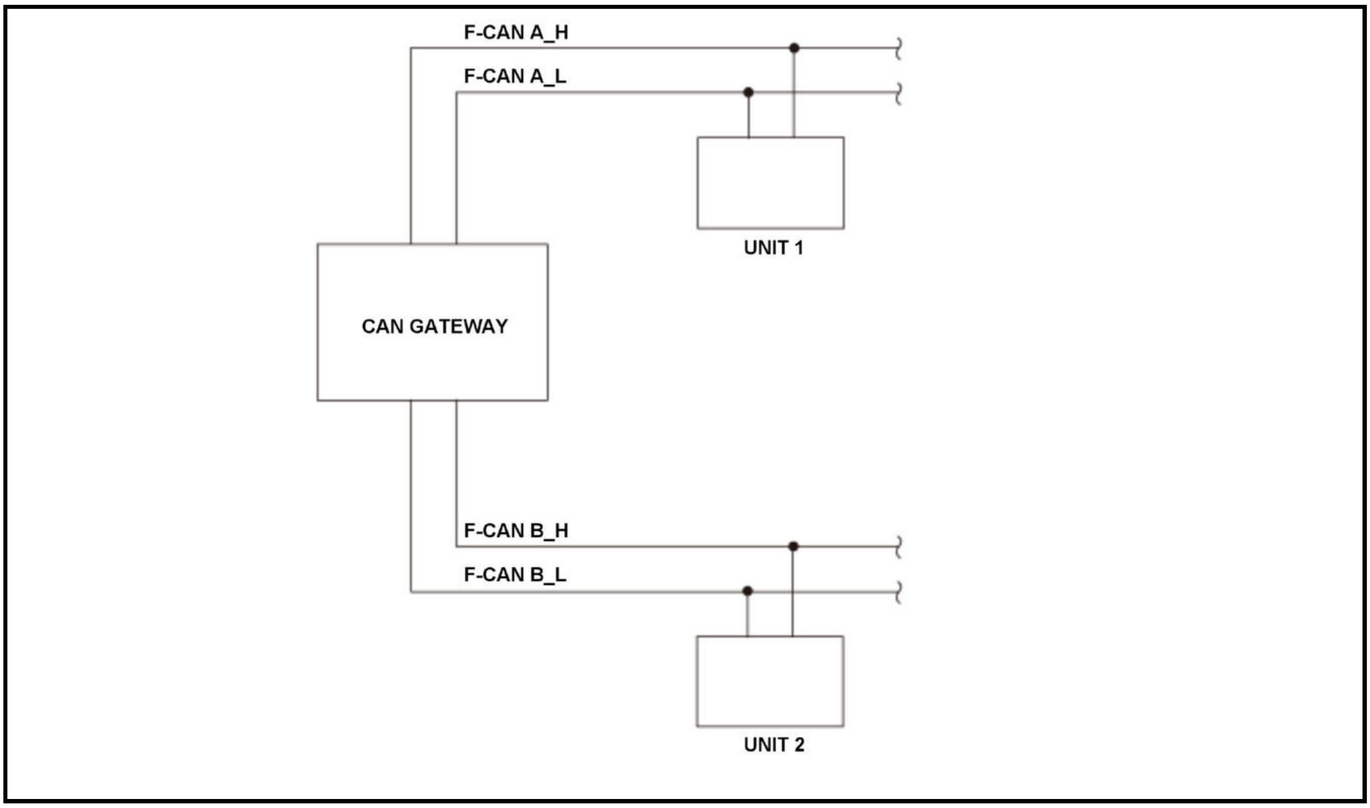
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U0047-00 (CAN GATEWAY)

DTC U0047-00: CAN Gateway F-CAN ch B Bus Off

General Description



The CAN gateway performs self-diagnosis to detect the state where the CAN frame cannot be sent due to failure in the F-CAN line. If the bus-off occurs due to open and short circuit in the F-CAN line is detected for a prescribed time, the CAN gateway detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 seconds or more
DTC Type	One drive cycle, MIL on or off (CAN gateway does not output MIL on/off request)

Enable Conditions

Condition	Minimum	Maximum
Elapsed time since the 12 volt battery voltage reaches to a specified value after the vehicle condition is turned to the ON mode	3 seconds	-
12 volt battery voltage [BATTERY]	10 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The F-CAN B line bus-off continues for at least 1 seconds.
- The CAN frame transmission to the F-CAN B line does not complete within 1 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CAN gateway F-CAN B_H line open (include connector loose connection or disconnection)
- CAN gateway F-CAN B_L line open (include connector loose connection or disconnection)
- CAN gateway F-CAN B_H line short to CAN gateway F-CAN B_L line
- CAN gateway F-CAN B_H line short to ground
- CAN gateway F-CAN B_L line short to ground
- CAN gateway internal circuit short
- Unit communicating on F-CAN B failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the CAN gateway memory.

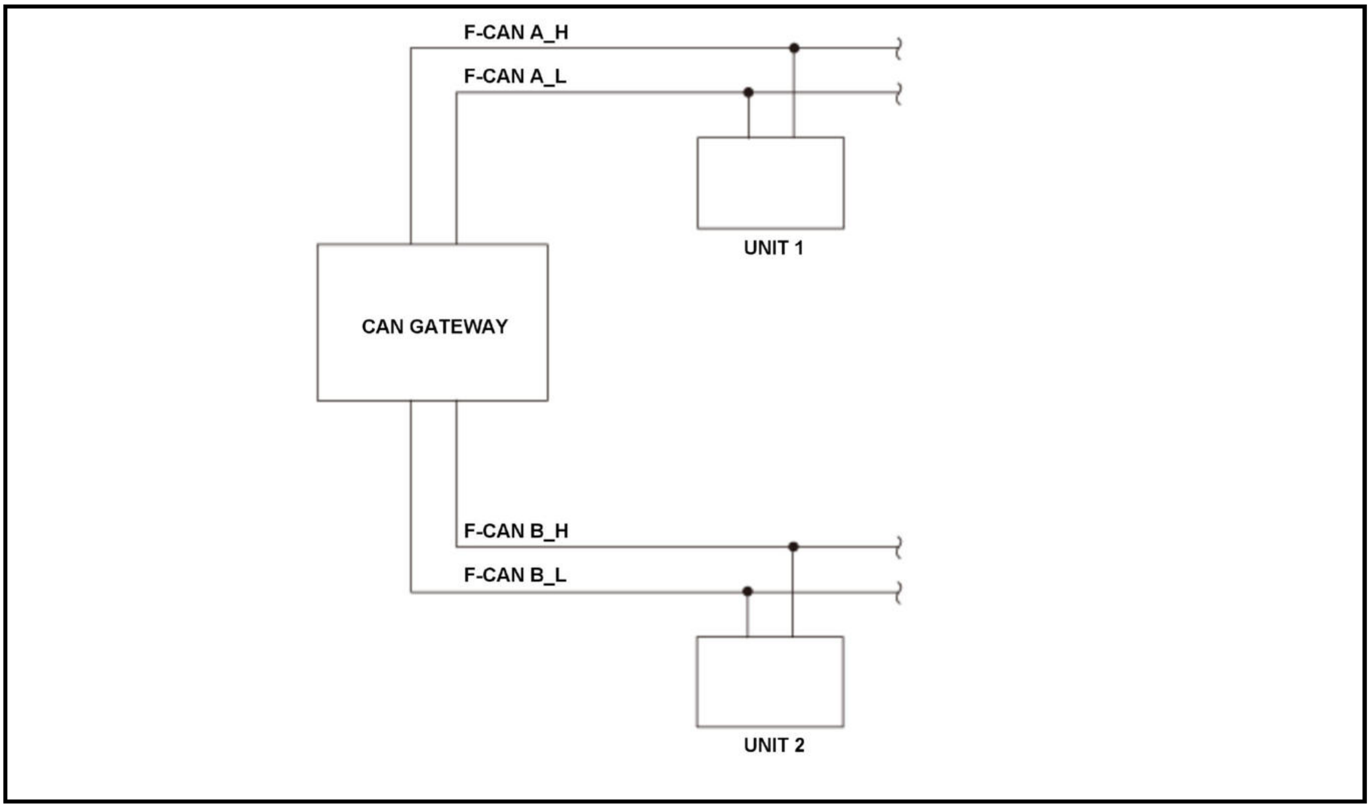
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U3000-49 (CAN GATEWAY)

DTC U3000-49: CAN Gateway Internal Failure

General Description



The CAN gateway performs on-board self-diagnosis to prevent transferring erroneous information when there is a malfunction in the CPU. If the CAN gateway detects a malfunction in the CPU, a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Immediately after the vehicle is turned to the ON mode, Continuous

Sequence	None
Duration	-
DTC Type	One drive cycle, MIL on or off (CAN gateway does not output MIL on/off request)

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	9.5 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

The CAN gateway detects a malfunction in the CPU.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CAN gateway internal failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the CAN gateway memory.

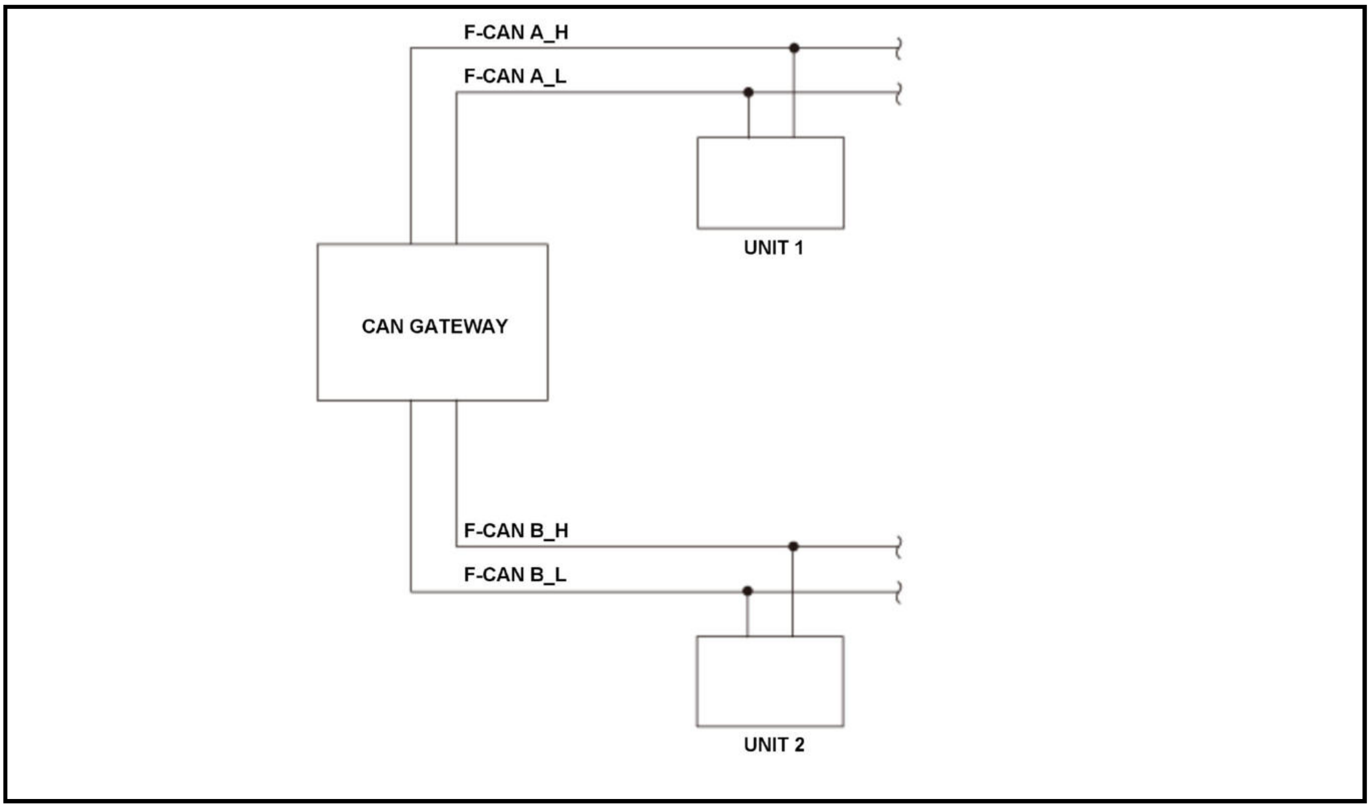
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U3000-51 (CAN GATEWAY)

DTC U3000-51: CAN Gateway Programming Error

General Description



The CAN gateway has a reprogramming function. The CAN gateway could not be able to operate normally if the reprogramming is failed. If the CAN gateway reprogramming fails, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Immediately after the vehicle is turned to the ON mode
Sequence	None
Duration	-
DTC Type	One drive cycle, MIL on or off (CAN gateway does not output MIL on/off request)

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [BATTERY]	8 V	-
Vehicle	ON mode	

[ ]: HDS Parameter

Malfunction Threshold

The CAN gateway reprogramming is failed.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CAN gateway internal software reprogramming failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, a Pending DTC, a Confirmed DTC, and the freeze data are stored in the CAN gateway memory.

Conditions for clearing the DTC

When the CAN gateway reprogramming is completed, DTC is cleared.

When the CAN gateway reprogramming is completed, DTC is cleared.

TROUBLESHOOTING

DTC U0029-00 (CAN GATEWAY)

DTC U0029-00 : CAN Gateway F-CAN ch A Bus Off

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- Information marked with an asterisk (*) applies to the CAN gateway (16P connector type).

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

DTC (CAN gateway)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Shorted unit check (PCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Clear the DTC with the HDS.

-7. Turn the vehicle to the OFF (LOCK) mode.

-8. Turn the vehicle to the ON mode, and wait 6 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

3. Shorted unit check (TCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

TCM 50P connector

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 4.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good TCM** .

4. Shorted unit check (VSA modulator-control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 5.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the known-good VSA modulator-control unit** .

5. Shorted unit check (electric brake booster)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open, then wait 3 minutes.

NOTE: Do not close the driver's door.

-2. Disconnect the following connector.

Electric brake booster 26P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 6.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the electric brake booster** .

6. Shorted unit check (body control module)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Body control module connector B (36P)

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode.

   -6. Turn the vehicle to the ON mode, and wait 6 seconds.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 7.

NO

Substitute a known-good body control module .

7. Shorted unit check (gauge control module)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Gauge control module connector A (32P)

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode.

   -6. Turn the vehicle to the ON mode, and wait 6 seconds.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 8.

NO

Substitute a known-good gauge control module .

8. Shorted wire check (F-CAN A_H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

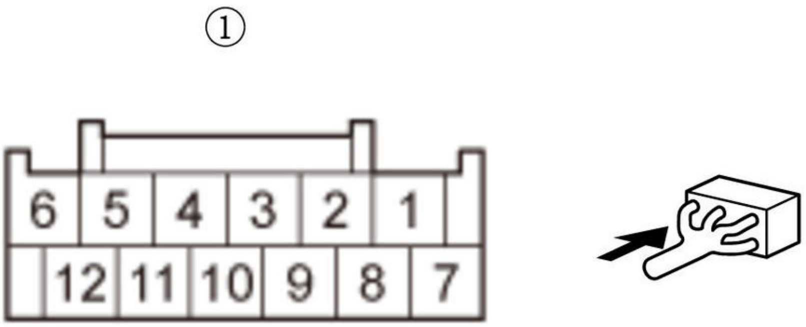
-2. Disconnect the following connector.

CAN gateway 12P (16P)* connector

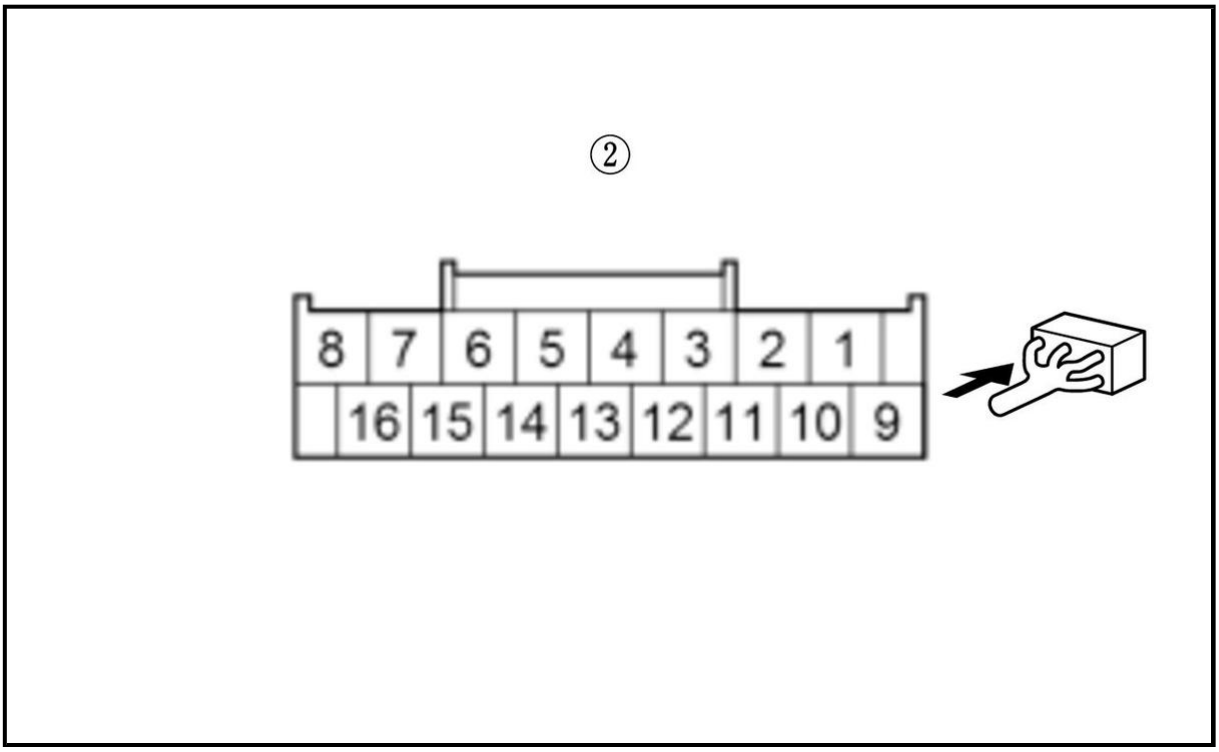
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	TCM 50P connector: disconnected
	VSA modulator-control unit 46P connector
	Electric brake booster 26P connector: disconnected
	Body control module connector B (36P): disconnected
	Gauge control module connector A (32P): disconnected
	CAN gateway 12P (16P)* connector: disconnected
Test point 1	CAN gateway 12P connector (female terminal) No. 3: ① CAN gateway 16P connector (female terminal) No. 3: ② *
Test point 2	Body ground

12P Connector Type



16P Connector Type*



Is there 1 MΩ or more?

YES

Go to step 9.

NO

Repair a short in the F-CAN A_H wire between the CAN gateway and the connected units.

9. Shorted wire check (F-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	TCM 50P connector: disconnected
	VSA modulator-control unit 46P connector
	Electric brake booster 26P connector: disconnected
	Body control module connector B (36P): disconnected
	Gauge control module connector A (32P): disconnected
	CAN gateway 12P (16P)* connector: disconnected

Test point 1	CAN gateway 12P connector (female terminal) No. 9: ① CAN gateway 16P connector (female terminals) No. 11: ② *
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 10.

NO

Repair a short in the F-CAN A_L wire between the CAN gateway and the connected units.

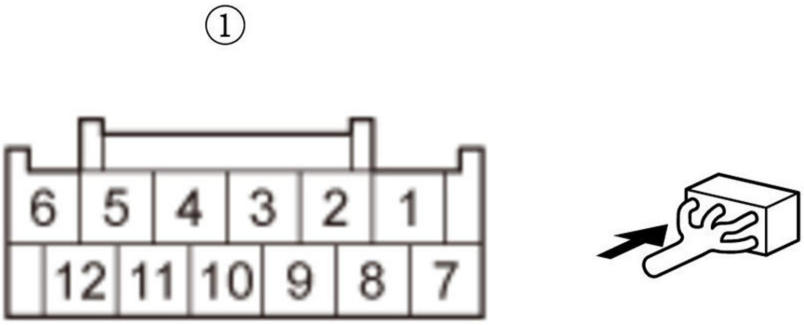
10. Shorted wire check (F-CAN A_H line to F-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

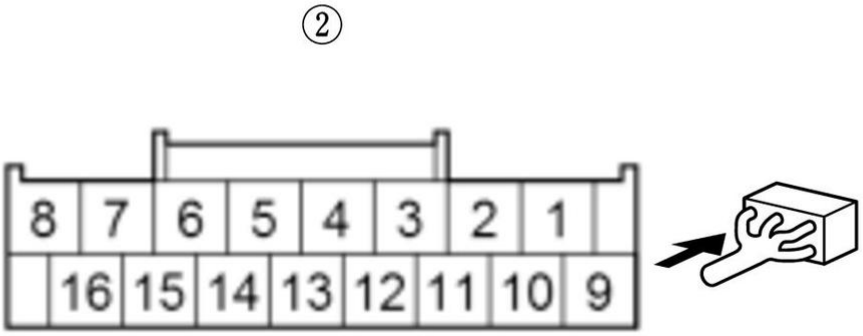
Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	TCM 50P connector: disconnected

	VSA modulator-control unit 46P connector
	Electric brake booster 26P connector: disconnected
	Body control module connector B (36P): disconnected
	Gauge control module connector A (32P): disconnected
Test point 1	CAN gateway 12P (16P)* connector: disconnected
	CAN gateway 12P connector (female terminal) No. 3: ① CAN gateway 16P connector (female terminal) No. 3: ② *
Test point 2	CAN gateway 12P connector (female terminal) No. 9: ① CAN gateway 16P connector (female terminals) No. 11: ② *

12P Connector Type



16P Connector Type*



Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good real time CAN gateway** .

NO

Repair a short in the F-CAN A_H wire to the F-CAN A_L wire between CAN gateway terminals No. 3 and No. 9 (No. 3 and No. 11)*.

DTC U0047-00 (CAN GATEWAY)

DTC U0047-00 : CAN Gateway F-CAN ch B Bus Off

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.
- Information marked with an asterisk (*) applies to the CAN gateway (16P connector type).

*2: Without navigation

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

DTC (CAN gateway)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

   Is DTC U0047-00 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Shorted unit check (PCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Clear the DTC with the HDS.

-7. Turn the vehicle to the OFF (LOCK) mode.

-8. Turn the vehicle to the ON mode, and wait 6 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

3. Shorted unit check (VSA modulator-control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 4.

NO

Replace the VSA modulator-control unit .

4. Shorted unit check (ANC/active sound control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ANC/active sound control unit 20P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 5.

NO

Substitute a known-good ANC/active sound control unit .

5. Shorted unit check (audio-navigation unit *1 audio unit *2):-1.

Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit *1 Audio unit *2 connector E (16P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 6.

NO

Substitute a known-good audio unit .

6. Shorted unit check (SRS unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

SRS unit connector A (39P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 7.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good SRS unit** .

7. Shorted unit check (EPS control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 8.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good EPS control unit** .

8. Shorted unit check (electric brake booster)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open, then wait 3 minutes.

NOTE: Do not close the driver's door.

-2. Disconnect the following connector.

Electric brake booster 26P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 9.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the electric brake booster** .

9. Shorted unit check (real time AWD control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Real time AWD control unit 24P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 10.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good real time AWD control unit** .

10. Shorted unit check (multipurpose camera unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Multipurpose camera unit 12P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 11.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good multipurpose camera unit** .

11. Shorted unit check (millimeter wave radar)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Millimeter wave radar 8P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 12.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good millimeter wave radar** .

12. Shorted wire check (F-CAN B_H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

CAN gateway 12P (16P)* connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	VSA modulator-control unit 46P connector: disconnected
	ANC/active sound control unit 20P connector: disconnected
	Audio-navigation unit *1 Audio unit *2 connector E (16P): disconnected
	SRS unit connector A (39P): disconnected
	EPS control unit connector B (6P): disconnected
	Electric brake booster 26P connector: disconnected
	Real time AWD control unit 24P connector: disconnected
	Multipurpose camera unit 12P connector: disconnected
	Millimeter wave radar 8P connector: disconnected
B	CAN gateway 12P (16P)* connector: disconnected

Is there 1 MΩ or more?

YES

Go to step 13.

NO

Repair a short in the F-CAN B_H wire between the CAN gateway and the connected units.

13. Shorted wire check (F-CAN B_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	VSA modulator-control unit 46P connector: disconnected

	ANC/active sound control unit 20P connector: disconnected
	Audio-navigation unit *1 Audio unit *2 connector E (16P): disconnected

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good real time CAN gateway** .

NO

Repair a short in the F-CAN B_H wire to the F-CAN B_L wire between CAN gateway terminals No. 5 and No. 12 (No. 6 and No. 14)*.

DTC U3000-49 (CAN GATEWAY)

DTC U3000-49 : CAN Gateway Internal Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	DTC
U3000-49 CAN Gateway Internal Failure	B

DTC (CAN gateway)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U3000-49 CAN Gateway Internal Failure	B

   Is DTC U3000-49 indicated?

   YES

   Replace the CAN gateway .

   NO

   Intermittent failure, the system is OK at this time.

DTC U3000-51 (CAN GATEWAY)

DTC U3000-51 : CAN Gateway Programming Error

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	DTC
U3000-51 CAN Gateway Programming Error	B

DTC (CAN gateway)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U3000-51 CAN Gateway Programming Error	B

   Is DTC U3000-51 indicated?

YES

Reprogram the CAN gateway .

NO

Intermittent failure, the system is OK at this time.

TROUBLESHOOTING

DTC U0029-00 (CAN GATEWAY)

DTC U0029-00 : CAN Gateway F-CAN ch A Bus Off

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

DTC (CAN GATEWAY)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted unit check (PCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

3. Shorted unit check (SBW shifter control module)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

SBW shifter control module 20P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 4.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good SBW shifter control module** .

4. Shorted unit check (PCU)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

PCU 33P connector

NOTE: Before disconnecting the PCU connector, **do the 12 volt battery terminal disconnection procedure** , and **turn off the service plug** .

-3. **Do the 12 volt battery terminal reconnection procedure** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 5.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCU** .

5. Shorted unit check (battery condition monitor module)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

NOTE: Before disconnecting the battery condition monitor module connector, **do the 12 volt battery terminal disconnection procedure** , and **turn off the service plug** .

Battery condition monitor module connector E (32P)

-3. **Do the 12 volt battery terminal reconnection procedure** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B

Is DTC U0029-00 indicated?

YES

Go to step 6.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good battery condition monitor module** .

6. Shorted wire check (F-CAN A_H line)

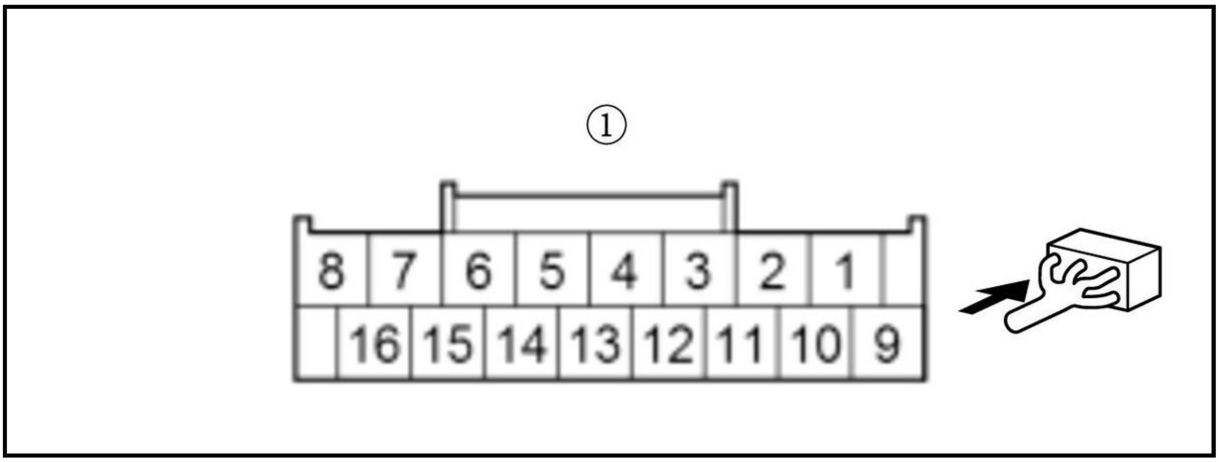
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	SBW shifter control module 20P connector: disconnected
B	PCU 33P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 7.

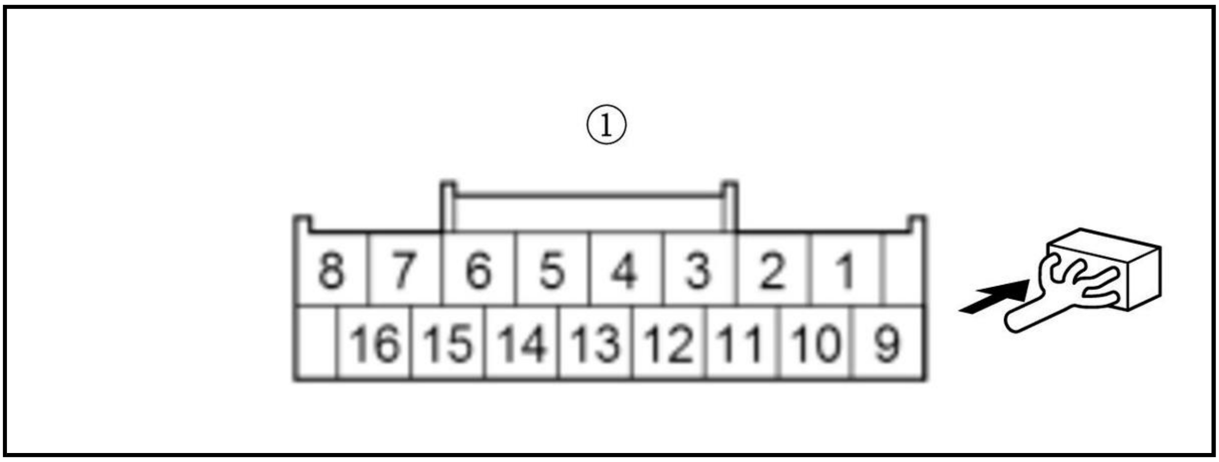
NO

Repair a short in the F-CAN A_H wire between the CAN gateway and the connected units.

7. Shorted wire check (F-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	SBW shifter control module 20P connector: disconnected
B	PCU 33P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 8.

NO

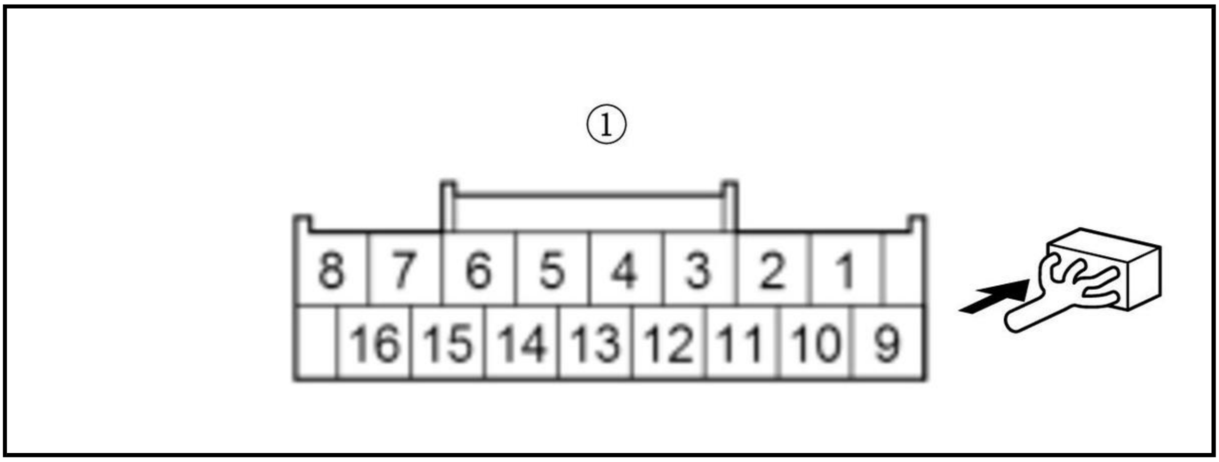
Repair a short in the F-CAN A_L wire between the CAN gateway and the connected units.

8. Shorted wire check (F-CAN A_H line to F-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	SBW shifter control module 20P connector: disconnected
B	PCU 33P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①

Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good CAN gateway .

NO

Repair a short in the F-CAN A_H wire to the F-CAN A_L wire between CAN gateway terminals No. 3 and No. 11.

DTC U0038-00 (CAN GATEWAY)

DTC U0038-00 : CAN Gateway F-CAN ch E Bus Off

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC
U0038-00 CAN Gateway F-CAN ch E Bus Off	B

DTC (CAN GATEWAY)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 6 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	DTC
U0038-00 CAN Gateway F-CAN ch E Bus Off	B

Is DTC U0038-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted unit check (PCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	DTC
U0038-00 CAN Gateway F-CAN ch E Bus Off	B

Is DTC U0038-00 indicated?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

3. Shorted unit check (SBW shifter control module)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

SBW shifter control module 20P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	DTC
U0038-00 CAN Gateway F-CAN ch E Bus Off	B

Is DTC U0038-00 indicated?

YES

Go to step 4.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good SBW shifter control module** .

4. Shorted unit check (park pawl actuator driver unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Park pawl actuator driver unit 26P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	DTC
U0038-00 CAN Gateway F-CAN ch E Bus Off	B

Is DTC U0038-00 indicated?

YES

Go to step 5.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good park pawl actuator driver unit** .

5. Shorted unit check (PCU)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

PCU 33P connector

NOTE: Before disconnecting the PCU connector, **do the 12 volt battery terminal disconnection procedure** , and **turn off the service plug** .

-3. **Do the 12 volt battery terminal reconnection procedure** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	DTC
U0038-00 CAN Gateway F-CAN ch E Bus Off	B

Is DTC U0038-00 indicated?

YES

Go to step 6.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCU** .

6. Shorted unit check (battery condition monitor module)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Battery condition monitor module connector E (32P)

NOTE: Before disconnecting the battery condition monitor module connector, **do the 12 volt battery terminal disconnection procedure** , and **turn off the service plug** .

-3. **Do the 12 volt battery terminal reconnection procedure** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	DTC
U0038-00 CAN Gateway F-CAN ch E Bus Off	B

Is DTC U0038-00 indicated?

YES

Go to step 7.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good battery condition monitor module** .

7. Shorted wire check (EP-CAN A_H line)

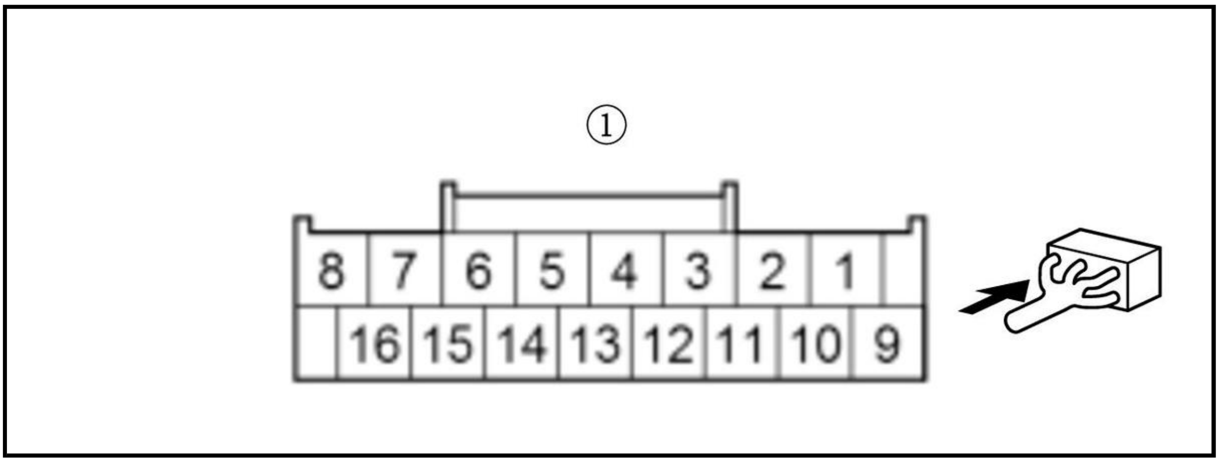
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	SBW shifter control module 20P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
B	PCU 33P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 16: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 8.

NO

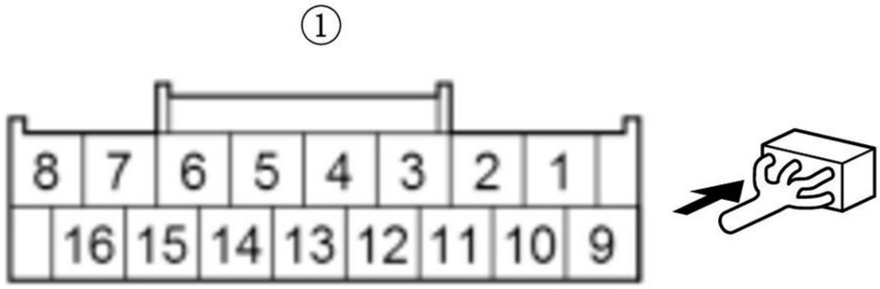
Repair a short in the EP-CAN A_H wire between the CAN gateway and the connected units.

8. Shorted wire check (EP-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	SBW shifter control module 20P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
B	PCU 33P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 8: ①

Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 9.

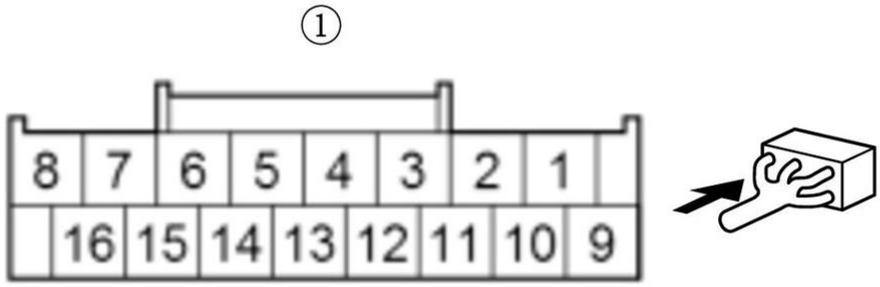
NO

Repair a short in the EP-CAN A_L wire between the CAN gateway and the connected units.

9. Shorted wire check (EP-CAN A_H line to EP-CAN A_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	SBW shifter control module 20P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
B	PCU 33P connector: disconnected
B	Battery condition monitor module connector E (32P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 8: ①
Test point 2	CAN gateway 16P connector (female terminals) No. 16: ①



Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good CAN gateway .

NO

Repair a short in the EP-CAN A_H wire to the EP-CAN A_L wire between CAN gateway terminals No. 8 and No. 16.

DTC U0047-00 (CAN GATEWAY)

DTC U0047-00 : CAN Gateway F-CAN ch B Bus Off

NOTE: Before you troubleshoot, review the general troubleshooting information .

*1: With navigation
*2: Without navigation

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

DTC (CAN GATEWAY)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Shorted unit check (PCM)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

3. Shorted unit check (electric servo brake control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric servo brake control unit 22P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES (with display audio)

Go to step 4.

YES (without display audio)

Go to step 5.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original electric servo brake control unit** .

4. Shorted unit check (audio-navigation unit *1, audio unit *2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Audio-navigation unit *1, Audio unit *2 connector E (16P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 5.

NO

Substitute a known-good audio unit .

5. Shorted unit check (ANC/active sound control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ANC/active sound control unit 20P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

Is DTC U0047-00 indicated?

YES

Go to step 6.

NO

Substitute a known-good ANC/active sound control unit .

6. Shorted unit check (acoustic vehicle alerting control unit)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Acoustic vehicle alerting control unit 12P connector

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode.

   -6. Turn the vehicle to the ON mode, and wait 6 seconds.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

   Is DTC U0047-00 indicated?

   YES

   Go to step 7.

   NO

   Substitute a known-good acoustic vehicle alerting control unit .

7. Shorted unit check (VSA modulator-control unit)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

VSA modulator-control unit 46P connector

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode.

   -6. Turn the vehicle to the ON mode, and wait 6 seconds.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

   Is DTC U0047-00 indicated?

   1. **YES**

      - Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good body control module** .

- If the original body control module is OK, go to step 8.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the VSA modulator-control unit** .

8. Shorted wire check (F-CAN B_H line)

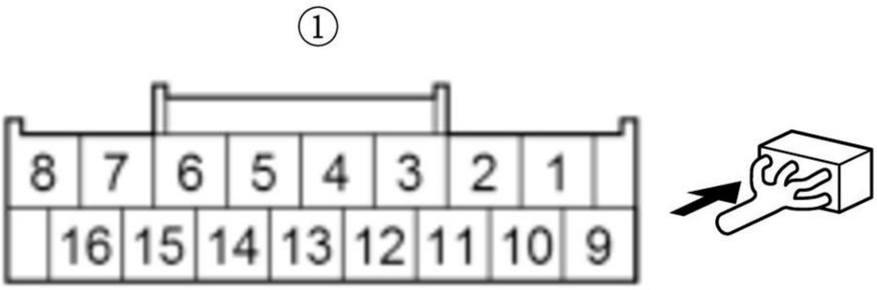
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector B (36P)
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Electric servo brake control unit 22P connector: disconnected
B	Audio-navigation unit *1, Audio unit *2 connector E (16P) (with display audio): disconnected
B	ANC/active sound control unit 20P connector: disconnected
B	Acoustic vehicle alerting control unit 12P connector: disconnected
B	VSA modulator-control unit 46P connector: disconnected
B	Body control module connector B (36P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 9.

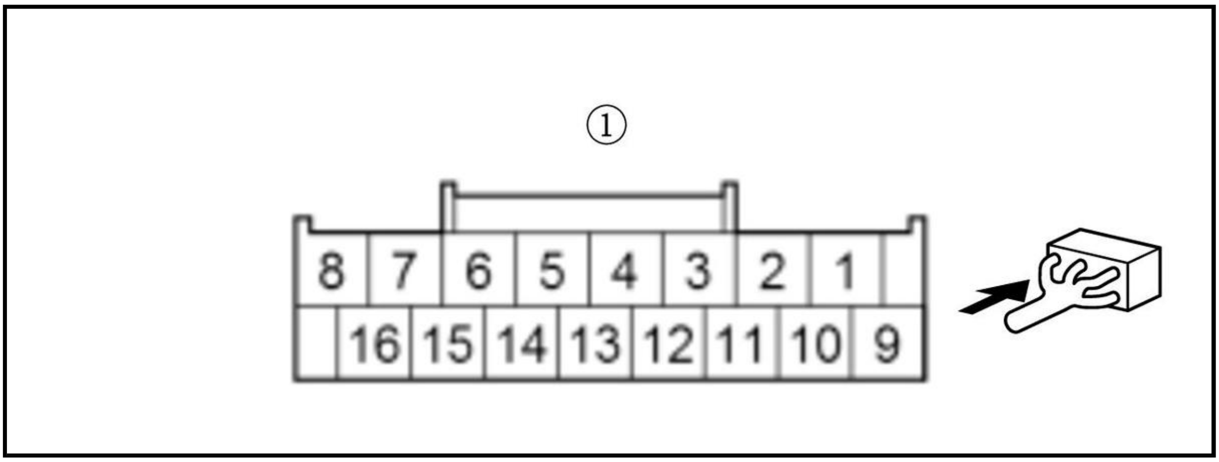
NO

Repair a short in the F-CAN B_H wire between the CAN gateway and the connected units.

9. Shorted wire check (F-CAN B_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Electric servo brake control unit 22P connector: disconnected
B	Audio-navigation unit *1, Audio unit *2 connector E (16P) (with display audio): disconnected
B	ANC/active sound control unit 20P connector: disconnected
B	Acoustic vehicle alerting control unit 12P connector: disconnected
B	VSA modulator-control unit 46P connector: disconnected
B	Body control module connector B (36P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 10.

NO

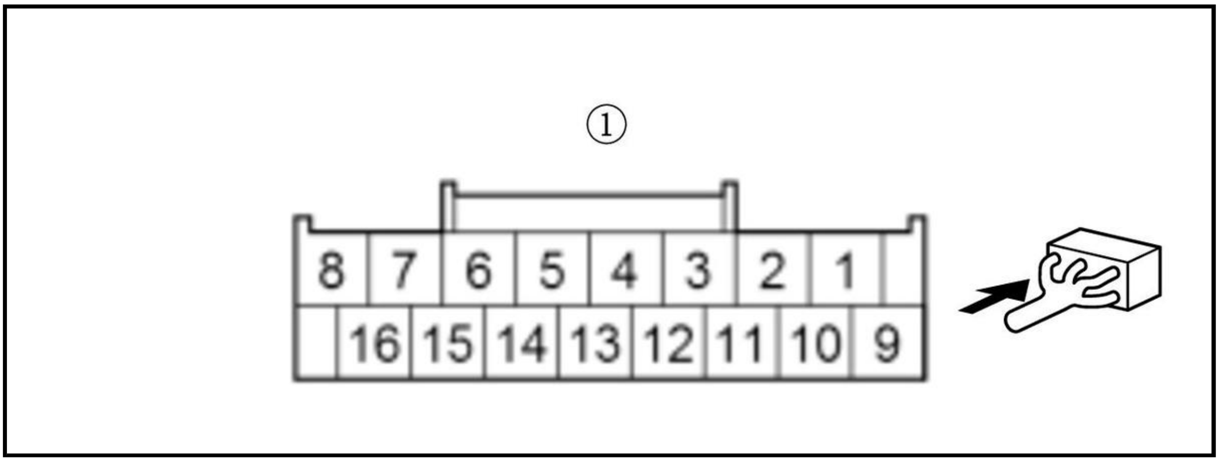
Repair a short in the F-CAN B_L wire between the CAN gateway and the connected units.

10. Shorted wire check (F-CAN B_H line to F-CAN B_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Electric servo brake control unit 22P connector: disconnected
B	Audio-navigation unit *1, Audio unit *2 connector E (16P) (with display audio): disconnected
B	ANC/active sound control unit 20P connector: disconnected
B	Acoustic vehicle alerting control unit 12P connector: disconnected
B	VSA modulator-control unit 46P connector: disconnected
B	Body control module connector B (36P): disconnected
B	CAN gateway 16P connector: disconnected

Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	CAN gateway 16P connector (female terminals) No. 14: ①



Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good CAN gateway** .

NO

Repair a short in the F-CAN B_H wire to the F-CAN B_L wire between CAN gateway terminals No. 6 and No. 14.

DTC U0056-00 (CAN GATEWAY)

DTC U0056-00 : CAN Gateway F-CAN ch C Bus Off

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	DTC
U0056-00 CAN Gateway F-CAN ch C Bus Off	B

DTC (CAN GATEWAY)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U0056-00 CAN Gateway F-CAN ch C Bus Off	B

Is DTC U0056-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted unit check (EPS control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector B (6P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0056-00 CAN Gateway F-CAN ch C Bus Off	B

Is DTC U0056-00 indicated?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original EPS control unit** .

3. Shorted unit check (VSA modulator-control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

VSA modulator-control unit 46P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0056-00 CAN Gateway F-CAN ch C Bus Off	B

Is DTC U0056-00 indicated?

YES

Go to step 4.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the VSA modulator-control unit** .

4. Shorted unit check (electric servo brake control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric servo brake control unit 22P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0056-00 CAN Gateway F-CAN ch C Bus Off	B

Is DTC U0056-00 indicated?

YES

Go to step 5.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the electric servo brake control unit** .

5. Shorted unit check (multipurpose camera unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Multipurpose camera unit 12P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0056-00 CAN Gateway F-CAN ch C Bus Off	B

Is DTC U0056-00 indicated?

YES

Go to step 6.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good multipurpose camera unit** .

6. Shorted unit check (millimeter wave radar)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Millimeter wave radar 8P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0056-00 CAN Gateway F-CAN ch C Bus Off	B

Is DTC U0056-00 indicated?

YES

Go to step 7.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good millimeter wave radar** .

7. Shorted unit check (SRS unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

SRS unit connector A (39P)

NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.

-3. Do the 12 volt battery terminal reconnection procedure .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
U0056-00 CAN Gateway F-CAN ch C Bus Off	B

Is DTC U0056-00 indicated?

YES

Go to step 8.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good SRS unit .

8. Shorted wire check (F-CAN C_H line)

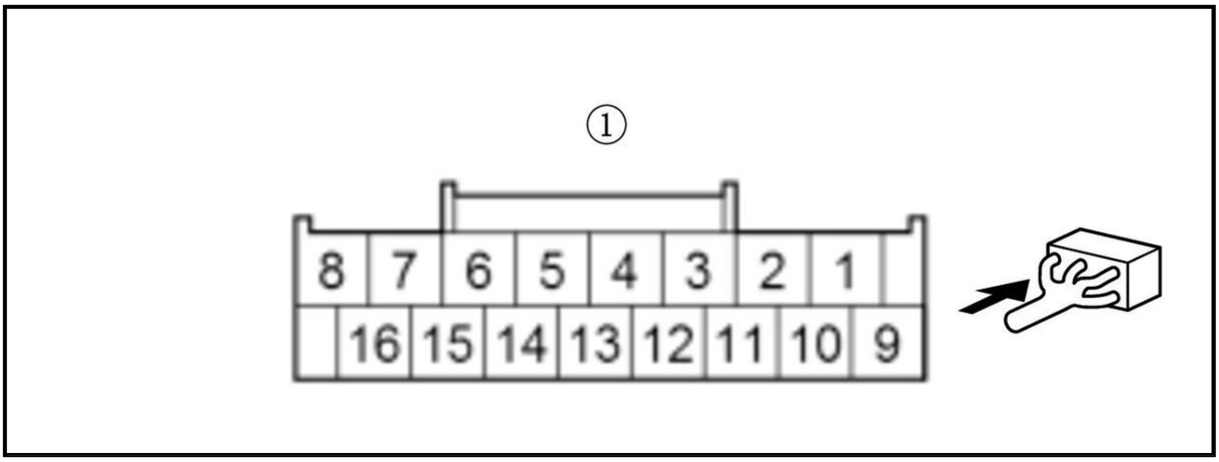
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	VSA modulator-control unit 46P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
B	Multipurpose camera unit 12P connector: disconnected
B	Millimeter wave radar 8P connector: disconnected
B	SRS unit connector A (39P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 9.

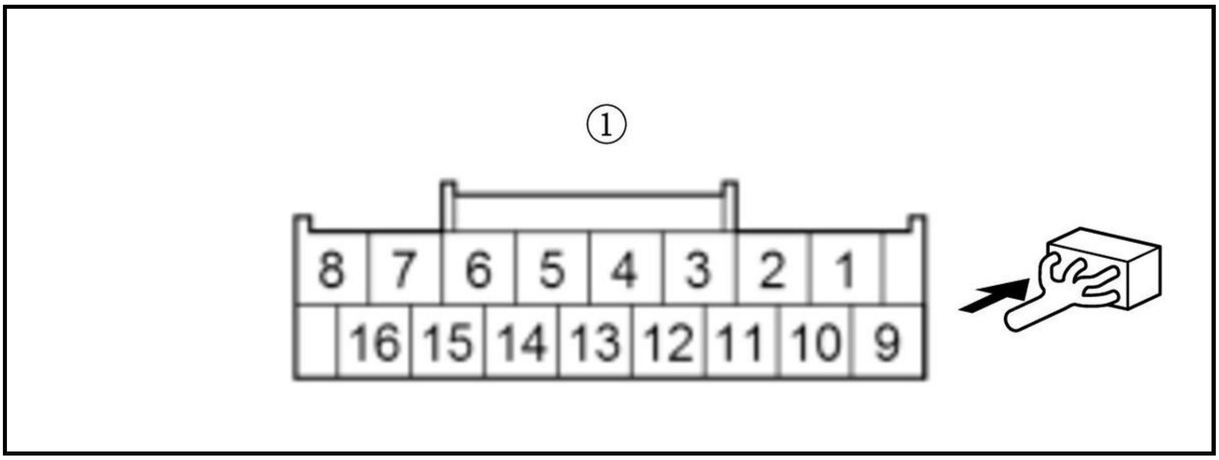
NO

Repair a short in the F-CAN C_H wire between the CAN gateway and the connected units.

9. Shorted wire check (F-CAN C_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	VSA modulator-control unit 46P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
B	Multipurpose camera unit 12P connector: disconnected
B	Millimeter wave radar 8P connector: disconnected
B	SRS unit connector A (39P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 13: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 10.

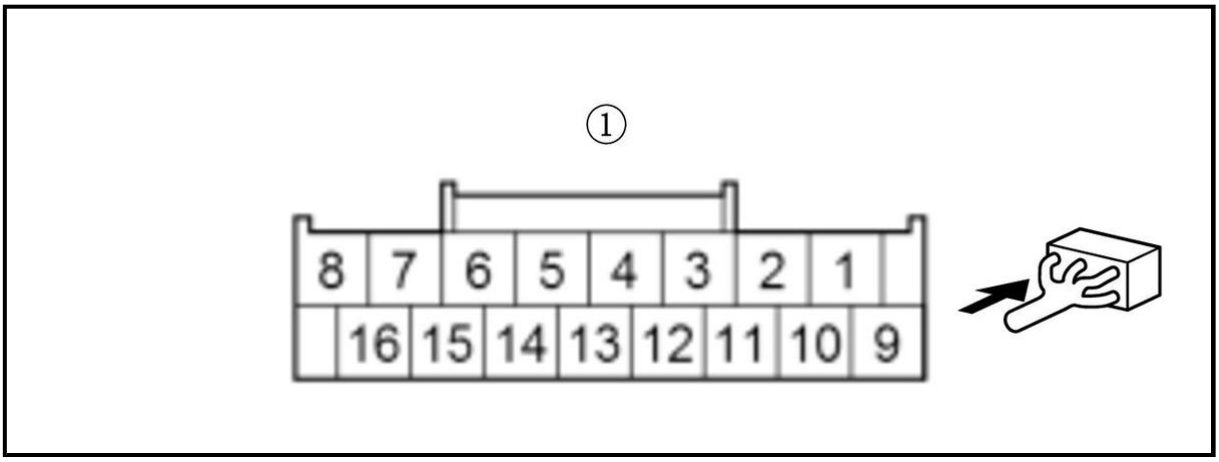
NO

Repair a short in the F-CAN C_L wire between the CAN gateway and the connected units.

10. Shorted wire check (F-CAN C_H line to F-CAN C_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	VSA modulator-control unit 46P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
B	Multipurpose camera unit 12P connector: disconnected
B	Millimeter wave radar 8P connector: disconnected
B	SRS unit connector A (39P): disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 5: ①
Test point 2	CAN gateway 16P connector (female terminals) No. 13: ①



Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good CAN gateway** .

NO

Repair a short in the F-CAN C_H wire to the F-CAN C_L wire between CAN gateway terminals No. 5 and No. 13.

DTC U0065-00 (CAN GATEWAY)

DTC U0065-00 : CAN Gateway F-CAN ch D Bus Off

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	DTC
U0065-00 CAN Gateway F-CAN ch D Bus Off	B

DTC (CAN GATEWAY)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 6 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	DTC
U0065-00 CAN Gateway F-CAN ch D Bus Off	B

Is DTC U0065-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted unit check (gauge control module)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for DTCs with the HDS.

DTC Description	DTC
U0065-00 CAN Gateway F-CAN ch D Bus Off	B

Is DTC U0065-00 indicated?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good gauge control module** .

3. Shorted unit check (electric A/C compressor)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric A/C compressor 4P connector

NOTE: Before disconnecting the electric A/C compressor connector, **do the 12 volt battery terminal disconnection procedure** , and **turn off the service plug** .

-3. **Do the 12 volt battery terminal reconnection procedure** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait 6 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
U0065-00 CAN Gateway F-CAN ch D Bus Off	B

Is DTC U0065-00 indicated?

YES

Go to step 4.

NO

Substitute a known-good electric A/C compressor .

4. Shorted unit check (real time AWD control unit)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Real time AWD control unit 24P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait 6 seconds.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	DTC
U0065-00 CAN Gateway F-CAN ch D Bus Off	B

Is DTC U0065-00 indicated?

YES

Go to step 5.

NO

Substitute a known-good real time AWD control unit .

5. Shorted wire check (F-CAN D_H line)

-1. Turn the vehicle to the OFF (LOCK) mode.

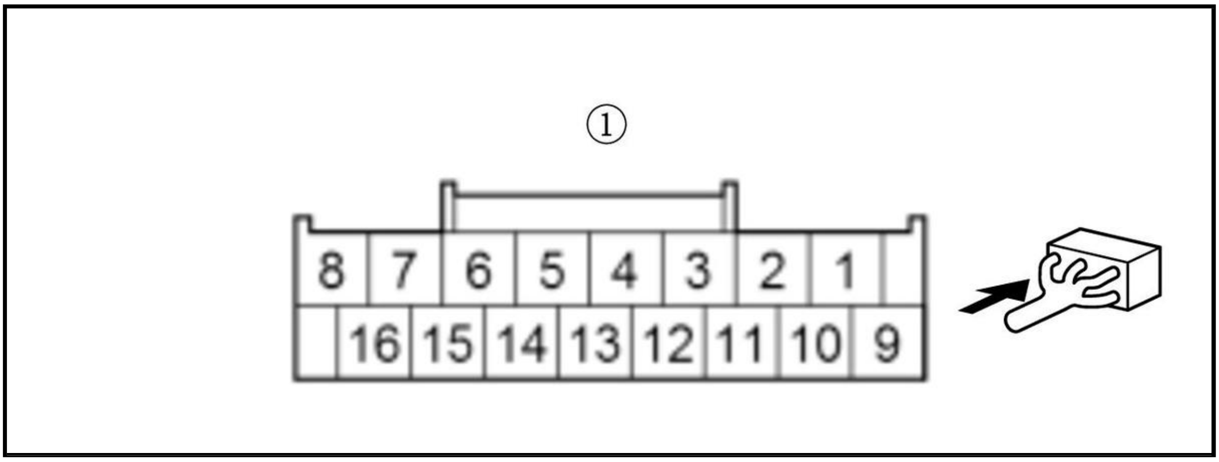
-2. Disconnect the following connector.

CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	Electric A/C compressor 4P connector: disconnected
B	Real time AWD control unit 24P connector: disconnected
B	CAN gateway 16P connector: disconnected

Test point 1	CAN gateway 16P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 6.

NO

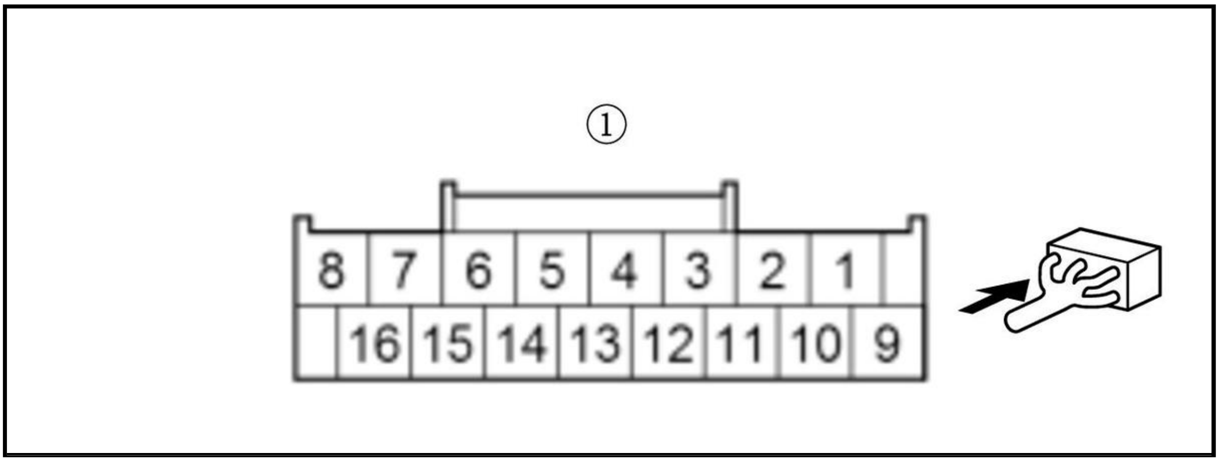
Repair a short in the F-CAN D_H wire between the CAN gateway and the connected units.

6. Shorted wire check (F-CAN D_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	Electric A/C compressor 4P connector: disconnected
B	Real time AWD control unit 24P connector: disconnected
B	CAN gateway 16P connector: disconnected

Test point 1	CAN gateway 16P connector (female terminals) No. 15: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 7.

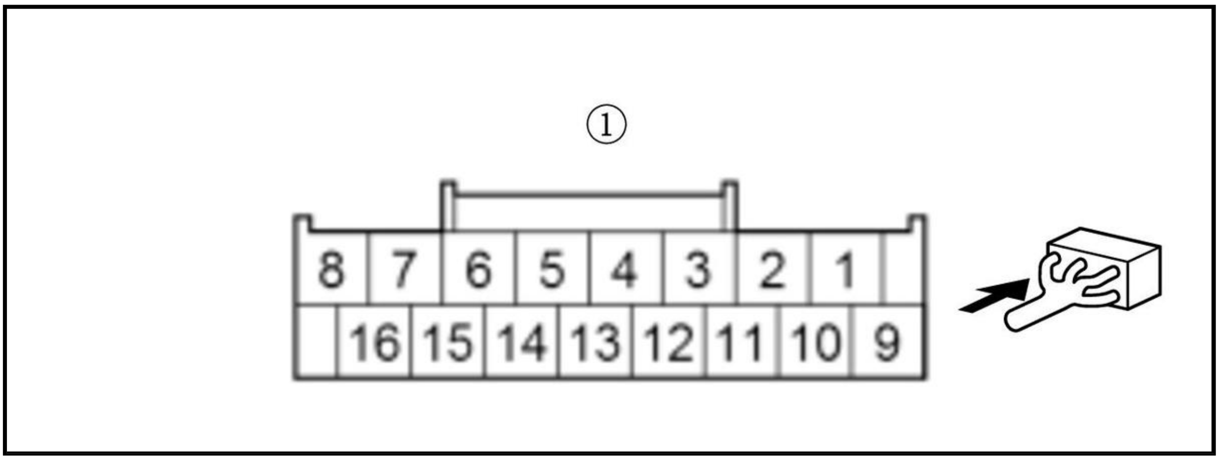
NO

Repair a short in the F-CAN D_L wire between the CAN gateway and the connected units.

7. Shorted wire check (F-CAN D_H line to F-CAN D_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	Electric A/C compressor 4P connector: disconnected
B	Real time AWD control unit 24P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 7: ①
Test point 2	CAN gateway 16P connector (female terminals) No. 15: ①



Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good CAN gateway** .

NO

Repair a short in the F-CAN D_H wire to the F-CAN D_L wire between CAN gateway terminals No. 7 and No. 15.

DTC U3000-49 (CAN GATEWAY)

DTC U3000-49 : CAN Gateway Internal Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	DTC
U3000-49 CAN Gateway Internal Failure	B

DTC (CAN GATEWAY)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U3000-49 CAN Gateway Internal Failure	B

Is DTC U3000-49 indicated?

YES

Replace the CAN gateway .

NO

Intermittent failure, the system is OK at this time.

DTC U3000-51 (CAN GATEWAY)

DTC U3000-51 : CAN Gateway Programming Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is indicated when the CAN gateway update is not completed.

DTC Description	DTC
U3000-51 CAN Gateway Programming Error	B

DTC (CAN GATEWAY)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U3000-51 CAN Gateway Programming Error	B

Is DTC U3000-51 indicated?

YES

Reprogram the CAN gateway .

NO

Intermittent failure, the system is OK at this time.

DTC TROUBLESHOOTING

DTC B0050-F0, C0061-F0, C0062-F0 (MILLIMETER WAVE RADAR)

DTC B0050-F0 : Driver's Seat Belt Buckle Switch (Subfault) Fault Detection By SRS Unit

DTC C0061-F0 : Lateral Acceleration Sensor(Subfault) Fault Detection By Source Module

DTC C0062-F0 : Longitudinal Acceleration Sensor (Subfault) Fault Detection By Source Module

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the millimeter wave radar receives the SRS unit failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **refer to the DTC troubleshoot for the SRS system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B0050-F0 Driver's Seat Belt Buckle Switch (Subfault) Fault Detection By SRS Unit	B
C0061-F0 Lateral Acceleration Sensor(Subfault) Fault Detection By Source Module	B
C0062-F0 Longitudinal Acceleration Sensor (Subfault) Fault Detection By Source Module	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B0050-F0 Driver's Seat Belt Buckle Switch (Subfault) Fault Detection By SRS Unit	B

DTC Description	DTC
C0061-F0 Lateral Acceleration Sensor(Subfault) Fault Detection By Source Module	B
C0062-F0 Longitudinal Acceleration Sensor (Subfault) Fault Detection By Source Module	B

Is DTC B0050-F0, C0061-F0, or C0062-F0 indicated?

YES

The failure is duplicated. Go to the indicated DTC's troubleshooting in the SRS system .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

DTC B2A00-92

DTC B2A00-92 : Temporary stop of Integrated Driver Support System (Detected Abnormal Signals)

NOTE:

- Before you troubleshoot, review the general troubleshooting information.
- This DTC is recorded when the millimeter wave radar and multipurpose camera receive an unexpected or out of range yaw rate, steering angle, or wheel speed sensor signal via F-CAN.
- The specific driving conditions that may cause this DTC to be recorded are as follows:
-
    - The vehicle is being driven in a manner that exceeds the capabilities and control of the driving support system. Question the customer about how and where the vehicle was being driven at the time of the warning.
    - Sharp turn, sudden steering, rapid acceleration or deceleration.
    - When the vehicle is driven in mountains or rough roads.
    - When the vehicle loses traction while driving (wheel spin or lock up).
- If input data from another system on F-CAN is out of range or incorrect. Inspect these systems for DTCs and/or OBS data and troubleshoot as needed.
- If this DTC is recorded, the integrated driver support system temporarily cancels its control.
- If this DTC is recorded, turn the vehicle OFF mode and ON mode again on the flat place or then test-drive for 10 minutes stably at 25 mph (40 km/h) or more to restore the vehicle to normal.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the DTC troubleshooting index .

DTC Description	DTC
B2A00-92 Temporary stop of Integrated Driver Support System (Detected Abnormal Signals)	B

DTC (IDAS)

1. DTC check

    -1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

    -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

    Is there any DTC(s) other than DTC B2A00-92?

    YES

    Perform a troubleshooting for the recorded DTC.

NO

Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC B2A60-49, B2A60-96

DTC B2A60-49 : Multipurpose Camera Unit Internal Electronic Failure

DTC B2A60-96 : Multipurpose Camera Unit Hardware Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A60-49 Multipurpose Camera Unit Internal Electronic Failure	B
B2A60-96 Multipurpose Camera Unit Hardware Malfunction	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to OFF (LOCK) mode and then ON mode repeatedly at least 3 times.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-49 Multipurpose Camera Unit Internal Electronic Failure	B
B2A60-96 Multipurpose Camera Unit Hardware Malfunction	B

Is DTC B2A60-49 or B2A60-96 indicated?

YES

The failure is duplicated. **Replace the multipurpose camera unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B2A60-54, P2583-54

DTC B2A60-54 : Static Camera Aiming Incomplete

DTC P2583-54 : Millimeter Wave Radar Aiming Incomplete

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when aiming is not performed or aiming is not successfully completed.
- If a DTC is recorded again after it is cleared with the HDS, perform the aiming procedure below:
-

  - B2A60-54: **Aim the multipurpose camera** .
  - P2583-54: **Aim the millimeter wave radar** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A60-54 Static Camera Aiming Incomplete	B
P2583-54 Millimeter Wave Radar Aiming Incomplete	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-54 Static Camera Aiming Incomplete	B
P2583-54 Millimeter Wave Radar Aiming Incomplete	B

   Is DTC B2A60-54 or P2583-54 indicated?

   YES

   The failure is duplicated. Aiming is incomplete. Aim **the millimeter wave radar** or **the multipurpose camera** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B2A60-57, U1387-4A, U1387-55, U3000-55

DTC B2A60-57 : Multipurpose Camera Unit Software Failure

DTC U1387-4A : Unmatch Combination of Millimeter Wave Radar-Multipurpose Camera Unit

DTC U1387-55 : Multipurpose Camera Unit Variant Incomplete

DTC U3000-55 : Millimeter Wave Radar Variant Incomplete

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If a DTC is recorded again after it is cleared with the HDS, confirm the part numbers compatible with the vehicle with the parts catalogue and replace the relevant parts.
- If DTC U1387-4A is recorded, confirm the part numbers of the multipurpose camera unit and the millimeter wave radar currently installed to the vehicle and replace the parts not compatible with the vehicle.
-

- B2A60-57: **Replace the multipurpose camera unit** .
- U1387-4A: **Replace the multipurpose camera unit** or **the millimeter wave radar** .
- U1387-55: **Replace the multipurpose camera unit** .
- U3000-55: **Replace the millimeter wave radar** .

- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A60-57 Multipurpose Camera Unit Software Failure	B
U1387-4A Unmatch Combination of Millimeter Wave Radar-Multipurpose Camera Unit	B
U1387-55 Multipurpose Camera Unit Variant Incomplete	B
U3000-55 Millimeter Wave Radar Variant Incomplete	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-57 Multipurpose Camera Unit Software Failure	B
U1387-4A Unmatch Combination of Millimeter Wave Radar-Multipurpose Camera Unit	B
U1387-55 Multipurpose Camera Unit Variant Incomplete	B
U3000-55 Millimeter Wave Radar Variant Incomplete	B

   Is DTC B2A60-57, U1387-4A, U1387-55, or U3000-55 indicated?

   YES

   The failure is duplicated. Confirm the parts catalogue and replace the parts related to the DTC with compatible ones.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B2A60-97

DTC B2A60-97 : Dust or Dirt On The Camera

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A60-97 Dust or Dirt On The Camera	B

DTC (IDAS)

1. Multipurpose camera unit visual check

   -1. Check for dust or dirt at the multipurpose camera lens, and crack, dust, or interference at the windshield surface.

   Are the multipurpose camera lens and the windshield surface OK?

   YES

   Go to step 2.

   NO

   Clean the multipurpose camera lens, or both sides of the windshield surface. If necessary, replace or repair the windshield.

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Test-drive the vehicle at 3 mph (5 km/h) or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-97 Dust or Dirt On The Camera	B

   Is DTC B2A60-97 indicated?

   YES

   The failure is duplicated. Check for loose terminals and poor connections in the multipurpose camera unit 12P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the multipurpose camera unit** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B2A60-98, P2583-98

DTC B2A60-98 : Multipurpose Camera Unit Temperature Too High

DTC P2583-98 : Millimeter Wave Radar Temperature Too High

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTC are recorded when the vehicle is left in the scorching heat, is in a traffic jam at high temperature, or is driving uphill continuously and the millimeter wave radar and the multipurpose camera

unit gets extremely hot.

- The function automatically returns to normal when the internal temperatures of the millimeter wave radar and the multipurpose camera unit drop.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A60-98 Multipurpose Camera Unit Temperature Too High	B
P2583-98 Millimeter Wave Radar Temperature Too High	B

DTC (IDAS)

1. Inspecting the temperature in the control unit

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) of the internal temperatures of the millimeter wave radar and the multipurpose camera unit with the HDS.

   Is the temperature 185 deg.F (85 deg.C) or less?

   YES

   Go to step 2.

   NO

   Cool the control unit until the internal temperature is 167 deg.F (75 deg.C) or less. Clear the DTC with the HDS.

2. Problem verification:

   NOTE: If the control unit has an internal temperature of 167 deg.F (75 deg.C) or more, cool the control unit until the internal temperature is 167 deg.F (75 deg.C) or less.

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-98 Multipurpose Camera Unit Temperature Too High	B
P2583-98 Millimeter Wave Radar Temperature Too High	B

   Is DTC B2A60-98 or P2583-98 indicated?

   YES

   The failure is duplicated. Faulty a control unit, replace the control unit related to the DTC.

   NO

   Intermittent failure, the system is OK at this time. The control unit was temporarily in a high temperature state.

DTC B2A60-99

DTC B2A60-99 : Out of automatic correction range for Misalignment of Multipurpose Camera Unit image

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If this DTC is recorded, the following is suspected:
-
    - Improper installation of the multipurpose camera unit (aging of vehicle, incorrect assembly, etc.).
    - The multipurpose camera unit installing portion is deformed by a minor collision or strong impact.
    - The axis of the multipurpose camera unit is out of alignment due to abnormal wheel alignment, abnormal tire pressure, etc.
    - Altered suspension
- After inspecting, repairing, or adjusting a possible cause of the failure, be sure to **perform multipurpose camera unit aiming** . If the DTC cannot be deleted after multipurpose camera unit aiming, **replace the multipurpose camera unit** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A60-99 Out of automatic correction range for Misalignment of Multipurpose Camera Unit image	B

DTC (IDAS)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Test-drive the vehicle on a straight road at speeds 25 mph (40 km/h) or more for 15 minutes or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-99 Out of automatic correction range for Misalignment of Multipurpose Camera Unit image	B

   Is DTC B2A60-99 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Multipurpose camera unit visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check that the multipurpose camera unit and camera bracket are installed properly and check them for deformation and damage.

Are the multipurpose camera unit and the camera bracket installed properly, and/or is there any no damage?

YES

Go to step 3.

NO

Repair or replace faulty parts, then **aim the multipurpose camera unit** .

3. Problem verification 2

-1. **Aim the multipurpose camera unit** .

-2. Test-drive the vehicle on a straight road at speeds 25 mph (40 km/h) or more for 15 minutes or more.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-99 Out of automatic correction range for Misalignment of Multipurpose Camera Unit image	B

Is DTC B2A60-99 indicated?

YES

If the multipurpose camera unit is installed properly but the DTC is recorded again after multipurpose camera unit aiming, **replace the multipurpose camera unit** .

NO

The system is OK at this time.

DTC B2A60-A2, U3006-16

DTC B2A60-A2 : Power Supply Voltage Too Low (Multipurpose Camera Unit)

DTC U3006-16 : Power Supply Voltage Too Low (Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- Before performing a troubleshooting, check the 12 volt battery voltage. If the voltage is less than 12 volt, charge the battery.
- These DTCs are recorded when the voltage supplied to the millimeter wave radar or the multipurpose camera unit drops below 9.5 volt while the vehicle is driving.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A60-A2 Power Supply Voltage Too Low (Multipurpose Camera Unit)	B
U3006-16 Power Supply Voltage Too Low (Millimeter Wave Radar)	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Test-drive the vehicle at speeds 5 mph (8 km/h) or more for at least 5 minutes.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-A2 Power Supply Voltage Too Low (Multipurpose Camera Unit)	B
U3006-16 Power Supply Voltage Too Low (Millimeter Wave Radar)	B

   Is DTC B2A60-A2 or U3006-16 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. PGM-FI system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting in the PGM-FI system . After performing a DTC troubleshooting for the PGM-FI system, clear the DTC again.

   NO

   Check the control unit related to the DTC for loose terminals and poor connections. If no problem is found, replace the control unit related to the DTC.

DTC B2A60-A3, U3006-17

DTC B2A60-A3 : Power Supply Voltage Too High (Multipurpose Camera Unit)

DTC U3006-17 : Power Supply Voltage Too High (Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- Before starting a troubleshooting, check that a 12 volt battery of a capacity compatible with the vehicle is installed.

- These DTCs are recorded when a voltage of 17 volt or more is supplied to the millimeter wave radar or the multipurpose camera unit.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A60-A3 Power Supply Voltage Too High (Multipurpose Camera Unit)	B
U3006-17 Power Supply Voltage Too High (Millimeter Wave Radar)	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-A3 Power Supply Voltage Too High (Multipurpose Camera Unit)	B
U3006-17 Power Supply Voltage Too High (Millimeter Wave Radar)	B

   Is DTC B2A60-A3 or U3006-17 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. PGM-FI system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting in the PGM-FI system . After performing a DTC troubleshooting for the PGM-FI system, clear the DTC again.

   NO

   Faulty a control unit, replace the control unit related to the DTC.

DTC B2A70-12

DTC B2A70-12 : LDW/RDM Switch Signal Circuit Short

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A70-12 LDW/RDM Switch Signal Circuit Short	B

DTC (IDAS)

*1: Without auto idle stop system*2: With auto idle stop system

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Press the RDM switch.

   -6. Check for DTCs with the HDS.

DTC Description	DTC
B2A70-12 LDW/RDM Switch Signal Circuit Short	B

   Is DTC B2A70-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. D5 (10 A) *1 No. F7 (7.5 A) *2
Location	Under-dash fuse/relay box *1 Auxiliary under-dash fuse/relay box *2

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. Turn the vehicle to the ON mode, then the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D5 (10 A) *1/F7 (7.5 A) *2 fuse circuit.

3. Open wire check (IG1 OPTION *1/IG1 EBB *2 line):-1.

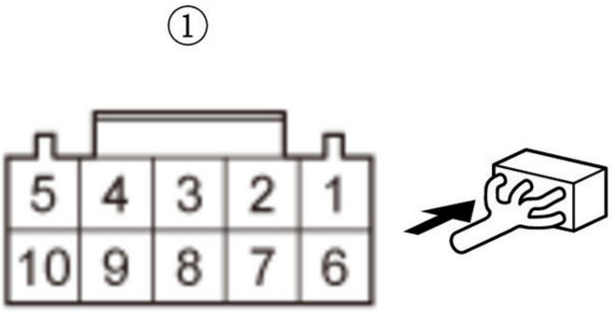
Disconnect the following connector.

CMBS OFF/RDM switch 10P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMBS OFF/RDM switch 10P connector: disconnected
Test point 1	CMBS OFF/RDM switch 10P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there battery voltage?

YES

IG1 OPTION *1/IG1 EBB *2 wire is OK. Go to step 4.

NO

Repair an open in the IG1 OPTION *1/IG1 EBB *2 wire between the RDM switch and No. D5 (10 A) *1/F7 (7.5 A) *2 fuse in the under-dash fuse/relay box *1/auxiliary under-dash fuse/relay box *2.

4. RDM switch internal resistance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove and test the RDM switch** .

Is the RDM switch OK?

YES

RDM switch is OK. Go to step 5.

NO

Replace the RDM switch .

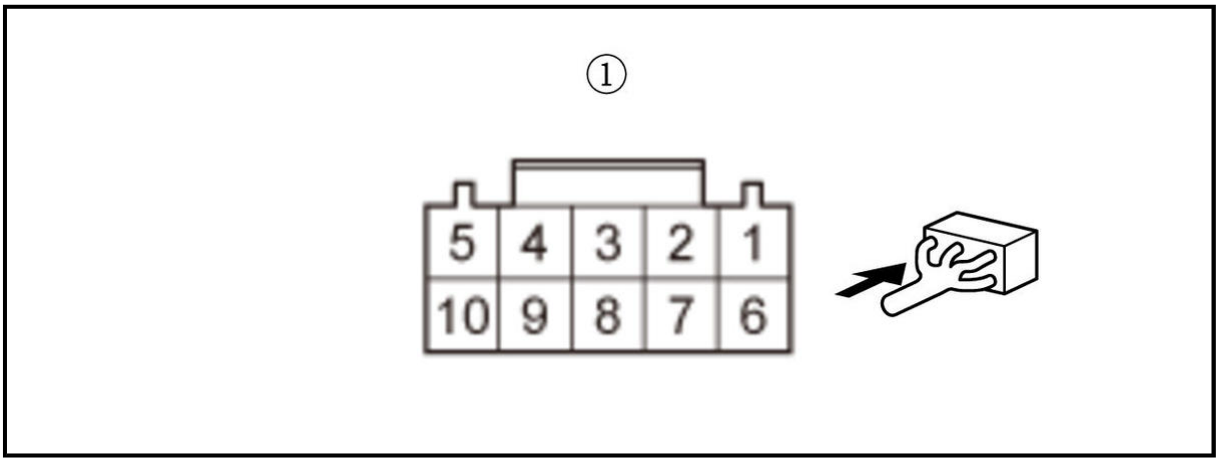
5. Open wire check (LDW OFF SW line)

-1. Disconnect the following connector.

Multipurpose camera unit 12P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	CMBS OFF/RDM switch 10P connector: disconnected
	Multipurpose camera unit 12P connector: disconnected
Test point 1	Multipurpose camera unit 12P connector No. 7
Test point 2	CMBS OFF/RDM switch 10P connector (female terminals) No. 4: ①



Is there continuity?

YES

Go to step 6.

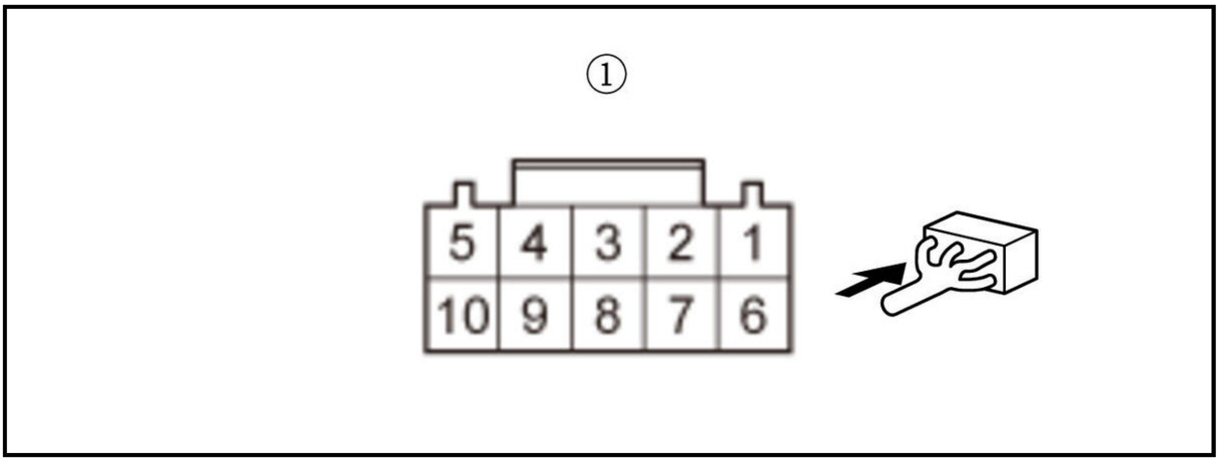
NO

Repair an open in the LDW OFF SW wire between the RDM switch and the multipurpose camera unit.

6. Open wire check (LDW OFF IND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	CMBS OFF/RDM switch 10P connector: disconnected
	Multipurpose camera unit 12P connector: disconnected
Test point 1	Multipurpose camera unit 12P connector No. 8
Test point 2	CMBS OFF/RDM switch 10P connector (female terminals) No. 2: ①



Is there continuity?

YES

Replace the multipurpose camera unit .

NO

Repair an open in the LDW OFF IND wire between the RDM switch and the multipurpose camera unit.

DTC B2A70-14

DTC B2A70-14 : LDW/RDM Switch Signal Circuit Short to Power

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
B2A70-14 LDW/RDM Switch Signal Circuit Short to Power	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B2A70-14 LDW/RDM Switch Signal Circuit Short to Power	B

Is DTC B2A70-14 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

2. RDM switch internal resistance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove and test the RDM switch** .

Is the RDM switch OK?

YES

RDM switch is OK. Go to step 3.

NO

Replace the RDM switch .

3. Shorted wire check (LDW OFF SW line to power)

-1. **Install the RDM switch** .

-2. Connect the following connector.

CMBS OFF/RDM switch 10P connector

-3. Disconnect the following connector.

Multipurpose camera unit 12P connector

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Multipurpose camera unit 12P connector: disconnected
Test point 1	**Multipurpose camera unit 12P connector No. 7**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the LDW OFF SW wire between the RDM switch and the multipurpose camera unit.

NO

Check for loose terminals and poor connections in the multipurpose camera unit 12P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the multipurpose camera unit** .

DTC C0023-F0, C0044-F0, U0416-68, U0416-F8

DTC C0023-F0 : Brake Light Drive Relay Circuit Malfunction

DTC C0044-F0 : Master Cylinder Pressure Sensor Failure

DTC U0416-68 : Brake Actuator Malfunction

DTC U0416-F8 : VSA Modulator-Control Unit Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the millimeter wave radar receives failure information from the VSA modulator-control unit via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, perform a troubleshooting for the VSA system.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
C0023-F0 Brake Light Drive Relay Circuit Malfunction	B
C0044-F0 Master Cylinder Pressure Sensor Failure	B
U0416-68 Brake Actuator Malfunction	B
U0416-F8 VSA Modulator-Control Unit Malfunction	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0023-F0 Brake Light Drive Relay Circuit Malfunction	B
C0044-F0 Master Cylinder Pressure Sensor Failure	B
U0416-68 Brake Actuator Malfunction	B

DTC Description	DTC
U0416-F8 VSA Modulator-Control Unit Malfunction	B

Is DTC C0023-F0, C0044-F0, U0416-68, or U0416-F8 indicated?

YES

The failure is duplicated. **Go to the indicated DTC's troubleshooting in the VSA system** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0031-62, C0034-62, C0037-62, C003A-62 (MILLIMETER WAVE RADAR)

DTC C0031-62 : Left Front Wheel Speed Sensor Signal Error

DTC C0034-62 : Right Front Wheel Speed Sensor Signal Error

DTC C0037-62 : Left Rear Wheel Speed Sensor Signal Error

DTC C003A-62 : Right Rear Wheel Speed Sensor Signal Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the millimeter wave radar receives wheel speed sensor failure information from the VSA modulator-control unit via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the VSA system** .
- The functions of the integrated driver support system that will be temporarily canceled when these DTC are recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
C0031-62 Left Front Wheel Speed Sensor Signal Error	B
C0034-62 Right Front Wheel Speed Sensor Signal Error	B
C0037-62 Left Rear Wheel Speed Sensor Signal Error	B
C003A-62 Right Rear Wheel Speed Sensor Signal Error	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Test-drive the vehicle on a straight road at speeds 25 mph (40 km/h) or more for 5 minutes.

NOTE: Check for abnormal tire diameter (low tire pressure, uneven wear, and spare tire) before test-driving.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0031-62 Left Front Wheel Speed Sensor Signal Error	B

DTC Description	DTC
C0034-62 Right Front Wheel Speed Sensor Signal Error	B
C0037-62 Left Rear Wheel Speed Sensor Signal Error	B
C003A-62 Right Rear Wheel Speed Sensor Signal Error	B

Is DTC C0031-62, C0034-62, C0037-62, or C003A-62 indicated?

YES

The failure is duplicated. **Go to the indicated DTC's troubleshooting in the VSA system** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0051-54 (MILLIMETER WAVE RADAR)

DTC C0051-54 : Steering Angle Neutral Position Learning Incomplete

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded if VSA sensor neutral position memorization is not completed.
- This DTC is automatically deleted without using the HDS when VSA sensor neutral position memorization is successfully completed.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
C0051-54 Steering Angle Neutral Position Learning Incomplete	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0051-54 Steering Angle Neutral Position Learning Incomplete	B

Is DTC C0051-54 indicated?

YES

The failure is duplicated. **Perform the VSA sensor neutral position memorization** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0051-96 (MILLIMETER WAVE RADAR)

DTC C0051-96 : Steering Angle Sensor Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the millimeter wave radar receives the EPS control unit failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the EPS system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
C0051-96 Steering Angle Sensor Malfunction	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
C0051-96 Steering Angle Sensor Malfunction	B

   Is DTC C0051-96 indicated?

   YES

   The failure is duplicated. **Go to the indicated DTC's troubleshooting in the EPS system** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0061-9A, C0062-9A, C0063-9A

DTC C0061-9A : Temporary stop of Integrated Driver Support System (Unstable Lateral Acceleration Sensor Signal)

DTC C0062-9A : Temporary stop of Integrated Driver Support System (Unstable Longitudinal Acceleration Sensor Signal)

DTC C0063-9A : Temporary stop of Integrated Driver Support System (Unstable Yaw Rate Sensor Signal)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the sensor signal reliability temporarily decreases due to a drop in the power supply voltage supplied to the yaw rate sensor and lateral acceleration sensor built in the SRS unit or for other reason.
- If this DTC is recorded, some of the integrated driver support system functions are temporarily canceled but it is not a failure.
- When the power supply voltage supplied to the yaw rate sensor and lateral acceleration sensor built in the SRS unit return to normal, the temporarily cancelled integrated driver support system functions are re-activated.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
C0061-9A Temporary stop of Integrated Driver Support System (Unstable Lateral Acceleration Sensor Signal)	B
C0062-9A Temporary stop of Integrated Driver Support System (Unstable Longitudinal Acceleration Sensor Signal)	B

DTC Description	DTC
C0063-9A Temporary stop of Integrated Driver Support System (Unstable Yaw Rate Sensor Signal)	B

DTC (IDAS)

1. DTC check

   -1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
C0061-9A Temporary stop of Integrated Driver Support System (Unstable Lateral Acceleration Sensor Signal)	B

DTC Description	DTC
C0062-9A Temporary stop of Integrated Driver Support System (Unstable Longitudinal Acceleration Sensor Signal)	B
C0063-9A Temporary stop of Integrated Driver Support System (Unstable Yaw Rate Sensor Signal)	B

Is there any DTC(s) other than DTC C0061-9A, C0062-9A, or C0063-9A?

YES

Perform a troubleshooting for the recorded DTC.

NO

Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC C0063-F0 (MILLIMETER WAVE RADAR)

DTC C0063-F0 : Yaw Rate Sensor (Subfault) Fault Detection By Source Module

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This vehicle's millimeter wave radar receives the failure information of the yaw rate sensor from the SRS unit. The SRS unit does not uses the yaw rate sensor for airbag deployment control, so the SRS system indicator does not come on even if the yaw rate sensor is faulty. If this DTC is stored, clear the DTC and then perform problem verification according to the troubleshooting flow. If this DTC is stored again, replace the SRS unit.
- If the DTC is recorded after it is cleared with the HDS, **replace the SRS unit** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
C0063-F0 Yaw Rate Sensor (Subfault) Fault Detection By Source Module	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0063-F0 Yaw Rate Sensor (Subfault) Fault Detection By Source Module	B

Is DTC C0063-F0 indicated?

YES

The failure is duplicated. **Replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C1040-00 (MILLIMETER WAVE RADAR)

DTC C1040-00 : Wheel Speed Signal Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the estimated yaw rate calculated based on the wheel speeds of the right and left wheels differs between the front and rear wheels.
- The specific conditions under which this DTC are as follows:
-
    - Abnormal tire diameter (low tire pressure, uneven wear, etc.)
    - Driving on a road having different road conditions on the right and left sides
- If this DTC is recorded, the integrated driver support system temporarily cancels its control to prevent the system from selecting an incorrect leading vehicle.
- When the difference in the estimated yaw rate between the front and rear wheels returns to normal, the integrated driver support system resumes its control.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
C1040-00 Wheel Speed Signal Error	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Test-drive the vehicle on a straight road at speeds 25 mph (40 km/h) or more for 10 minutes or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1040-00 Wheel Speed Signal Error	B

Is DTC C1040-00 indicated?

YES

The failure is duplicated. Check the tire pressure and inspect for uneven wear.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C1C00-F0, U0401-68, U0402-68

DTC C1C00-F0 : APP Sensor Signal Failure

DTC U0401-68 : PCM (PGM-FI System) Malfunction

DTC U0402-68 : PCM/TCM Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is recorded when the millimeter wave radar receives failure information for the PCM via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the PGM-FI system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
C1C00-F0 APP Sensor Signal Failure	B
U0401-68 PCM (PGM-FI System) Malfunction	B
U0402-68 PCM/TCM Malfunction	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1C00-F0 APP Sensor Signal Failure	B
U0401-68 PCM (PGM-FI System) Malfunction	B
U0402-68 PCM/TCM Malfunction	B

Is DTC C1C00-F0, U0401-68, or U0402-68 indicated?

YES

The failure is duplicated. Go to the indicated DTC's troubleshooting in the PGM-FI system .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting .

DTC P0564-11

DTC P0564-11 : ACC/LKAS Switch Signal Circuit Short

NOTE:

- Before you troubleshoot, review the general troubleshooting information.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the DTC troubleshooting index .

DTC Description	DTC
P0564-11 ACC/LKAS Switch Signal Circuit Short	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
P0564-11 ACC/LKAS Switch Signal Circuit Short	B

Is DTC P0564-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting.

2. Shorted wire check (LKAS/DIST line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

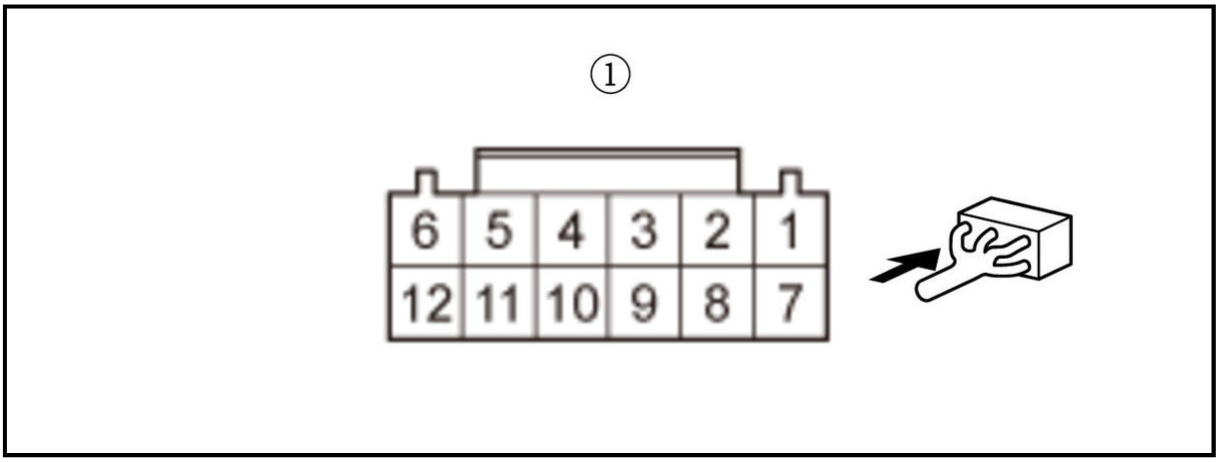
-2. Disconnect the following connector.

ACC combination switch 12P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 12: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the ACC combination switch .

NO

Go to step 3.

3. Shorted wire check (LKAS/DIST line) 2

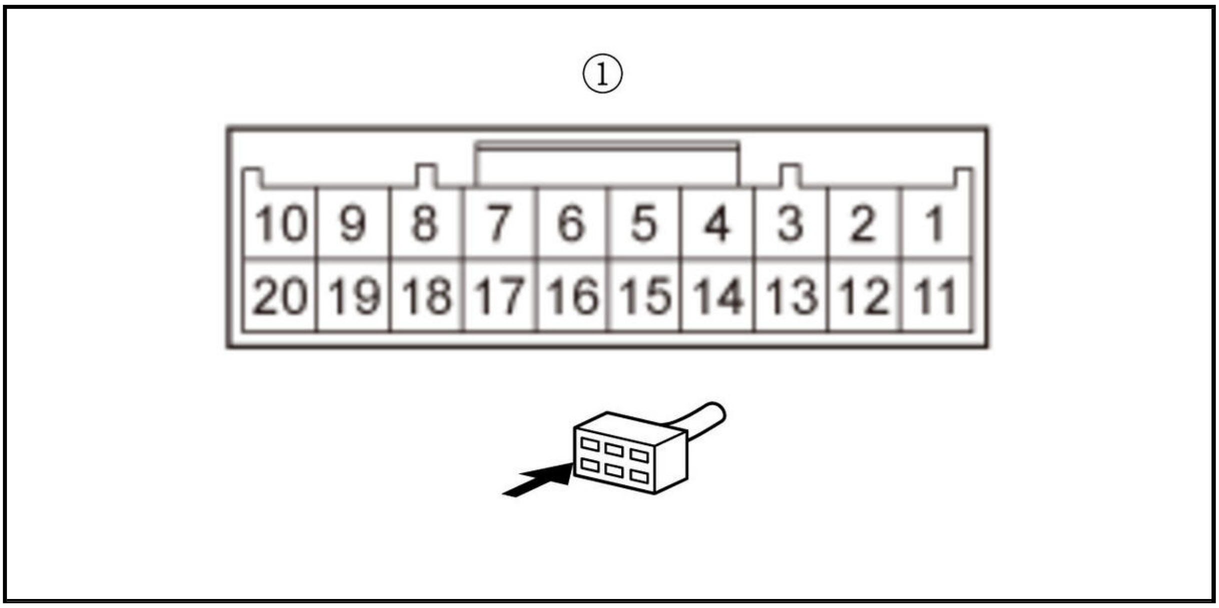
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. On the cable reel side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector D (20P) (male terminals) No. 20: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Repair a short to ground in the LKAS/DIST wire between the ACC combination switch and the cable reel.

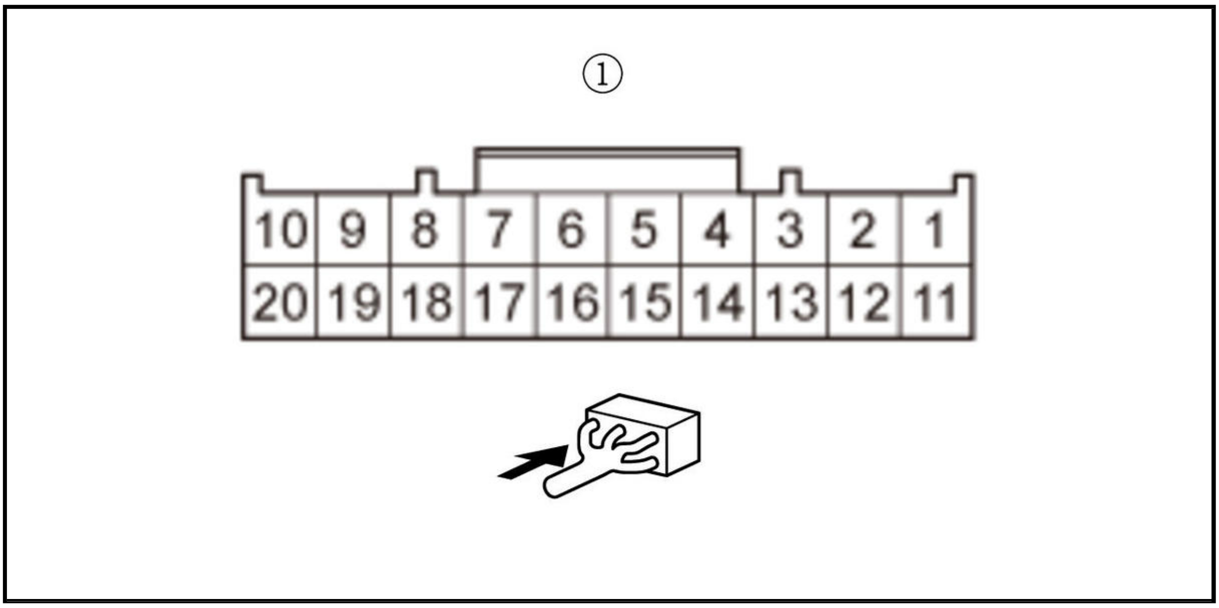
4. Shorted wire check (DISTANCE SW line) 1

-1. Disconnect the following connector.

Cable reel connector A (20P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P): disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector A (20P) (female terminals) No. 8: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 5.

NO

Replace the cable reel .

5. Shorted wire check (DISTANCE SW line) 2

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P): disconnected
B	Cable reel connector D (20P): disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 28**

Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the DISTANCE SW wire between the gauge control module and the cable reel.

NO

Replace the gauge control module .

DTC P0564-15

DTC P0564-15 : ACC/LKAS Switch Signal Circuit Open

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
P0564-15 ACC/LKAS Switch Signal Circuit Open	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
P0564-15 ACC/LKAS Switch Signal Circuit Open	B

   Is DTC P0564-15 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Open wire check (LKAS/DIST line) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

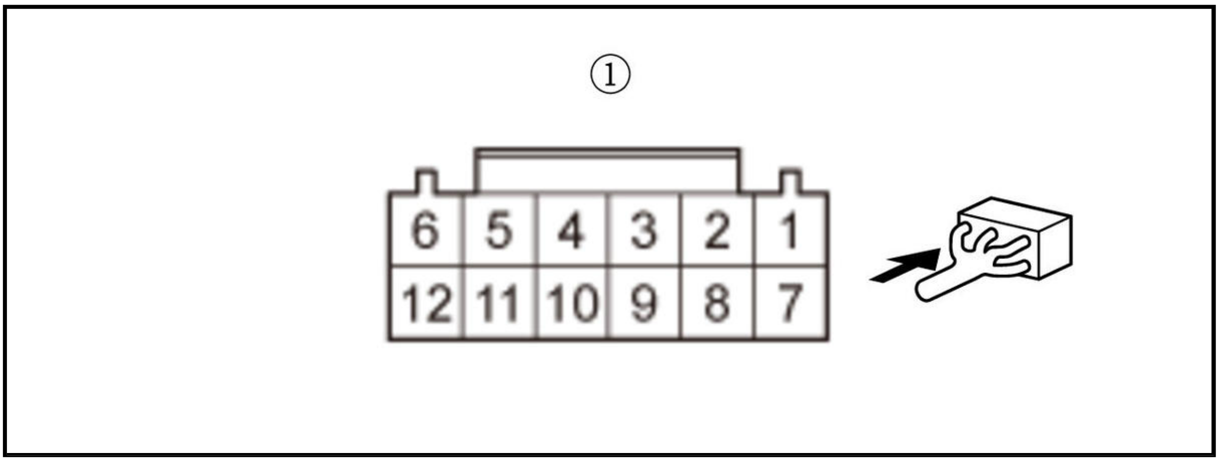
   -2. Disconnect the following connector.

ACC combination switch 12P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 12: ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 3.

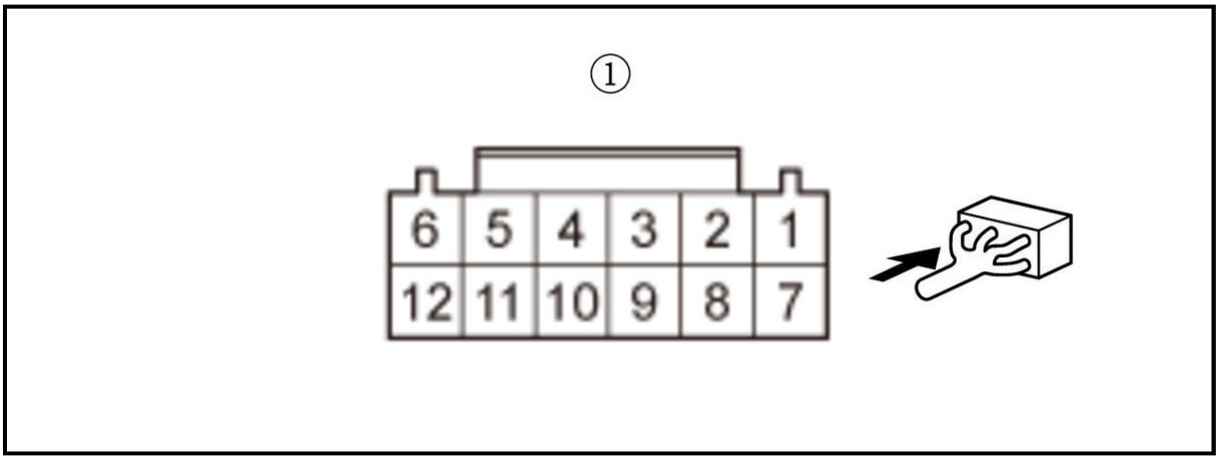
NO

Go to step 7.

3. Determine possible failure area (ACC combination switch, CRUISE GND line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 12: ①
Test point 2	ACC combination switch 12P connector (female terminals) No. 5: ①



Is there about 5 V?

YES

Replace the ACC combination switch .

NO

Go to step 4.

4. Open wire check (CRUISE GND line) 1

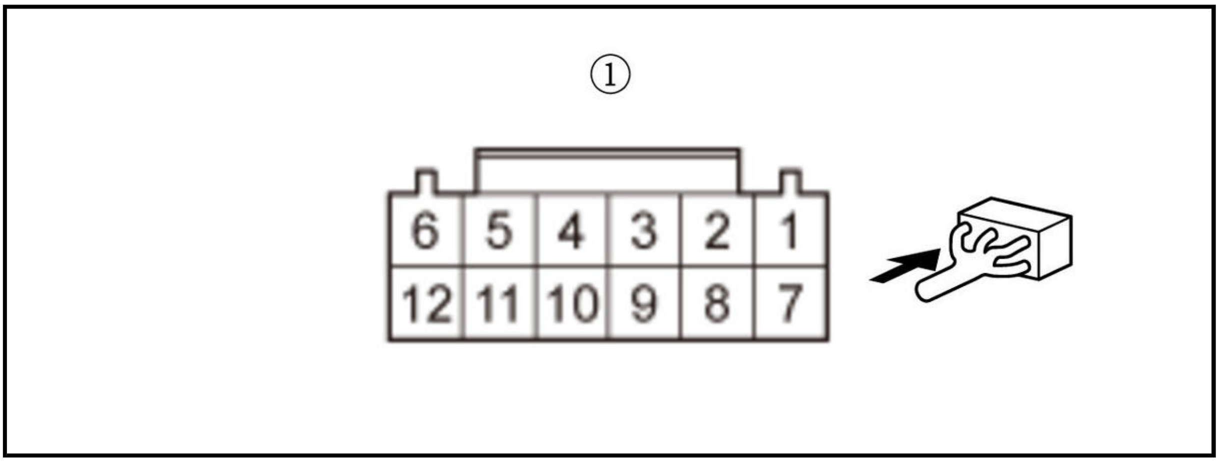
-1. Turn the vehicle to the OFF (LOCK) mode.

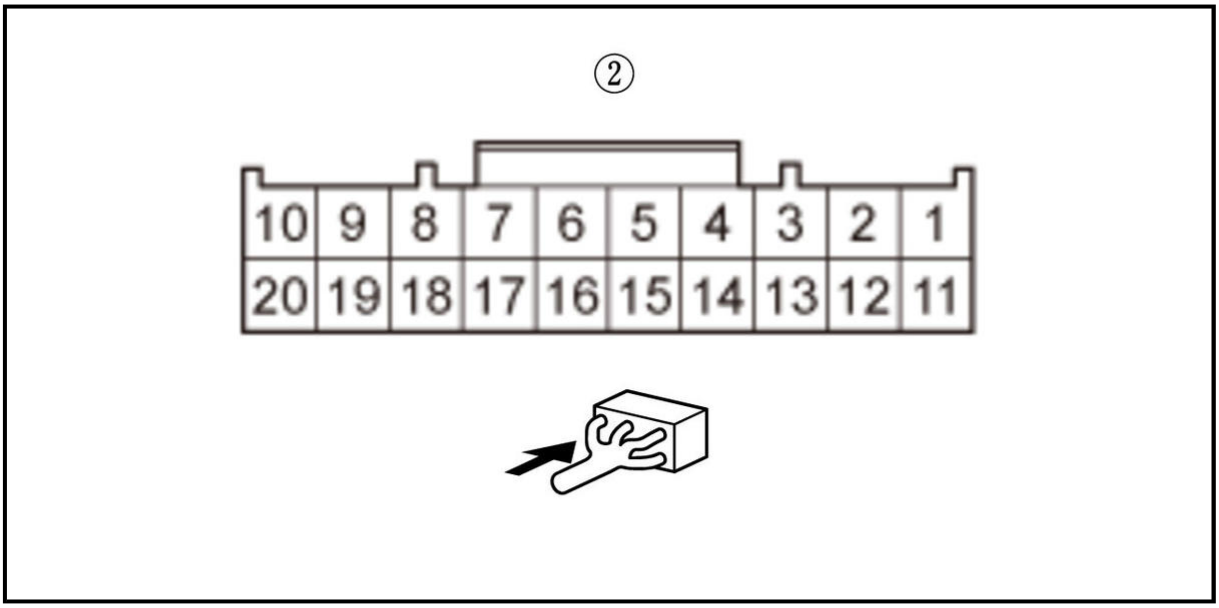
-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 5: ①
Test point 2	Cable reel connector D (20P) (female terminals) No. 17: ②





Is there continuity?

YES

Go to step 5.

NO

Repair an open in the CRUISE GND wire between the ACC combination switch and the cable reel.

5. Cable reel check

-1. **Remove the cable reel** .

-2. On the cable reel side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
B	Cable reel connector A (20P): disconnected
Test point 1	Cable reel connector A (20P) (male terminals) No. 5: ①
Test point 2	Cable reel connector D (20P) (male terminals) No. 17: ②

Go to step 6.

NO

Replace the cable reel .

6. Open wire check (CRUISE GND line) 2

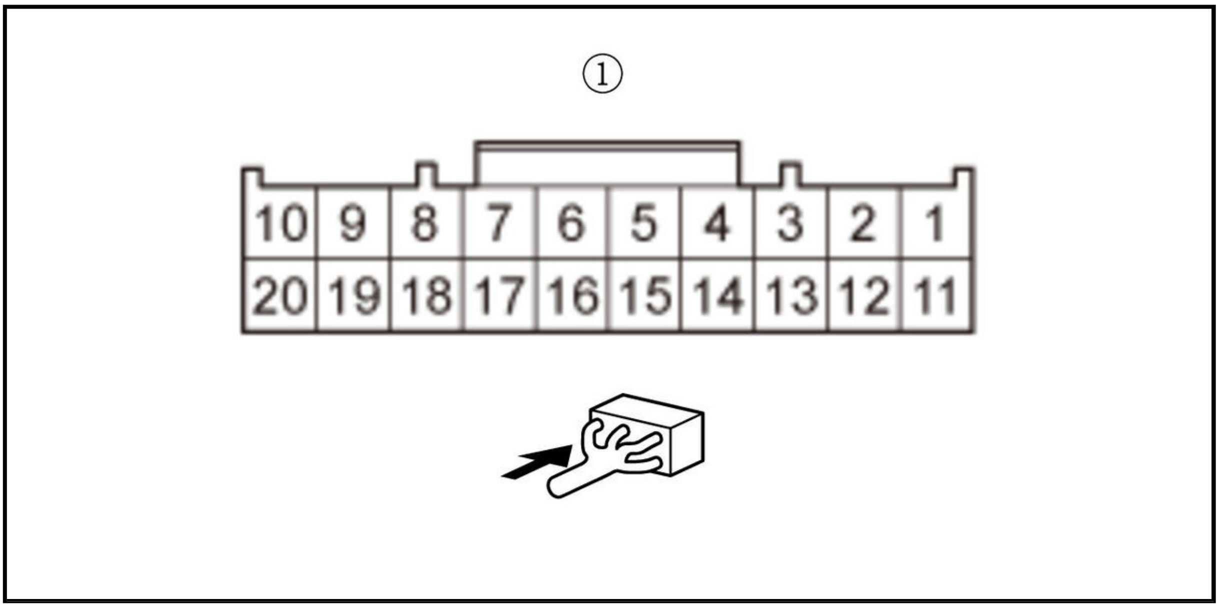
-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
B	Cable reel connector A (20P): disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 5**

Test point 2	Cable reel connector A (20P) (female terminals) No. 5: ①



Is there continuity?

YES

Replace the gauge control module .

NO

Repair an open in the CRUISE GND wire between the gauge control module and the cable reel.

7. Open wire check (LKAS/DIST line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

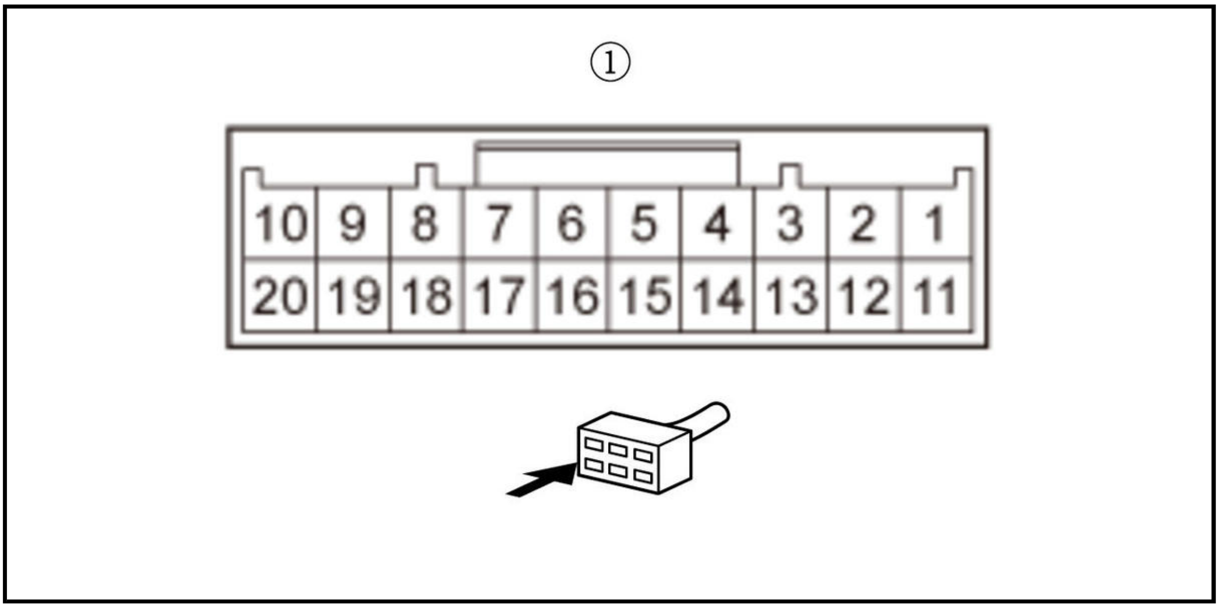
-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. Turn the vehicle to the ON mode.

-4. On the cable reel side, measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector D (20P) (male terminals) No. 20: ①
Test point 2	Body ground



Is there about 5 V?

YES

Repair an open in the LKAS/DIST wire between the ACC combination switch and the cable reel.

NO

Go to step 8.

8. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

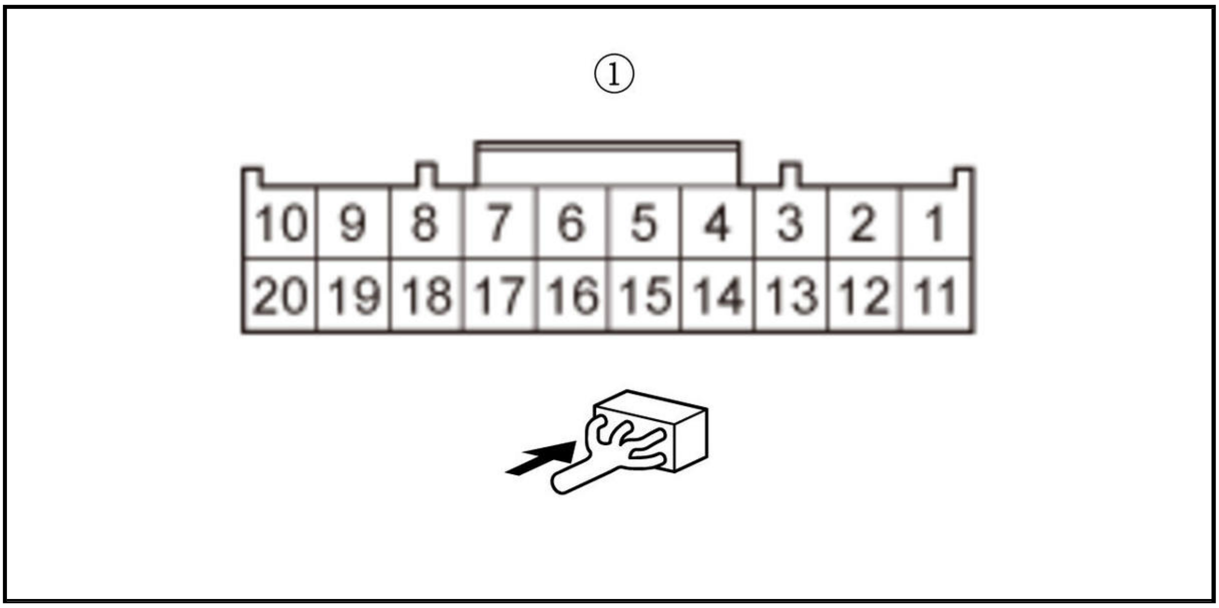
-2. Disconnect the following connector.

Cable reel connector A (20P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
B	Cable reel connector A (20P): disconnected
Test point 1	Cable reel connector A (20P) (female terminals) No. 8: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the cable reel .

NO

Go to step 9.

9. Open wire check (DISTANCE SW line)

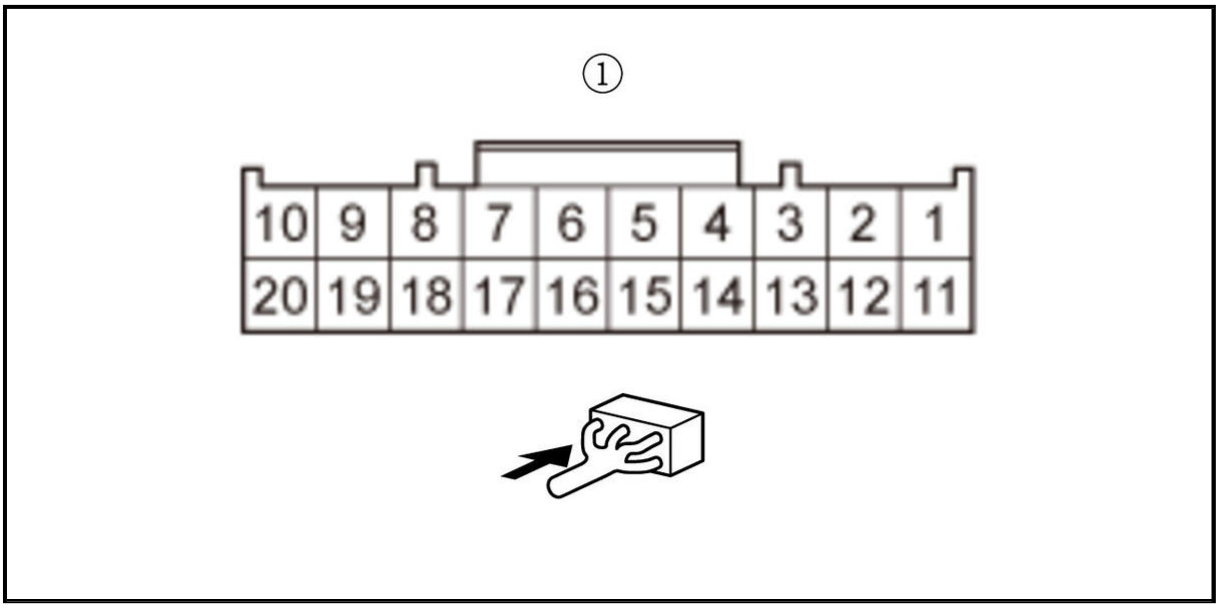
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
B	Cable reel connector A (20P): disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 28**
Test point 2	Cable reel connector A (20P) (female terminals) No. 8: ①



Is there continuity?

YES

Replace the gauge control module .

NO

Repair an open in the DISTANCE SW wire between the gauge control module and the cable reel.

DTC P0589-11

DTC P0589-11 : Main Switch Signal Circuit Short

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
P0589-11 Main Switch Signal Circuit Short	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
P0589-11 Main Switch Signal Circuit Short	B

Is DTC P0589-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Shorted wire check (CRUISE SW line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

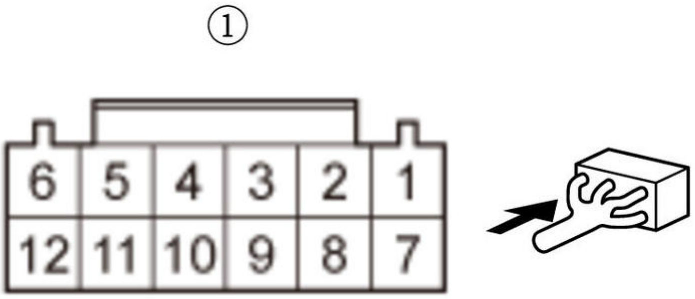
-2. Disconnect the following connector.

ACC combination switch 12P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the ACC combination switch .

NO

Go to step 3.

3. Shorted wire check (CRUISE SW line) 2

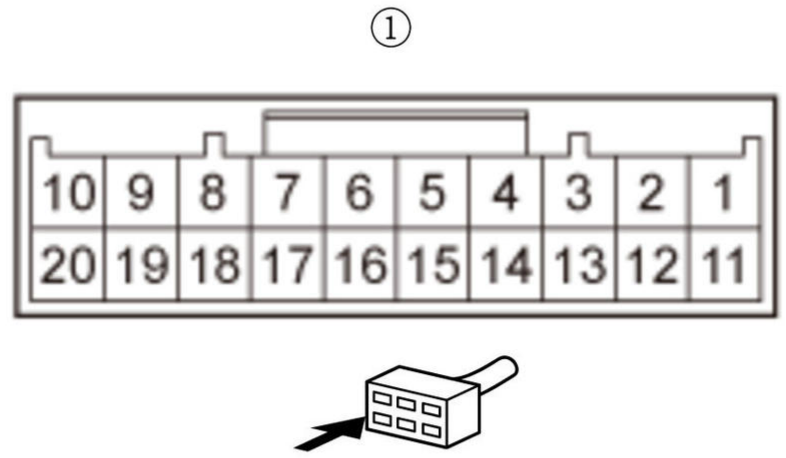
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. On the cable reel side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector D (20P) (male terminals) No. 16: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Repair a short to ground in the CRUISE SW wire between the ACC combination switch and the cable reel.

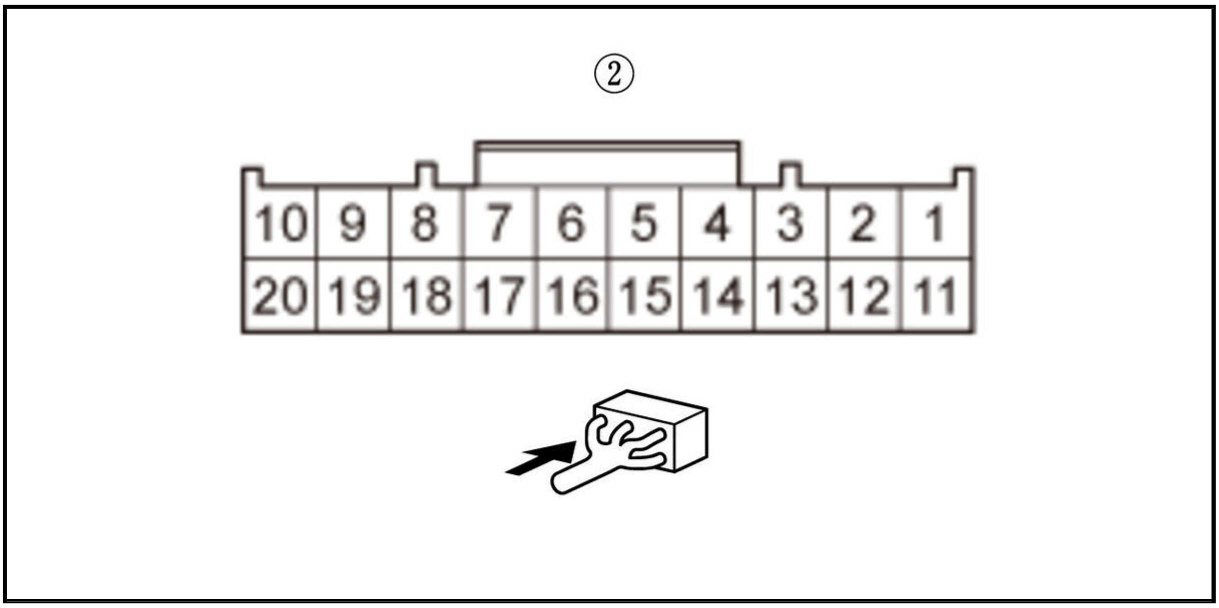
4. Shorted wire check (CRUISE SW line) 3

-1. Disconnect the following connector.

Cable reel connector A (20P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
B	Cable reel connector A (20P): disconnected
Test point 1	Cable reel connector A (20P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 5.

NO

Replace the cable reel .

5. Shorted wire check (CRUISE SW line) 4

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
B	Cable reel connector A (20P): disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 14**

Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the CRUISE SW wire between the gauge control module and the cable reel.

NO

Replace the gauge control module .

DTC P0589-15

DTC P0589-15 : Main Switch Signal Circuit Open

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
P0589-15 Main Switch Signal Circuit Open	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
P0589-15 Main Switch Signal Circuit Open	B

   Is DTC P0589-15 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Open wire check (CRUISE SW line) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

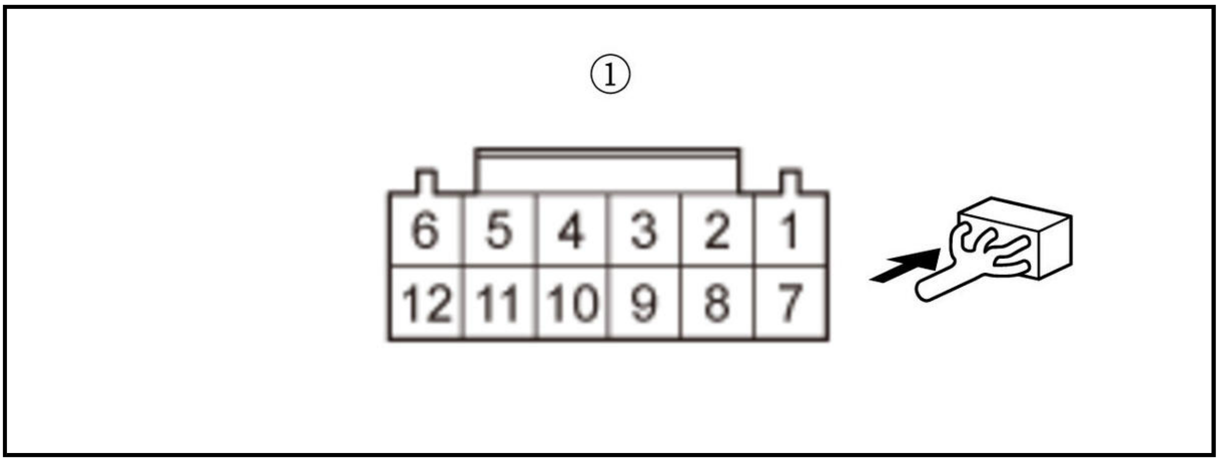
   -2. Disconnect the following connector.

ACC combination switch 12P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 3.

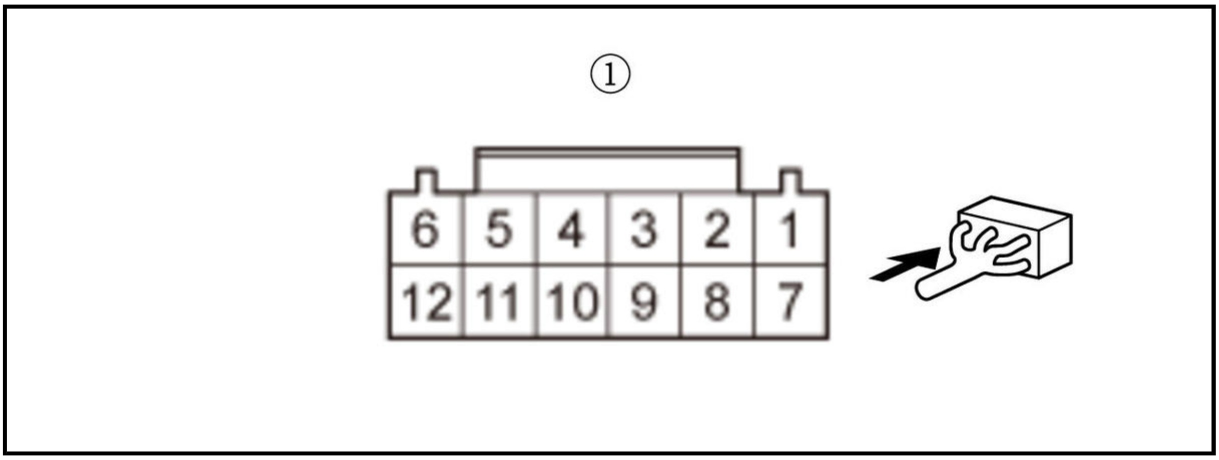
NO

Go to step 7.

3. ACC combination switch circuit check

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 6: ①
Test point 2	ACC combination switch 12P connector (female terminals) No. 5: ①



Is there about 5 V?

YES

Replace the ACC combination switch .

NO

Go to step 4.

4. Open wire check (CRUISE GND line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P) connector: disconnected

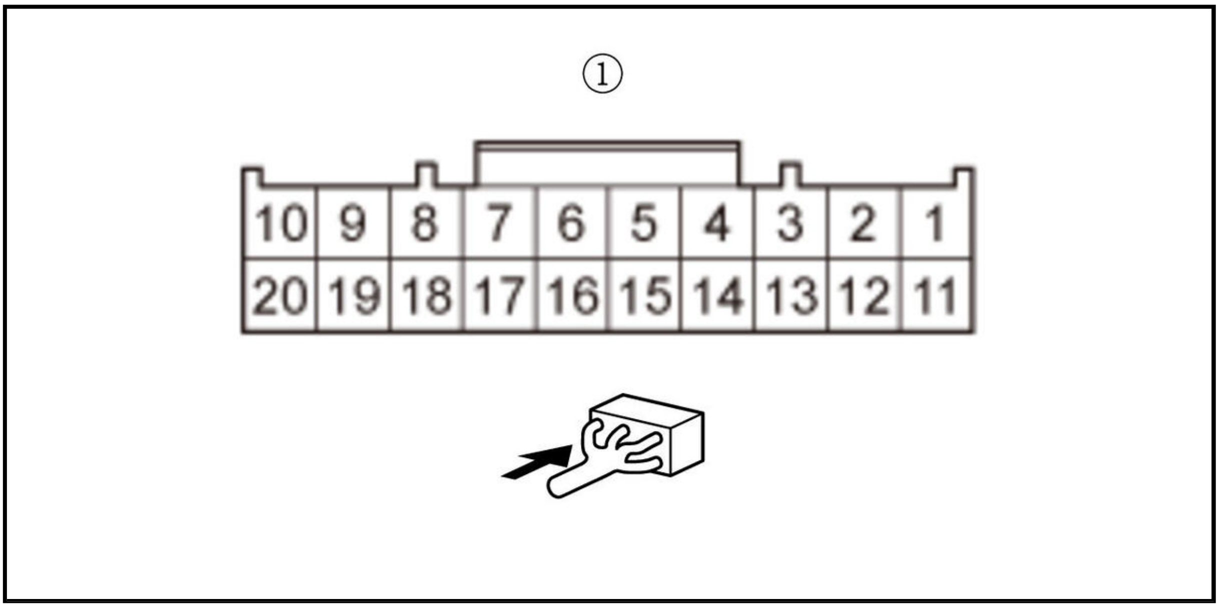
6. Open wire check (CRUISE GND line) 2

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P) connector: disconnected
B	Cable reel connector A (20P) connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 5**
Test point 2	Cable reel connector A (20P) (female terminals) No. 5: ①



Is there continuity?

YES

Replace the gauge control module .

NO

Repair an open in the CRUISE GND wire between the gauge control module and the cable reel.

7. Open wire check (CRUISE SW line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

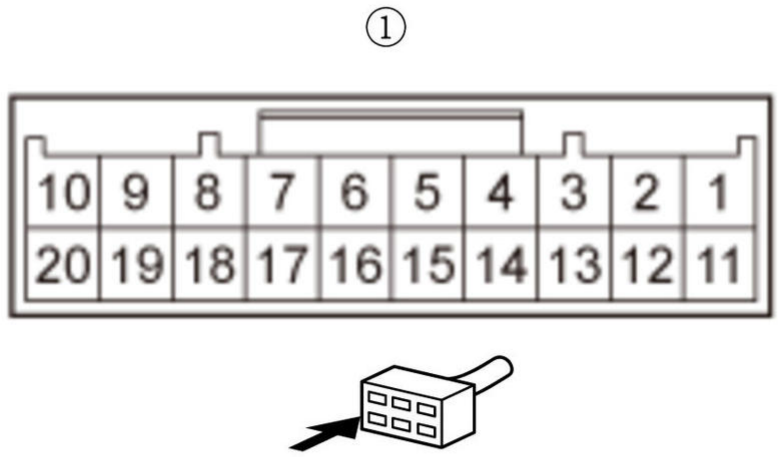
B	Cable reel connector D (20P) connector: disconnected
Test point 1	Cable reel connector D (20P) (male terminals) No. 16: ①
Test point 2	Body ground



Is there about 5 V?

YES

Repair an open in the CRUISE SW wire between the ACC combination switch and the cable reel.

NO

Go to step 8.

8. Open wire check (CRUISE SW line) 3

-1. Turn the vehicle to the OFF (LOCK) mode.

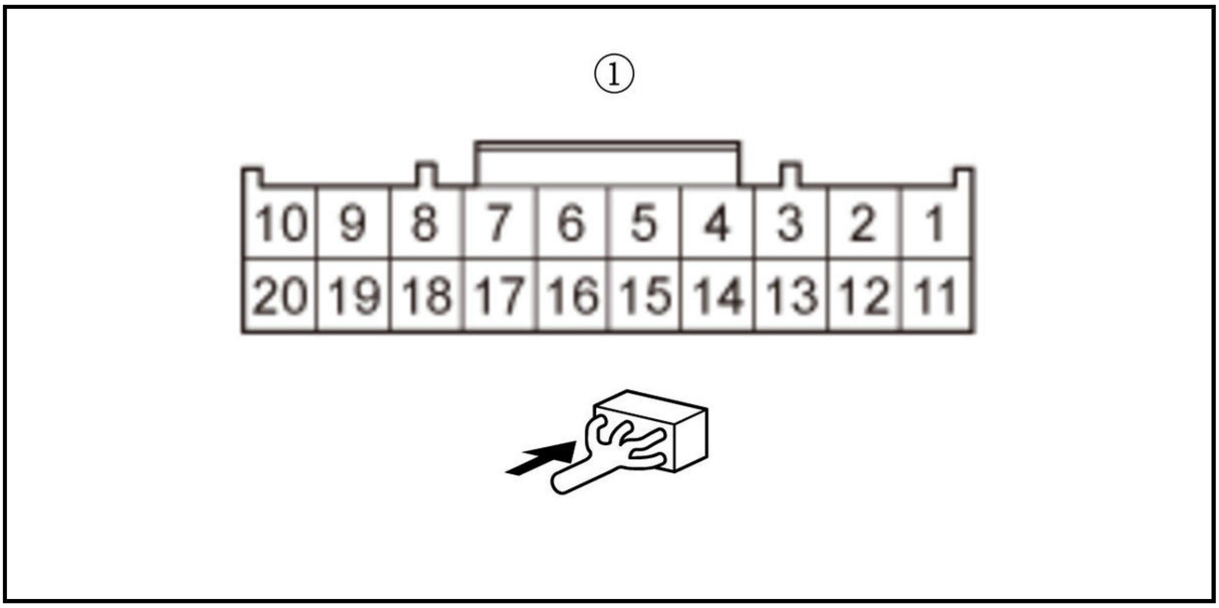
-2. Disconnect the following connector.

Cable reel connector A (20P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P) connector: disconnected
B	Cable reel connector A (20P) connector: disconnected
Test point 1	Cable reel connector A (20P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the cable reel .

NO

Go to step 9.

9. Open wire check (CRUISE SW line) 4

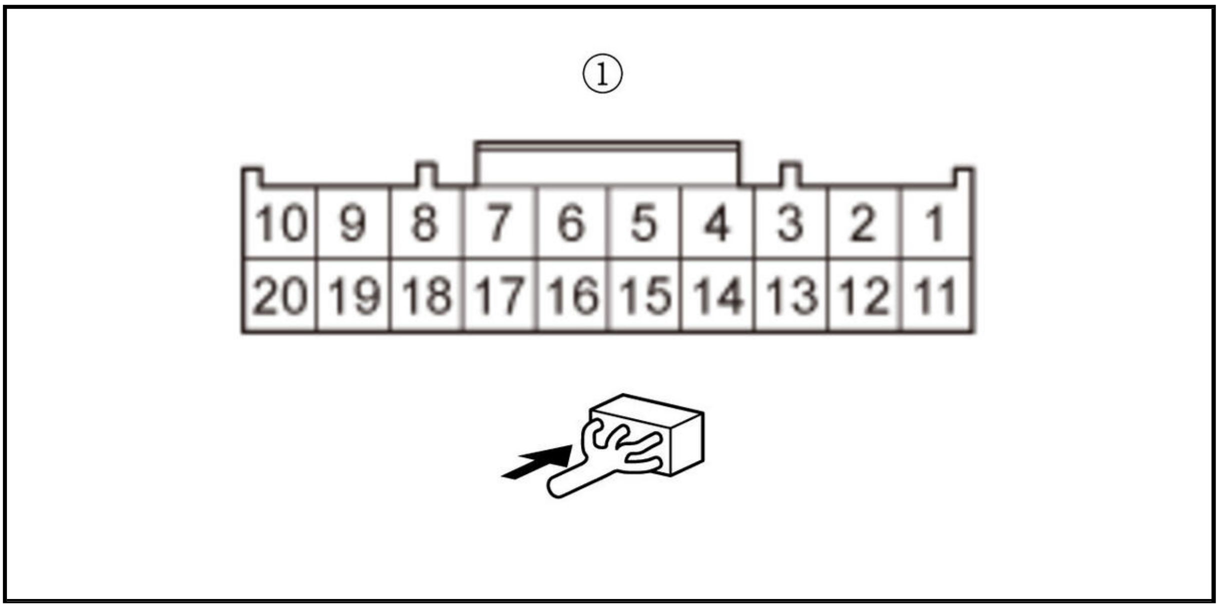
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P) connector: disconnected
B	Cable reel connector A (20P) connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 14**
Test point 2	Cable reel connector A (20P) (female terminals) No. 4: ①



Is there continuity?

YES

Replace the gauge control module .

NO

Repair an open in the CRUISE SW wire between the gauge control module and the cable reel.

DTC P2583-49, U3000-49, U3000-57 (MILLIMETER WAVE RADAR)

DTC P2583-49 : Millimeter Wave Radar Internal Electronic Failure

DTC U3000-49 : Millimeter Wave Radar Internal Electronic Failure

DTC U3000-57 : Millimeter Wave Radar Software Failure

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
P2583-49 Millimeter Wave Radar Internal Electronic Failure	B
U3000-49 Millimeter Wave Radar Internal Electronic Failure	B
U3000-57 Millimeter Wave Radar Software Failure	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to OFF (LOCK) mode and then ON mode repeatedly at least 3 times.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
P2583-49 Millimeter Wave Radar Internal Electronic Failure	B
U3000-49 Millimeter Wave Radar Internal Electronic Failure	B
U3000-57 Millimeter Wave Radar Software Failure	B

Is DTC P2583-49, U3000-49, or U3000-57 indicated?

YES

The failure is duplicated. **Replace the millimeter wave radar** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC P2583-76

DTC P2583-76 : Temporary stop of Integrated Driver Support System (Misalignment Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- Before you troubleshoot, make sure all the tire pressures are correct, and remove all the cargo from the vehicle.
- This DTC is recorded if the beam axis of the millimeter wave radar gets out of alignment as follows while the vehicle is driving.
-
  - Vertical direction: 3.0 degrees or more
  - Horizontal direction: 2.5 degrees or more
- If this DTC is recorded, the following is suspected:
-
  - Change in the vehicle posture caused by an overload or the vehicle being towed.
  - It has been detected that the beam axis of the millimeter wave radar is out of alignment due to improper installation.
  - The millimeter wave radar installing portion is deformed by a minor collision or strong impact.
  - The beam axis of the millimeter wave radar is out of alignment due to abnormal wheel alignment, abnormal tire pressure, etc.
  - Altered suspension
  - When it is snowing, the radio waves transmitted and received by the millimeter wave radar may be refracted by the snow or ice attached around the millimeter wave radar such as the front grille, and are detected as a misalignment.
- If this DTC is recorded, the integrated drive support system temporarily cancels its control to prevent excessive operation or malfunction.
- Even when this DTC is recorded, the vehicle returns to normal if the misalignment of the detection axis of the millimeter wave radar is 1.5 degrees or less.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
P2583-76 Temporary stop of Integrated Driver Support System (Misalignment Millimeter Wave Radar)	B

1. Check the vehicle condition

   -1. Turn the vehicle to the ON mode.

   -2. Check if any integrated driver support system related indicator comes on in the gauge control module.

   Is any indicator currently comes on?

   YES

   The failure is duplicated. Go to step 2.

   NO

   The system is OK at this time. Clear the DTC with the HDS. If the indicator is turned off, and axis misalignment has been recorded, explain to the customer that the system detected a temporarily misaligned millimeter wave axis and stopped functioning.

2. Millimeter wave radar installation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the front bumper** .

   -3. Check that the millimeter wave radar and radar bracket are installed properly and check them for deformation and damage.

   Are the millimeter wave radar and the radar bracket installed properly, and/or there are no signs of damage?

   YES

   Aim the millimeter wave radar . After the millimeter wave radar aiming is complete, clear the DTC with the HDS.

   NO

   Repair or replace faulty parts, then **aim the millimeter wave radar** .

DTC P2583-92

DTC P2583-92 : CMBS or FCW Over Working

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the CMBS is activated several times in a single vehicle ON mode cycle.
- If this DTC is recorded, the CMBS function does not return to normal until the DTC is cleared with the HDS.
- If this DTC is recorded, the following is suspected:
-
    - The millimeter wave radar is installed improperly and close-range obstacles are detected frequently.
    - The millimeter wave radar installing portion is deformed by a minor collision or strong impact.
    - The beam axis of the millimeter wave radar is out of alignment due to abnormal wheel alignment, abnormal tire pressure, etc.
    - The CMBS is activated several times in a row intentionally by the driver.

- After inspecting, repairing, or adjusting a possible cause of the failure, be sure to **perform millimeter wave radar aiming** . If the DTC cannot be deleted after millimeter wave radar aiming, **replace the millimeter wave radar** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
P2583-92 CMBS or FCW Over Working	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
P2583-92 CMBS or FCW Over Working	B

   Is DTC P2583-92 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Millimeter wave radar installation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the front bumper** .

   -3. Check that the millimeter wave radar and radar bracket are installed properly and check them for deformation and damage.

   Are the millimeter wave radar and the radar bracket installed properly, and/or is there any no damage?

   YES

   Go to step 3.

   NO

   Repair or replace faulty parts, then **aim the millimeter wave radar** .

3. Millimeter wave radar check (aiming)

   -1. **Install the front bumper** .

-2. **Aim the millimeter wave radar** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. **Test-drive the vehicle in a speed range where the CMBS is activated** .

-7. Check the operation of the CMBS.

Is the CMBS activated frequently?

YES

If the millimeter wave radar is installed properly but the DTC is recorded again after millimeter wave radar aiming, **replace the millimeter wave radar** .

NO

The system is OK at this time.

DTC P2583-97

DTC P2583-97 : Dust or Dirt On The Millimeter Wave Radar

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is stored when the millimeter wave radar determines that the detection capability (sensitivity) has decreased. A decrease in the detection capability (sensitivity) of the millimeter wave radar does not always mean a there is an obstruction on the radar surface.
-
    - Wipe off any dirt or dust off the millimeter wave radar surface and cover and test drive the vehicle. If the DTC is not record again, the millimeter wave radar is OK.
- This DTC may be stored when passing through an enclosed space such as a tunnel.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
P2583-97 Dust or Dirt On The Millimeter Wave Radar	B

DTC (IDAS)

1. Millimeter wave radar and radar cover visual check

   -1. Check for dirt and dust on the radar cover surface.

   -2. Remove the radar cover, and check for dirt and dust on the inner side of the radar cover.

   -3. Check for dirt and dust on the millimeter wave radar surface.

   Is it surface dirty?

   YES

Clean the millimeter wave radar and/or the radar cover. After cleaning, install the radar cover, then go to step 2.

NO

Go to step 2.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Test-drive the vehicle at speeds 25 mph (40 km/h) or more for 2 minutes.

-5. Check for DTCs with the HDS.

DTC Description	DTC
P2583-97 Dust or Dirt On The Millimeter Wave Radar	B

Is DTC P2583-97 indicated?

YES

The failure is duplicated. **Replace the millimeter wave radar** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC P2583-9A

DTC P2583-9A : Temporary stop of Integrated Driver Support System (Jammed Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the millimeter wave radar malfunctions due to the impact of external radio waves.
- If this DTC is recorded, the integrated driver support system temporarily cancels its control.
- If this DTC is recorded, the vehicle returns to normal if the factor causing the failure has disappeared when the vehicle is stopped (vehicle OFF mode) and is turned to the ON mode again.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
P2583-9A Temporary stop of Integrated Driver Support System (Jammed Millimeter Wave Radar)	B

DTC (IDAS)

1. DTC check

-1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-2. Check for DTCs with the HDS.

DTC Description	DTC
P2583-9A Temporary stop of Integrated Driver Support System (Jammed Millimeter Wave Radar)	B

Is there any DTC(s) other than DTC P2583-9A?

YES

Perform a troubleshooting for the recorded DTC.

NO

Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC U0029-00 (MILLIMETER WAVE RADAR)

DTC U0029-00 : Millimeter Wave Radar F-CAN Malfunction (BUS-OFF)

NOTE:

- Before you troubleshoot, **review the how to troubleshooting information**.
- This DTC is stored by communication failure between the F-CAN line and the millimeter wave radar. When DTC U0029-00 is indicated, the F-CAN line has already returned to normal. Check for loose terminals and poor connections at the connectors. If the connectors are OK, clear the DTC and following this troubleshooting.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0029-00 Millimeter Wave Radar F-CAN Malfunction (BUS-OFF)	B

DTC (IDAS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to indicated DTC's troubleshooting in the CAN gateway system .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U0029-F1 (MILLIMETER WAVE RADAR)

DTC U0029-F1 : F-CAN Malfunction (BUS-OFF) (Multipurpose Camera Unit)

NOTE:

- Before you troubleshoot, **review the how to troubleshooting information**.
- This DTC is stored by communication failure between the F-CAN line and the multipurpose camera unit. When DTC U0029-F1 is indicated, the F-CAN line has already returned to normal. Check for loose terminals and poor connections at the connectors. If the connectors are OK, clear the DTC and following this troubleshooting.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0029-F1 F-CAN Malfunction (BUS-OFF) (Multipurpose Camera Unit)	B

DTC (IDAS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to indicated DTC's troubleshooting in the CAN gateway system .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U0047-00, U0047-F1, U12B7-00 (MILLIMETER WAVE RADAR)

DTC U0047-00 : Millimeter Wave Radar Local-CAN Malfunction (BUS-OFF)

DTC U0047-F1 : Multipurpose Camera Unit Local-CAN Malfunction

DTC U12B7-00 : Millimeter Wave Radar Local-CAN Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If the transmitting control unit is malfunctioning, a DTC may be recorded. According to the recorded DTC, inspect the power circuits and ground circuits of the millimeter wave radar or the multipurpose camera unit.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0047-00 Millimeter Wave Radar Local-CAN Malfunction (BUS-OFF)	B
U0047-F1 Multipurpose Camera Unit Local-CAN Malfunction	B
U12B7-00 Millimeter Wave Radar Local-CAN Malfunction	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 Millimeter Wave Radar Local-CAN Malfunction (BUS-OFF)	B

DTC Description	DTC
U0047-F1 Multipurpose Camera Unit Local-CAN Malfunction	B
U12B7-00 Millimeter Wave Radar Local-CAN Malfunction	B

Is DTC U0047-00, U0047-F1, or U12B7-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the millimeter wave radar and the multipurpose camera unit.

2. Open wire check (ACC CAN-H line, ACC CAN-L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Millimeter wave radar 8P connector
Multipurpose camera unit 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Millimeter wave radar 8P connector: disconnected
B	Multipurpose camera unit 12P connector: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0047-00	ACC CAN-H	**Millimeter wave radar 8P connector**	No. 4	**Multipurpose camera unit 12P connector**	No. 12
	ACC CAN-L		No. 3		No. 6
U0047-F1	ACC CAN-H	**Multipurpose camera unit 12P connector**	No. 12	**Millimeter wave radar 8P connector**	No. 4
	ACC CAN-L		No. 6		No. 3
U12B7-00	ACC CAN-H	**Millimeter wave radar 8P connector**	No. 4	**Multipurpose camera unit 12P connector**	No. 12
	ACC CAN-L		No. 3		No. 6

Is there continuity?

YES

Check for poor connections or loose terminals at the millimeter wave radar and the multipurpose camera unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace **the millimeter wave radar** or **the multipurpose camera unit** .

NO

Repair an open in the ACC CAN-H wire or the ACC CAN-L wire between the millimeter wave radar and the multipurpose camera unit.

DTC U0100-00, U0101-00, U0122-00, U0128-00, U0129-00, U0131-00, U0151-00, U0155-00 (MILLIMETER WAVE RADAR) (2017 2018 2019)

DTC U0100-00 : Lost Communication With The PCM (PGM-FI System) (Millimeter Wave Radar)

DTC U0101-00 : Lost Communication With The PCM/TCM (Millimeter Wave Radar)

DTC U0122-00 : Lost Communication With The VSA Modulator-Control Unit (Millimeter Wave Radar)

DTC U0128-00 : Lost Communication With The Electric Parking Brake Control Unit (Millimeter Wave Radar)

DTC U0129-00 : Lost Communication With The Electric Servo Brake Control Unit or Electric Brake Booster Control Unit (Millimeter Wave Radar)

DTC U0131-00 : Lost Communication With The EPS Control Unit (Millimeter Wave Radar)

DTC U0151-00 : Lost Communication With The SRS Unit (Millimeter Wave Radar)

DTC U0155-00 : Lost Communication With The Gauge Control Module (Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If the transmitting control unit is malfunctioning, a DTC may be recorded. According to the recorded DTC, inspect the power circuits and ground circuits of the units with which the millimeter wave radar does not communicate.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0100-00 Lost Communication With The PCM (PGM-FI System) (Millimeter Wave Radar)	B
U0101-00 Lost Communication With The PCM/TCM (Millimeter Wave Radar)	B
U0122-00 Lost Communication With The VSA Modulator-Control Unit (Millimeter Wave Radar)	B
U0128-00 Lost Communication With The Electric Parking Brake Control Unit (Millimeter Wave Radar)	B
U0129-00 Lost Communication With The Electric Servo Brake Control Unit or Electric Brake Booster Control Unit (Millimeter Wave Radar)	B
U0131-00 Lost Communication With The EPS Control Unit (Millimeter Wave Radar)	B
U0151-00 Lost Communication With The SRS Unit (Millimeter Wave Radar)	B
U0155-00 Lost Communication With The Gauge Control Module (Millimeter Wave Radar)	B

DTC (IDAS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

   Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

   YES

   Go to the indicated DTCs troubleshooting .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Does the millimeter wave radar detect the CAN gateway Bus channels B?

   Bus B is Not Available

   Go to step 3.

   Bus B is Available

   Go to step 4.

3. Open wire check (F-CAN B_H line, F-CAN B_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

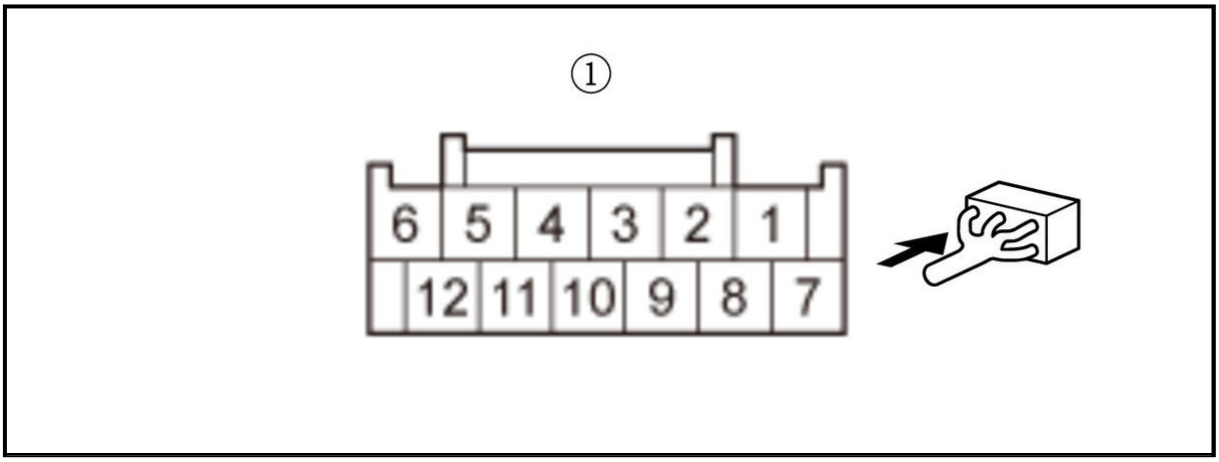
   -2. Disconnect the following connectors.

CAN gateway 12P connector
Millimeter wave radar 8P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	Millimeter wave radar 8P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminals) No. 5: ①
Test point 2	**Millimeter wave radar 8P connector No. 6**

Test point 1	CAN gateway 12P connector (female terminals) No. 12: ①
Test point 2	**Millimeter wave radar 8P connector No. 7**



Is there continuity?

YES

Check for poor connections or loose terminals at the CAN gateway and the millimeter wave radar. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the millimeter wave radar** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the millimeter wave radar and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN getaway Bus channel(s) at normal
U0100-00	PCM	A, B
U0101-00	TCM	A
U0122-00	VSA modulator-control unit	A, B
U0128-00	VSA modulator-control unit	A, B
U0129-00	Electric brake booster	A, B
U0131-00	EPS control unit	B
U0151-00	SRS unit	B
U0155-00	Gauge control module	A

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-00: PCM is Not Available for Bus A

Go to step 5.

U0100-00: PCM is Not Available for Bus B

Go to step 6.

U0101-00: TCM is Not Available for Bus A

Go to step 5.

U0122-00: VSA modulator-control unit is Not Available for Bus A

Go to step 5.

U0122-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0128-00: VSA modulator-control unit is Not Available for Bus A

Go to step 5.

U0128-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0129-00: Electric brake booster is Not Available for Bus A

Go to step 5.

U0129-00: Electric brake booster is Not Available for Bus B

Go to step 6.

U0131-00: EPS control unit is Not Available for Bus B

Go to step 6.

U0151-00: SRS unit is Not Available for Bus B

Go to step 6.

U0155-00: Gauge control module is Not Available for Bus A

Go to step 5.

5. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 12P connector
U0100-00	PCM connector A (50P)
U0101-00	TCM 50P connector
U0122-00	VSA modulator-control unit 46P connector

DTC	Connector
U0128-00	VSA modulator-control unit 46P connector
U0129-00	Electric brake booster 26P connector
U0155-00	Gauge control module connector A (32P)

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	**Circuit name**	**Test point 1 (Receiving control unit)**		**Test point 2 (Transmitting control unit)**	
		Connector	**Terminal**	**Connector**	**Terminal**
U0100-00	F-CAN A_H	CAN gateway 12P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37

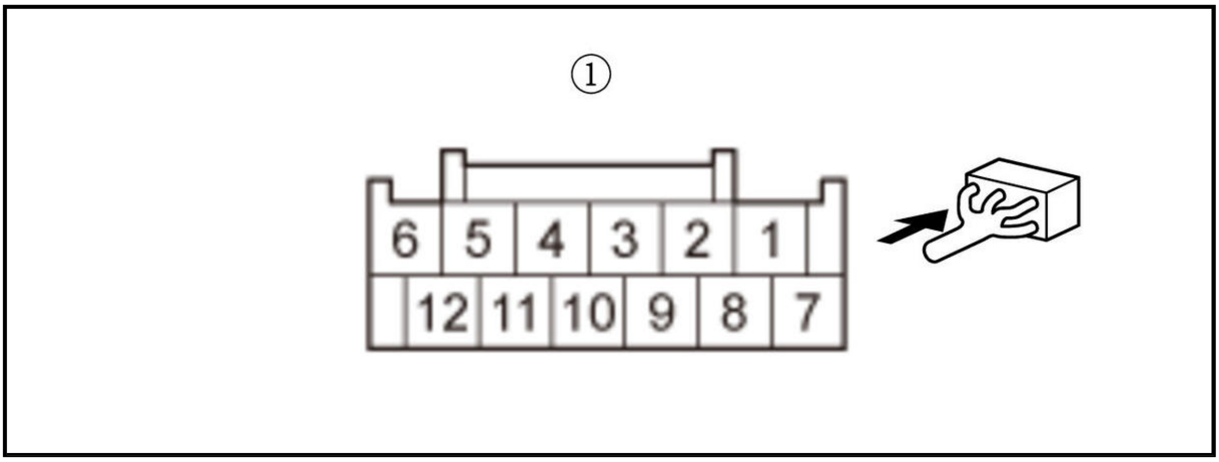
	F-CAN A_L		No. 9		No. 20



Is there continuity?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the millimeter wave radar and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0101-00	Check for poor connections or loose terminals at the millimeter wave radar and the TCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known TCM** , then recheck. If they are OK, **replace the original TCM** .
U0122-00	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0128-00	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0129-00	Check for poor connections or loose terminals at the millimeter wave radar and the electric brake booster. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .
U0155-00	Check for poor connections or loose terminals at the millimeter wave radar and the gauge control module. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good gauge control module** , then recheck. If they are OK, **replace the original gauge control module** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 12P connector
U0100-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector
U0128-00	VSA modulator-control unit 46P connector
U0129-00	Electric brake booster 26P connector
U0131-00	EPS control unit connector B (6P)
U0151-00	SRS unit connector A (39P)

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**PCM connector A (50P) (L15BE engine)**	No. 39
	F-CAN B_L		No. 5		No. 38
U0122-00	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**VSA modulator-control unit 46P connector**	No. 46
	F-CAN B_L		No. 5		No. 34
U0128-00	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**VSA modulator-control unit 46P connector**	No. 46

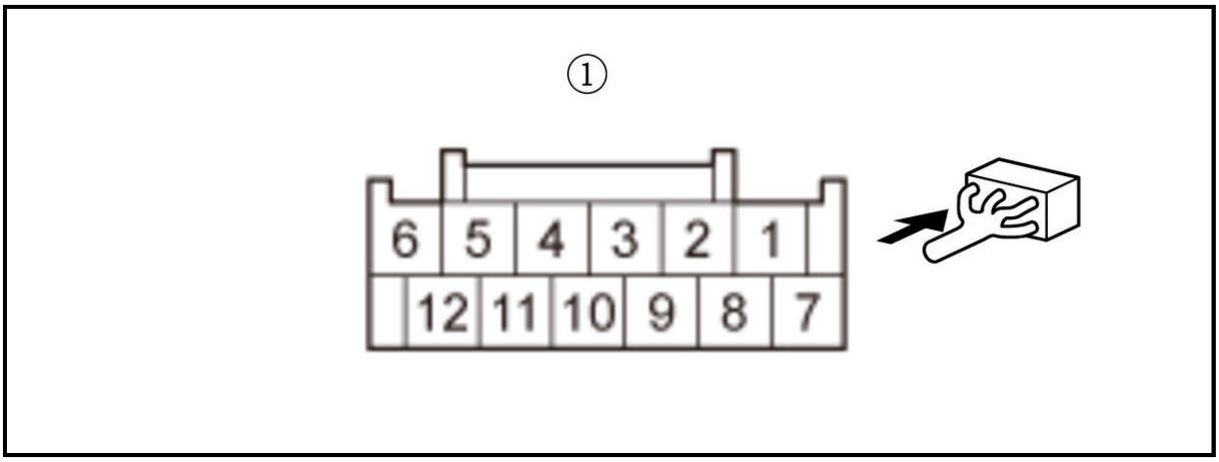
	F-CAN B_L		No. 5		No. 12
U0131-00	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**EPS control unit connector B (6P)**	No. 3
	F-CAN B_L		No. 5		No. 1
U0151-00	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**SRS unit connector A (39P)**	No. 34
	F-CAN B_L		No. 5		No. 35



Is there continuity?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the millimeter wave radar and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .

DTC	Operation for transmitting control unit
U0122-00	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0128-00	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0129-00	Check for poor connections or loose terminals at the millimeter wave radar and the electric brake booster. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .
U0131-00	Check for poor connections or loose terminals at the multipurpose camera unit and the EPS control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the EPS motor/control unit** .
U0151-00	Check for poor connections or loose terminals at the millimeter wave radar and the SRS unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the SRS unit** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

DTC U0100-00, U0101-00, U0122-00, U0128-00, U0129-00, U0131-00, U0151-00, U0155-00 (MILLIMETER WAVE RADAR) (2020 2021)

DTC U0100-00 : Lost Communication With The PCM (PGM-FI System) (Millimeter Wave Radar)

DTC U0101-00 : Lost Communication With The PCM/TCM (Millimeter Wave Radar)

DTC U0122-00 : Lost Communication With The VSA Modulator-Control Unit (Millimeter Wave Radar)

DTC U0128-00 : Lost Communication With The Electric Parking Brake Control Unit (Millimeter Wave Radar)

DTC U0129-00 : Lost Communication With The Electric Servo Brake Control Unit or Electric Brake Booster Control Unit (Millimeter Wave Radar)

DTC U0131-00 : Lost Communication With The EPS Control Unit (Millimeter Wave Radar)

DTC U0151-00 : Lost Communication With The SRS Unit (Millimeter Wave Radar)

DTC U0155-00 : Lost Communication With The Gauge Control Module (Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If the transmitting control unit is malfunctioning, a DTC may be recorded. According to the recorded DTC, inspect the power circuits and ground circuits of the units with which the millimeter wave radar does not communicate.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0100-00 Lost Communication With The PCM (PGM-FI System) (Millimeter Wave Radar)	B
U0101-00 Lost Communication With The PCM/TCM (Millimeter Wave Radar)	B
U0122-00 Lost Communication With The VSA Modulator-Control Unit (Millimeter Wave Radar)	B
U0128-00 Lost Communication With The Electric Parking Brake Control Unit (Millimeter Wave Radar)	B
U0129-00 Lost Communication With The Electric Servo Brake Control Unit or Electric Brake Booster Control Unit (Millimeter Wave Radar)	B
U0131-00 Lost Communication With The EPS Control Unit (Millimeter Wave Radar)	B
U0151-00 Lost Communication With The SRS Unit (Millimeter Wave Radar)	B
U0155-00 Lost Communication With The Gauge Control Module (Millimeter Wave Radar)	B

DTC (IDAS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

   Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

   YES

   Go to the indicated DTCs troubleshooting .

NO

Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Does the millimeter wave radar detect the CAN gateway Bus channels B?

   Bus B is Not Available

   Go to step 3.

   Bus B is Available

   Go to step 4.

3. Open wire check (F-CAN B_H line, F-CAN B_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

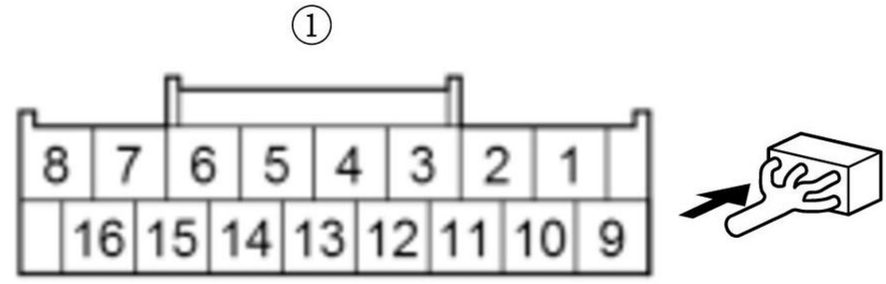
   -2. Disconnect the following connectors.

CAN gateway 16P connector
Millimeter wave radar 8P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Millimeter wave radar 8P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**Millimeter wave radar 8P connector No. 7**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**Millimeter wave radar 8P connector No. 6**



Is there continuity?

YES

Check for poor connections or loose terminals at the CAN gateway and the millimeter wave radar. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the millimeter wave radar** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the millimeter wave radar and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100-00	PCM	A, B
U0101-00	TCM	A
U0122-00	VSA modulator-control unit	A, B
U0128-00	VSA modulator-control unit	A, B
U0129-00	Electric brake booster	A, B
U0131-00	EPS control unit	B
U0151-00	SRS unit	B
U0155-00	Gauge control module	A

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-00: PCM is Not Available for Bus A

Go to step 5.

U0100-00: PCM is Not Available for Bus B

Go to step 6.

U0101-00: TCM is Not Available for Bus A

Go to step 5.

U0122-00: VSA modulator-control unit is Not Available for Bus A

Go to step 5.

U0122-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0128-00: VSA modulator-control unit is Not Available for Bus A

Go to step 5.

U0128-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0129-00: Electric brake booster is Not Available for Bus A

Go to step 5.

U0129-00: Electric brake booster is Not Available for Bus B

Go to step 6.

U0131-00: EPS control unit is Not Available for Bus B

Go to step 6.

U0151-00: SRS unit is Not Available for Bus B

Go to step 6.

U0155-00: Gauge control module is Not Available for Bus A

Go to step 5.

5. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	TCM 50P connector
U0122-00	VSA modulator-control unit 46P connector
U0128-00	VSA modulator-control unit 46P connector
U0129-00	Electric brake booster 26P connector
U0155-00	Gauge control module connector A (32P)

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)

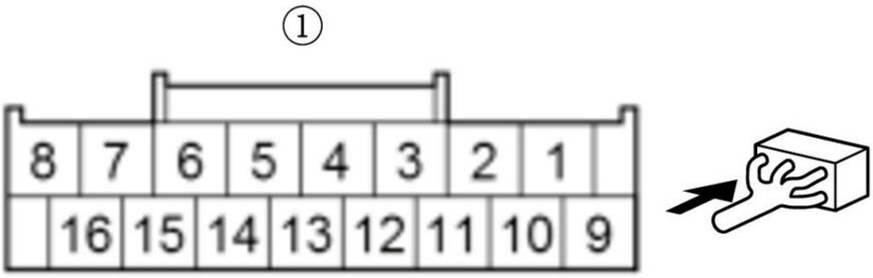
	F-CAN A_L		No. 11		No. 20



Is there continuity?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the millimeter wave radar and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .

DTC	Operation for transmitting control unit
U0101-00	Check for poor connections or loose terminals at the millimeter wave radar and the TCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known TCM** , then recheck. If they are OK, **replace the original TCM** .
U0122-00	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0128-00	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0129-00	Check for poor connections or loose terminals at the millimeter wave radar and the electric brake booster. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .
U0155-00	Check for poor connections or loose terminals at the millimeter wave radar and the gauge control module. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good gauge control module** , then recheck. If they are OK, **replace the original gauge control module** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector
U0128-00	VSA modulator-control unit 46P connector
U0129-00	Electric brake booster 26P connector
U0131-00	EPS control unit connector B (6P)
U0151-00	SRS unit connector A (39P)

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

U0155-F1 Lost Communication With The Gauge Control Module (Multipurpose Camera Unit)	B

DTC (IDAS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

DTC Description	DTC
U3000-49 CAN Gateway Internal Failure	B

   Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

   YES

   Go to the indicated DTCs troubleshooting .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Does the millimeter wave radar detect the CAN gateway Bus channels B?

   Bus B is Not Available

   Go to step 3.

   Bus B is Available

   Go to step 4.

3. Open wire check (F-CAN B_H line, F-CAN B_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

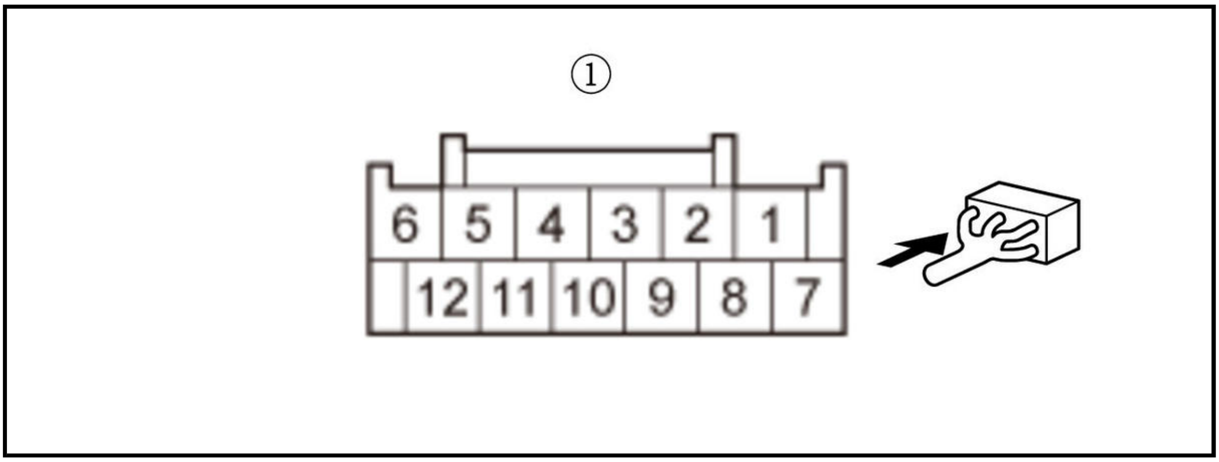
   -2. Disconnect the following connectors.

CAN gateway 12P connector
Multipurpose camera unit 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	Multipurpose camera unit 12P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminals) No. 5: ①
Test point 2	**Multipurpose camera unit 12P connector No. 5**

Test point 1	CAN gateway 12P connector (female terminals) No. 12: ①
Test point 2	**Multipurpose camera unit 12P connector No. 11**



Is there continuity?

YES

Check for poor connections or loose terminals at the CAN gateway and the multipurpose camera unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the multipurpose camera unit** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the multipurpose camera unit and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

-2. According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN getaway Bus channel(s) at normal
U0100-F1	PCM	A, B
U0101-F1	TCM	A
U0122-F1	VSA modulator-control unit	A, B
U0129-F1	Electric brake booster	A, B
U0131-F1	EPS control unit	B
U0151-F1	SRS unit	B
U0155-F1	Gauge control module	A

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-F1: PCM is Not Available for Bus A

Go to step 5.

U0100-F1: PCM is Not Available for Bus B

Go to step 6.

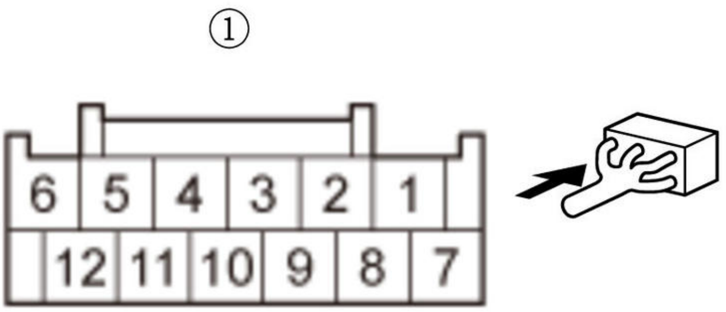
	F-CAN A_L		No. 9		No. 18
U0155-F1	F-CAN A_H	CAN gateway 12P connector (female terminals): ①	No. 3	Gauge control module connector A (32P)	No. 19
	F-CAN A_L		No. 9		No. 20



Is there continuity?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-F1	Check for poor connections or loose terminals at the millimeter wave radar and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0101-F1	Check for poor connections or loose terminals at the millimeter wave radar and the TCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known TCM** , then recheck. If they are OK, **replace the original TCM** .
U0122-F1	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

DTC	Operation for transmitting control unit
U0129-F1	Check for poor connections or loose terminals at the millimeter wave radar and the electric brake booster. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .
U0155-F1	Check for poor connections or loose terminals at the millimeter wave radar and the gauge control module. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good gauge control module** , then recheck. If they are OK, **replace the original gauge control module** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

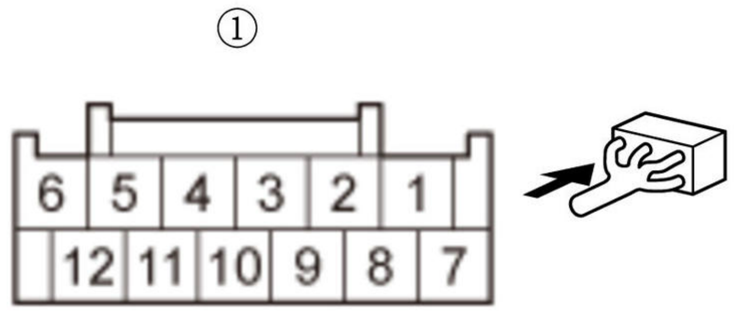
DTC	Connector
B	CAN gateway 12P connector
U0100-F1	PCM connector A (50P)
U0122-F1	VSA modulator-control unit 46P connector
U0129-F1	Electric brake booster 26P connector
U0131-F1	EPS control unit connector B (6P)
U0151-F1	SRS unit connector A (39P)

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-F1	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 5		No. 38
U0122-F1	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**VSA modulator-control unit 46P connector**	No. 46
	F-CAN B_L		No. 5		No. 34
U0129-F1	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**Electric brake booster 26P connector**	No. 19
	F-CAN B_L		No. 5		No. 12
U0131-F1	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**EPS control unit connector B (6P)**	No. 3
	F-CAN B_L		No. 5		No. 1
U0151-F1	F-CAN B_H	CAN gateway 12P connector (female terminals): ①	No. 12	**SRS unit connector A (39P)**	No. 34
	F-CAN B_L		No. 5		No. 35



Is there continuity?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-F1	Check for poor connections or loose terminals at the millimeter wave radar and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0122-F1	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0129-F1	Check for poor connections or loose terminals at the millimeter wave radar and the electric brake booster. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

DTC	Operation for transmitting control unit
U0131-F1	Check for poor connections or loose terminals at the multipurpose camera unit and the EPS control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the EPS motor/control unit** .
U0151-F1	Check for poor connections or loose terminals at the millimeter wave radar and the SRS unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the SRS unit** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

DTC U0100-F1, U0101-F1, U0122-F1, U0129-F1, U0131-F1, U0151-F1, U0155-F1 (MILLIMETER WAVE RADAR) (2020 2021)

DTC U0100-F1 : Lost Communication With The PCM (PGM-FI System) (Multipurpose Camera Unit)

DTC U0101-F1 : Lost Communication With The PCM/TCM (Multipurpose Camera Unit)

DTC U0122-F1 : Lost Communication With The VSA Modulator-Control Unit (Multipurpose Camera Unit)

DTC U0129-F1 : Lost Communication With The Electric Servo Brake Control Unit/Electric Brake Booster Control Unit (Multipurpose Camera Unit)

DTC U0131-F1 : Lost Communication With The EPS Control Unit (Multipurpose Camera Unit)

DTC U0151-F1 : Lost Communication With The SRS Unit (Multipurpose Camera Unit)

DTC U0155-F1 : Lost Communication With The Gauge Control Module (Multipurpose Camera Unit)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If the transmitting control unit is malfunctioning, a DTC may be recorded. According to the recorded DTC, inspect the power circuits and ground circuits of the units with which the multipurpose camera unit does not communicate.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0100-F1 Lost Communication With The PCM (PGM-FI System) (Multipurpose Camera Unit)	B
U0101-F1 Lost Communication With The PCM/TCM (Multipurpose Camera Unit)	B
U0122-F1 Lost Communication With The VSA Modulator-Control Unit (Multipurpose Camera Unit)	B
U0129-F1 Lost Communication With The Electric Servo Brake Control Unit/Electric Brake Booster Control Unit (Multipurpose Camera Unit)	B
U0131-F1 Lost Communication With The EPS Control Unit (Multipurpose Camera Unit)	B
U0151-F1 Lost Communication With The SRS Unit (Multipurpose Camera Unit)	B
U0155-F1 Lost Communication With The Gauge Control Module (Multipurpose Camera Unit)	B

DTC (IDAS)

1. CAN gateway system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B

DTC Description	DTC
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

YES

Go to the indicated DTCs troubleshooting .

NO

Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the millimeter wave radar detect the CAN gateway Bus channels B?

Bus B is Not Available

Go to step 3.

Bus B is Available

Go to step 4.

3. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

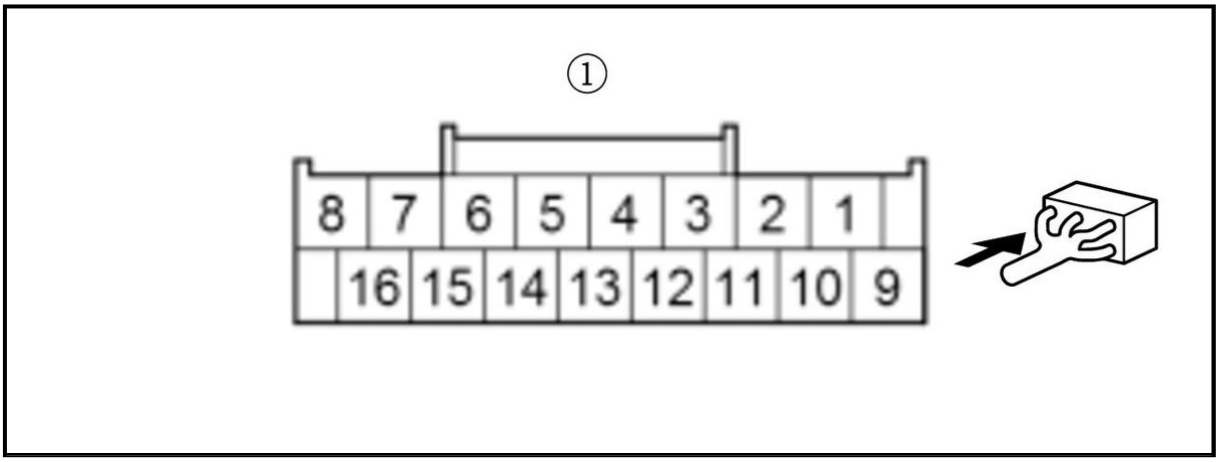
-2. Disconnect the following connectors.

CAN gateway 16P connector
Multipurpose camera unit 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	Multipurpose camera unit 12P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**Multipurpose camera unit 12P connector No. 11**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**Multipurpose camera unit 12P connector No. 5**



Is there continuity?

YES

Check for poor connections or loose terminals at the CAN gateway and the multipurpose camera unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the multipurpose camera unit** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the multipurpose camera unit and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

-2. According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100-F1	PCM	A, B
U0101-F1	TCM	A
U0122-F1	VSA modulator-control unit	A, B
U0129-F1	Electric brake booster	A, B
U0131-F1	EPS control unit	B
U0151-F1	SRS unit	B
U0155-F1	Gauge control module	A

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-F1: PCM is Not Available for Bus A

Go to step 5.

U0100-F1: PCM is Not Available for Bus B

Go to step 6.

U0101-F1: TCM is Not Available for Bus A

Go to step 5.

U0122-F1: VSA modulator-control unit is Not Available for Bus A

Go to step 5.

U0122-F1: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0129-F1: Electric brake booster is Not Available for Bus A

Go to step 5.

U0129-F1: Electric brake booster is Not Available for Bus B

Go to step 6.

U0131-F1: EPS control unit is Not Available for Bus B

Go to step 6.

U0151-F1: SRS unit is Not Available for Bus B

Go to step 6.

U0155-F1: Gauge control module is Not Available for Bus A

Go to step 5.

5. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0100-F1	PCM connector A (50P)

DTC	Connector
U0101-F1	TCM 50P connector
U0122-F1	VSA modulator-control unit 46P connector
U0129-F1	Electric brake booster 26P connector
U0155-F1	Gauge control module connector A (32P)

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)

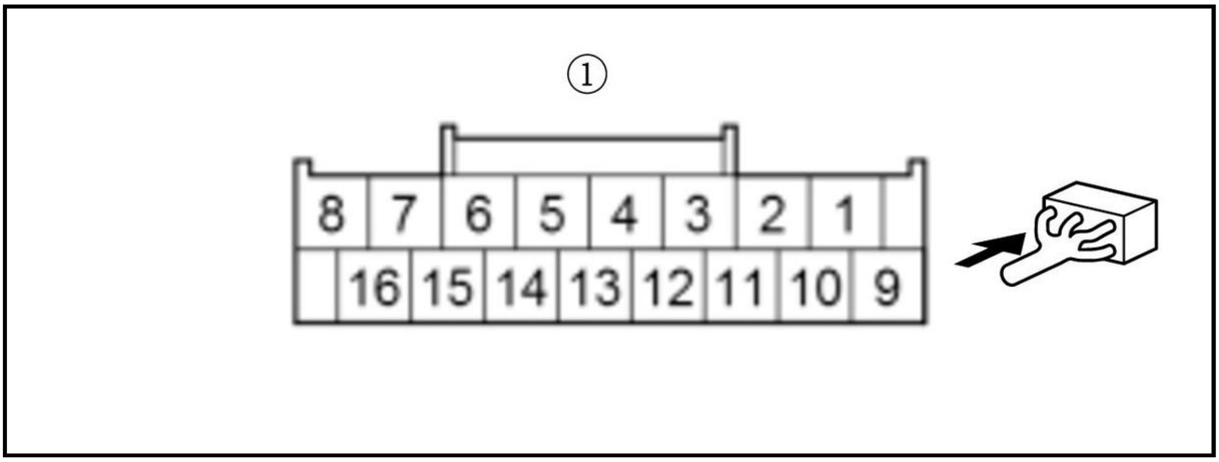
U0155-F1	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**Gauge control module connector A (32P)**	No. 19
	F-CAN A_L		No. 11		No. 20



Is there continuity?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-F1	Check for poor connections or loose terminals at the millimeter wave radar and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0101-F1	Check for poor connections or loose terminals at the millimeter wave radar and the TCM. Check for any authorized service information related to the DTCs or symptoms you are

DTC	Operation for transmitting control unit
	troubleshooting, or **substitute a good-known TCM** , then recheck. If they are OK, **replace the original TCM** .
U0122-F1	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

DTC	Operation for transmitting control unit
U0129-F1	Check for poor connections or loose terminals at the millimeter wave radar and the electric brake booster. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .
U0155-F1	Check for poor connections or loose terminals at the millimeter wave radar and the gauge control module. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good gauge control module** , then recheck. If they are OK, **replace the original gauge control module** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0100-F1	PCM connector A (50P)
U0122-F1	VSA modulator-control unit 46P connector
U0129-F1	Electric brake booster 26P connector
U0131-F1	EPS control unit connector B (6P)
U0151-F1	SRS unit connector A (39P)

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal

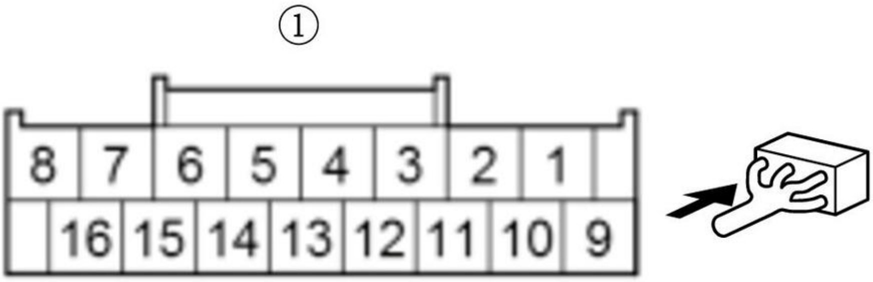
	F-CAN B_L		No. 14		No. 35



Is there continuity?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-F1	Check for poor connections or loose terminals at the millimeter wave radar and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0122-F1	Check for poor connections or loose terminals at the millimeter wave radar and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0129-F1	Check for poor connections or loose terminals at the millimeter wave radar and the electric brake booster. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

DTC	Operation for transmitting control unit
U0131-F1	Check for poor connections or loose terminals at the multipurpose camera unit and the EPS control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the EPS motor/control unit** .
U0151-F1	Check for poor connections or loose terminals at the millimeter wave radar and the SRS unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the SRS unit** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

DTC U0401-53, U0401-92 (MILLIMETER WAVE RADAR)

DTC U0401-53 : Temporary stop of Integrated Driver Support System (Received stop request by PGM-FI System)

DTC U0401-92 : Temporary stop of Integrated Driver Support System (Rejected control request by PGM-FI System)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If these DTC are recorded, the following is suspected:
-
    - ACC operation is inhibited this way when there is a transmission malfunction, transmission and transmission fluid temperatures are too high, or if the PCM determines ACC is still active when the brake pedal is pressed.
    - The brake pedal position switch is failed or out of adjustment, or the brake pedal was pressed lightly while driving. (electric brake booster equipped models)
    - If this sets due to transmission fluid temperature, a warning will also be displayed in the MID.
- If these DTC are recorded, some of the integrated driver support system functions are temporarily canceled but it is not a failure.
- When the PCM becomes ready to receive a control request from the millimeter wave radar and the multipurpose camera unit, the temporarily cancelled integrated driver support system functions are re-activated.
- The functions of the integrated driver support system that will be temporarily canceled when these DTC are recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0401-53 Temporary stop of Integrated Driver Support System (Received stop request by PGM-FI System)	B
U0401-92 Temporary stop of Integrated Driver Support System (Rejected control request by PGM-FI System)	B

DTC (IDAS)

1. DTC check

   -1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
U0401-53 Temporary stop of Integrated Driver Support System (Received stop request by PGM-FI System)	B
U0401-92 Temporary stop of Integrated Driver Support System (Rejected control request by PGM-FI System)	B

Is there any DTC(s) other than DTC U0401-53 or U0401-92?

YES

Perform a troubleshooting for the recorded DTC.

NO

Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC U0416-92, U0416-9A (MILLIMETER WAVE RADAR)

DTC U0416-92 : Temporary stop of Integrated Driver Support System (Rejected control request by VSA System)

DTC U0416-9A : Temporary stop of Integrated Driver Support System (Unstable Wheel Speed Sensor Signal)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the VSA modulator-control unit cannot temporarily receives a brake request from the integrated driver support system due to a drop in the 12 volt battery voltage supplied to the VSA modulator-control unit.
- If this DTC is recorded, some of the integrated driver support system functions are temporarily canceled but it is not a failure.
- When the VSA modulator-control unit returns to normal, the temporarily cancelled integrated driver support system functions are re-activated.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0416-92 Temporary stop of Integrated Driver Support System (Rejected control request by VSA System)	B
U0416-9A Temporary stop of Integrated Driver Support System (Unstable Wheel Speed Sensor Signal)	B

DTC (IDAS)

1. DTC check

-1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-2. Check for DTCs with the HDS.

DTC Description	DTC
U0416-92 Temporary stop of Integrated Driver Support System (Rejected control request by VSA System)	B
U0416-9A Temporary stop of Integrated Driver Support System (Unstable Wheel Speed Sensor Signal)	B

Is there any DTC(s) other than U0416-92 or U0416-9A?

YES

Perform a troubleshooting for the recorded DTC.

NO

Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC U0417-68 (MILLIMETER WAVE RADAR)

DTC U0417-68 : Electric Parking Brake Control Unit Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTCs are recorded when the millimeter wave radar receives electric parking brake control unit failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the electric parking brake system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0417-68 Electric Parking Brake Control Unit Malfunction	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U0417-68 Electric Parking Brake Control Unit Malfunction	B

Is DTC U0417-68 indicated?

YES

The failure is duplicated. **Go to the indicated DTC's troubleshooting in the electric parking brake system** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U0418-68 (MILLIMETER WAVE RADAR)

DTC U0418-68 : Electric Servo Brake System/Electric Brake Booster System Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the millimeter wave radar receives electric brake booster failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the electric brake booster system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0418-68 Electric Servo Brake System/Electric Brake Booster System Malfunction	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U0418-68 Electric Servo Brake System/Electric Brake Booster System Malfunction	B

   Is DTC U0418-68 indicated?

   YES

   The failure is duplicated. **Go to the indicated DTC's troubleshooting in the electric brake booster system** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U0418-9A (MILLIMETER WAVE RADAR)

DTC U0418-9A : Temporary stop of Integrated Driver Support System (Not Start-Up Electric Brake Booster Control Unit)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the electric brake booster cannot temporarily receives a brake request from the integrated driver support system due to a drop in the 12 volt battery voltage supplied to the electric brake booster.
- If this DTC is recorded, some of the integrated driver support system functions are temporarily canceled but it is not a failure.

- When the electric brake booster returns to normal, the temporarily cancelled integrated driver support system functions are re-activated.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0418-9A Temporary stop of Integrated Driver Support System (Not Start-Up Electric Brake Booster Control Unit)	B

DTC (IDAS)

1. DTC check

-1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-2. Check for DTCs with the HDS.

DTC Description	DTC
U0418-9A Temporary stop of Integrated Driver Support System (Not Start-Up Electric Brake Booster Control Unit)	B

Is there any DTC(s) other than U0418-9A?

YES

Perform a troubleshooting for the recorded DTC.

NO

Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC U0420-68 (MILLIMETER WAVE RADAR)

DTC U0420-68 : EPS Control Unit Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the millimeter wave radar receives the EPS control unit failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the EPS system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0420-68 EPS Control Unit Malfunction	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U0420-68 EPS Control Unit Malfunction	B

Is DTC U0420-68 indicated?

YES

The failure is duplicated. **Go to the indicated DTC's troubleshooting in the EPS system** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U0423-68, U1280-00, U1281-00, U128C-00 (MILLIMETER WAVE RADAR)

DTC U0423-68 : Gauge Control Module Malfunction

DTC U1280-00 : Lost Communication With The B-CAN Systems

DTC U1281-00 : Lost Communication with The MICU (Body Control Module)

DTC U128C-00 : Lost Communication with The Wiper Control Unit

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- These DTCs are recorded when the millimeter wave radar receives failure information for relevant B-CAN systems or switches judged by the gauge control module.
- B-CAN system information used to control the integrated driver support system of this vehicle is obtained from the gauge control module via the F-CAN.
- If a DTC is recorded after it is cleared with the HDS, **perform a self-diagnostic function for the gauge control module** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U0423-68 Gauge Control Module Malfunction	B
U1280-00 Lost Communication With The B-CAN Systems	B
U1281-00 Lost Communication with The MICU (Body Control Module)	B
U128C-00 Lost Communication with The Wiper Control Unit	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U0423-68 Gauge Control Module Malfunction	B

DTC Description	DTC
U1280-00 Lost Communication With The B-CAN Systems	B
U1281-00 Lost Communication with The MICU (Body Control Module)	B
U128C-00 Lost Communication with The Wiper Control Unit	B

Is DTC U0423-68, U1280-00, U1281-00, or U128C-00 indicated?

YES

The failure is duplicated. **Go to the indicated DTC's troubleshooting in the gauge control module** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

DTC U3000-51 (MILLIMETER WAVE RADAR)

DTC U3000-51 : Millimeter Wave Radar Update Incomplete

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is indicated when a millimeter wave radar update is not completed properly.
- This DTC is not deleted until the millimeter wave radar is updated.
- After the update is successfully completed, these DTCs are automatically deleted without using the HDS.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index** .

DTC Description	DTC
U3000-51 Millimeter Wave Radar Update Incomplete	B

DTC (IDAS)

1. Millimeter wave radar (update)

-1. **Update the millimeter wave radar** .

NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

-2. Check for DTCs with the HDS.

DTC Description	DTC
U3000-51 Millimeter Wave Radar Update Incomplete	B

Is DTC U3000-51 indicated?

YES

The failure is duplicated. **Replace the millimeter wave radar** .

NO

Update is complete.

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE ADAPTIVE CRUISE CONTROL (ACC)

ACC Indicator (Amber)

When the ACC system detects a problem while operating, the ACC system stops working, then the ACC indicator and the brake system indicator (amber) stay on.

NOTE:

- For ACC function, **review the Adaptive Cruise Control (ACC) Description** .
- The ACC system communicates with other control units via F-CAN. For ACC system diagram, **review the ACC System Diagram** . If a connected unit malfunctions, the ACC system will not operate. In this case, both ACC indicator and connected unit indicator come on and stay on (except for the gauge control module).

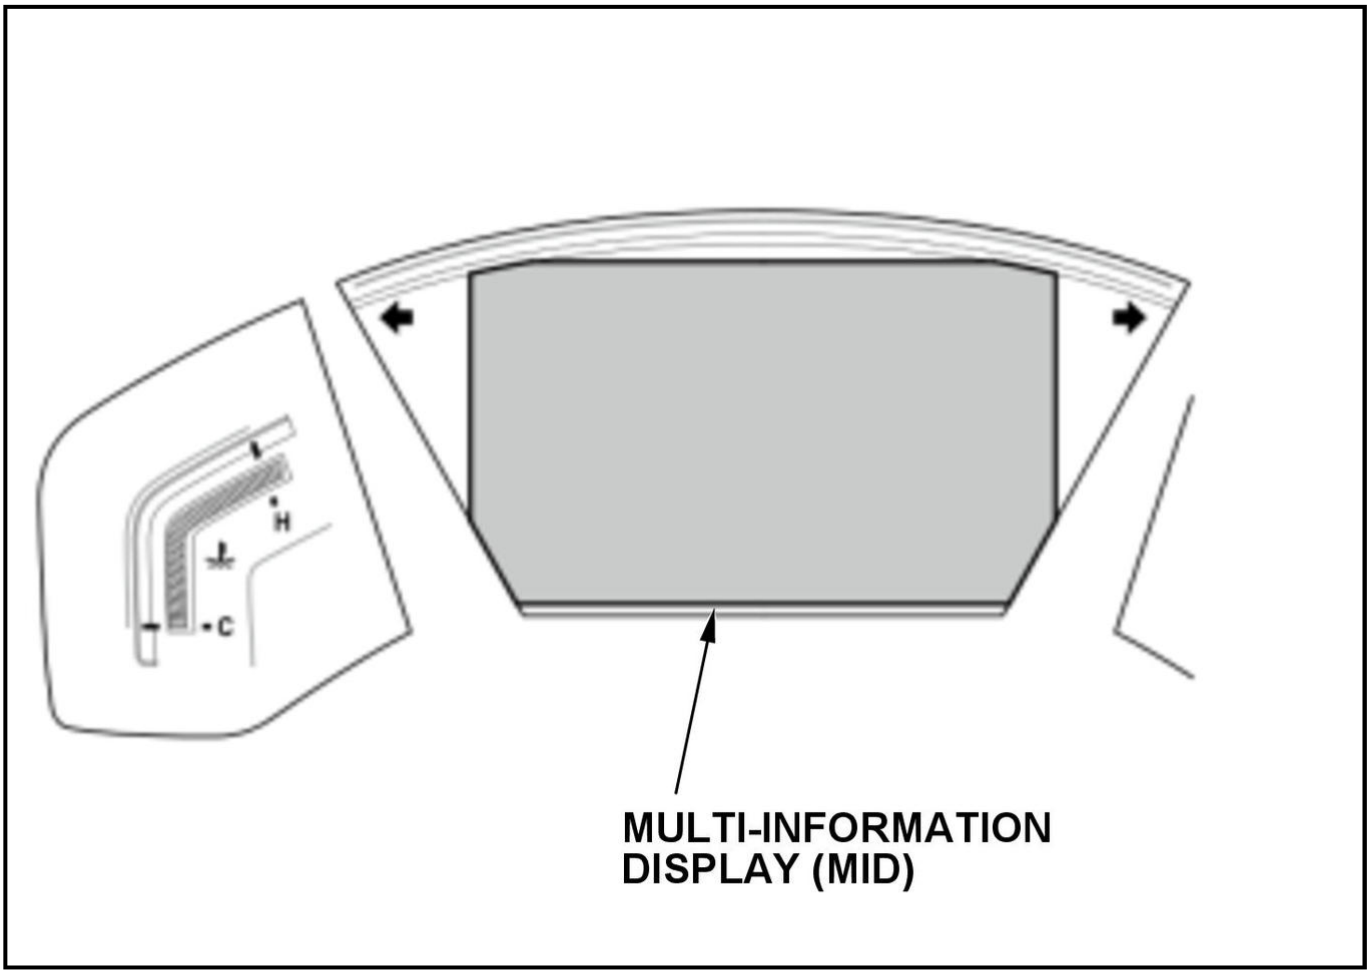
ACC INDICATOR
(amber)

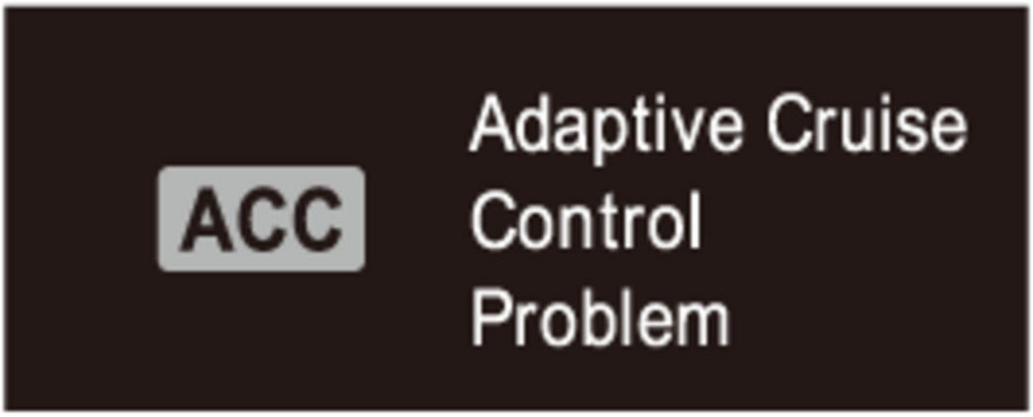
Multi-Information Display (MID) Indication

When the ACC system is OK, the ACC indicates its status on the multi-information display (MID) when the MAIN switch is ON.



Self-Diagnostic Function

The ACC system has a self-diagnostic function. If the self-diagnostic function detects a malfunction, the ACC system stops operating. The ACC indicator comes on, and the ACC system indicates "Adaptive Cruise Control Problem" on the MID.



ACC

Adaptive Cruise
Control
Problem

Millimeter Wave Radar

The millimeter wave radar measures the distance between your vehicle and the vehicle directly ahead to calculate the difference in speed between the vehicles.

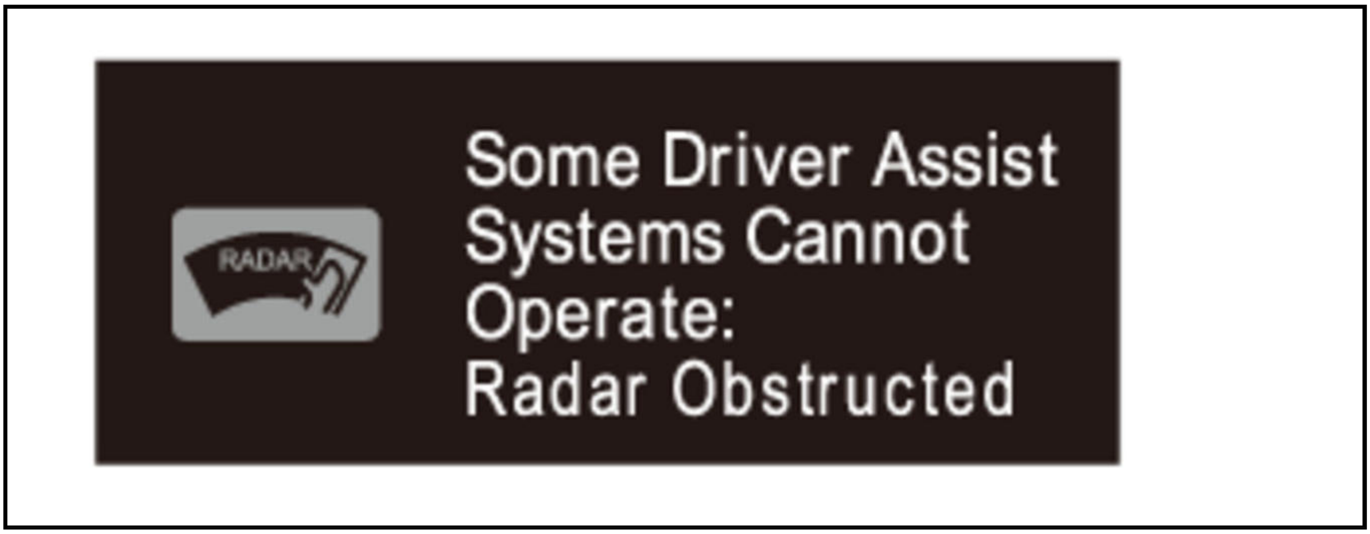
The millimeter wave radar has a self-diagnostic function. If the system detects a problem, it disables the ACC, and turns on the ACC indicator.

Dirt or dust detective function (Clean Millimeter Wave Radar Indication)

If the millimeter wave radar or front grille gets dirty, the ACC system stops operating and the following message on the MID will appear. Clean the millimeter wave radar and the front grille surface. Once the millimeter wave radar and front grille surface are clean, the message on the MID disappears and the ACC system automatically turns on.

NOTE:

- The following MID message may come on temporarily when passing through an enclosed space, such as tunnel.
- Under the above conditions DTC P2583-97 is stored.
- When it is snowing, the radio waves transmitted and received by the millimeter wave radar may be refracted by the snow or ice attached around the millimeter wave radar such as the front grille. At this time, DTC P2583-76 is stored depending on the situation.
- After DTC P2583-76 is stored, the message (Radar Obstructed) is displayed on the MID at the initial stage in some models, and then the indicators come on.



Some Driver Assist Systems Cannot Operate:
Radar Obstructed

Millimeter Wave Radar Aiming

If the millimeter wave radar is removed or replaced, you must do the millimeter wave radar aiming procedure, otherwise the ACC indicator blinks.

Multipurpose Camera Unit

The multipurpose camera unit uses inputs from the millimeter wave radar to maintain a constant distance between your vehicle and the vehicle directly ahead by accelerating and braking as needed.

The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected.

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the ACC indicator blinks.

CAN Communication

The ACC system communicates with other control units via F-CAN. For ACC system diagram, **review the ACC System Diagram** .

If the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the ACC system will not operate even though it is OK. In this case, both the ACC indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTCs. If intermittent failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check the DTCs with the HDS.

NOTE: For ACC system DTCs, **refer to the DTC troubleshooting index** .

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the ACC indicator does not come on while test-driving, but if your troubleshooting was based on a DTC, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the ACC indicator does not come on.
- The ACC system sometimes stops operating because of certain environmental conditions (weather, road conditions, driving conditions, etc.). Intermittent failure DTCs or **ACC System Auto Stop Control Codes** may be stored in these cases.

How to Retrieve DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. Use the HDS to check for Integrated Driver Support System DTCs.

3. Read and record the DTC.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. In the Driving Support of the HDS, select Integrated Driver Support System, then DTCs, choose the clear DTCs icon, and follow the prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS.

HOW TO TROUBLESHOOT THE COLLISION MITIGATION BRAKING SYSTEM (CMBS)

CMBS Indicator (Amber)

When the CMBS detects a problem during operation, the CMBS stops operating, and the CMBS indicator and the brake system indicator (amber) turns on.

NOTE:

- For CMBS function, **review the Collision Mitigation Braking System (CMBS) Description** .
- The CMBS communicates with other control units via F-CAN. For CMBS diagram, **refer to the System Diagram for CMBS** . If a connected unit malfunctions, the CMBS will not operate. In this case, both CMBS indicator and connected unit indicator come on and stay on (except for the gauge control module).

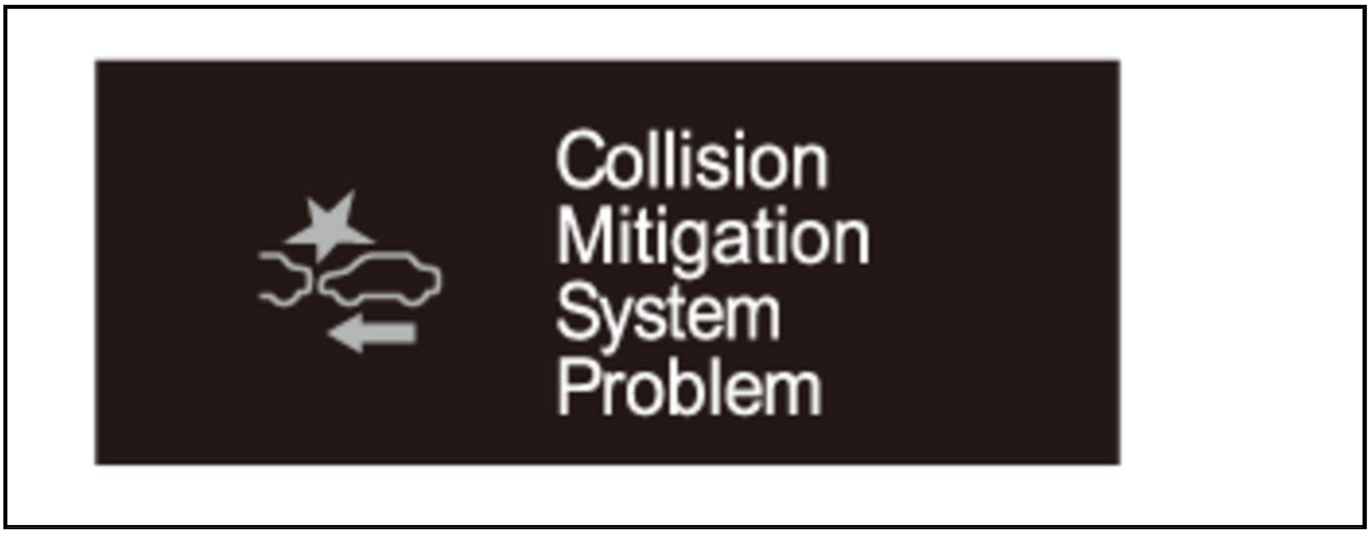
Self-Diagnostic Function

When a problem is detected by the self-diagnostic function, the CMBS stops operating, turns on the CMBS indicator, indicates the problem on the multi-information display (MID), and stores a DTC.



Collision Mitigation System Problem

CMBS OFF Switch

Press and hold the CMBS OFF switch for at least 1 second to turn the CMBS off and on.

CMBS Indication

- When the CMBS is OK, the CMBS indicator comes on for a few seconds, then goes off after turning the vehicle to the ON mode.
- When you set the CMBS to OFF, the multipurpose camera unit turns on the CMBS indicator.
- When the system is activated, the MID indicates a brake system warning indicator and a warning buzzer sounds.
- If the system stops operating because of a problem, the MID indicates the problem.

Millimeter Wave Radar

The millimeter wave radar measures the distance between your vehicle and the vehicle directly ahead to calculate the difference in speed between the vehicles.

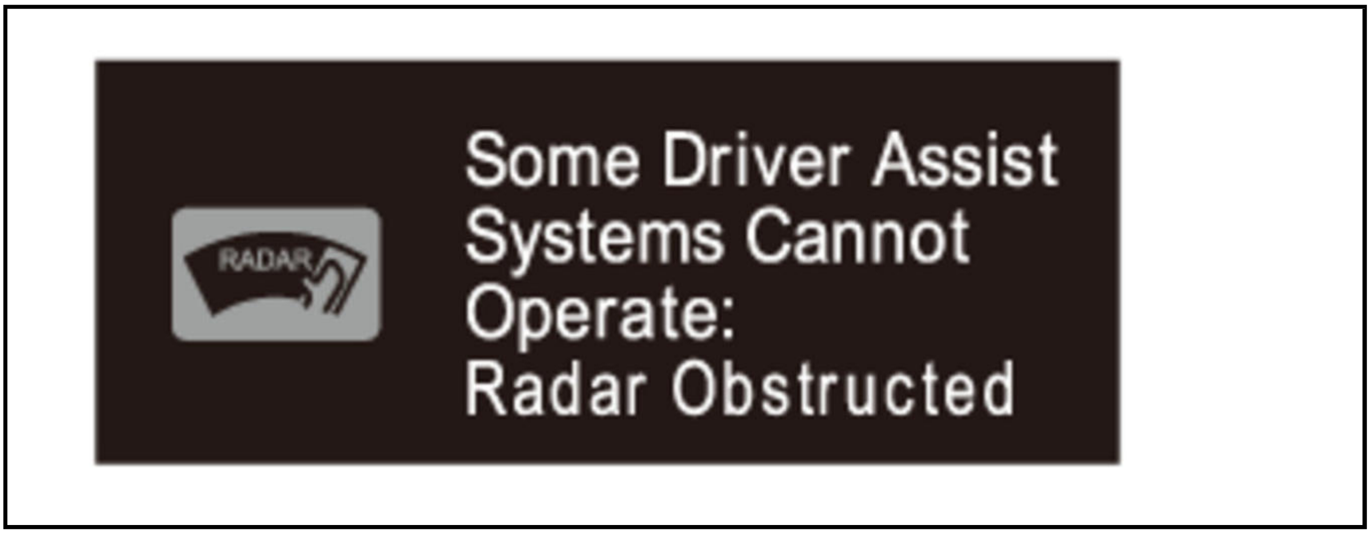
The millimeter wave radar has a self-diagnostic function. If the system detects a problem, it disables the CMBS, and turns on the CMBS indicator.

Dirt or dust detective function (Clean Millimeter Wave Radar Indication)

If the millimeter wave radar or front grille gets dirty, the CMBS stops operating and the following message on the MID will appear. Clean the millimeter wave radar and the front grille surface. Once the millimeter wave radar and front grille surface are clean, the message on the MID disappears and the CMBS automatically turns on.

NOTE:

- The following MID message may come on temporarily when passing through an enclosed space, such as tunnel.
- Under the above conditions DTC P2583-97 is stored.
- When it is snowing, the radio waves transmitted and received by the millimeter wave radar may be refracted by the snow or ice attached around the millimeter wave radar such as the front grille. At this time, DTC P2583-76 is stored depending on the situation.
- After DTC P2583-76 is stored, the message (Radar Obstructed) is displayed on the MID at the initial stage in some models, and then the indicators come on.



Some Driver Assist
Systems Cannot
Operate:
Radar Obstructed

Millimeter Wave Radar Aiming

If the millimeter wave radar is removed or replaced, you must do the millimeter wave radar aiming procedure, otherwise the CMBS indicator blinks.

Multipurpose Camera Unit

The multipurpose camera unit controls the brakes and the various driver warnings when the system recognizes the possibility of a collision.

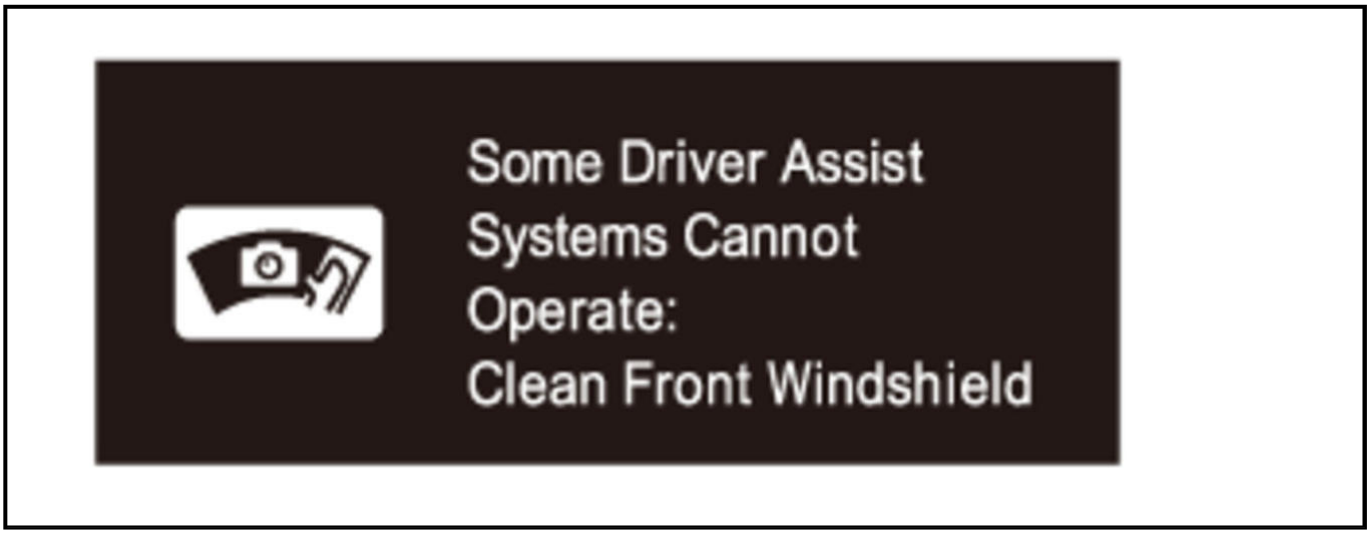
The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected. The millimeter wave radar receives this information from the multipurpose camera unit.

Dirt or dust detective function (CLEAN FRONT WINDSHIELD Indication)

If the following message appears on the MID, the camera lens or the windshield has enough dirt so that the camera view is obstructed, the CMBS stops operating.

Clean any dirt or contamination on the camera lens or the windshield. Once the camera's view is unobstructed, the indicator on the MID turns off and the CMBS automatically turns back to ON.

NOTE: When millimeter wave radar detected dirt or dust on the multipurpose camera lens or the windshield surface, DTC B2A60-97 is stored as a past failure.

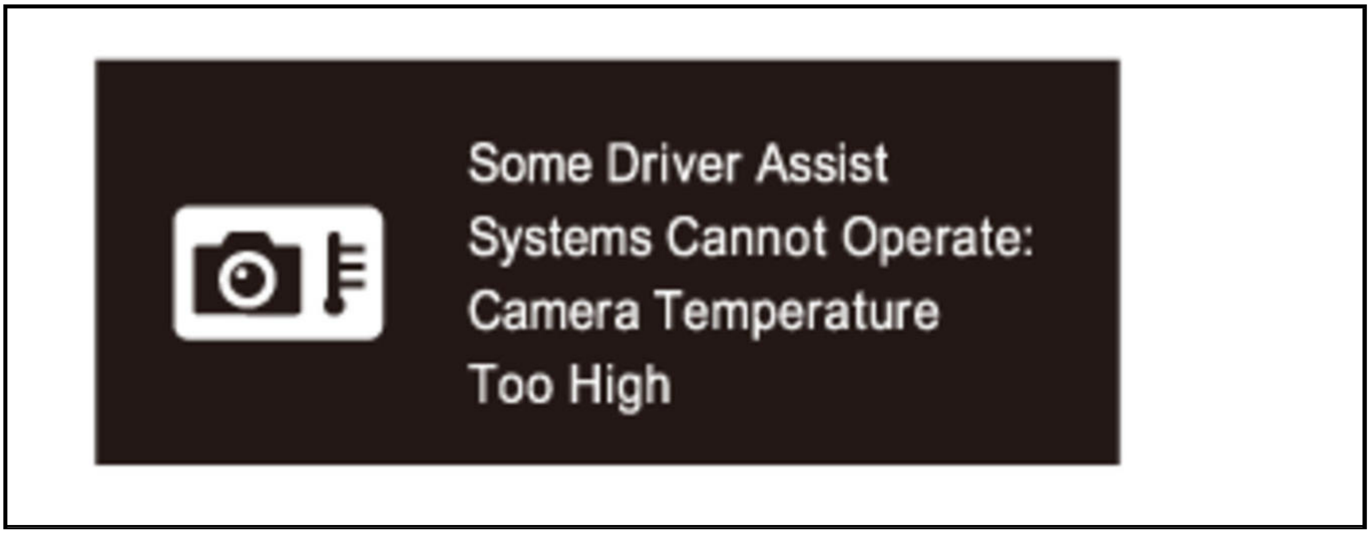


Some Driver Assist
Systems Cannot
Operate:
Clean Front Windshield

System Protect Function (High temperature) (MULTIPURPOSE CAMERA HOT Indication)

If the following message appears on the MID, the CMBS stops operating, and stores a DTC.

When the multipurpose camera temperature cools down to its proper operating temperature, the indicator on the MID turns off, and the CMBS automatically resumes operation.



Some Driver Assist
Systems Cannot Operate:
Camera Temperature
Too High

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the CMBS indicator blinks.

CAN Communication

The CMBS communicates with other control units via F-CAN. For CMBS diagram, **refer to the System Diagram for CMBS** .

If the millimeter wave radar and the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the CMBS system will not operate even though it is OK. In this case, both the CMBS indicator and the related unit indicator will come on and stay on.

How to Troubleshoot DTCs

Check the DTCs with the HDS.

NOTE: For CMBS DTCs, **refer to the DTC troubleshooting index** .

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the CMBS indicator does not come on while test-driving, but troubleshooting is done based on the DTC, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the CMBS indicator does not come on.
- The CMBS may sometimes stop control because of the environment (weather, road conditions, driving conditions, etc.). Intermittent failure DTCs may be stored in these cases.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTCs. If intermittent failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Retrieve DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**
2. Use the HDS to check for Integrated Driver Support System DTCs.
3. Read and record the DTC.
4. Turn the vehicle to the OFF (LOCK) mode.
5. Disconnect the HDS.
6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**
2. In the Driving Support of the HDS, select Integrated Driver Support System, then DTCs, choose the clear DTCs icon, and follow the prompts.
3. Turn the vehicle to the OFF (LOCK) mode.
4. Disconnect the HDS.

REMOVAL & INSTALLATION TEST

ACC COMBINATION SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

SRS components are located in this area. Review the SRS component locations , and the precautions and procedures before doing repairs or service.

1. ACC Combination Switch -Remove
2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. ACC Combination Switch - Test

	1. Measure the resistance between the ACC combination switch 12P connector (male terminals) terminals No. 5 and No. 6 according to the chart. - If there is no resistance in one or more positions, replace the ACC combination switch. 2. Measure the resistance between the ACC combination switch 12P connector (male terminals) terminals No. 5 and No. 12 according to the chart. - If there is no resistance in one or more positions, replace the ACC combination switch.

Position	Resistance
OFF (Released)	About 2.2 kΩ
DISTANCE (Pressed and held)	About 450 Ω

Position	Resistance
OFF (Released)	About 2.2 kΩ
MAIN (Pressed and held)	About 60 Ω
CANCEL (Pressed and held)	About 190 Ω
SET - (Pressed and held)	About 450 Ω
RES + (Pressed and held)	About 900 Ω

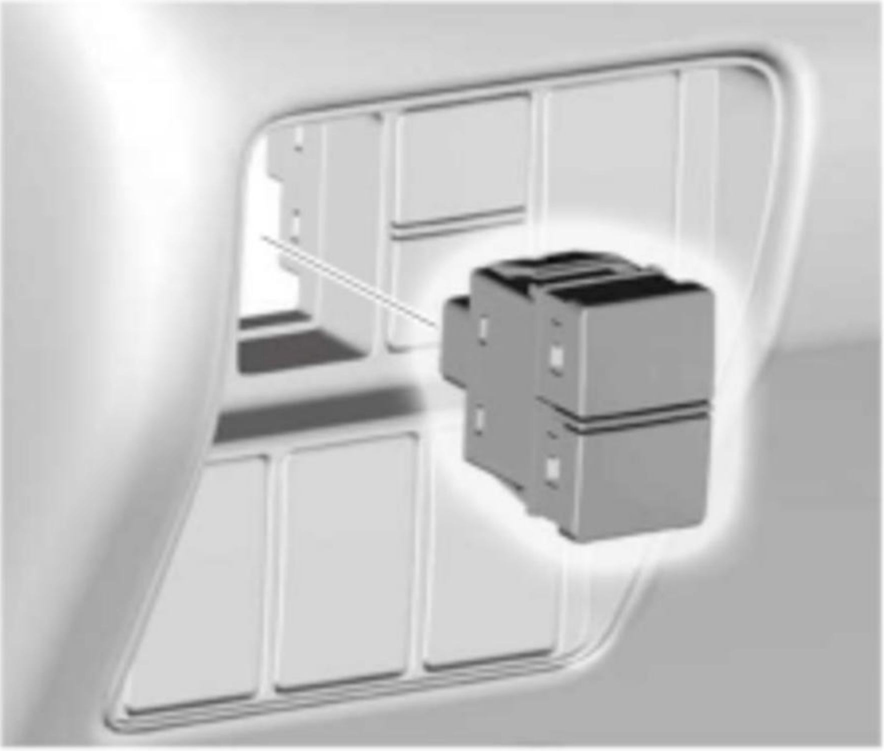
 Terminal Position 7 9 ILLUMINATION LIGHTS = Voltage for LED	3. Check the LED for illumination when connecting battery power and ground to the switch terminals according to the chart. **NOTE:** **Note this important**

	operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).If the results are not as specified, replace the ACC combination switch.

CMBS OFF SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1. Driver's Dashboard Lower Cover - Remove
2. CMBS OFF Switch - Remove



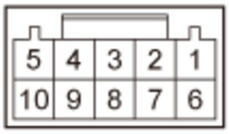
NOTE: Position of the switch is different depending on the model.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. CMBS OFF Switch - Test



Terminal / Position	9	10
RELEASED		
PRESSED	○—	—○

1. Check for continuity between the CMBS OFF/RDM switch 10P connector (male terminals) terminals in each switch position according to the chart.

- If the continuity is not as specified, replace the CMBS OFF switch.

 Terminal Position 3 8 ILLUMINATION LIGHTS ⊕—⊖ = Voltage for LED	2. Check the LED for illumination when connecting battery power and ground to the switch terminals according to the chart. **NOTE:** **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).If the results are not as specified, replace the CMBS OFF switch.**

CRUISE CONTROL COMBINATION SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

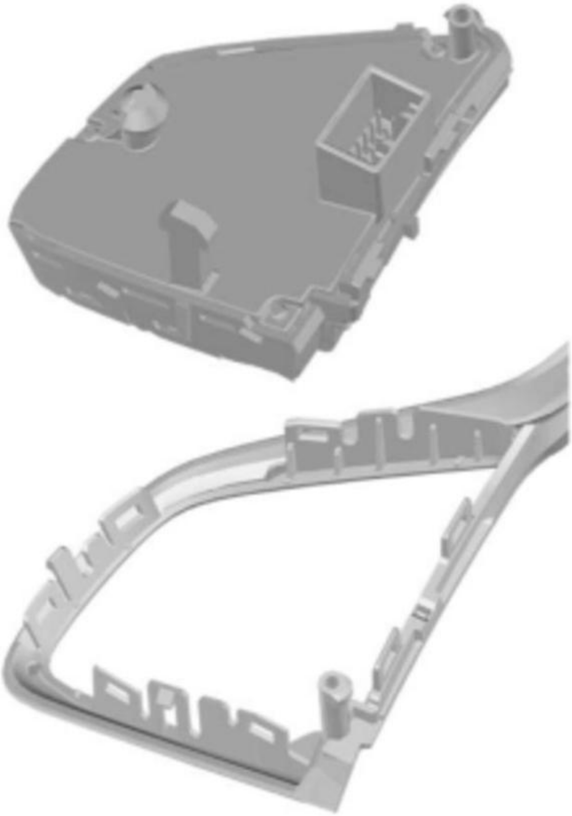
NOTE:

- 📖 Where icon is shown, further information shown below.
- SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.

1

	Detailed information, notes and precautions

1. **Driver's Airbag - Remove**
2. Steering Wheel Trim - Remove
3. Cruise Control Combination Switch - Remove

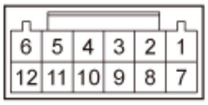


4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

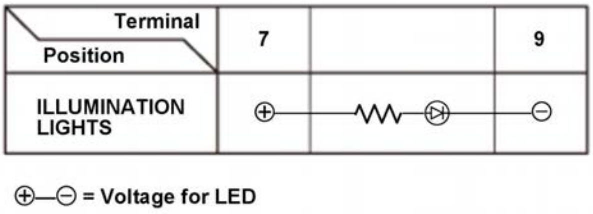
1. Cruise Control Combination Switch - Test



1. Measure the resistance between the cruise control combination switch 12P connector (male terminals) terminals No. 5 and No. 6 according to the chart.

- If there is no resistance in one or more positions, replace the cruise control combination switch.

Position	Resistance
OFF (Released)	About 2.2 kΩ
CRUISE/MAIN (Pressed and held)	About 60 Ω
CANCEL (Pressed and held)	About 190 Ω
SET - (Pressed and held)	About 450 Ω
RES + (Pressed and held)	About 900 Ω



2. Check the LED for illumination by applying power and ground to the terminals according to the chart.

NOTE:

Important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).If the results are not as specified, replace the cruise control combination switch.

LKAS SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

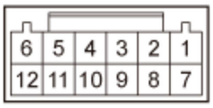
SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.

1. **ACC Combination Switch -Remove**
2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. LKAS Switch - Test



1. Measure the resistance between the ACC combination switch 12P connector (male terminals) terminals No. 5 and No. 12 according to the chart.

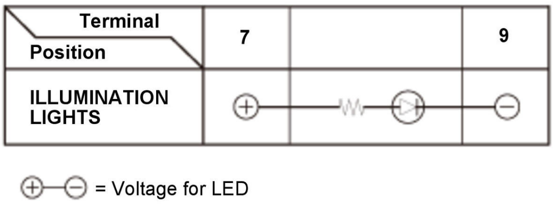
- If there is no resistance in one or more positions, replace the ACC combination switch.

Position	Resistance
OFF (Released)	About 2.2 kΩ
LKAS (Pressed and held)	About 60 Ω

2. Check the LED for illumination when connecting battery power and ground to the switch terminals according to the chart.

NOTE:

Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).If the results are not as specified, replace the ACC combination switch.



DESCRIPTION & OPERATION

ADAPTIVE CRUISE CONTROL (ACC) SYSTEM DESCRIPTION

Function

The ACC system with Low Speed Follow (LSF) uses the multipurpose camera and the millimeter radar to calculate and adjust the vehicle speed to maintain the appropr between your vehicle and the leading vehicle ahead based on your vehicle speed and driving conditions. When another vehicle cuts in between your vehicle and the leac the system switches the target vehicle to a new vehicle using the image information (vehicle and lane information) from the multipurpose camera. When the leading veh the lane or goes out of the detection range, the vehicle drives at the preset vehicle speed until detecting a new target vehicle. ACC system works with the cruise control s adjust the vehicle speed.

The cruise control mode can be entered by operating the distance switch while the ACC is working.

Operation Conditions

Control vehicle speed	Following function	0 - 90 mph (0 - 145 km/h)
	Set speed range	25 - 90 mph (40 - 145 km/h)
Maximum acceleration		0.2 G
Maximum deceleration		0.4 G (0.3 G for all speeds from 37 mph (60 km/h) up)
Left/right detection angle of millimeter wave radar		+/-42.6 degrees
Up/down detection angle of millimeter wave radar		-6 to +11.5 degrees
Road inclination		Less than 6%
Detection object		Vehicle only

Basic Controls of ACC and Low Speed Follow (LSF)

- The ACC system uses the millimeter wave radar to detect the leading vehicle, determines the target vehicle and measures the distance to the target vehicle and its speed. (the system also uses the multipurpose camera as needed to determine the target vehicle based on the lane and vehicle position information)
- When there is no leading vehicle, your vehicle drives at the preset speed. When there is a leading vehicle, your vehicle follows the vehicle and drives within the p

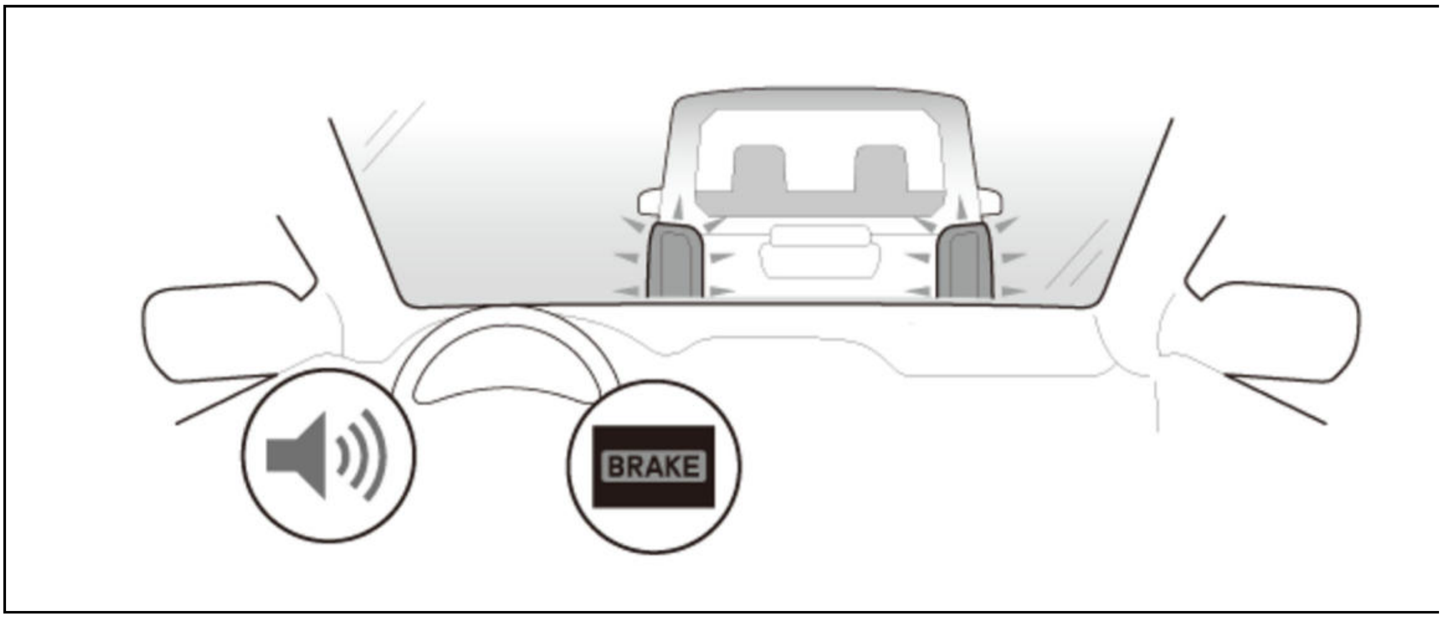
COLLISION MITIGATION BRAKING SYSTEM (CMBS) DESCRIPTION

The CMBS can detect a possible collision and assist brake operation to reduce the impact on occupants and vehicle damage.



CMBS Operation Sequence

- When a speed difference between your vehicle and the vehicle ahead or pedestrian in front of your vehicle is greater than 3 mph (5 km/h) and the system detects a collision, the system issues a warning message on the Multi Information Display (MID) and sets an alarm off.
- When your vehicle is getting close to the vehicle ahead or the pedestrian ahead of your vehicle, the system issues a warning message on the MID and sets an alarr the warning to the driver that there is a possible collision (First step).
- When your vehicle gets even closer to the vehicle ahead or pedestrian ahead of your vehicle and the system anticipates a collision, CMBS applies light braking fo issuing the MID warning and setting an alarm off (Second step).
- When the system determines that a collision is inevitable, the CMBS applies strong brake force while issuing the MID warning and setting an alarm off (Third ste

CMBS OFF Switch
SRS Unit

F-CAN Communication Data

Millimeter Wave Radar Receiving Signal:

Originating Unit	Signal Name
EPS motor/control unit	• EPS system failure information • Steering angle signal • Steering angle neutral position learning information
Gauge control module	• CMBS OFF switch status information • Gauge control module failure information • Customized information
Multipurpose camera unit	• Object recognition information • Multipurpose camera unit failure information

Originating Unit	Signal Name
PCM	• Accelerator pedal position (APP) sensor signal • Brake pedal position switch signal • Shift position status • Transmission failure information
SRS unit	• Yaw rate sensor signal • Yaw rate sensor failure information • Longitudinal acceleration sensor signal
VSA modulator-control unit	• Master cylinder pressure signal • VSA system actuation information • VSA system failure information • Wheel speed sensor signals
Electric brake booster	Electric brake booster system failure information

Millimeter Wave Radar Transmitting Signal:

Destination Unit	Signal Name
EPS motor/control unit	---
Gauge control module	• Buzzer request signal • CMBS status information • Multi information display (MID) screen requirement: • • - CMBS indicator • - CMBS indicates for self-diagnostic function • - Customized information
Multipurpose camera unit	Vehicle information
SRS unit	CMBS operating information
VSA modulator-control unit	• Automatic brake actuation request signal • Brake light lighting control request signal • CMBS failure information

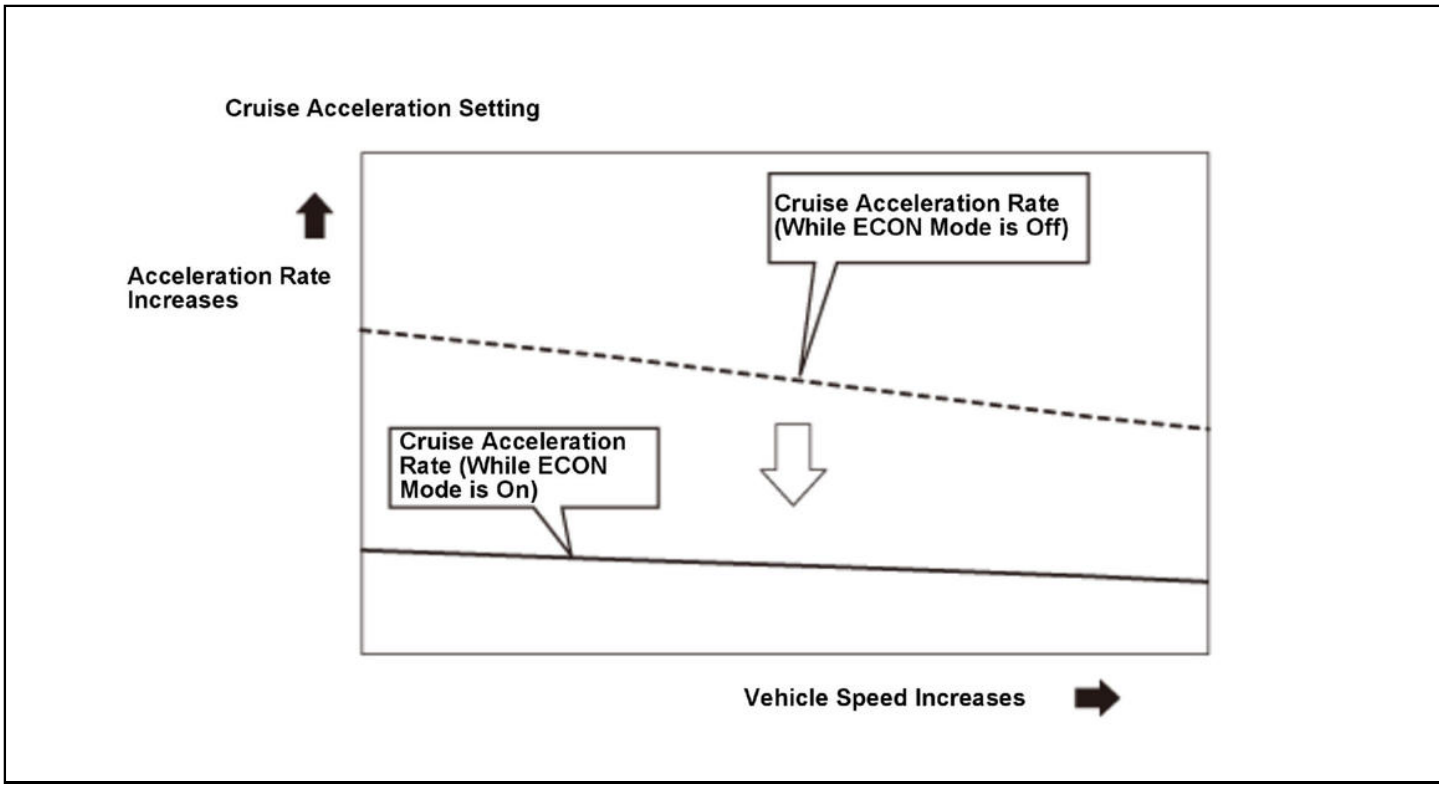
CRUISE CONTROL SYSTEM DESCRIPTION

The cruise control system maintains a constant vehicle speed without operating the accelerator pedal.

Operation

To operate the cruise control system, the driver must first turn on the CRUISE/MAIN switch. With the CRUISE/MAIN switch on, the cruise main indicator appears in t control module, and the gauge control module will send cruise control commands to the PCM via the F-CAN line. The speed value is set at the moment a drive releases button on the combination switch. Once the speed is set, the cruise control system maintains this speed in the system memory until: a new speed replaces the current val CRUISE/MAIN switch is turned off, the brake pedal is depressed, or the CANCEL button is pressed.The driver can also increase and decrease the set speed by pressing and minus (-) buttons on the combination switch. To maintain the set speed, the PCM monitors the throttle actuator position using the throttle position sensor and contro by commanding the throttle actuator to open and close as needed.

The system changes throttle inputs depending on whether the vehicle's ECON mode is on or off. When the ECON mode is on, the system limits the throttle position to excessive throttle application to improve fuel economy when there is a change in vehicle load - for example, it will take longer for the vehicle to accelerate to the set spe applying throttle to maintain speed when climbing a hill. When the ECON mode is off, the vehicle will accelerate quicker to compensate for the change in vehicle load.



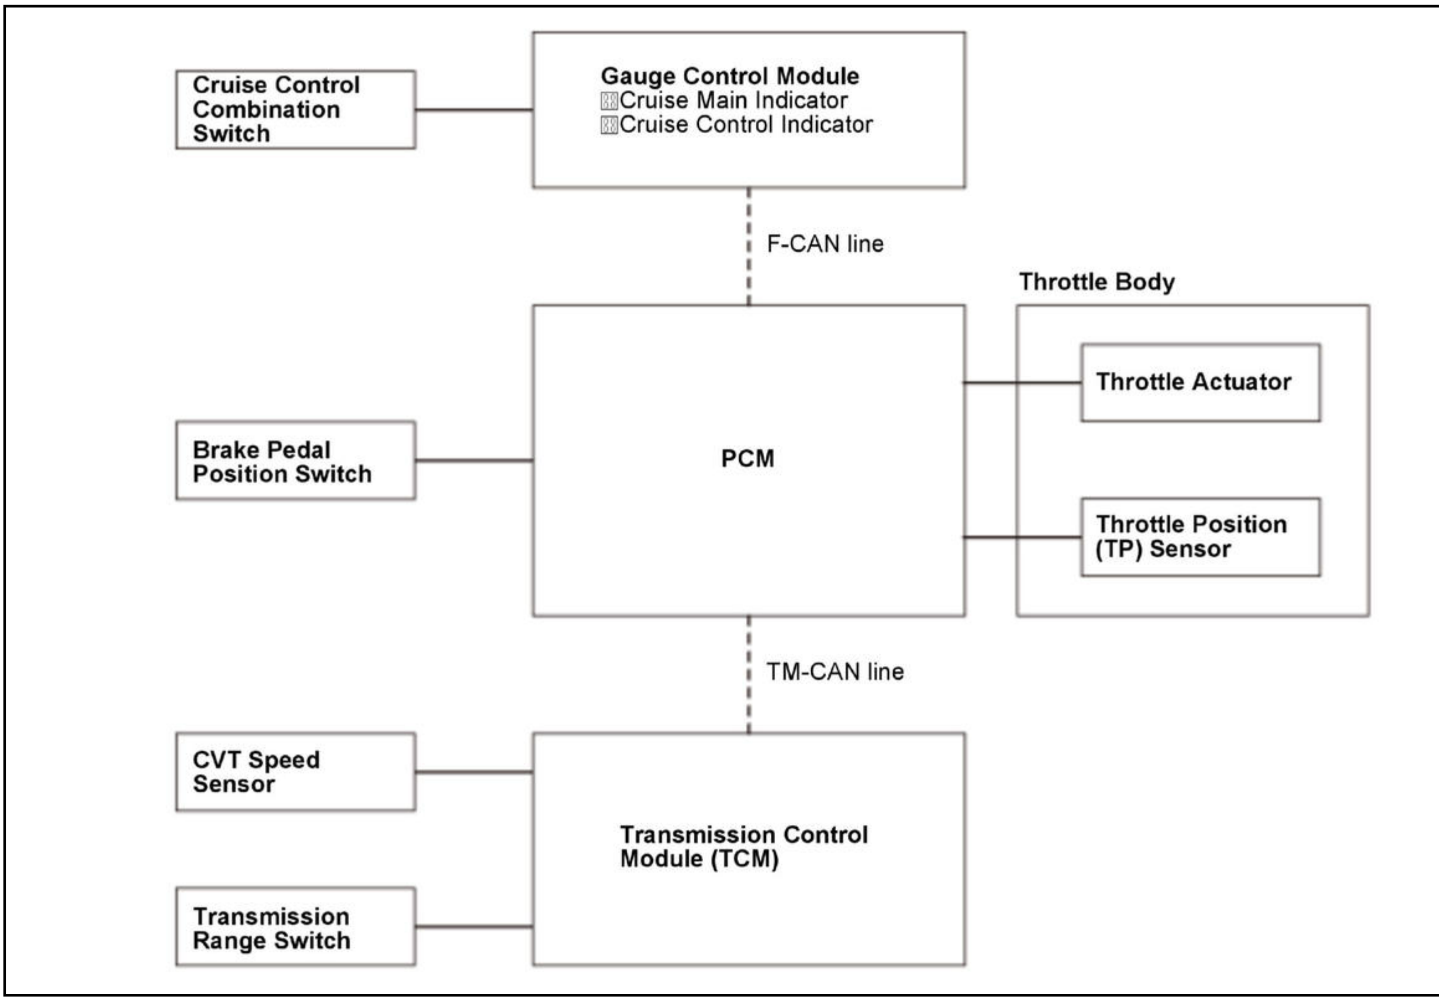
CRUISE CONTROL SYSTEM DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the cruise control system is shown below.

For locations of each component on the vehicle, refer to Component Location Index:

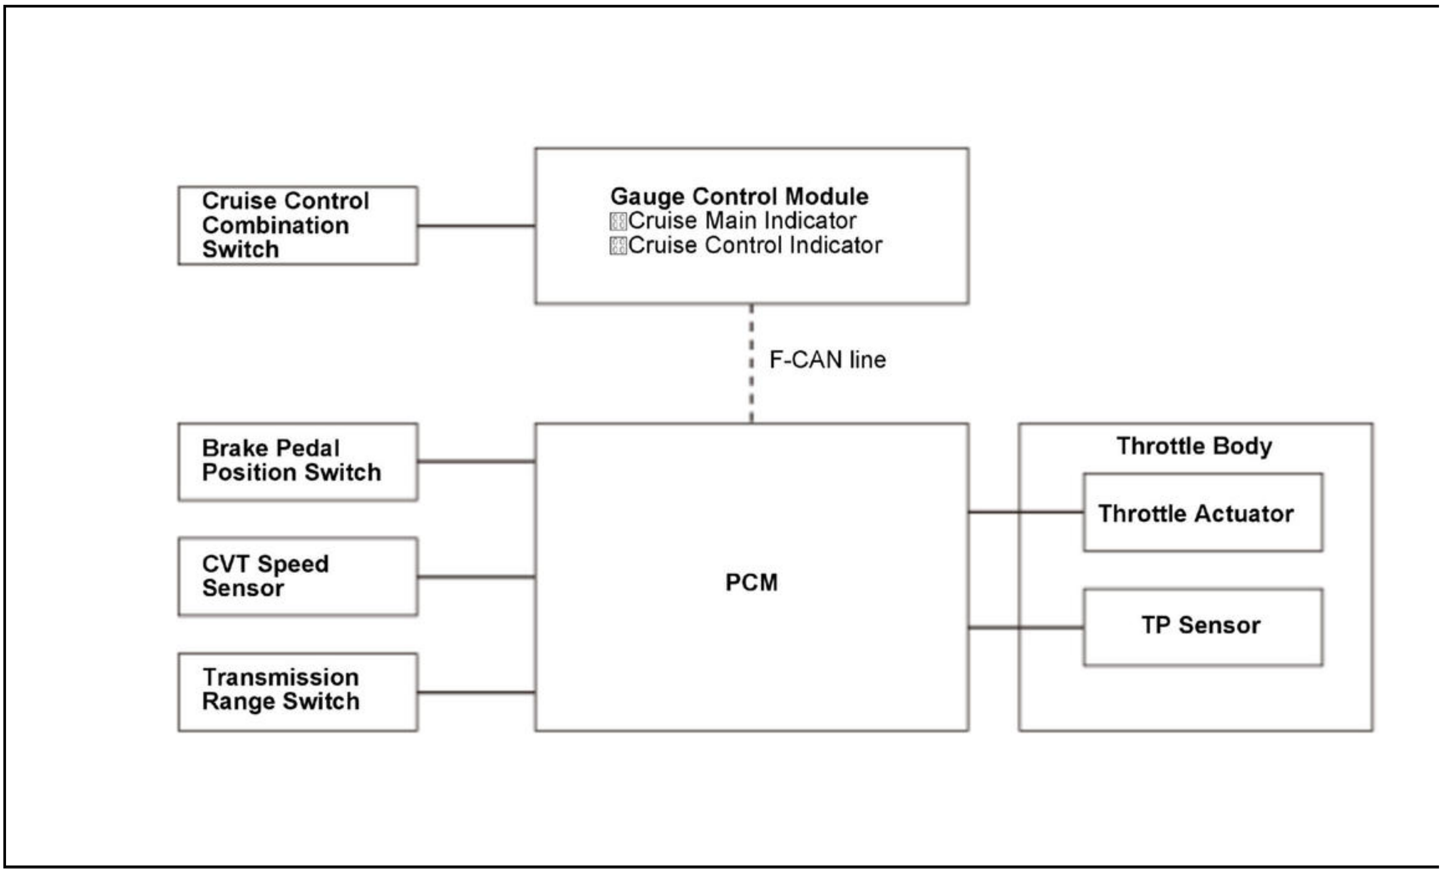
- **Brake pedal position switch**
- **Cruise control combination switch**
- **Gauge control module**
- **PCM**
- **Throttle body (Throttle actuator, Throttle position (TP) sensor)**
- **Transmission range switch, CVT speed sensor**
- 1.5 L engine model: **Transmission control module (TCM)**

1.5 L engine model:



Cruise Control Combination Switch
Gauge Control Module
▨Cruise Main Indicator
▨Cruise Control Indicator
F-CAN line
Throttle Body
Throttle Actuator
Brake Pedal Position Switch
PCM
Throttle Position (TP) Sensor
TM-CAN line
CVT Speed Sensor
Transmission Control Module (TCM)
Transmission Range Switch

Except 1.5 L engine model:



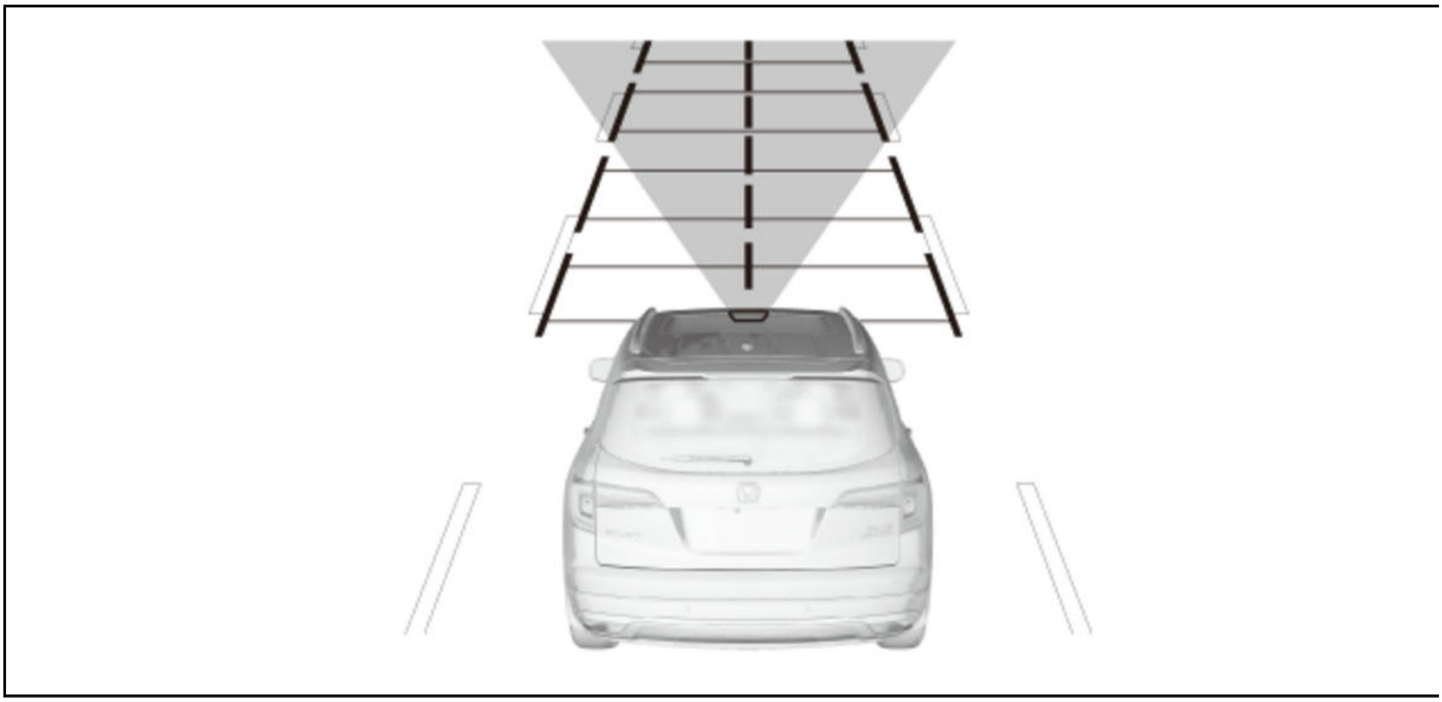
Cruise Control Combination Switch
Gauge Control Module
▨Cruise Main Indicator
▨Cruise Control Indicator
F-CAN line
Brake Pedal Position Switch
Throttle Body
Throttle Actuator
CVT Speed Sensor
PCM
TP Sensor
Transmission Range Switch

LANE KEEPING ASSIST SYSTEM (LKAS) DESCRIPTION

Lane Keeping Assist System (LKAS)

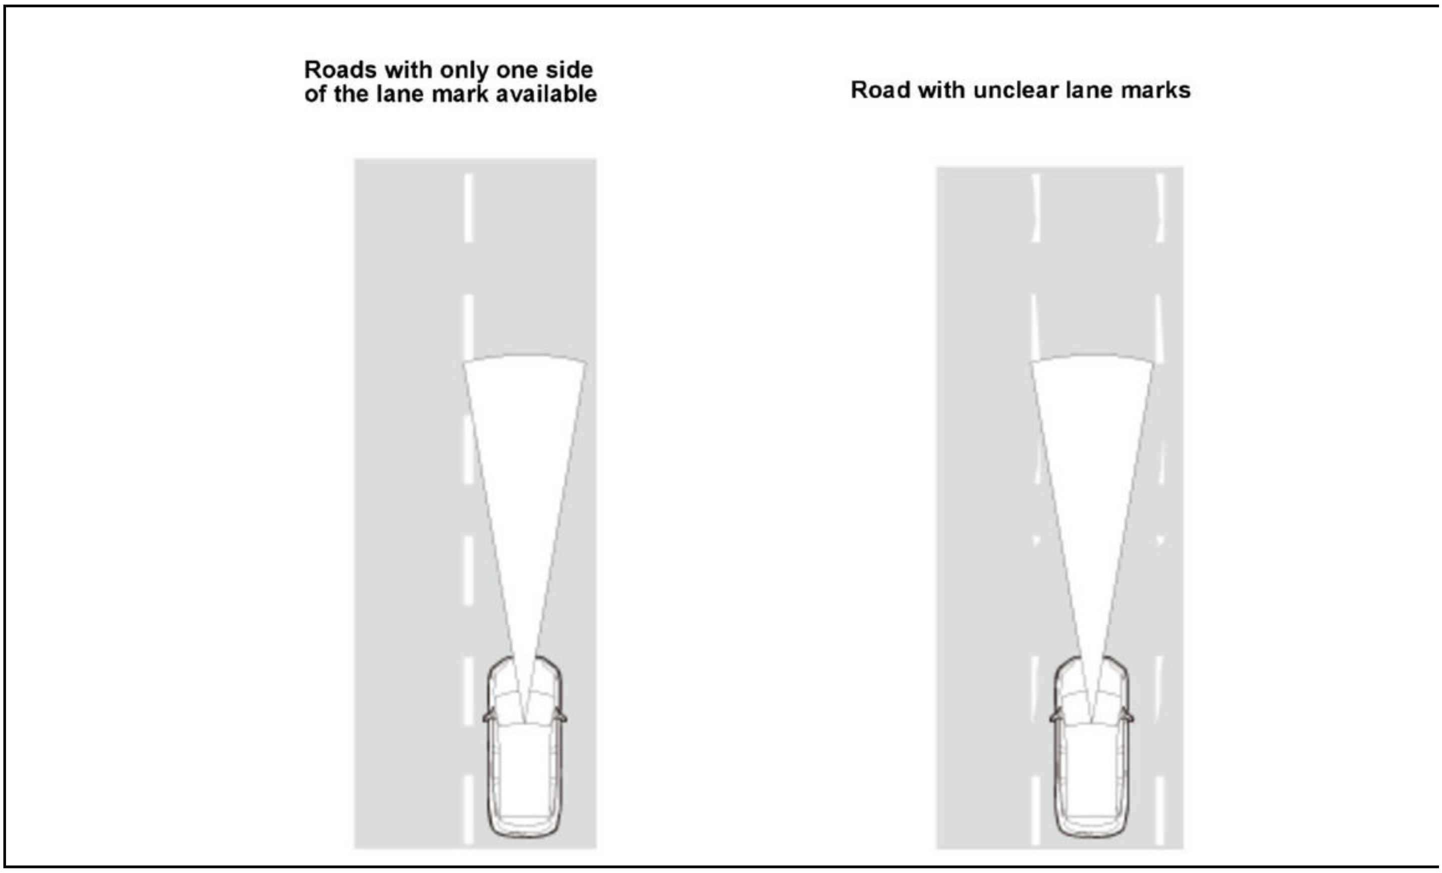
The LKAS uses the multipurpose camera to read the lane lines on both sides of the road. The multipurpose camera unit draws an imaginary line at the center between bo
and lane keeping assist control is performed by assisting the steering so that the vehicle is guided along this imaginary line near the center of the lane.The system gets su

when the system determines that the driver is not holding the steering wheel for a certain period of time while LKAS is in operation.



LKAS Inoperative Road Conditions

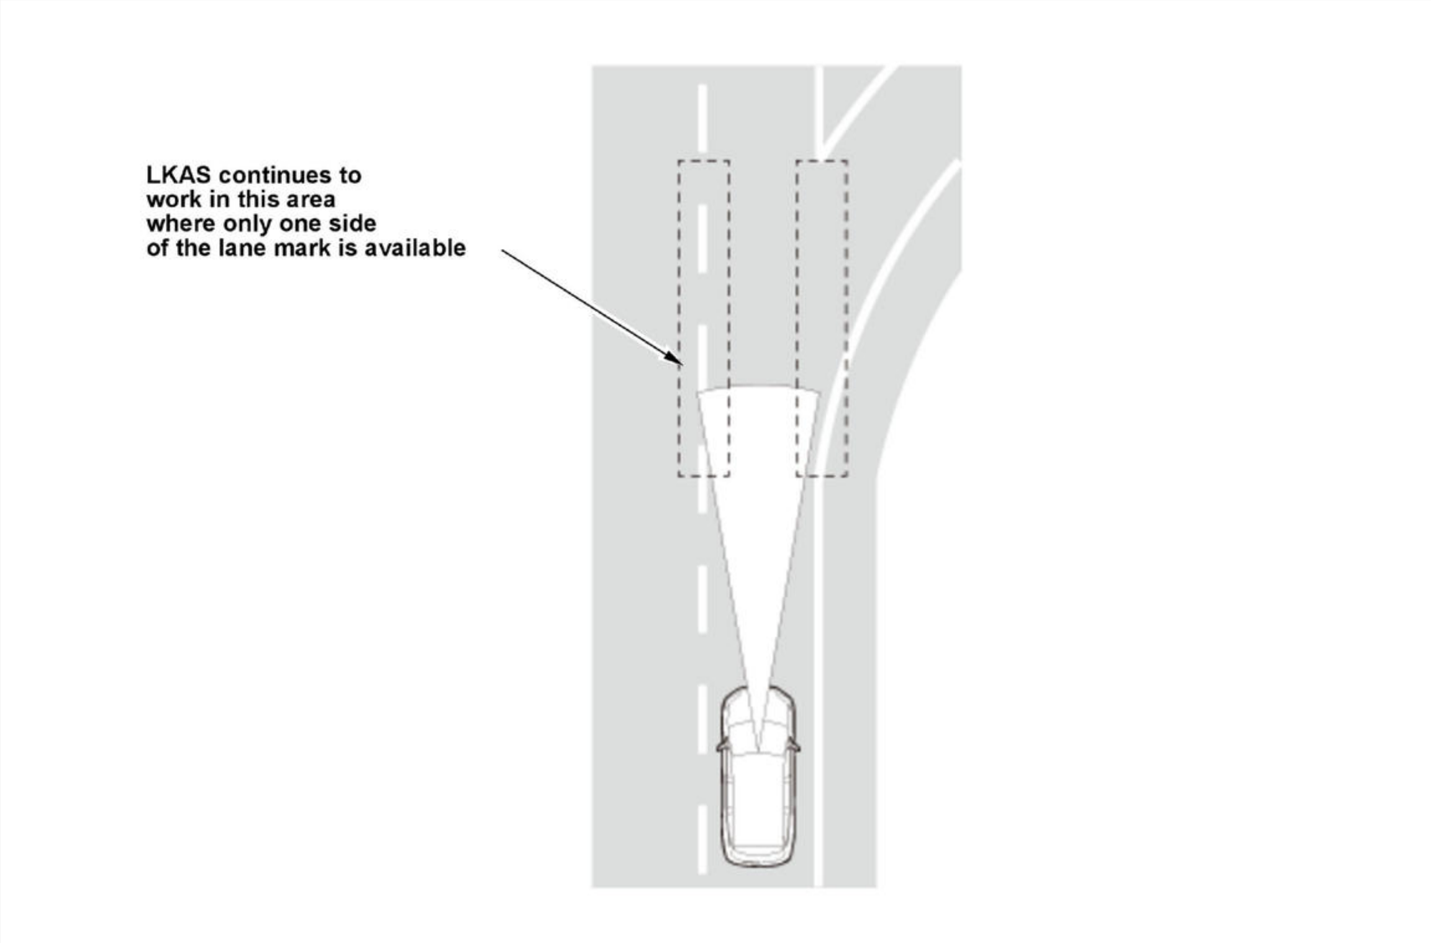
LKAS does not operate in the following road conditions (LKAS is inoperative while LDW continues to operate).



Roads with only one side of the lane mark available
Road with unclear lane marks

In case one side of lane mark is temporary missing (KA, KC models)

LKAS will continue to work even when one side of the lane mark is missing temporarily such as an intersection or a junction.



Operation Conditions

System Operation Conditions	Operation under conditions where lane line recognition is possible on both sides (Lane line recognition may not be possible in bad weather, snow-covered roads, or areas with backlight).	
	Operation vehicle speed	45 - 90 mph (72 - 145 km/h)
	Object lane line types	Broken lines or solid lines on the road (white and yellow)
	Driver operation	No operation when the driver's intent to act is recognized by movements of the steering wheel, brake pedal, turn signal switch, etc.
LKAS Cancel Alarm	When the LKAS system is canceled, a buzzer sounds ("beep") to warn the driver. The alarm can be set ON/OFF.	

LANE KEEPING ASSIST SYSTEM (LKAS) DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the LKAS is shown below.

For locations of each component on the vehicle, refer to Component Location Index:

- **EPS motor/control unit**
- **Gauge control module**
- **Millimeter wave radar**
- **Multipurpose camera unit**
- **PCM**
- **SRS unit**
- **VSA modulator-control unit**

The LKAS for this vehicle uses the multipurpose camera unit to calculate camera image information, and sends the LKAS indicated value to the control unit via the mil radar.

F-CAN Communication Data

Multipurpose Camera Unit Receiving Signal:

Originating Unit	Signal Name
EPS motor/control unit	• EPS system failure information • Steering angle neutral position learning information • Steering angle signal • Torque sensor signal

Originating Unit	Signal Name
Gauge control module	• Customization signal • MAIN switch signal • LKAS switch signal • Turn signal lights operating status • Wiper operating status
PCM	• Brake pedal position switch signal • PCM failure information • Vehicle speed signal
SRS unit	• Yaw rate sensor signal • Yaw rate sensor failure information
VSA modulator-control unit	• VSA system actuation information • VSA system failure information • Wheel speed sensor signals

Multipurpose Camera Unit Transmitting Signal:

Destination Unit	Signal Name
EPS motor/control unit	• Integrated driver support system failure information • LKAS control command

Destination Unit	Signal Name

Gauge control module	• Buzzer request signal
	• Customization information
	• Integrated driver support system failure information
	• Multi information display (MID) screen requirement:
	•
	  • -
	  LKAS indicator
	  • -
	  LKAS activation indicator
	  • -
	  LKAS indicates for self-diagnostic function

VSA modulator-control unit	---

INPUT TEST

CRUISE CONTROL (ECM/PCM) INPUT TEST

NOTE: Always make sure that you have the latest HDS software.

1. Connect the HDS

2. Select PGM-FI system and check the diagnostic trouble code (DTC) and note it. Also check the on-board snapshot data, and download any data found. Then refer to t DTC's troubleshooting, and begin the appropriate troubleshooting procedure.

3. If no DTCs are found, do the following tests while monitoring parameters in the DATA LIST with the HDS.If the input tests prove OK, replace the PCM

.**NOTE:** Intermittent failures are often caused by loose circuit connections. While monitoring cruise control inputs, flex the circuit wires, and note if any of the test resu

Signal to be tested	Test condition	Parameter: Desired result	Possible cause if result is not obtained
Cruise control system switch status	Cruise control combination switch buttons are not pressed	CRUISE CONTROL SYSTEM SWITCH STATUS in the HDS data list should indicate DEFAULT when the cruise control combination switch buttons are not pressed.	If the CRUISE CONTROL SYSTEM SWITCH STATUS in the HDS d list indicates SIGNAL LOST, check as shown: • Check for DTCs in the PGM-FI system and do the appropriate troubleshooting. • Faulty gauge control module • Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A short to power in the wire between the gauge control module a the cruise control combination switch when the combination ligh switch is turned on If the CRUISE CONTROL SYSTEM SWITCH STATUS in the HDS d list indicates SIGNAL SHORT, check as shown: • Check for DTCs in the PGM-FI system and do the appropriate troubleshooting • Faulty gauge control module • Faulty cruise control combination switch • A short to ground in the wire between the gauge control module a the cruise control combination switch If the CRUISE CONTROL SYSTEM SWITCH STATUS in the HDS d list indicates a different status, check for a faulty cruise control combination switch.
	CRUISE switch is pressed	CRUISE CONTROL SYSTEM SWITCH STATUS in the HDS data list should indicate MAIN SW when the CRUISE switch is pressed.	
	CANCEL switch is pressed	CRUISE CONTROL SYSTEM SWITCH STATUS in the HDS data list should indicate CANCEL SW when the CANCEL switch is pressed.	
	SET- switch is pressed	CRUISE CONTROL SYSTEM SWITCH STATUS in the HDS data list should indicate SET SW when the SET- switch is pressed.	
	RES+ switch is pressed	CRUISE CONTROL SYSTEM SWITCH STATUS in the HDS data list should indicate RES SW when the RES+ switch is pressed.	

Signal to be tested	Test condition	Parameter: Desired result	Possible cause if result is not obtained
Cruise control indicator signal	Start the engine, press the CRUISE button on and drive the vehicle above 25 mph (40 km/h) with the cruise control set and cancel the cruise control	CRUISE INDICATOR should indicate ON when the cruise control is set and OFF when the cruise control is canceled.	• Faulty gauge control module • Faulty cruise control combination switch • An open in the wire between the gauge control module and the cruise control combination switch • A wire shorted to ground between the gauge control module and cruise control combination switch
Brake pedal position switch signal	Brake pedal is pressed, then released	CRUISE BRAKE SW should indicate OPEN when the brake pedal is pressed and CLOSE when the brake pedal is released.	• Faulty brake pedal position switch • Blown No. D21 (10 A) fuse in the under-dash fuse/relay box • An open in the wire between the PCM and the brake pedal positi switch • A wire shorted to ground or power between the PCM and the bra pedal position switch

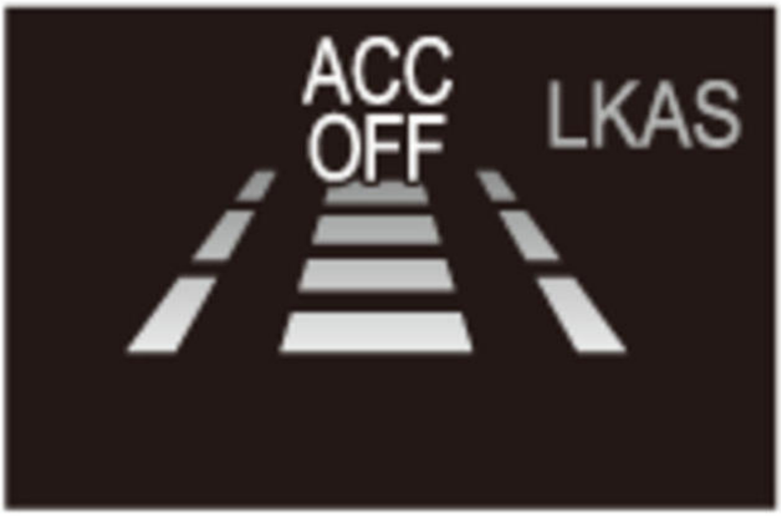
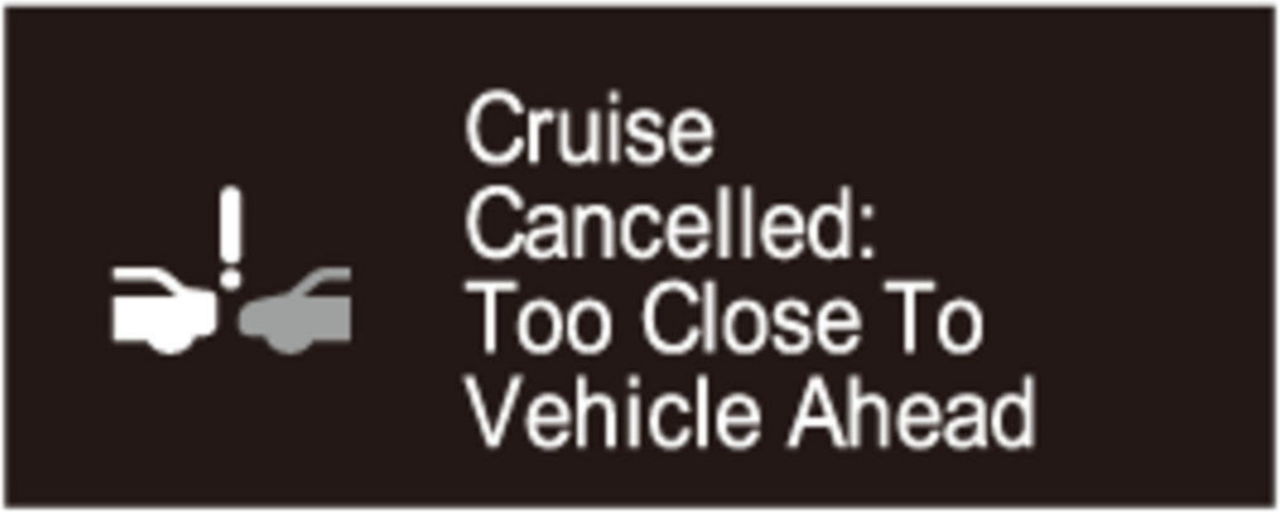
GENERAL INFORMATION

ACC SYSTEM AUTO STOP CONTROL HISTORY

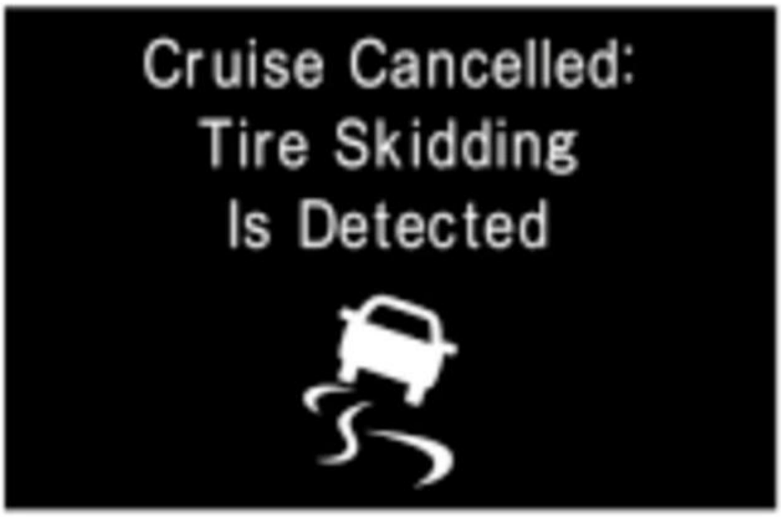
When the ACC is activated, if the millimeter wave radar determines that the ACC is unable to operate normally due to an environmental factors (such as weather or roac condition and driving or vehicle condition) or other reasons even when the ACC system itself is normal, the millimeter wave radar automatically cancels the activation c and records the ACC system auto stop control code in it.

When the ACC is automatically cancelled, "ACC OFF" is displayed on the multi-information display (MID) to notify the driver of the cancellation. At this time, the AC (amber) does not come on.





Cruise Cancelled: Too Close To Vehicle Ahead



Cruise Cancelled: Tire Skidding Is Detected

Checking for ACC System Auto Stop Control Codes

The ACC system auto stop control codes recorded in the millimeter wave radar can be read out by the procedure below.

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. Connect the HDS .

2. In the Driving Support of the HDS, select Integrated Driver Support System, then select Data List on the HDS.Checking for ACC system auto stop control codes recc Data List.

NOTE:

- **ACC system auto stop control history is recorded from 1. When automatic cancellation takes place 11 times or more, the p records are held. In this case, history 10 is the latest record and the 10 latest records are held. When 0, no record is held.**
- **When DTCs are cleared with the HDS, the ACC system auto stop control history is cleared as well.**
- **Some of the following ACC system auto stop control codes may not be used for specific model specifications.**

ACC System Auto Stop Control Codes

Code	ACC System Auto Stops Operating	Examples	Detection Conditions	Restoration Conditions (Conditions under which ACC SET is possible)	Reasons for Control OFF
80	Engine Speed too high or too low	The vehicle decelerated because the leading vehicle decelerated, and the engine speed dropped below the mid-speed ranges.	The driver did not operate the clutch pedal within 10 seconds after the shift-down request was displayed.	The engine speed returned to the specified speed or higher.	Prevention of engine stall while the vehicle is decelerating beca the leading vehicle is decelerati
84	Target vehicle comes closer than the radar detecting limits	• The leading vehicle slowed down rapidly. • Another vehicle suddenly cut in front of the own vehicle.	The distance between the leading vehicle and your vehicle is less than the minimum allowable vehicle-to-vehicle distance. • Models with the low speed follow (LSF) feature: 1.5 m (4.9 ft) • Models without the low speed follow (LSF) feature: 5 m (16 ft)	The system returns to normal when the distance between the leading vehicle and your vehicle reaches or exceeds the minimum allowable vehicle-to-vehicle distance + 0.5 m (1.6 ft).	The control is prohibited at a cl distance to the leading vehicle where the ACC system is unavailable. If the leading vehi is too close to your vehicle, the millimeter wave radar may fail detect the leading vehicle.
89	Front wheel spin	• Driving on a low μ road • TCS control is executed.	A change in the wheel speed equivalent to 0.75 G occurs.	Other than those listed to the left	Prevention of use of ACC on a road where vehicle behavior is unstable

*: This value differs depending on whether or not the vehicle is equipped with Low Speed Follow (LSF).

Code	ACC System Auto Stops Operating	Examples	Detection Conditions	Restoration Conditions (Conditions under which ACC SET is possible)	Reasons for Control OFF
99	Acceleration/deceleration abnormality	• The inclination of the road changed significantly while the vehicle accelerates/decelerates at around the maximum acceleration/deceleration speed of the ACC system. • The powertrain or brake system is abnormal.	• While the ACC was operating, an acceleration of 0.4 G or more* continued for 1.0 second or more. • While the ACC was operating, a deceleration of -0.5 G or less* continued for 1.5 seconds or more.	Other than those listed to the left	Because the maximum acceleration/deceleration speed the ACC system is exceeded.
101	Rear wheel locked	The parking brake is not released or the vehicle is driven on a frozen road surface.	A signal of 5 mph (8 km/h) or more is inputted to the front wheel sensor and a signal of 0 mph (0 km/h) is inputted to the rear wheel sensor.	The front and rear wheel sensors detect a wheel speed.	Prevention of unstable vehicle behavior
109	Movement distance too short after initiation	When the millimeter wave radar detects an object that turns on low speed follow (LSF) control immediately after vehicle ON mode.	When the distance the vehicle travels after vehicle ON mode, which is calculated based on the vehicle speed, is less than 8 m (26 ft).	When the distance the vehicle travels is 8 m (26 ft) or more.	This is because an object other than a vehicle may be recognizi as the leading vehicle after veh ON mode in a parking lot etc.
110	Shift position 1st	• While driving in 1st gear. • Vehicle is driven at an extremely low speed.	1st gear shift position is detected.	Vehicle is driven in 2nd or higher gear (forward gear).	Inappropriate gear is selected fo ACC system.

*: This value differs depending on whether or not the vehicle is equipped with Low Speed Follow (LSF).

SYMPTOM TROUBLESHOOTING

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - ACC ACTIVATION INDICATOR (ON THE MID) DOES NOT COME ON

ACC activation indicator (on the MID) does not come on

1. Gauge control module operation check

   -1. Do the gauge control module self-diagnostic function .

   Is the gauge control module OK?

   YES

   Go to step 2.

   NO

   Replace the gauge control module .

2. ACC combination switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Test the ACC combination switch .

   Is the switch OK?

   YES

   Go to step 3.

   NO

   Replace the ACC combination switch .

3. Open wire check (CRUISE SW line)

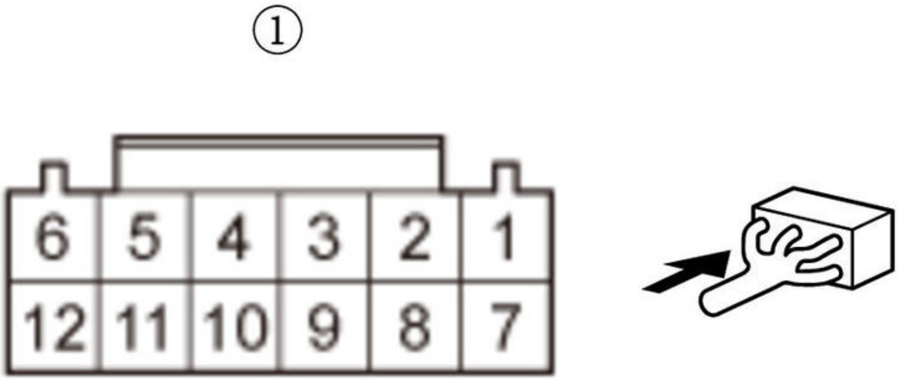
-1. Disconnect the following connector.

ACC combination switch 12P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5 V?

YES

Repair an open in the CRUISE GND wire between the ACC combination switch and the gauge control module.

NO

Repair an open in the CRUISE SW wire between the ACC combination switch and the gauge control module.

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - ACC ACTIVATION INDICATOR (ON THE MID) DOES NOT GO OFF

ACC activation indicator (on the MID) does not go off

1. Gauge control module operation check

-1. **Do the gauge control module self-diagnostic function** .

Is the gauge control module OK?

YES

Go to step 2.

NO

Replace the gauge control module .

2. ACC combination switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Test the ACC combination switch** .

Is the switch OK?

YES

Repair a short to ground in the CRUISE GND wire between the ACC combination switch and the gauge control module.

NO

Replace the ACC combination switch .

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - ACC INDICATOR (ON THE MID) DOES NOT COME ON

ACC indicator (on the MID) does not come on

NOTE: ***1: Without auto idle stop system**
***2: With auto idle stop system**

1. Gauge control module operation check

-1. Turn the vehicle to the ON mode.

Check the following indicators in the gauge control module:

- Malfunction indicator lamp (MIL)
- Brake system indicator
- 12 volt charging system indicator

Do the indicators come on?

YES

Go to the gauge control module self-diagnostic function .

NO

Go to step 2.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D7 (10 A) *1No. F6 (5 A) *2
Location	Under-dash fuse/relay box *1Auxiliary under-dash fuse/relay box *2

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. Turn the vehicle to the ON mode, then the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D7 (10 A) *1/F6 (5
circuit.

3. Open wire check (IG1 METER *1/IG1 VST *2 line):-1.

Disconnect the following connector.

Gauge control module connector A (32P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 17**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the gauge control module .

NO

Repair an open in the IG1 METER *1/IG1 VST *2 wire between the under-dash fuse/relay box *1/auxiliary under-dash fuse/relay box *2 and the gauge control n

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - ACC INDICATOR (ON THE MID) DOES NOT GO OFF

ACC indicator (on the MID) does not go off

NOTE: ***1: Without auto idle stop system**
***2: With auto idle stop system**

***3: CAN gateway 12P connector type**

***4: CAN gateway 16P connector type**

1. DTCs check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   DTC (IDAS)

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 2.

2. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

   Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

   YES

   Go to the indicated DTCs troubleshooting .

   NO

   Go to step 3.

3. Fuse check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. D5 (10 A) *1No. F7 (7.5 A) *2
Location	Under-dash fuse/relay box *1Auxiliary under-dash fuse/relay box *2

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 4.

   NO

   Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D5 (10 A) *1/F7 fuse circuit.

4. Fuse check 2

   -1. Check the following fuse.

Fuse	No. D7 (10 A) *1No. F6 (5 A) *2
Location	Under-dash fuse/relay box *1Auxiliary under-dash fuse/relay box *2

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 5.

   NO

   Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D7 (10 A) *1/F6 circuit.

5. Gauge control module operation check

   -1. Turn the vehicle to the ON mode.

   -2. Check if all of the gauge indicators come on for a few seconds.

Do all the gauge indicators on?

YES

Go to step 6.

NO

Go to the gauge control module self-diagnostic function .

6. Open wire check (IG1 OPTION *1/IG1 EBB *2 line):-1.

Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Millimeter wave radar 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Millimeter wave radar 8P connector: disconnected
Test point 1	**Millimeter wave radar 8P connector No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 OPTION *1/IG1 EBB *2 wire is OK. Go to step 7.

NO

Repair an open in the wire between the millimeter wave radar and the under-dash fuse/relay box *1/auxiliary under-dash fuse/relay box *2.

7. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Millimeter wave radar 8P connector: disconnected
Test point 1	**Millimeter wave radar 8P connector No. 8**
Test point 2	Body ground

Is there continuity?

YES

Go to step 8.

NO

Repair an open in the wire between the millimeter wave radar and body ground at G251.

8. F-CAN circuit communication check

-1. Reconnect the following connector.

Millimeter wave radar 8P connector

-2. Turn the vehicle to the ON mode.

-3. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Gauge control module (Bus A) is Not Available

Go to step 9.

Millimeter wave radar (Bus B) is Not Available

Go to step 10.

Millimeter wave radar and gauge control module are Detected

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

9. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

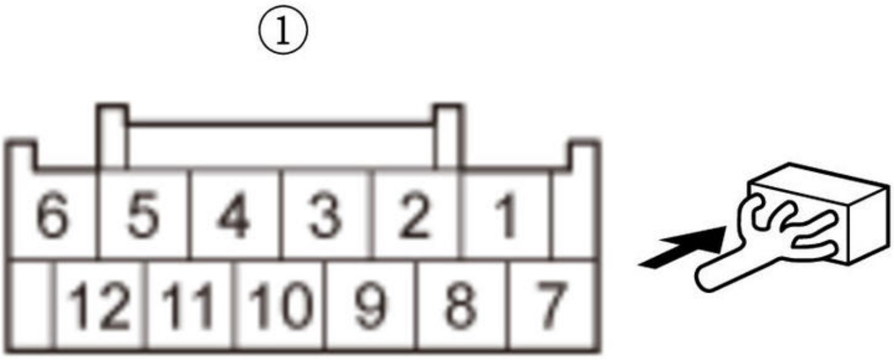
-2. Disconnect the following connectors.

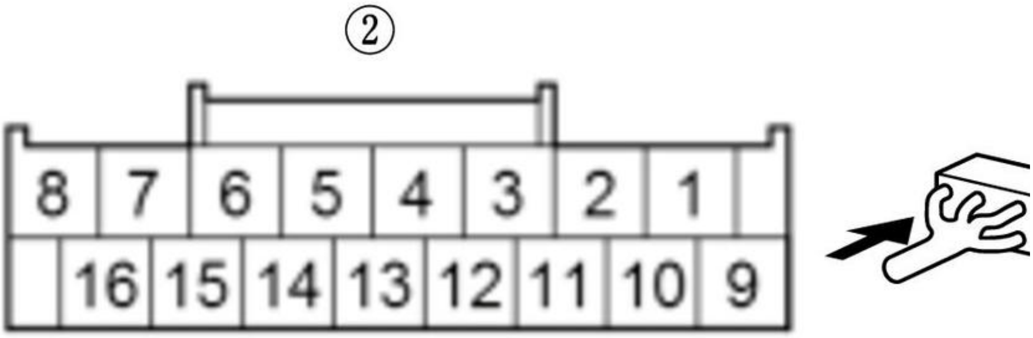
CAN gateway 12P connector *3CAN gateway 16P connector *4
Gauge control module connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector *3: disconnectedCAN gateway 16P connector *4: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	CAN gateway 12P connector *3 (female terminals) No. 3: ① CAN gateway 16P connector *4 (female terminals) No. 3: ②
Test point 2	**Gauge control module connector A (32P) No. 19**

Test point 1	CAN gateway 12P connector *3 (female terminals) No. 9: ① CAN gateway 16P connector *4 (female terminals) No. 11: ②
Test point 2	**Gauge control module connector A (32P) No. 20**





Is there continuity?

YES

Check for loose terminals in the CAN gateway 12P *3/16P *4 connector and gauge control module connector A (32P). If they are OK, **substitute a known-good control module** , then retest. If the indicators come on then go off after substitution, **replace the original gauge control module** .

NO

Repair an open in the wire between the gauge control module and the CAN gateway.

10. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

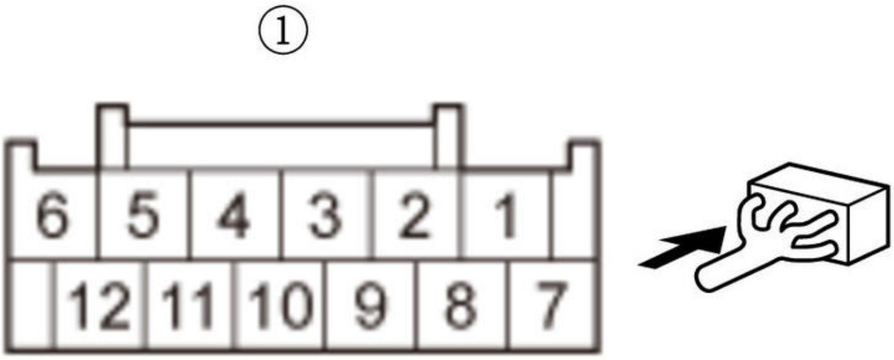
-2. Disconnect the following connectors.

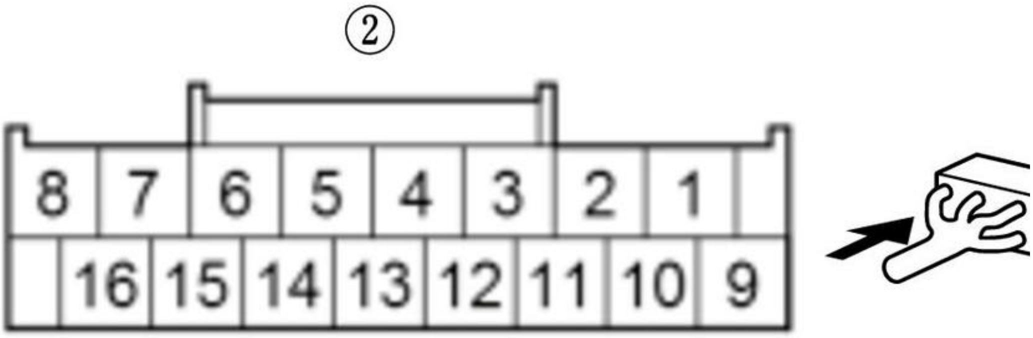
CAN gateway 12P connector *3CAN gateway 16P connector *4
Millimeter wave radar 8P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector *3: disconnectedCAN gateway 16P connector *4: disconnected
B	Millimeter wave radar 8P connector: disconnected
Test point 1	CAN gateway 12P connector *3 (female terminals) No. 12: ① CAN gateway 16P connector *4 (female terminals) No. 6: ②
Test point 2	**Millimeter wave radar 8P connector No. 7**

Test point 1	CAN gateway 12P connector *3 (female terminals) No. 5: ① CAN gateway 16P connector *4 (female terminals) No. 14: ②
Test point 2	**Millimeter wave radar 8P connector No. 6**





Is there continuity?

YES

Check for loose terminals and poor connections in the millimeter wave radar 8P connector. Check for any authorized service information related to the DTCs or s are troubleshooting. If they are OK, **replace millimeter wave radar** .

NO

Repair an open in the wire between the millimeter wave radar and the CAN gateway.

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - DOES NOT SENSE THE VEHICLE DRIVING AHEAD

Does not sense the vehicle driving ahead

1. All condition check

-1. Find out if the detection problem occurs under all conditions.

Does it occur under all conditions?

YES

The millimeter wave radar vertical aiming is incorrect. **Aim the millimeter wave radar** .

NO

Go to step 2.

2. Road condition check

   -1. Find out if the detection problem occurs only on a particular road such as a winding road, an entrance of a corner, an exit of a corner, a tight corner, or a bad ro

   Does it occur only on a particular road?

   YES

   Explain to the customer that the system sometimes cannot detect under certain road conditions.

   NO

   Go to step 3.

3. Weather condition check

   -1. Find out if the detection problem occurs only under poor weather conditions such as fog, snow, heavy rain, or gusty winds.

   Does it occur only under poor weather conditions?

   YES

   Explain to the customer that the system sometimes cannot detect under poor weather conditions.

   NO

   Go to step 4.

4. Driving condition check:

   Find out if the detection problem occurs only when the vehicle ahead drives under these conditions:

   - Merged into the lane suddenly.
   - Closing on a vehicle within 4 m (13 ft).

   Does it occur only under certain driving conditions?

   YES

   Explain to the customer that the system sometimes cannot detect under certain driving conditions.

   NO

   Go to step 5.

5. Millimeter wave radar aiming check

   -1. Confirm if the radar detects vehicles driving in another lane.

   Does it detect vehicles in other lanes?

   YES

   The millimeter wave radar horizontal aiming is incorrect. **Aim the millimeter wave radar** .

   NO

   Go to step 6.

6. Other component check

   -1. Confirm if the detection problem is caused by instability.

   NOTE: If the cause of the misdetection or undetectable problems is unclear, it is possible that the problem was caused by environmental conditions. Explain to th that intermittent failures are sometimes caused by environmental conditions.

   Is the vehicle unstable? (Compare it to a known-good, like vehicle.)

   YES

   Check other components such as VSA modulator-control unit or wheel speed sensors, etc.

   NO

   Go to step 7.

7. Heavy load check

   -1. Check if there is a heavy load on the vehicle.

   Is there a heavy load on the vehicle?

   YES

   Remove the heavy load from the vehicle. Advise the customer that this problem may occur temporarily when hauling heavy loads.

   NO

   Go to step 8.

8. Millimeter wave radar and front grille check

   -1. Check for dirt, dust, or snow on the surface of the millimeter wave radar and the front grille.

   Are the millimeter wave radar and front grille OK?

   YES

   Go to step 9.

   NO

   Clean the millimeter wave radar and the front grille.

9. Vehicle ride height check

   -1. Measure the front and rear vehicle ride height.

   Is the vehicle ride height equal?

   YES

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

   NO

   Inspect the suspension for damage, and compare ride height to a known-good vehicle. **Adjust the wheel alignment as needed** .

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - INTERMITTENTLY SENSES THE VEHICLE DRIVING AHEAD

Intermittently senses the vehicle driving ahead

1. Road condition check

   -1. Find out if the detection problem occurs only on a particular road such as a winding road, an entrance of a corner, an exit of a corner, a tight corner, or a bad ro

   Does it occur only on a particular road?

   YES

   Explain to the customer that the system sometimes cannot detect under certain road conditions.

   NO

   Go to step 2.

2. Weather condition check

   -1. Find out if the detection problem occurs only under poor weather conditions such as fog, snow, heavy rain, or gusty winds.

   Does it occur only under poor weather conditions?

   YES

   Explain to the customer that the system sometimes cannot detect under poor weather conditions.

   NO

   Go to step 3.

3. Driving condition check:

   Find out if the detection problem occurs only when the vehicle ahead drives under these conditions:

   - Merged into the lane suddenly.
   - Closing on a vehicle within 4 m (13 ft).

   Does it occur only under certain driving conditions?

   YES

   Explain to the customer that the system sometimes cannot detect under certain driving conditions.

   NO

   Go to step 4.

4. Millimeter wave radar aiming check

   -1. Confirm if the radar detects vehicles driving in another lane.

   Does it detect vehicles in other lanes?

   YES

   The millimeter wave radar horizontal aiming is incorrect. **Aim the millimeter wave radar aiming** .

   NO

   Go to step 5.

5. All condition check

   -1. Find out if the detection problem occurs under all conditions.

   Does it occur under all conditions?

   YES

   The millimeter wave radar vertical aiming is incorrect. **Aim the millimeter wave radar aiming** .

   NO

   Go to step 6.

6. Other component check

   -1. Confirm if the detection problem is caused by instability.

   NOTE: If the cause of the misdetection or undetectable problems is unclear, it is possible that the problem was caused by environmental conditions. Explain to th that intermittent failures are sometimes caused by environmental conditions.

   Is the vehicle unstable? (Compare it to a known-good, like vehicle.)

   YES

   Check other components such as VSA modulator-control unit or wheel speed sensors, etc.

   NO

   Go to step 7.

7. Heavy load check

   -1. Check if there is a heavy load on the vehicle.

   Was there a heavy load on the vehicle?

   YES

   Remove the heavy load from the vehicle. Advise the customer that this problem may occur temporarily when hauling heavy loads.

   NO

   Go to step 8.

8. Millimeter wave radar and front grille check

   -1. Check for dirt, dust, or snow on the surface of the millimeter wave radar and the front grille.

   Are the millimeter wave radar and front grille OK?

   YES

   Go to step 9.

   NO

   Clean the millimeter wave radar and the front grille.

9. Vehicle's history check

   -1. Check the vehicle's history for front end collision repairs.

   Has the vehicle been in a collision and repaired?

   YES

   Go to step 10.

   NO

   Go to step 12.

10. Millimeter wave radar installing check

   -1. Check if the millimeter wave radar and its bracket are installed correctly, and also check if the vehicle frame is straight.

   Are all parts installed correctly?

   YES

   Go to step 11.

   NO

   Reinstall the part correctly, or if damaged, replace the part, then **aim the millimeter wave radar** .

11. Vehicle ride height check

   -1. Measure the front and rear vehicle ride height.

   Is the vehicle ride height equal?

YES

Go to step 12.

NO

Inspect the suspension for damage, and compare ride height to a known-good vehicle. **Adjust the wheel alignment as needed** .

12. Wheel alignment check

    -1. **Check the wheel alignment** .

    Is the wheel alignment OK?

    YES

    Aim the millimeter wave radar .

    NO

    Adjust the wheel alignment .

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING - SENSES A VEHICLE DRIVING IN ANOTHER LANE

Senses a vehicle driving in another lane

1. Problem verification 1

   -1. Find out when and under what conditions the system has misdetections.

   Do they occur within 20 minutes or less?

   YES

   Go to step 2.

   NO

   Explain to the customer that system misdetections are sometimes caused by the environment (weather, road conditions, driving conditions, etc.).

2. Problem verification 2

   -1. Find out if the detection problem occurs only with certain types of vehicles (dirty vehicle, tall vehicle, motorcycle, or special vehicle).

   Does it occur only with certain types of vehicles?

   YES

   Explain to the customer that the system sometimes cannot detect certain vehicle types.

   NO

   Go to step 3.

3. Vehicle's history check

   -1. Check the vehicle's history for front end collision repairs.

   Has the vehicle been in a collision and repaired?

   YES

   Go to step 4.

   NO

   Go to step 5.

4. Millimeter wave radar installing check

   -1. Check if the millimeter wave radar and its bracket are installed correctly, and also check if the vehicle frame is straight.

   Are all parts installed correctly?

   YES

   Go to step 5.

   NO

   Reinstall the part correctly, or if damaged, replace the part, then **aim the millimeter wave radar** .

5. Wheel alignment check

   -1. **Check the wheel alignment** .

   Is the wheel alignment OK?

   YES

   Aim the millimeter wave radar .

NO

Adjust the wheel alignment .

COLLISION MITIGATION BRAKING SYSTEM (CMBS) SYMPTOM TROUBLESHOOTING - CMBS INDICATOR (ON THE MID) DOES NOT GO OF

CMBS indicator (on the MID) does not go off

1. DTCs check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   DTC (IDAS)

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 2.

2. VSA system DTCs check

   -1. Check for VSA system DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 3.

3. PGM-FI system DTCs check

   -1. Check for PGM-FI system DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 4.

4. Gauge control module operation check

   -1. **Do the gauge control module self-diagnostic function** .

   Is the gauge control module OK?

   YES

   Go to step 5.

   NO

   Replace the gauge control module .

5. CMBS OFF switch check

   -1. **Test the CMBS OFF switch** .

   Is the switch OK?

   YES

   Check for loose terminals and poor connections in the millimeter wave radar 8P connector. Check for any authorized service information related to the DTCs or s are troubleshooting. If they are OK, **replace millimeter wave radar** .

   NO

Replace the CMBS OFF switch .

LANE KEEPING ASSIST SYSTEM (LKAS) SYMPTOM TROUBLESHOOTING - LKAS ACTIVATION INDICATOR (ON THE MID) DOES NOT COME

1. Gauge control module operation check

-1. **Do the gauge control module self-diagnostic function** .

Is the gauge control module OK?

YES

Go to step 2.

NO

Replace the gauge control module .

2. ACC combination switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Test the ACC combination switch** .

Is the switch OK?

YES

Go to step 3.

NO

Replace the ACC combination switch .

3. Open wire check (CRUISE SW line)

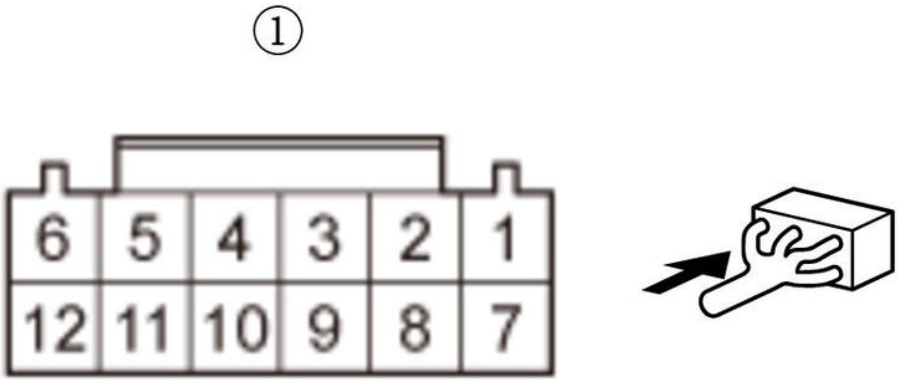
-1. Disconnect the following connector.

ACC combination switch 12P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5 V?

YES

Repair an open in the CRUISE GND wire between the ACC combination switch and the gauge control module.

NO

Repair an open in the CRUISE SW wire between the ACC combination switch and the gauge control module.

LANE KEEPING ASSIST SYSTEM (LKAS) SYMPTOM TROUBLESHOOTING - LKAS ACTIVATION INDICATOR (ON THE MID) DOES NOT GO OF

1. Gauge control module operation check

-1. Do the gauge control module self-diagnostic function .

Is the gauge control module OK?

YES

Go to step 2.

NO

Replace the gauge control module .

2. ACC combination switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Test the ACC combination switch .

Is the switch OK?

YES

Repair a short to ground in the wire between the ACC combination switch and the gauge control module.

NO

Replace the ACC combination switch .

LANE KEEPING ASSIST SYSTEM (LKAS) SYMPTOM TROUBLESHOOTING - LKAS INDICATOR (ON THE MID) DOES NOT COME ON

*1: Without auto idle stop system
*2: With auto idle stop system

1. Gauge control module operation check

-1. Turn the vehicle to the ON mode.

Check the following indicators in the gauge control module:

- Malfunction indicator lamp (MIL)
- Brake system indicator
- 12 volt charging system indicator

Do the indicators come on?

YES

Go to the gauge control module self-diagnostic function .

NO

Go to step 2.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D7 (10 A) *1No. F6 (5 A) *2
Location	Under-dash fuse/relay box *1Auxiliary under-dash fuse/relay box *2

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. Turn the vehicle to the ON mode then the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D7 (10 A) *1/F6 (5 circuit.

3. Open wire check (IG1 METER *1/IG1 VST *2 line):-1.

Disconnect the following connector.

Gauge control module connector A (32P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 17**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the gauge control module .

NO

Repair an open in the IG1 METER *1/IG1 VST *2 wire between the under-dash fuse/relay box *1/auxiliary under-dash fuse/relay box *2 and the gauge control m

LANE KEEPING ASSIST SYSTEM (LKAS) SYMPTOM TROUBLESHOOTING - LKAS INDICATOR (ON THE MID) DOES NOT GO OFF

NOTE:

***1: Without auto idle stop system**
***2: With auto idle stop system**
***3: CAN gateway 12P connector type**
***4: CAN gateway 16P connector type**

1. DTCs check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

DTC (IDAS)

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 2.

2. CAN gateway system DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

YES

Go to the indicated DTCs troubleshooting .

NO

Go to step 3.

3. EPS system DTCs check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 4.

4. Fuse check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D5 (10 A) *1No. F7 (7.5 A) *2

Location	Under-dash fuse/relay box *1Auxiliary under-dash fuse/relay box *2

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 5.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D5 (10 A) *1/F7 fuse circuit.

5. Fuse check 2

-1. Check the following fuse.

Fuse	No. D7 (10 A) *1No. F6 (5 A) *2
Location	Under-dash fuse/relay box *1Auxiliary under-dash fuse/relay box *2

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 6.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D7 (10 A) *1/F6 circuit.

6. Gauge control module operation check

-1. Turn the vehicle to the ON mode.

Do the indicators come on?

YES

Go to step 7.

NO

Go to the gauge control module self-diagnostic function .

7. Open wire check (IG1 OPTION *1/IG1 EBB *2 line):-1.

Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Millimeter wave radar 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Millimeter wave radar 8P connector: disconnected
Test point 1	**Millimeter wave radar 8P connector No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 OPTION *1/IG1 EBB *2 wire is OK. Go to step 8.

NO

Repair an open in the wire between the millimeter wave radar and the under-dash fuse/relay box *1/auxiliary under-dash fuse/relay box *2.

8. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Millimeter wave radar 8P connector: disconnected

Test point 1	**Millimeter wave radar 8P connector No. 8**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 9.

NO

Repair an open in the wire between the millimeter wave radar and the body ground (G251).

9. F-CAN circuit communication check

-1. Reconnect the following connector.

Millimeter wave radar 8P connector

-2. Turn the vehicle to the ON mode.

-3. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Gauge control module (Bus A) is Not Available

Go to step 10.

Millimeter wave radar (Bus B) is Not Available

Go to step 11.

Millimeter wave radar and gauge control module are Detected

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

10. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

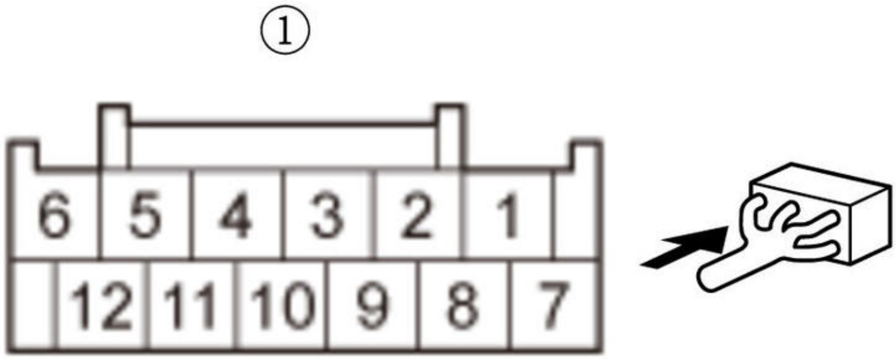
CAN gateway 12P connector *3CAN gateway 16P connector *4
Gauge control module connector A (32P)

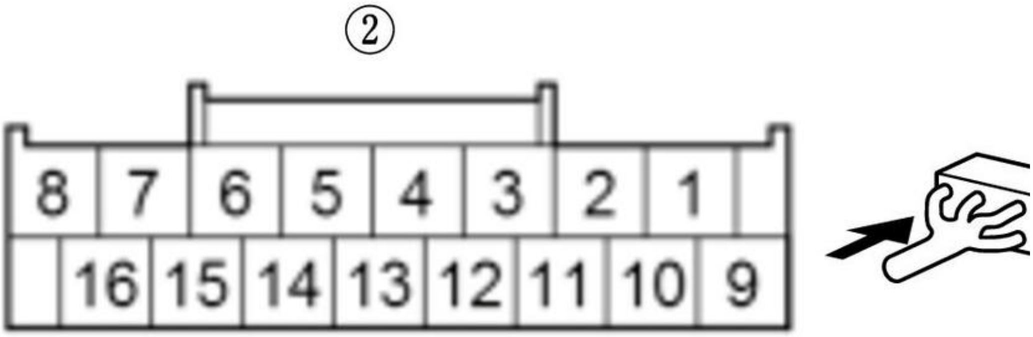
-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector *3: disconnectedCAN gateway 16P connector *4: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	CAN gateway 12P connector *3 (female terminals) No. 3: ① CAN gateway 16P connector *4 (female terminals) No. 3: ②
Test point 2	**Gauge control module connector A (32P) No. 19**

Test point 1	CAN gateway 12P connector *3 (female terminals) No. 9: ① CAN gateway 16P connector *4 (female terminals) No. 11: ②

Test point 2	**Gauge control module connector A (32P) No. 20**





Is there continuity?

YES

Check for loose terminals in the CAN gateway 12P *3/16P *4 connector and gauge control module connector A (32P). If they are OK, **substitute a known-good control module** , then retest. If the indicators come on then go off after substitution, **replace the original gauge control module** .

NO

Repair an open in the wire between the gauge control module and the CAN gateway.

11. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

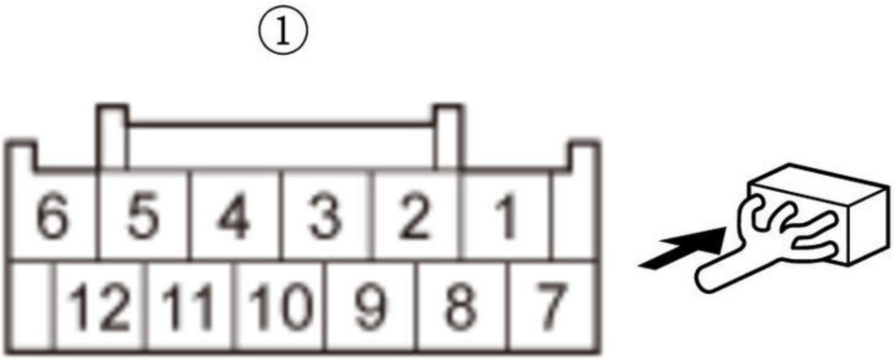
-2. Disconnect the following connectors.

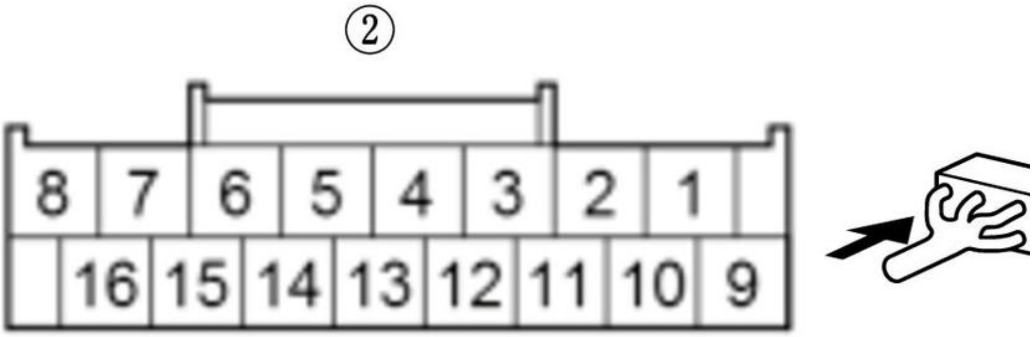
CAN gateway 12P connector *3CAN gateway 16P connector *4
Millimeter wave radar 8P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector *3: disconnectedCAN gateway 16P connector *4: disconnected
B	Millimeter wave radar 8P connector: disconnected
Test point 1	CAN gateway 12P connector *3 (female terminals) No. 12: ① CAN gateway 16P connector *4 (female terminals) No. 6: ②
Test point 2	**Millimeter wave radar 8P connector No. 7**

Test point 1	CAN gateway 12P connector *3 (female terminals) No. 5: ① CAN gateway 16P connector *4 (female terminals) No. 14: ②
Test point 2	**Millimeter wave radar 8P connector No. 6**





Is there continuity?

YES

Check for loose terminals and poor connections in the millimeter wave radar 8P connector. Check for any authorized service information related to the DTCs or s are troubleshooting. If they are OK, replace millimeter wave radar .

NO

Repair an open in the wire between the millimeter wave radar and the CAN gateway.

SYMPTOM TROUBLESHOOTING INDEX

ADAPTIVE CRUISE CONTROL (ACC) SYMPTOM TROUBLESHOOTING INDEX(ADAPTIVE CRUISE CONTROL (ACC))

NOTE: The ACC system is cancelled when the VSA system is activated.

Symptom	Diagnostic procedure	Also check for
Vehicle speed can be set, but there is no ACC indication on the MID	Do the gauge control module self-diagnostic function .	B
ACC OFF is displayed on the MID unexpectedly	Check the ACC system auto stop control history.	B
Vehicle speed cannot be set when the SET switch is pressed between 25 mph (40 km/h) and 90 mph (145 km/h)	- Test the ACC combination switch . - Test the brake pedal position switch .	- An open in the wire. - A short in the wire. - The system is in service mode.
Vehicle does not decelerate or accelerate accordingly when the SET or RES switch is pressed	Test the ACC combination switch .	An open in the wire.
Set speed does not cancel when the brake pedal is pressed	Test the brake pedal position switch .	An open in the wire.
Set speed does not cancel when the MAIN switch is turned off	Test the ACC combination switch .	An open in the wire.
Set distance cannot be adjusted with the distance switch	Test the ACC combination switch .	B
Vehicle speed can be set, but vehicle decelerates	Check for DTCs in the PGM-FI system with the HDS .	Faulty ETCS.
ACC activation indicator (on the MID) does not come on	Symptom troubleshooting.	B
ACC activation indicator (on the MID) does not go off	Symptom troubleshooting.	B
ACC indicator (on the MID) does not come on	Symptom troubleshooting.	B
ACC indicator (on the MID) does not go off	Symptom troubleshooting.	B
Senses a vehicle driving in another lane	Symptom troubleshooting.	- Incorrect millimeter wave rada installation. - Wheel alignment.
Does not sense the vehicle driving ahead	Symptom troubleshooting.	- Out of the performance limits. - Wheel alignment. - Undetectable environment.
Intermittently senses the vehicle driving ahead	Symptom troubleshooting.	- Incorrect millimeter wave rada installation. - Wheel alignment. - Undetectable environment.

COLLISION MITIGATION BRAKING SYSTEM (CMBS) SYMPTOM TROUBLESHOOTING INDEX(COLLISION MITIGATION BRAKING SYSTEM

Symptom	Diagnostic procedure	Also check for
CMBS OFF switch does not turn On/turn Off (CMBS indicator does not change)	- Do the gauge control module self-diagnostic function . - Test the CMBS OFF switch .	- An open or increased resistance in the wire. - A short in the wire.

Symptom	Diagnostic procedure	Also check for
The MID does not indicate when the CMBS OFF switch is operated	• **Do the gauge control module self-diagnostic function** . • **Test the CMBS OFF switch** .	• An open or increased resistance in the wire • A short in the wire.
The buzzer does not sound	**Do the gauge control module self-diagnostic function** .	B
The buzzer does not sound when the CMBS OFF switch is operated	**Do the gauge control module self-diagnostic function** .	B
The MID does not indicate with the CMBS operating	**Do the gauge control module self-diagnostic function** .	B
The CMBS operates frequently	• **Check the millimeter wave radar installation** . • Check the front grille for warpage. • **Check the wheel alignment** .	Driving conditions, weather environmental influence.
The CMBS operated without danger of collision	• **Check the millimeter wave radar installation** . • Check the front grille for warpage. • **Check the wheel alignment** .	Driving conditions, weather environmental influence.
The CMBS did not operate	• **Check the millimeter wave radar installation** . • Check the front grille for warpage. • **Check the wheel alignment** .	• Driving conditions, weather, environment influences. • Undetectable environment.
CMBS indicator (on the MID) does not come on	**Do the gauge control module self-diagnostic function** .	B
CMBS indicator (on the MID) does not go off	**Symptom troubleshooting**.	B

CRUISE CONTROL SYMPTOM TROUBLESHOOTING INDEX (CRUISE CONTROL)

Symptom	Diagnostic procedure	Also check for
Cruise control cannot be set	• **Check the PGM-FI system** . • Check the No. D21 (10 A) fuse in the under-dash fuse/relay box. • **Do the cruise control combination switch test** . • **Do the cruise control input test**.	• Open circuit, loose or disconne terminals: wires between the cr control combination switch and gauge control module • Faulty gauge control module • Faulty cable reel
Cruise control can be set, but the cruise main indicator does not come on	• **Do the gauge control module self-diagnostic function procedure** . • **Do the cruise control input test**. Test the cruise main indicator signal input. • **Check the PGM-FI system** .	Faulty gauge control module
Cruise control can be set, but the cruise control indicator does not come on	• **Do the gauge control module self-diagnostic function procedure** . • **Do the cruise control input test**. Test the cruise control indicator signal input. • **Check the PGM-FI system** .	Faulty gauge control module
Vehicle does not accelerate accordingly when the RES+ switch is pressed	• **Do the cruise control combination switch test** . • **Do the cruise control input test**. Test the RES+ switch signal input. • **Check the PGM-FI system** .	B
Vehicle does not decelerate accordingly when the SET- switch is pressed	• **Do the cruise control combination switch test** . • **Do the cruise control input test**. Test the RES- switch signal input. • **Check the PGM-FI system** .	B
Set speed does not cancel when the brake pedal is pressed	• **Do the brake pedal position switch test** . • **Do the cruise control input test**. Test the brake pedal position switch signal input. • **Check the PGM-FI system** .	• Faulty brake pedal position swi • An open in the wire between th PCM and the brake pedal positi switch • A wire shorted to ground or po between the PCM and the brak pedal position switch
Set speed does not cancel when the CRUISE switch is pressed	• **Do the cruise control combination switch test** . • **Do the cruise control input test**. Test the CRUISE switch signal input. • **Check the PGM-FI system** .	B
Set speed does not cancel when the CANCEL switch is pressed	• **Do the cruise control combination switch test** . • **Do the cruise control input test**. Test the CANCEL switch signal input. • **Check the PGM-FI system** .	B

Symptom	Diagnostic procedure	Also check for
Set speed does not resume when the RES+ switch is pressed (with the CRUISE button pressed on, and set speed temporarily canceled by pressing the brake pedal)	• **Check the PGM-FI system** . • **Do the cruise control combination switch test** . • **Do the cruise control input test**. Test the RES+ switch signal input.	B

Symptom	Diagnostic procedure	Also check for
Set speed does not resume when the RES+ switch is pressed (with the CRUISE switch pressed on, and set speed temporarily canceled by pressing the CANCEL switch)	- Check the PGM-FI system . - Do the cruise control combination switch test . - Do the cruise control input test. Test the RES+ switch signal input.	B

LANE KEEPING ASSIST SYSTEM (LKAS) SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
LKAS indicator (on the MID) does not come on	Symptom troubleshooting.	B
LKAS indicator (on the MID) does not go off	Symptom troubleshooting.	B
LKAS activation indicator (on the MID) does not come on	Symptom troubleshooting.	B
LKAS activation indicator (on the MID) does not go off	Symptom troubleshooting.	B

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

ACC OFF IS DISPLAYED ON THE MID UNEXPECTEDLY(ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Check the ACC system auto stop control history.

ACC ACTIVATION INDICATOR (ON THE MID) DOES NOT COME ON (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Symptom troubleshooting.

ACC ACTIVATION INDICATOR (ON THE MID) DOES NOT GO OFF (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Symptom troubleshooting.

ACC INDICATOR (ON THE MID) DOES NOT COME ON (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Symptom troubleshooting.

ACC INDICATOR (ON THE MID) DOES NOT GO OFF (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Symptom troubleshooting.

CMBS OFF SWITCH DOES NOT TURN ON/TURN OFF (CMBS INDICATOR DOES NOT CHANGE) (COLLISION MITIGATION BRAKING SYSTEM

Diagnostic procedure

- Do the gauge control module self-diagnostic function .
- Test the CMBS OFF switch .

Also check for

- An open or increased resistance in the wire.
- A short in the wire.

CMBS INDICATOR (ON THE MID) DOES NOT COME ON (COLLISION MITIGATION BRAKING SYSTEM (CMBS))

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

CMBS INDICATOR (ON THE MID) DOES NOT GO OFF (COLLISION MITIGATION BRAKING SYSTEM (CMBS))

Diagnostic procedure

- Symptom troubleshooting.

CRUISE CONTROL CAN BE SET, BUT THE CRUISE CONTROL INDICATOR DOES NOT COME ON (CRUISE CONTROL)

Diagnostic procedure

- Do the gauge control module self-diagnostic function procedure .
- Do the cruise control input test. Test the cruise control indicator signal input.
- Check the PGM-FI system .

Also check for

Faulty gauge control module

CRUISE CONTROL CAN BE SET, BUT THE CRUISE MAIN INDICATOR DOES NOT COME ON (CRUISE CONTROL)

Diagnostic procedure

- Do the gauge control module self-diagnostic function procedure .

- Do the cruise control input test. Test the cruise main indicator signal input.
- Check the PGM-FI system .

Also check for

Faulty gauge control module

CRUISE CONTROL CANNOT BE SET (CRUISE CONTROL)

Diagnostic procedure

- Check the PGM-FI system .
- Check the No. D21 (10 A) fuse in the under-dash fuse/relay box.
- Do the cruise control combination switch test .
- Do the cruise control input test.

Also check for

- Open circuit, loose or disconnected terminals: wires between the cruise control combination switch and the gauge control module
- Faulty gauge control module
- Faulty cable reel

DOES NOT SENSE THE VEHICLE DRIVING AHEAD (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Symptom troubleshooting.

Also check for

- Out of the performance limits.
- Wheel alignment.
- Undetectable environment.

INTERMITTENTLY SENSES THE VEHICLE DRIVING AHEAD (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Symptom troubleshooting.

Also check for

- Incorrect millimeter wave radar installation.
- Wheel alignment.
- Undetectable environment.

LKAS ACTIVATION INDICATOR (ON THE MID) DOES NOT COME ON

Diagnostic procedure

- Symptom troubleshooting.

LKAS ACTIVATION INDICATOR (ON THE MID) DOES NOT GO OFF

Diagnostic procedure

- Symptom troubleshooting.

LKAS INDICATOR (ON THE MID) DOES NOT COME ON

Diagnostic procedure

- Symptom troubleshooting.

LKAS INDICATOR (ON THE MID) DOES NOT GO OFF

Diagnostic procedure

- Symptom troubleshooting.

SENSES A VEHICLE DRIVING IN ANOTHER LANE (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Symptom troubleshooting.

Also check for

- Incorrect millimeter wave radar installation.
- Wheel alignment.

SET DISTANCE CANNOT BE ADJUSTED WITH THE DISTANCE SWITCH (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Test the ACC combination switch .

SET SPEED DOES NOT CANCEL WHEN THE CANCEL SWITCH IS PRESSED (CRUISE CONTROL)

Diagnostic procedure

- Do the cruise control combination switch test .
- Do the cruise control input test. Test the CANCEL switch signal input.
- Check the PGM-FI system .

SET SPEED DOES NOT CANCEL WHEN THE CRUISE SWITCH IS PRESSED (CRUISE CONTROL)

Diagnostic procedure

- Do the cruise control combination switch test .
- Do the cruise control input test. Test the CRUISE switch signal input.
- Check the PGM-FI system .

SET SPEED DOES NOT CANCEL WHEN THE MAIN SWITCH IS TURNED OFF(ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Test the ACC combination switch .

Also check for

An open in the wire.

SET SPEED DOES NOT CANCEL WHEN THE BRAKE PEDAL IS PRESSED (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Test the brake pedal position switch .

Also check for

An open in the wire.

SET SPEED DOES NOT CANCEL WHEN THE BRAKE PEDAL IS PRESSED (CRUISE CONTROL)

Diagnostic procedure

- Do the brake pedal position switch test .
- Do the cruise control input test. Test the brake pedal position switch signal input.
- Check the PGM-FI system .

Also check for

- Faulty brake pedal position switch
- An open in the wire between the PCM and the brake pedal position switch
- A wire shorted to ground or power between the PCM and the brake pedal position switch

SET SPEED DOES NOT RESUME WHEN THE RES+ SWITCH IS PRESSED (WITH THE CRUISE BUTTON PRESSED ON, AND SET SPEED TEMPO CANCELED BY PRESSING THE BRAKE PEDAL) (CRUISE CONTROL)

Diagnostic procedure

- Check the PGM-FI system .
- Do the cruise control combination switch test .
- Do the cruise control input test. Test the RES+ switch signal input.

SET SPEED DOES NOT RESUME WHEN THE RES+ SWITCH IS PRESSED (WITH THE CRUISE SWITCH PRESSED ON, AND SET SPEED TEMPO CANCELED BY PRESSING THE CANCEL SWITCH) (CRUISE CONTROL)

Diagnostic procedure

- Check the PGM-FI system .
- Do the cruise control combination switch test .
- Do the cruise control input test. Test the RES+ switch signal input.

THE CMBS DID NOT OPERATE (COLLISION MITIGATION BRAKING SYSTEM (CMBS))

Diagnostic procedure

- Check the millimeter wave radar installation .
- Check the front grille for warpage.
- Check the wheel alignment .

Also check for

- Driving conditions, weather, environmental influences.
- Undetectable environment.

THE CMBS OPERATED WITHOUT DANGER OF COLLISION (COLLISION MITIGATION BRAKING SYSTEM (CMBS))

Diagnostic procedure

- Check the millimeter wave radar installation .
- Check the front grille for warpage.

- Check the wheel alignment .

Also check for

Driving conditions, weather, environmental influence.

THE CMBS OPERATES FREQUENTLY (COLLISION MITIGATION BRAKING SYSTEM (CMBS))

Diagnostic procedure

- Check the millimeter wave radar installation .
- Check the front grille for warpage.
- Check the wheel alignment .

Also check for

Driving conditions, weather, environmental influence.

THE MID DOES NOT INDICATE WHEN THE CMBS OFF SWITCH IS OPERATED (COLLISION MITIGATION BRAKING SYSTEM (CMBS))

Diagnostic procedure

- Do the gauge control module self-diagnostic function .
- Test the CMBS OFF switch .

Also check for

- An open or increased resistance in the wire.
- A short in the wire.

THE MID DOES NOT INDICATE WITH THE CMBS OPERATING (COLLISION MITIGATION BRAKING SYSTEM (CMBS))

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

THE BUZZER DOES NOT SOUND WHEN THE CMBS OFF SWITCH IS OPERATED (COLLISION MITIGATION BRAKING SYSTEM (CMBS))

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

THE BUZZER DOES NOT SOUND(COLLISION MITIGATION BRAKING SYSTEM (CMBS))

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

VEHICLE DOES NOT ACCELERATE ACCORDINGLY WHEN THE RES+ SWITCH IS PRESSED (CRUISE CONTROL)

Diagnostic procedure

- Do the cruise control combination switch test .
- Do the cruise control input test. Test the RES+ switch signal input.
- Check the PGM-FI system .

VEHICLE DOES NOT DECELERATE ACCORDINGLY WHEN THE SET- SWITCH IS PRESSED (CRUISE CONTROL)

Diagnostic procedure

- Do the cruise control combination switch test .
- Do the cruise control input test. Test the RES- switch signal input.
- Check the PGM-FI system .

VEHICLE DOES NOT DECELERATE OR ACCELERATE ACCORDINGLY WHEN THE SET OR RES SWITCH IS PRESSED (ADAPTIVE CRUISE CO (ACC))

Diagnostic procedure

- Test the ACC combination switch .

Also check for

An open in the wire.

VEHICLE SPEED CAN BE SET, BUT THERE IS NO ACC INDICATION ON THE MID (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Do the gauge control module self-diagnostic function .

VEHICLE SPEED CAN BE SET, BUT VEHICLE DECELERATES (ADAPTIVE CRUISE CONTROL (ACC))

Diagnostic procedure

- Check for DTCs in the PGM-FI system with the HDS .

Also check for

Faulty ETCS.

VEHICLE SPEED CANNOT BE SET WHEN THE SET SWITCH IS PRESSED BETWEEN 25 MPH (40 KM/H) AND 90 MPH (145 KM/H) (ADAPTIVE C CONTROL (ACC))

Diagnostic procedure

- **Test the ACC combination switch** .
- **Test the brake pedal position switch** .

Also check for

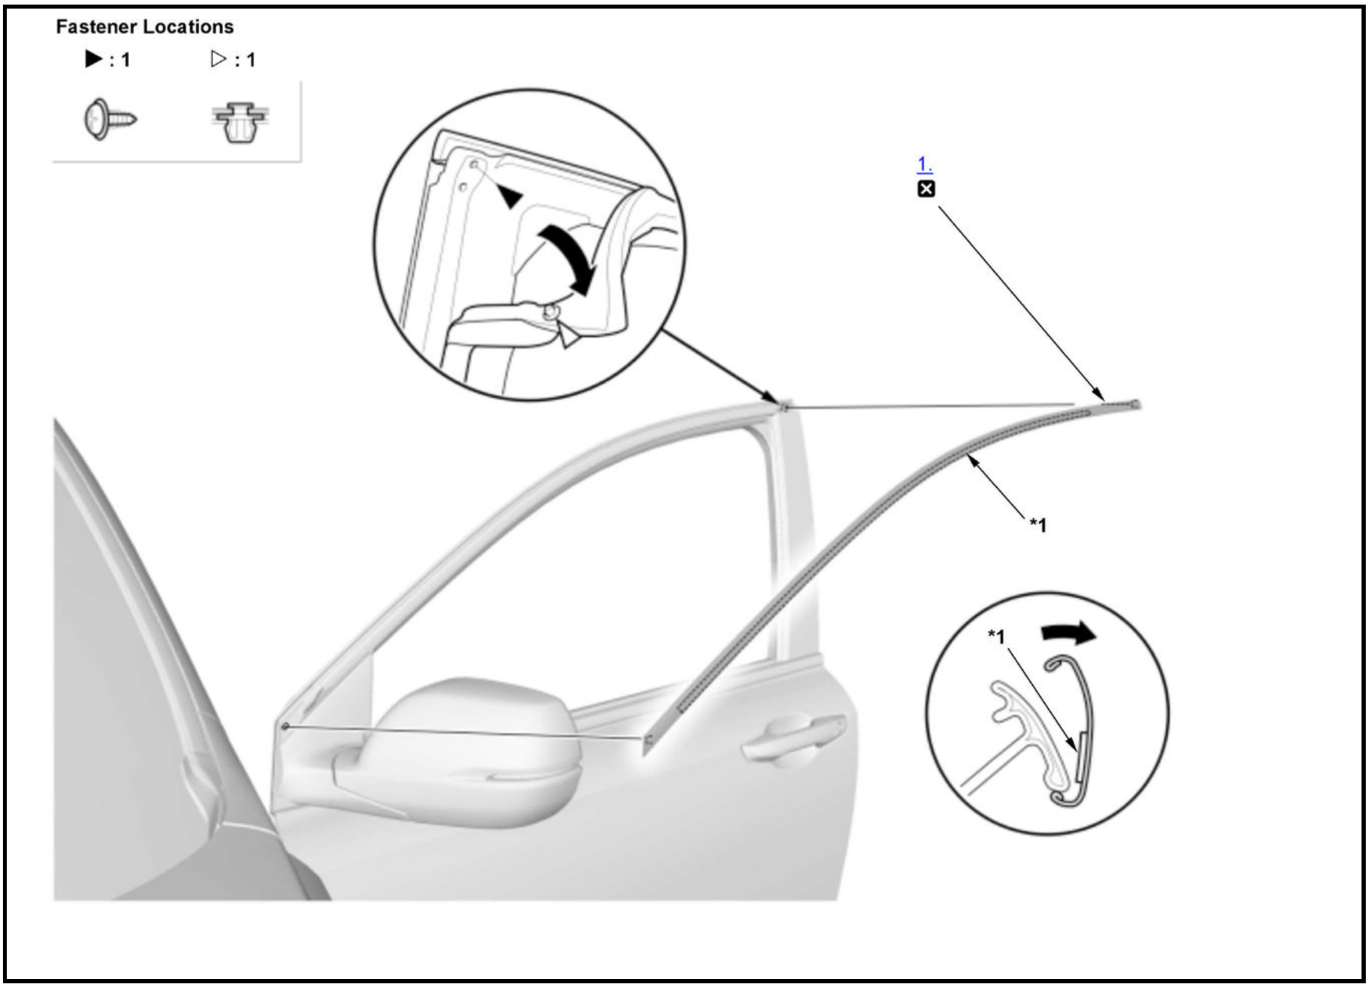
- An open in the wire.
- A short in the wire.
- The system is in service mode.

REPLACEMENT

FRONT DOOR OUTER MOLDING REPLACEMENT

Replacement

1



☒	Replace
*1	Double-sided adhesive tape

1. Front Door Outer Molding - Remove
2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- **Scrape off the remaining double-sided adhesive tape from** the sash, then clean the surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface.

- Install the new front door outer molding.

REAR DOOR OUTER MOLDING REPLACEMENT

Replacement

1. Front Fender Fairing - Remove
2. Door Position - Adjust

Front Door  B 30 (3.1, 22) A 29 (3.0, 21) A 29 (3.0, 21) B 30 (3.1, 22) **Rear Door**  A 29 (3.0, 21) B 30 (3.1, 22) A 29 (3.0, 21) B 30 (3.1, 22)	**NOTE:** Place the vehicle on a firm, level surface when adjusting the doors. 1. Adjust at the hinges: • Have an assistant help you, when adjusting the door. • Loosen the hinge mounting bolts (A) slightly, and move the door backward or forward, up or down as necessary to equalize the gaps. 2. If necessary, replace the door mounting bolts (B) with the adjusting bolts made specifically for door adjustment, then adjust at the door: Loosen the door mounting bolts slightly, and move the door up or down as necessary to equalize the gaps, and move it in or out until it is flush with the body. **NOTE:** **Refer to the Parts Catalog if you need to use an adjusting bolt.**

	3. Check that the door and body edges are parallel. If necessary, adjust the door cushions (A) to make the rear of the doors flush fit with the body. 4. Make sure the door opens without popping or binding and latches securely without slamming. If not, adjust the door striker 5. Apply touch-up paint to the hinge mounting bolts and around the hinges.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. Water Leaks - Check
5. LaneWatch Camera - Aim (With LaneWatch)

DOOR STRIKER ADJUSTMENT

Adjustment

NOTE: How to read the torque specifications

1. Door Striker - Adjust

	Make sure the door latches securely without slamming it. If necessary, adjust the striker (A): The striker screws are fixed, but the striker can be adjusted slightly up or down, and in or out. 1. Loosen the screws (B). 2. Wrap the striker with a shop towel, then adjust the striker by tapping it with a plastic hammer. Do not tap the striker too hard. 3. Lightly tighten the screws. 4. Hold the outer handle out, and push the door against the body to be sure the striker allows a flush fit. If the door latches properly, tighten the screws to the specified torque, and recheck.

REPLACEMENT

FRONT DOOR OUTER MOLDING REPLACEMENT

Replacement

NOTE: ℹ Where icon is shown, for further information see below.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

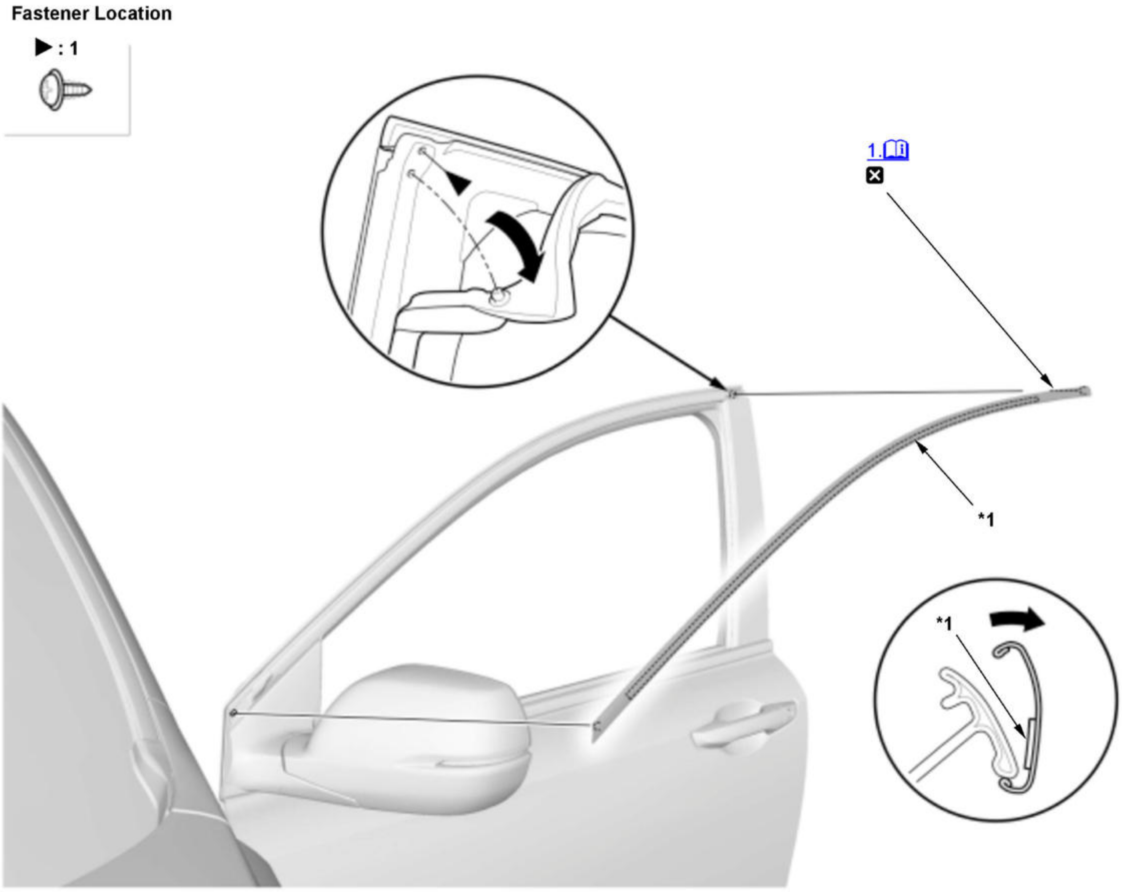

Fig. 1: Front Door Outer Molding Replacement Components

Courtesy of HONDA, U.S.A., INC.

ℹ	Detailed information, notes, and precautions
☒	Replace
*1	Double-sided adhesive tape

1. Front Door Outer Molding - Remove

   NOTE: Pull out the upper edge of the front door outer molding from the edge of the sash, and cut the double-sided adhesive tape with a utility knife, and then remove the molding from the sash.

Note for installation

- Scrape off the remaining double-sided adhesive tape from the sash, then clean the surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface.
- Install the new front door outer molding.

2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

REAR DOOR OUTER MOLDING REPLACEMENT

Replacement

NOTE: ⓘ Where icon is shown, for further information see below.

Procedure

NOTE: Numbered call-outs in figure pertain to list numbers in following procedure.

ⓘ	Detailed information, notes, and precautions
☒	Replace
*1	Double-sided adhesive tape

1. Rear Door Outer Molding - Remove

   Note for installation

   Scrape off the remaining double-sided adhesive tape from the sash, then clean the surface with a sponge dampened in isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface.

2. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

ADJUSTMENT

DOOR GLASS ADJUSTMENT

Adjustment

NOTE:

- **How to read the torque specifications**
- Check the door weatherstrip and the glass run channel for damage or deterioration, and replace them if necessary.

1. Door Panel - Remove
   - **Front**
   - **Rear**
2. Plastic Cover - Remove
   - **Front**
   - **Rear**
3. Door Glass - Adjustment

 **Front Door**	**NOTE:** Place the vehicle on a firm, level surface when adjusting the door glass. 1. Carefully lower the glass (A) until you can see the glass mounting bolts (B), then loosen them. 2. Push the glass against the glass run channel (C), then tighten the glass mounting bolts. 3. Check that the glass moves smoothly.
Rear Door	

	

	4. Raise the glass fully, and check for gaps. Also make sure that the glass (A) contacts the glass run channel (B) evenly.

4. Plastic Cover - Install
    - **Front**
    - **Rear**
5. Door Panel - Install
    - **Front**
    - **Rear**
6. Water Leaks - Check

	1. Check for water leaks. Run water over the roof and on the sealing area as shown, and note these items: • Use a 12 mm (0.47 in) diameter hose (A). • Adjust the rate of water flow as shown. • Do not use a nozzle. • Hold the hose about 300 mm (11.81 in) away from the door.

7. **Power Window Control Unit - Reset**

REAR DOOR WHEEL ARCH PROTECTOR REMOVAL AND INSTALLATION

Removal

1. Rear Door Lower Trim - Remove
2. Rear Door Wheel Arch Protector - Remove

   1. Remove the screws and the clips (A, B).

   2. Cut the adhesive tape (C) along the edge of the rear door wheel arch protector (D) with a utility knife while separating the trim from the rear door (E) with a trim tool.

   NOTE: Apply protective tape around the cutting area.

   3. Slide the rear door wheel arch protector downward and remove it.

   NOTE: The clips (F) will stay in the door.

Installation

1. Rear Door Wheel Arch Protector - Install

	1. If you are reusing the original rear door wheel arch protector (A), apply primer to the areas where new double-sided adhesive tapes (B) will be applied, then attach the new double-sided adhesive tapes to the rear door wheel arch protector on the scribes (C) as shown. **Double-sided adhesive tape (B)**

Thickness	1.0 mm (0.04 in)
Width	6 mm (0.24 in)
Length	23 mm (0.91 in)

2. Install the clips (C) on the rear door wheel arch protector (D).

REMOVAL, INSTALLATION & TEST

ACC COMBINATION SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: SRS components are located in this area. Review the SRS component locations , and the precautions and procedures before doing repairs or service.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

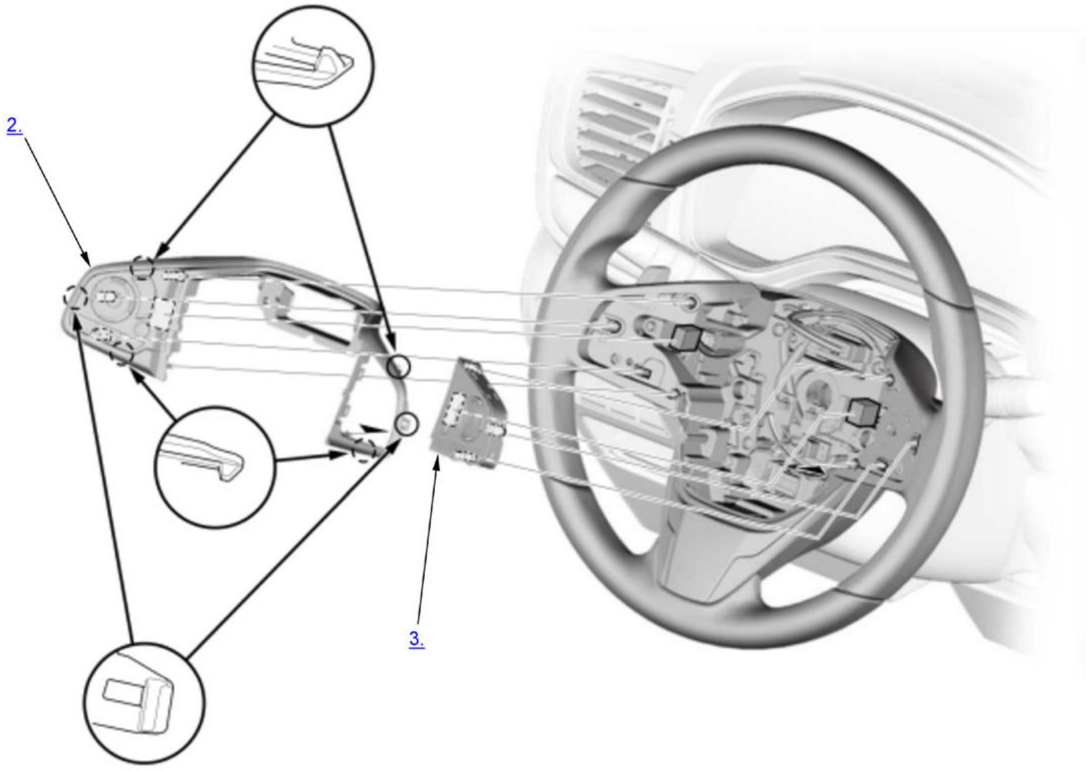

Fig. 1: Exploded View Of ACC Combination Switch Components
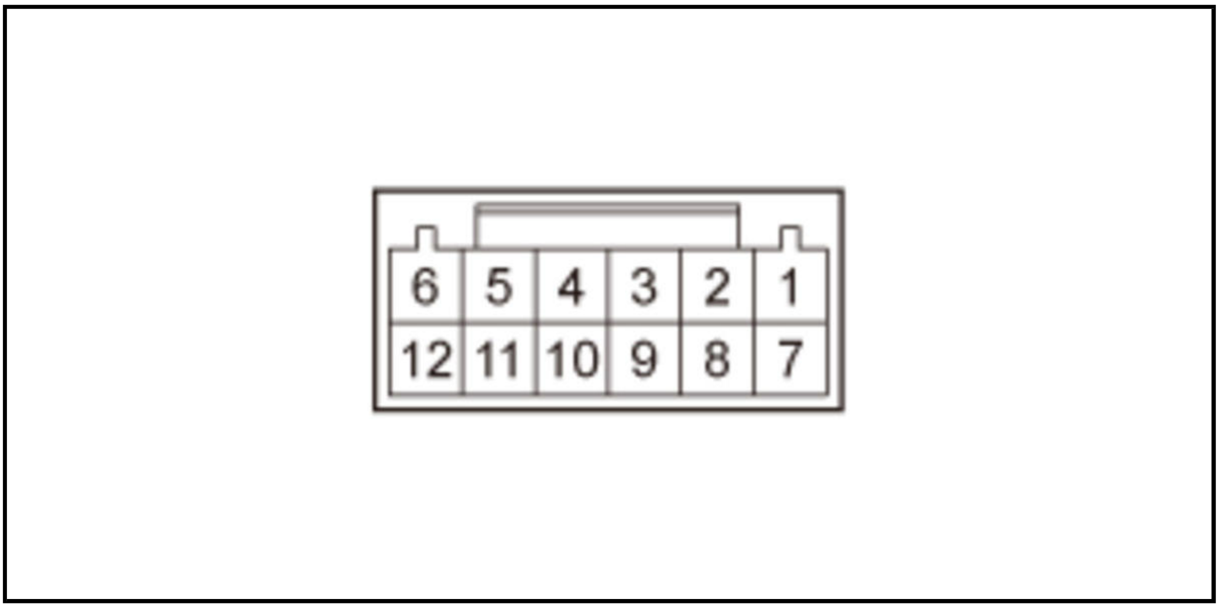
Courtesy of HONDA, U.S.A., INC.

1. Driver's Airbag - Remove
2. Steering Wheel Trim - Remove
3. ACC Combination Switch - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. ACC Combination Switch - Test



ACC Combination Switch Internal Resistance Check:

1. Measure the resistance between the ACC combination switch 12P connector (male terminals) terminals No. 5 and No. 6 according to the table.

- If there is no resistance in one or more positions, replace the ACC combination switch.

Position	Resistance at normal ambient temperature
OFF (Released)	2.0-2.4 kΩ
MAIN (Pressed and held)	54.3-66.3 Ω
CANCEL (Pressed and held)	165.0-201.7 Ω
SET - (Pressed and held)	401.7-491.0 Ω
RES + (Pressed and held)	802.7-981.1 Ω

Distance Switch Internal Resistance Check:

1. Measure the resistance between the ACC combination switch 12P connector (male terminals) terminals No. 5 and No. 12 according to the table.

- If there is no resistance in one or more positions, replace the ACC combination switch.

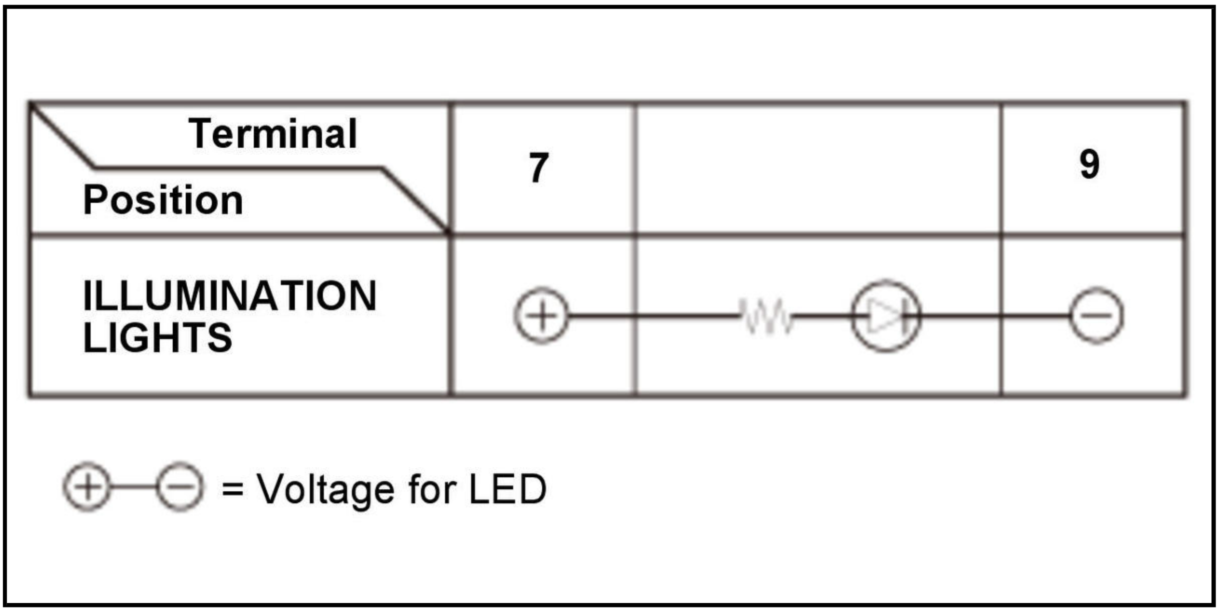
Position	Resistance
OFF (Released)	2.0-2.4 kΩ
DISTANCE (Pressed and held)	401.7-491.0 Ω

LKAS Switch Internal Resistance Check:

1. Measure the resistance between the ACC combination switch 12P connector (male terminals) terminals No. 5 and No. 12 according to the table.

- If there is no resistance in one or more positions, replace the ACC combination switch.

Position	Resistance
OFF (Released)	2.0-2.4 kΩ
LKAS (Pressed and held)	54.3-66.3 Ω



Terminal Position	7		9
ILLUMINATION LIGHTS	⊕		⊖

⊕—⊖ = Voltage for LED

Switch Illumination Circuit Check:

1. Check the LED for illumination by applying power and ground to the terminals according to the table.

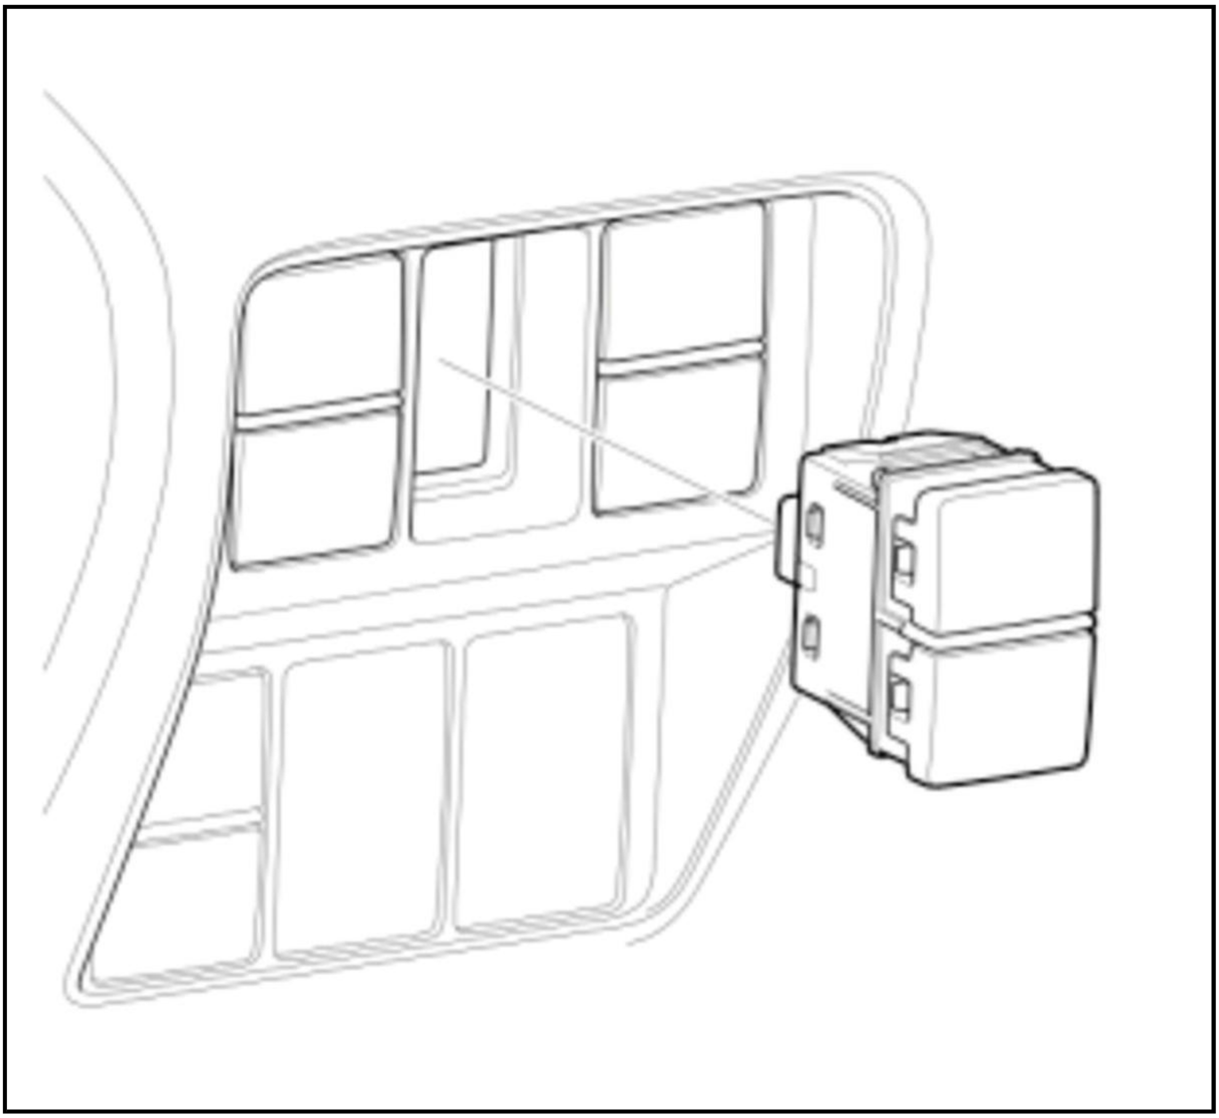
NOTE: Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

If the results are not as specified, replace the ACC combination switch.

CMBS OFF SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1. Driver's Dashboard Lower Cover - Remove
2. CMBS OFF Switch - Remove



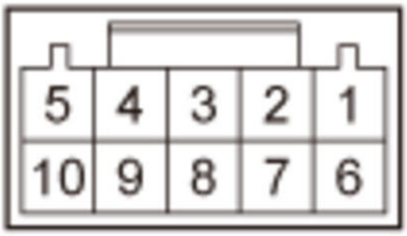
NOTE: Position of the switch is different depending on the model.

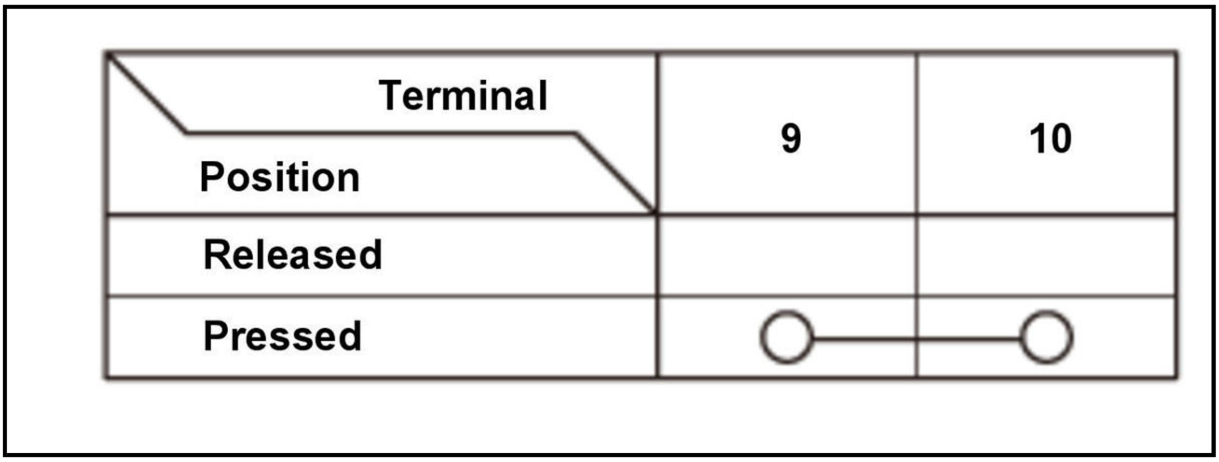
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. CMBS OFF Switch - Test



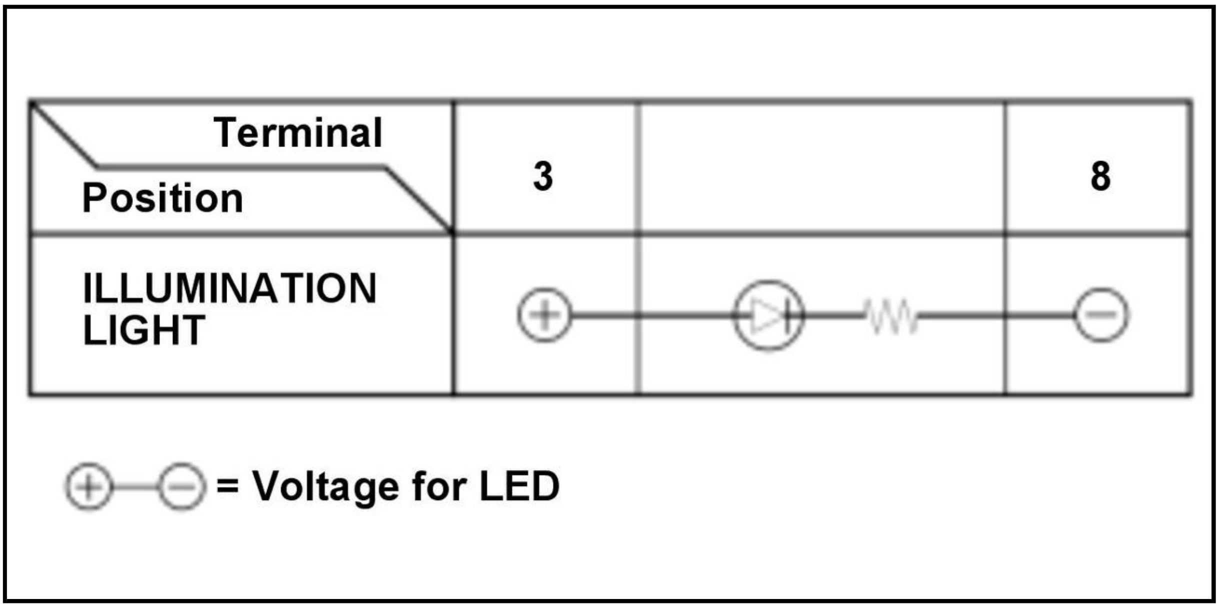


Terminal / Position	9	10
Released		
Pressed	○	○

CMBS OFF Switch Continuity Check:

1. Check for continuity between the CMBS OFF switch/RDM switch 10P connector (male terminals) terminals in each switch position according to the table.

If the switch does not work as described in the table, replace the CMBS OFF switch/RDM switch.



Terminal / Position	3		8
ILLUMINATION LIGHT	⊕		⊖

⊕—⊖ = Voltage for LED

CMBS OFF Switch Illumination Circuit Check:

1. Check the LED for illumination by applying power and ground to the terminals according to the table.

NOTE: Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

If the results are not as specified, replace the CMBS OFF switch/RDM switch.

LKAS SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE:

- SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.
- The LKAS switch is contained in the ACC combination switch.

1. **ACC Combination Switch - Remove**
2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. **LKAS Switch - Test**

REMOVAL AND INSTALLATION

MILLIMETER WAVE RADAR REMOVAL AND INSTALLATION

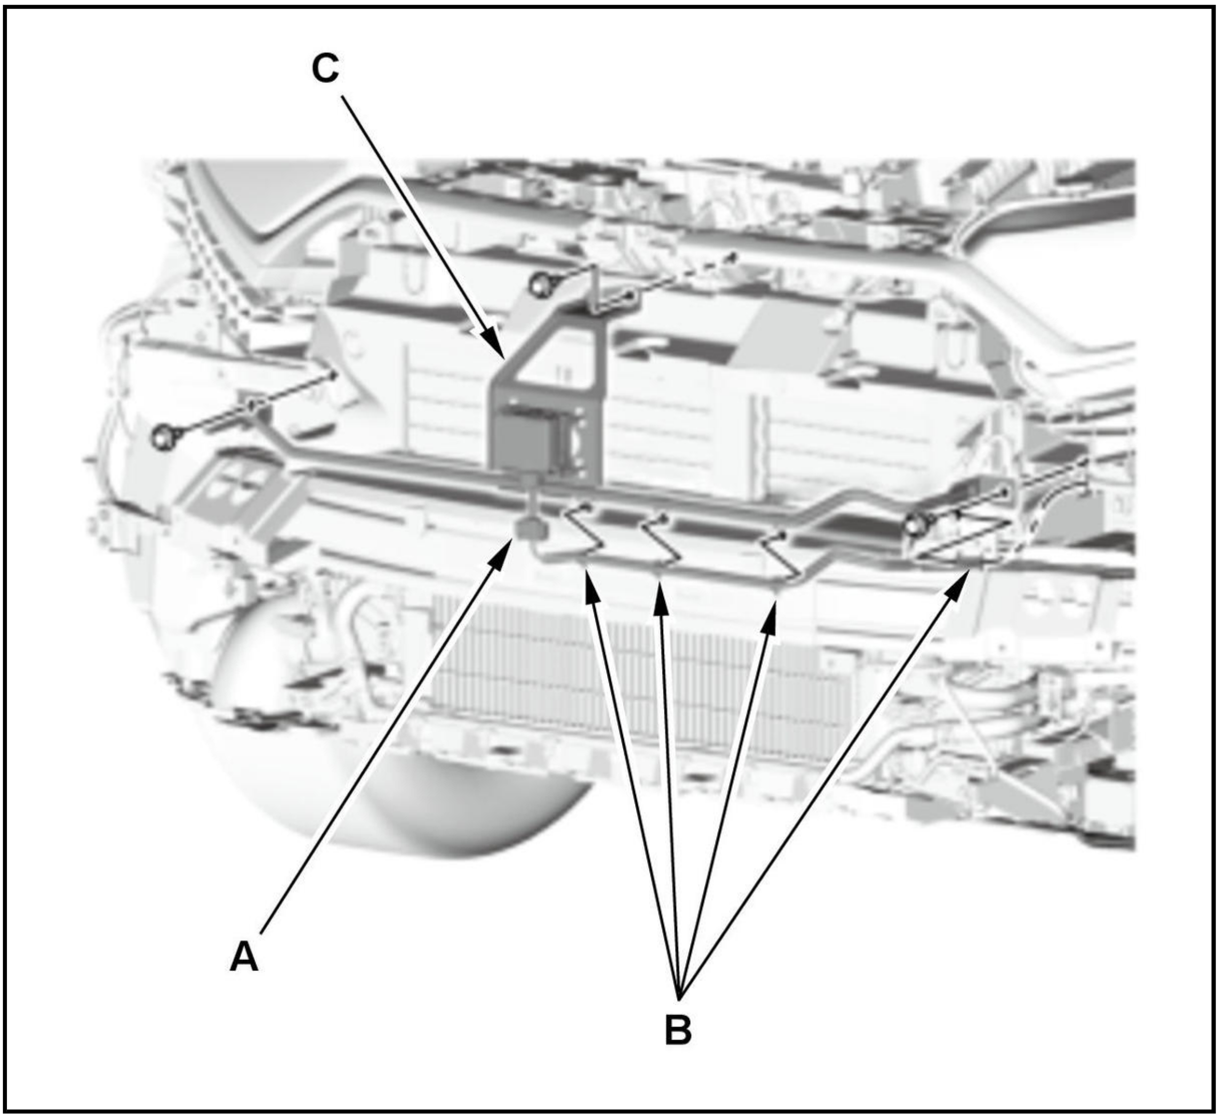
Special Tools Required

Image	Description/Tool Number
	Adaptive Speed Control Alignment Tool SPX 10243
	ADJUSTER, RADAR 3.5 MM 07AAA-TGVA100*

* (SPX 10243/07AAA-TGVA100): Adaptive Speed Control Alignment Tool SPX 10243 or ADJUSTER, RADAR 3.5 MM 07AAA-TGVA100 can be used.

Removal

1. Front Bumper - Remove
2. Millimeter Wave Radar - Remove

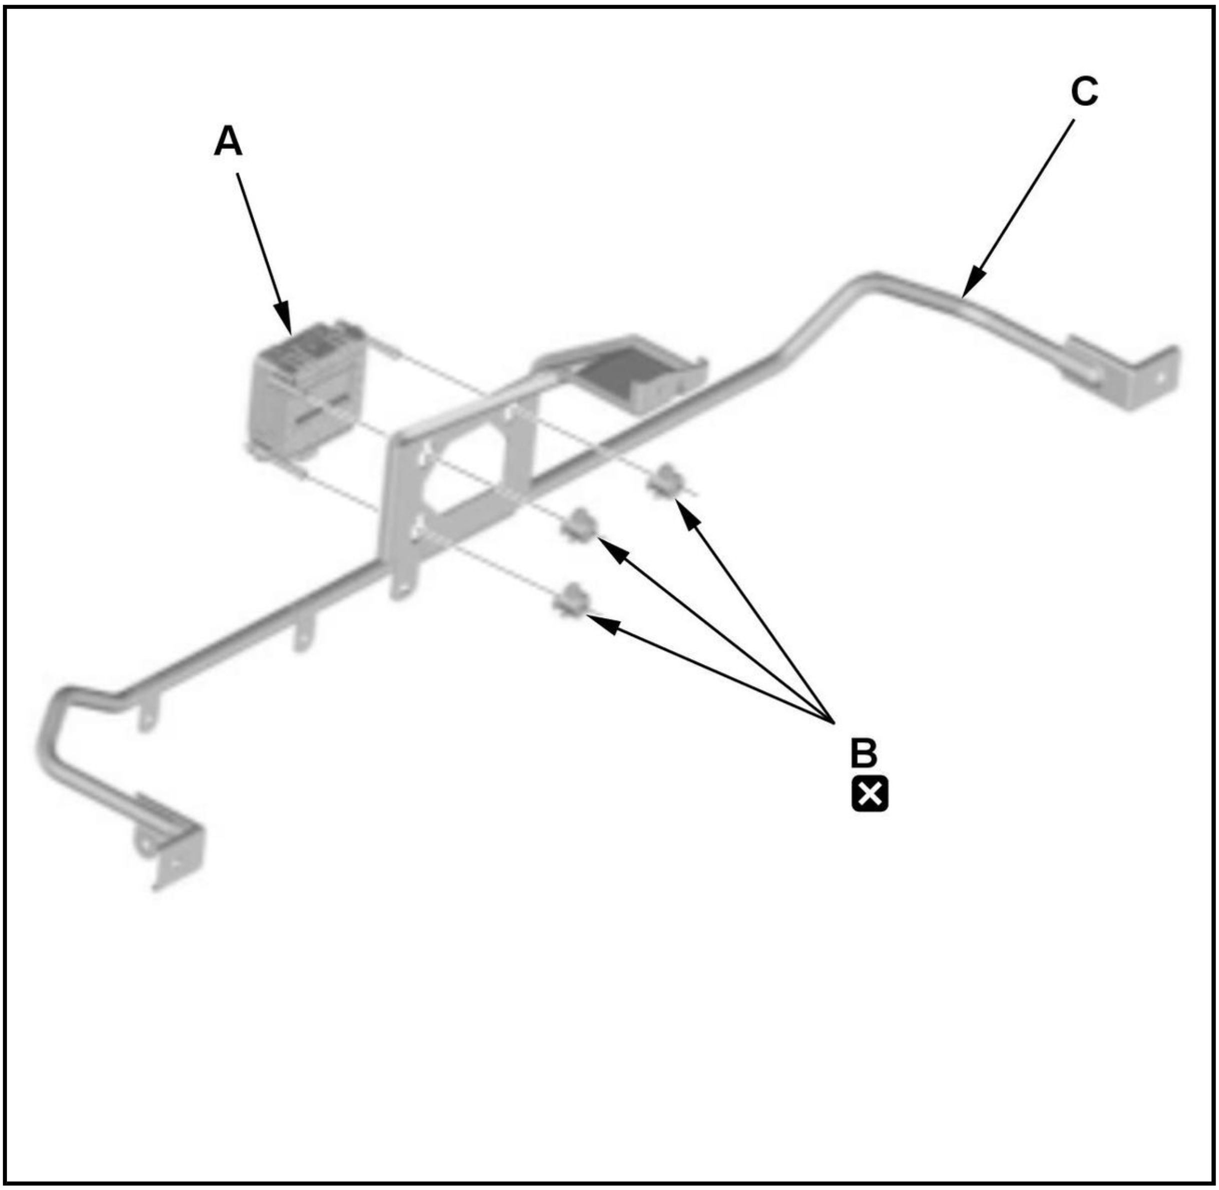


Millimeter Wave Radar Assembly Removal

1. Disconnect the connector (A).

2. Remove the harness clips (B).

3. Remove the millimeter wave radar assembly (C).



Millimeter Wave Radar Subassembly Removal

NOTE: The millimeter wave radar subassembly (A) cannot be disassembled.

1. Rotate the three clips (B) counterclockwise.

2. Remove the millimeter wave radar subassembly from the clips.

3. Remove the clips from the radar bracket (C).

Installation

NOTE: How to read the torque specifications .

1. Millimeter Wave Radar - Install

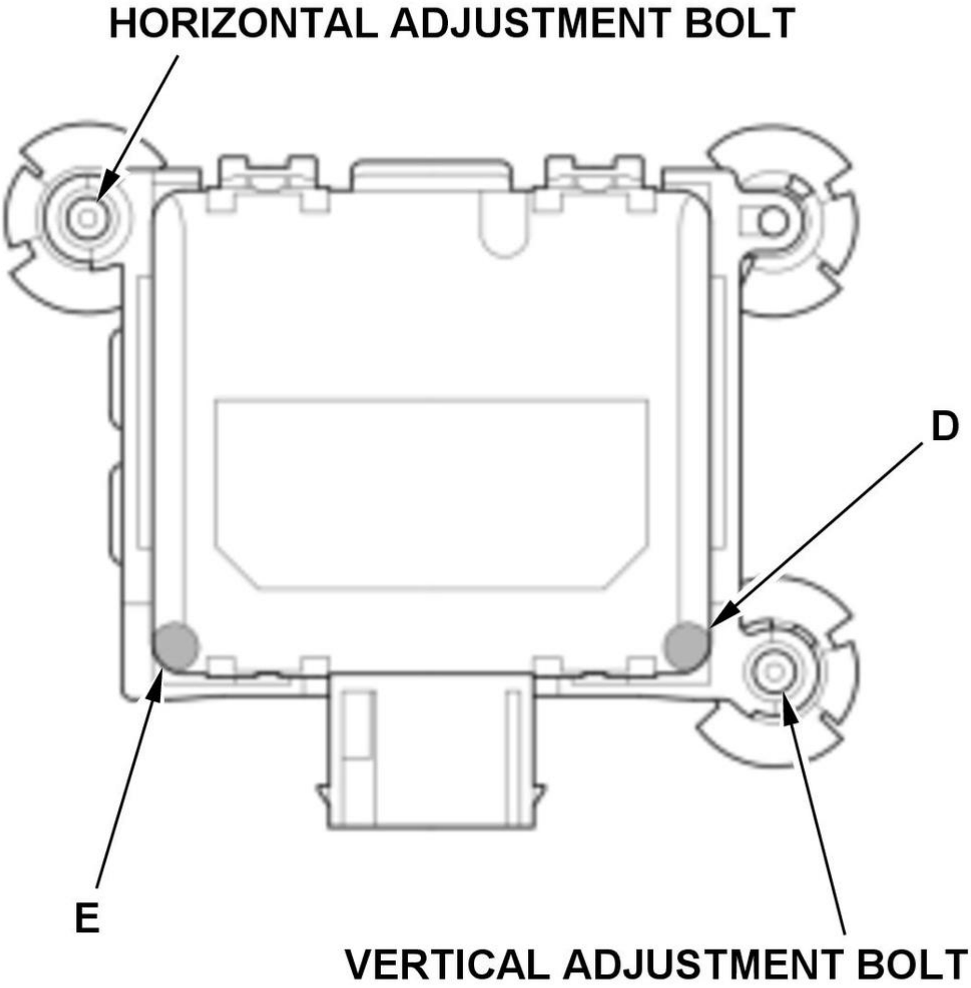
A ☒
44.8 mm
(1.764 in)
D
E
44.8 mm
(1.764 in)



HORIZONTAL ADJUSTMENT BOLT
D
E
VERTICAL ADJUSTMENT BOLT

Millimeter Wave Radar Subassembly Installation

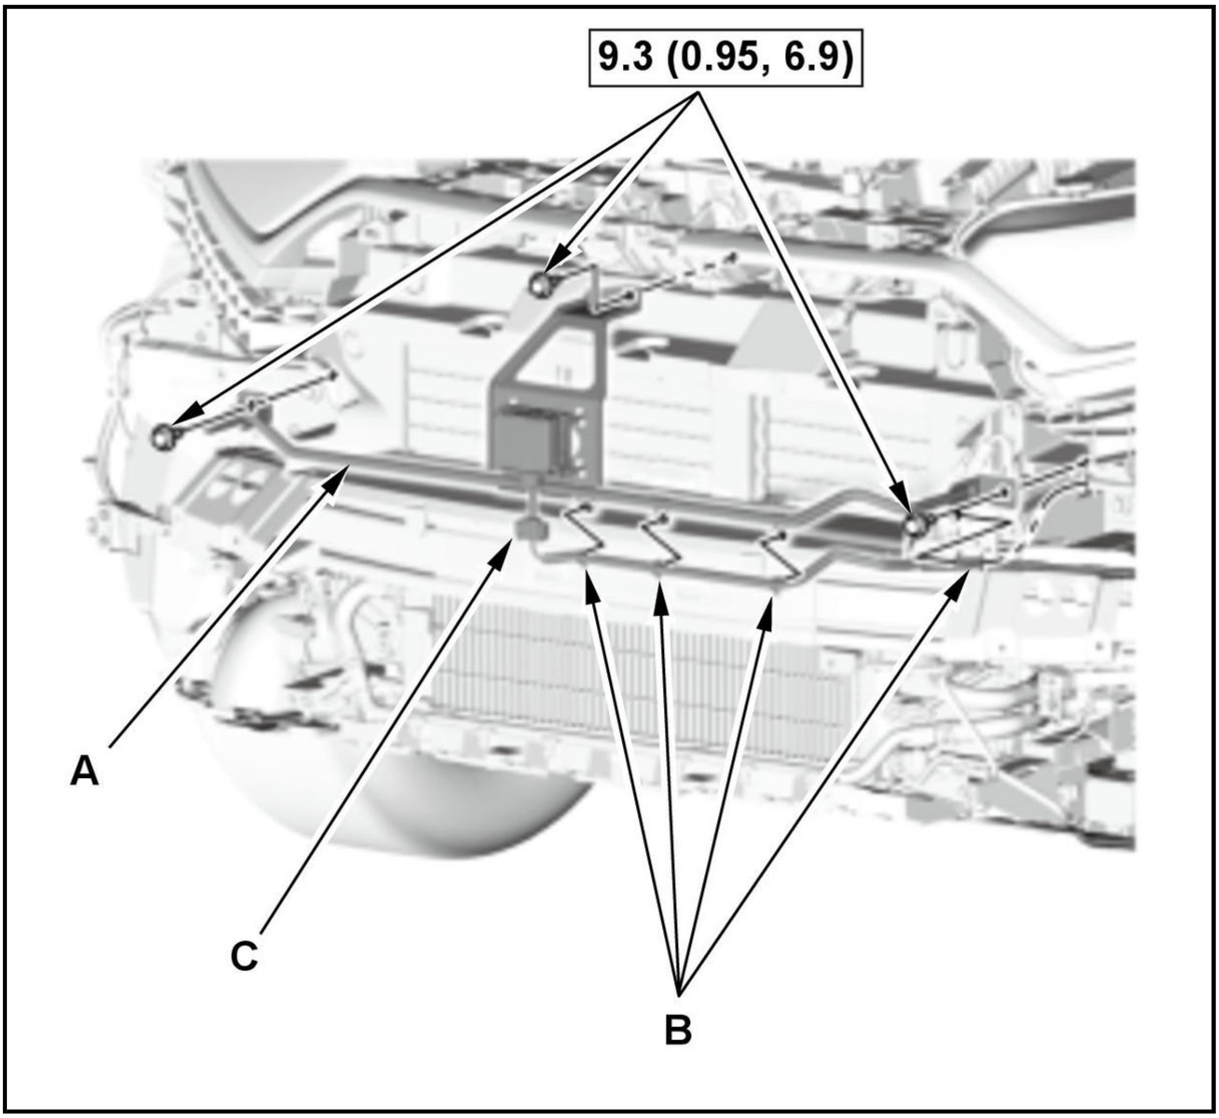
1. Install new clips (A) on the radar bracket (B).

2. Install the millimeter wave radar subassembly (C) on the clips.

3. Rotate the three clips clockwise to secure the millimeter wave radar subassembly to the radar bracket.

4. Measure the distance from D to the radar bracket and E to the radar bracket. Both measured values should be within the range of the standard value.

Standard :	**approximately 44.8 mm (1.764 in)**



Millimeter Wave Radar Assembly Installation

1. Install the millimeter wave radar assembly (A).
2. Install the harness clips (B).
3. Connect the connector (C) while holding the millimeter wave radar assembly.

NOTE: Applying excessive force may deform the radar bracket.

2. **Front Bumper - Install**
3. **Millimeter Wave Radar - Update**
4. **Millimeter Wave Radar - Aim**

MULTIPURPOSE CAMERA UNIT REMOVAL AND INSTALLATION

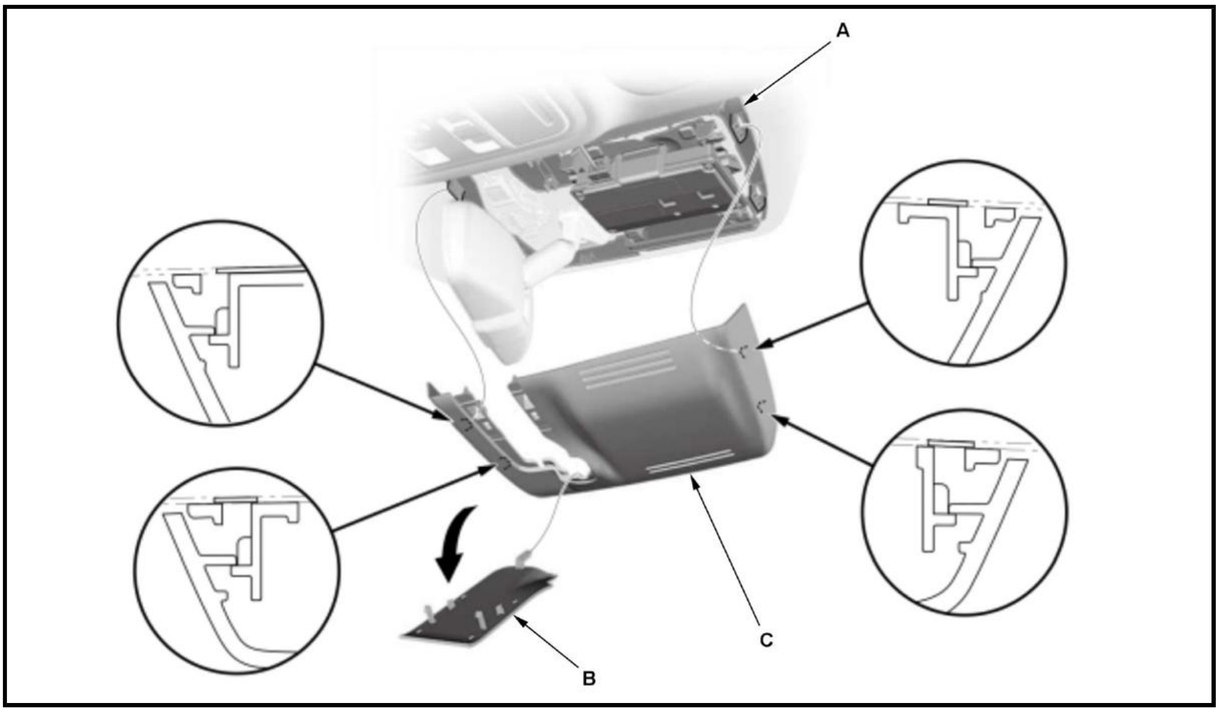
Removal

NOTE: Unless otherwise indicated, illustrations used in the procedure are for a model with automatic wiper.

1. Sensor Cover - Remove

NOTE: When removing the sensor cover, take care not to break the sensor cover base (A).

1. Remove the sensor cover lid (B).



2. Remove the sensor cover (C).

2. Multipurpose Camera Unit - Remove

	**NOTE:** Do not touch the lens part of the multipurpose camera unit. 1. Disconnect the connector (A). 2. Pull back the multipurpose camera unit (B) to remove it while supporting the camera bracket rib (C) and the front part of the multipurpose camera unit by hand as shown in the figure.

3. **Automatic Lighting/Rain Sensor Connector (With Automatic Wiper) - Disconnect**
4. **Rearview Mirror - Remove**
5. Sensor Cover Base - Remove

 	**NOTE:** If necessary, remove the sensor cover base (A). 1. Remove the sensor cover base. 2. Scrape off the adhesive from the windshield.

Installation

1. Sensor Cover Base - Install

 	1. Clean the windshield surface. 2. Peel the adhesive backing on the sensor cover base (A), then apply the primer. **NOTE:** Must use the primer G-200 of 3M or equivalent. Using other commercially available primers may prevent the sensor cover base from attaching properly.

 	3. Align the sensor cover base (A) with the alignment marks (B), then install the sensor cover base.

2. **Rearview Mirror - Install**

3. Automatic Lighting/Rain Sensor Connector (With Automatic Wiper) - Connect

4. Multipurpose Camera Unit - Install

	1. Install the multipurpose camera unit (B). **NOTE:** Visually check that the tabs (C) on both sides of the multipurpose camera unit are inserted into between the camera bracket (D) and spring A. 2. Connect the connector (E).

5. Sensor Cover - Install

	1. Install the sensor cover (A). 2. Install the sensor cover lid (B).

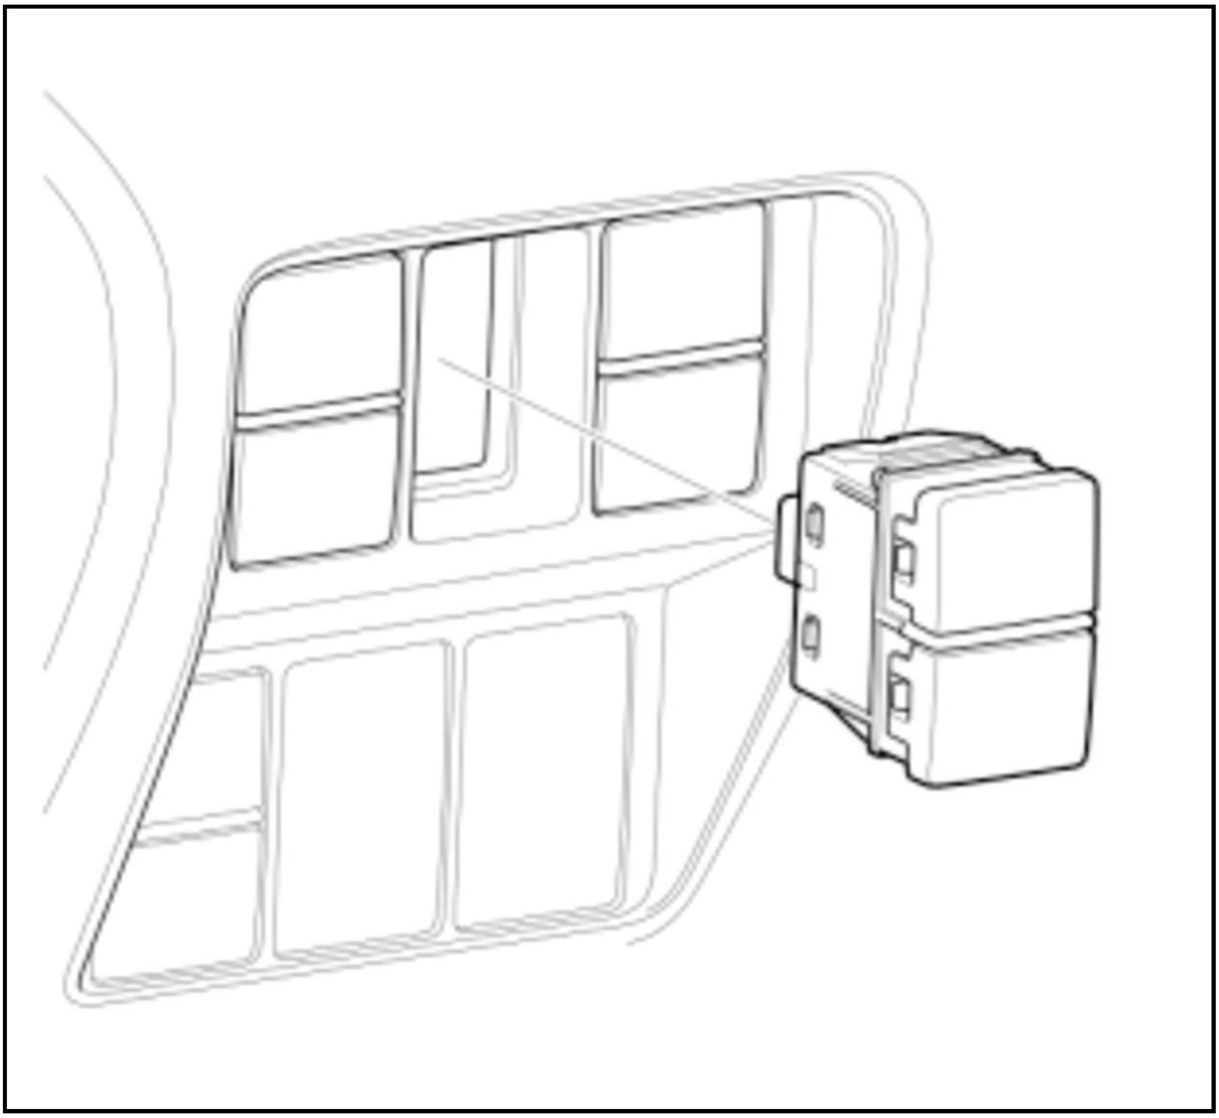
6. Multipurpose Camera Unit - Update
7. Multipurpose Camera Unit - Aim

REMOVAL, INSTALLATION & TEST

RDM SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1. Driver's Dashboard Lower Cover - Remove
2. RDM Switch - Remove



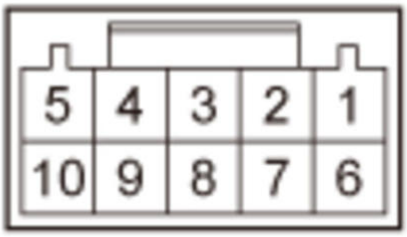
NOTE: Position of the switch is different depending on the model.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. RDM Switch - Test

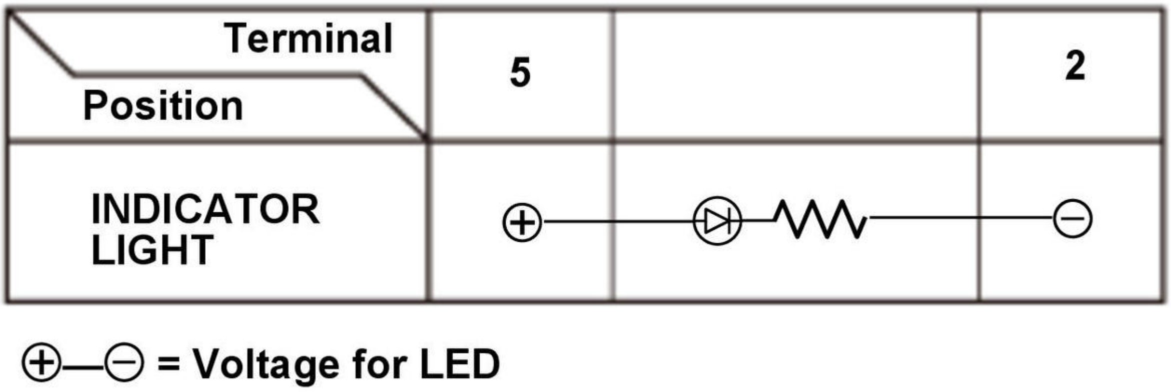


RDM Switch Internal Resistance Check:

1. Measure the resistance between the CMBS OFF/RDM switch 10P connector (male terminals) terminals No. 4 and No. 5 according to the table.

- If there is no resistance in one or more positions, replace the CMBS OFF switch/RDM switch.

Position	Resistance at normal ambient temperature
Released	12.1-14.8 kΩ
Pressed and held	3.1-3.8 kΩ

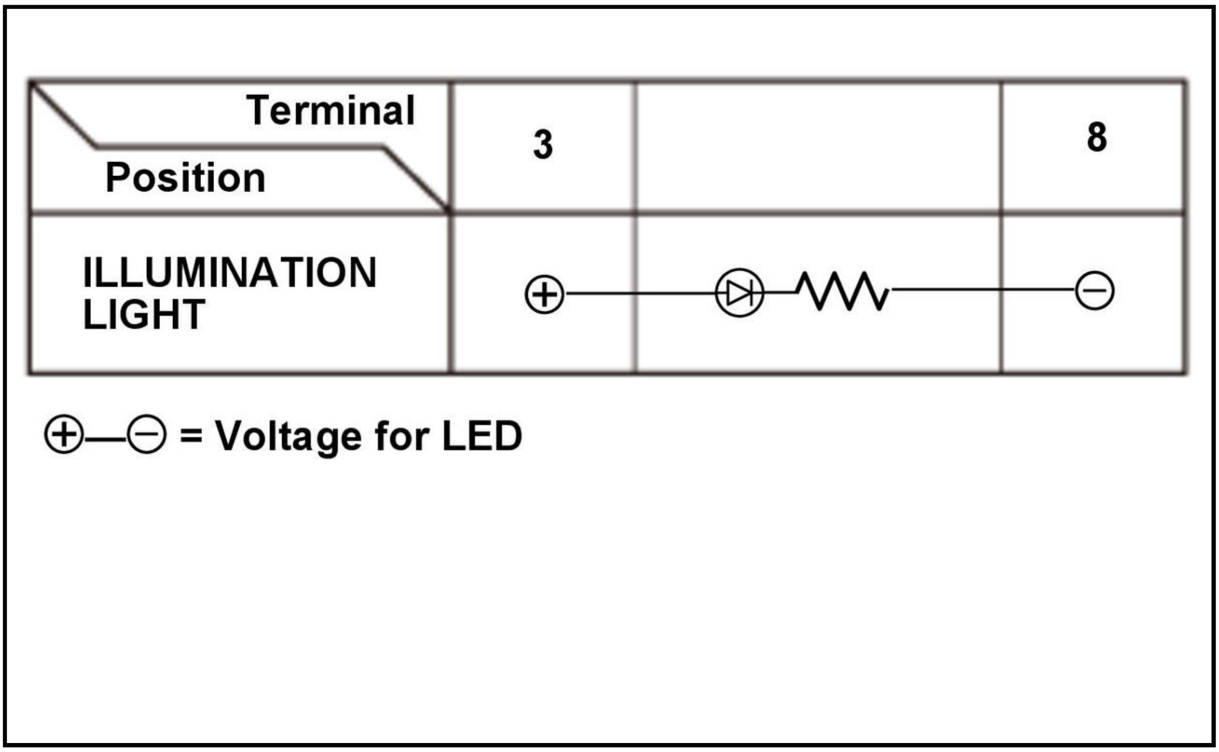


RDM Switch Indicator Drive Circuit Check:

1. Check the LED for illumination by applying power and ground to the terminals according to the table.

NOTE: Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

If the results are not as specified, replace the CMBS OFF switch/RDM switch.



Terminal / Position	3		8
ILLUMINATION LIGHT	⊕		⊖

⊕—⊖ = Voltage for LED

RDM Switch Illumination Circuit Check:

1. Check the LED for illumination by applying power and ground to the terminals according to the table.

NOTE: Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

If the results are not as specified, replace the CMBS OFF switch/RDM switch.

REMOVAL & INSTALLATION TEST

RDM SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

4. Multipurpose Camera Unit - Install

	1. Install the multipurpose camera unit (B). **NOTE:** **Visually check that the tabs (C) on both sides of the multipurpose camera unit are inserted into between the camera bracket (D) and spring A.** 2. Connect the connector (E).

5. Sensor Cover - Install

	1. Install the sensor cover (A). 2. Install the sensor cover lid (B).

6. **Multipurpose Camera Unit - Update**
7. **Multipurpose Camera Unit - Aim**

ADJUSTMENT

BEFORE AIMING SETTING

Special Tools Required

Image	Description/Tool Number
	Alignment Set 07AAJ-STKA210

Adjustment

1. Before Aiming - Set

   NOTE:

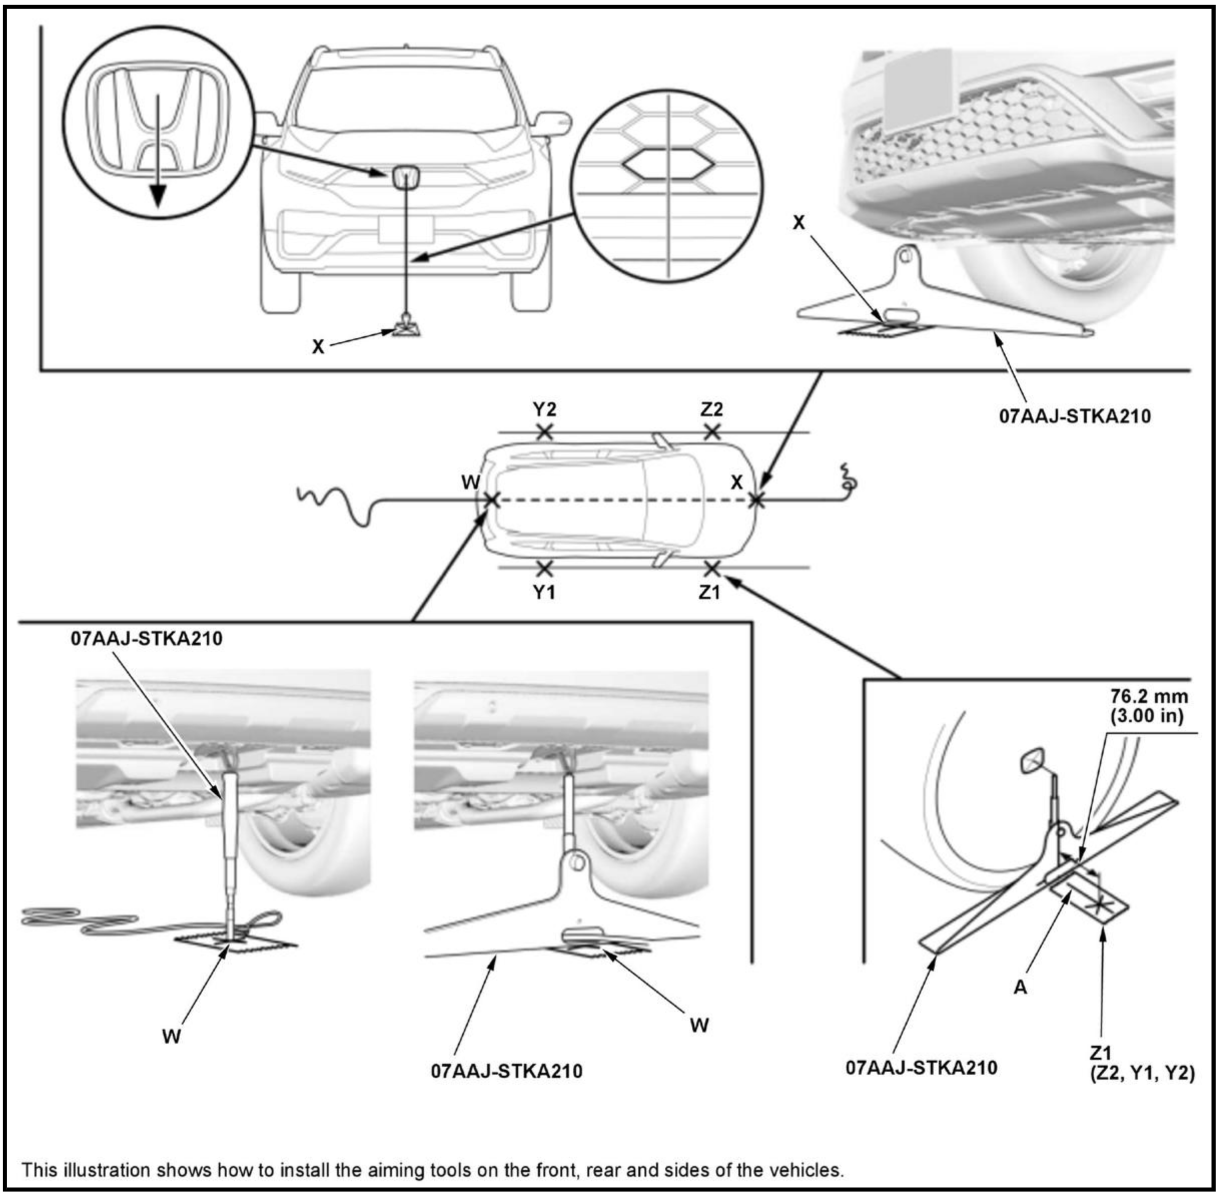
   - Aiming should be done in a well-lighted area.
   - There should be no bright objects at the back of the target (sunlight, windows, illumination, or reflectors) or designs similar to the target pattern.
   - Make sure the suspension has not been modified.
   - Make sure all the tire sizes are correct and that their pressure is correct.
   - Make sure the fuel tank is full.
   - Remove all cargo from the vehicle except the tool kit and the spare tire.
   - Make sure the steering wheel is pointed straight ahead, and do not turn it after setting the vehicle.
   - Shift the transmission to P position/mode, and apply the parking brake.
   - When marking on the floor surface, use suitable tape to mark the exact locations.

   Prepare these items:

   - Tape measure and ruler
   - Felt-tip pen
   - Tape
   - String
   - Plumb bob

   Measure the Lines along the Sides of the Vehicle

   1. Find the center of one wheel (A) using the centering stand and mark it.



X
X
07AAJ-STKA210
Y2
Z2
W
X
Y1
Z1
07AAJ-STKA210

07AAJ-STKA210
W
A
07AAJ-STKA210
Z1
(Z2, Y1, Y2)

This illustration shows how to install the aiming tools on the front, rear and sides of the vehicles.

2. Measure 76.2 mm (3.00 in) from the edge of the centering stand and mark a new point Z1 that intersects the wheel's center-line.

NOTE: Repeat this step for each wheel (Z2, Y1, and Y2).

Set the Cord along the Center-Line of the Vehicle

NOTE:

- When installing a cord along the center-line of the vehicle, install the cord using these items as reference points.
- The reference items may vary by vehicle.
-
    - -

      Front and rear jacking brackets
    - -

      Rear towing hook
    - -

      Front emblem

- -

  Scribe lines of the front subframe part
- When installing an aiming target at the rear of the vehicle, use the centering stand in the rear.
- When installing an aiming target at the front of the vehicle, use the centering stand in the front.

3. Hang the plumb bob from the center of the front emblem, and mark a new point X on the floor where the tip of the plumb bob touches the floor.

4. Place the centering stand under the rear jacking bracket, then mark a new point W at the center-line of the centering stand.

For targets at the front of the vehicle

5. Position the gas strut holder of the alignment set between the floor and the rear jack-up bracket at mark W.

6. Place the center-line of the centering stand at mark X and run the cord through it.

7. Attach the cord to the collar of the alignment set, then place the alignment set about 2.0 m (6.6 ft) in front of the vehicle.

NOTE: Make sure the cord is tight and not lying on the floor surface, then align the cord in the center of the alignment set.

For targets at the rear of the vehicle

8. Place one end of the cord on mark X and firmly tape it to the floor.

NOTE: Lightly pull on the cord to make sure that it is secured and apply additional tape as necessary.

9. Place the center-line of the centering stand at mark W and run the cord through it.

10. Attach the cord to the collar of the alignment set, then place the alignment set about 2.0 m (6.6 ft) behind the vehicle.

NOTE: Make sure the cord is tight and not lying on the floor surface, then align the cord in the center of the alignment set.

MILLIMETER WAVE RADAR AIMING

Special Tools Required

Image	Description/Tool Number
	Stand Set 07AAJ-STKA220*

Image	Description/Tool Number
	Stand 07AAJ-TK8A100*
	Reflector Set 07AAJ-STKA200*
	Alignment Set 07AAJ-STKA210
	Adaptive Speed Control Alignment Tool SPX 10243*

Image	Description/Tool Number
	ADJUSTER, RADAR 3.5MM 07AAA-TGVA100*

* (07AAJ-STKA220/07AAJ-TK8A100/07AAJ-STKA200): Stand 07AAJ-TK8A100 with Reflector Set 07AAJ-STKA200 or Stand Set 07AAJ-STKA220 can be used for aiming.* (SPX 10243/07AAA-TGVA100): Adaptive Speed Control Alignment Tool SPX 10243 or ADJUSTER, RADAR 3.5MM 07AAA-TGVA100 can be used for aiming.

Adjustment

NOTE:

- The millimeter wave radar must be re-aimed if the millimeter wave radar is removed or replaced. The ACC indicator comes on if the aiming process is not completed correctly.
-
    - -

      The millimeter wave radar has a self-diagnosis function and if the mounting angle of the millimeter wave radar is outside of the horizontal auto-aiming range, it stores the failure information.
- If DTCs are indicated, do the indicated DTCs first. If the DTCs are not repaired, you cannot complete the millimeter wave radar aiming procedure. However, if you have the following DTC, proceed with the aiming procedure.
-
    - -

      Millimeter Wave Radar Aiming Incomplete: **DTC P2583-54**
- If the vehicle you are aiming was involved in a collision or if you suspect the alignment is out of specifications, you must perform a wheel alignment prior to aiming the millimeter wave radar.
- Conditions for the aiming environment:
-
    - -

      Aiming should be on level ground in a wide open space to avoid errors caused by reflecting objects.
    - -

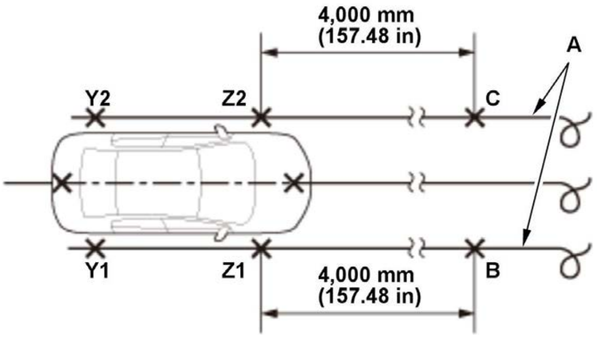
      Amount of space require in front of the vehicle: 10 m (33 ft) measured from the front bumper 5 m (16 ft) in width 3 m (10 ft) in height, measured from the floor.
- The vehicle must be parked on a horizontal floor in order to adjust the vertical radar aiming correctly. Check the levelness of the floor surface, but if there is a continuous slope, then adjust the angle of the millimeter wave radar so it is parallel to the floor surface. Lay a ruler or other flat straight object on the floor surface and put the level on top to confirm the levelness of the floor surface.

- When marking on the floor surface, use suitable tape to mark the exact locations.

Prepare these items:

- HDS
- Tape measure and ruler
- Felt-tip pen
- Tape
- String
- Plumb bob

1. Before Aiming - Set



NOTE: Make sure the steering wheel is pointed straight ahead, and do not turn it after setting up the vehicle.

Marking of the Target Position

1. **Make points (Z1, Y1, Z2, Y2) and set the cord along the center-Line of the vehicle.**

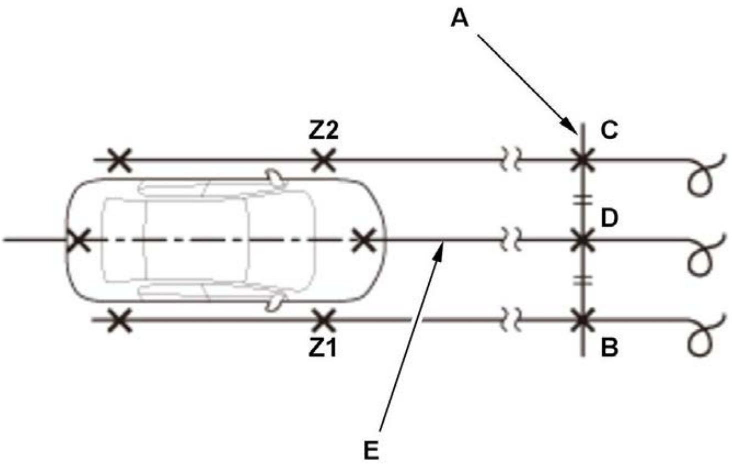
2. Place a string (A) between point Z1 and point Y1, and tape both ends of the string on the floor surface.

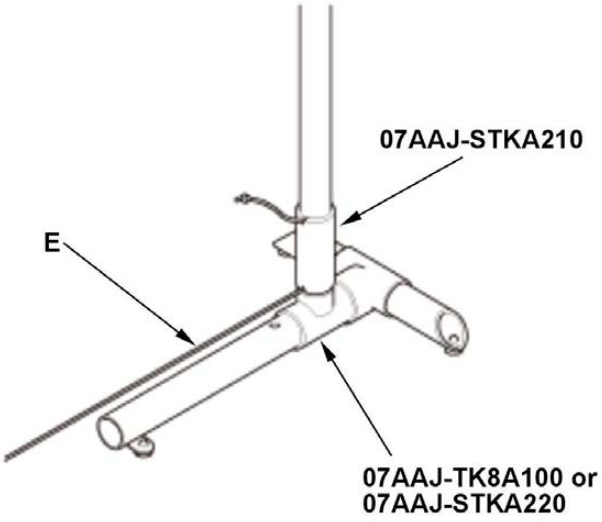
NOTE: Repeat this step for the opposite side for points Z2 and Y2.

3. Measure and make a new point B on the floor surface in front of the vehicle, 4, 000 mm (157.48 in) from point Z1.

4. Pull one end of the string to point B and tape it to the floor surface.

NOTE: Repeat these steps for the opposite side, and mark a new point C.



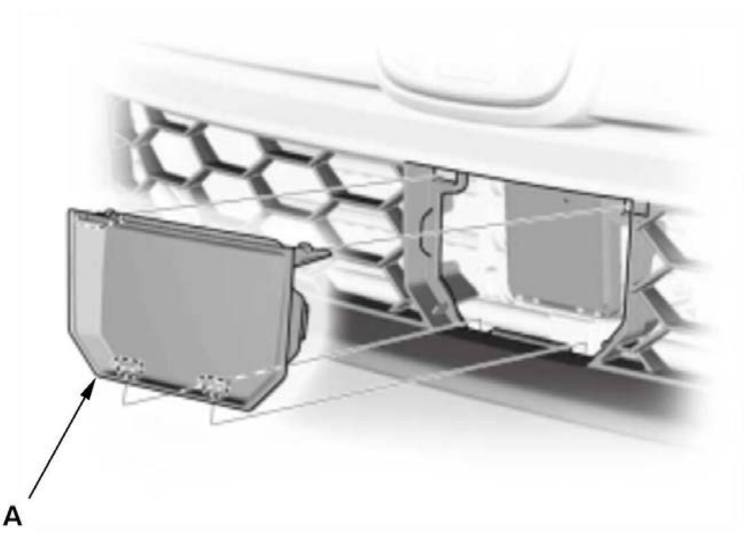


07AAJ-STKA210
E
07AAJ-TK8A100 or
07AAJ-STKA220

5. Set the string (A) between point B and point C, and tape both ends of the string on the floor surface.

6. Route the cord (E) through the collar and place it on the stand set.

7. Use the stand set to stretch the cord of the center-line, and mark a new point D where the string crosses with the cord.



8. Remove the radar cover (A).

NOTE:

- **Clean the surface of the millimeter wave radar.**
- **If the radar cover is damaged or cracked, replace the cover and inspect the millimeter wave radar assembly and subassembly for any damages before proceeding.**

 07AAJ-STKA200 or 07AAJ-STKA220 Y	9. Align the lower edge of the millimeter wave radar with the shaft end. 10. Draw a line (Y) on the pole of the stand set as shown.

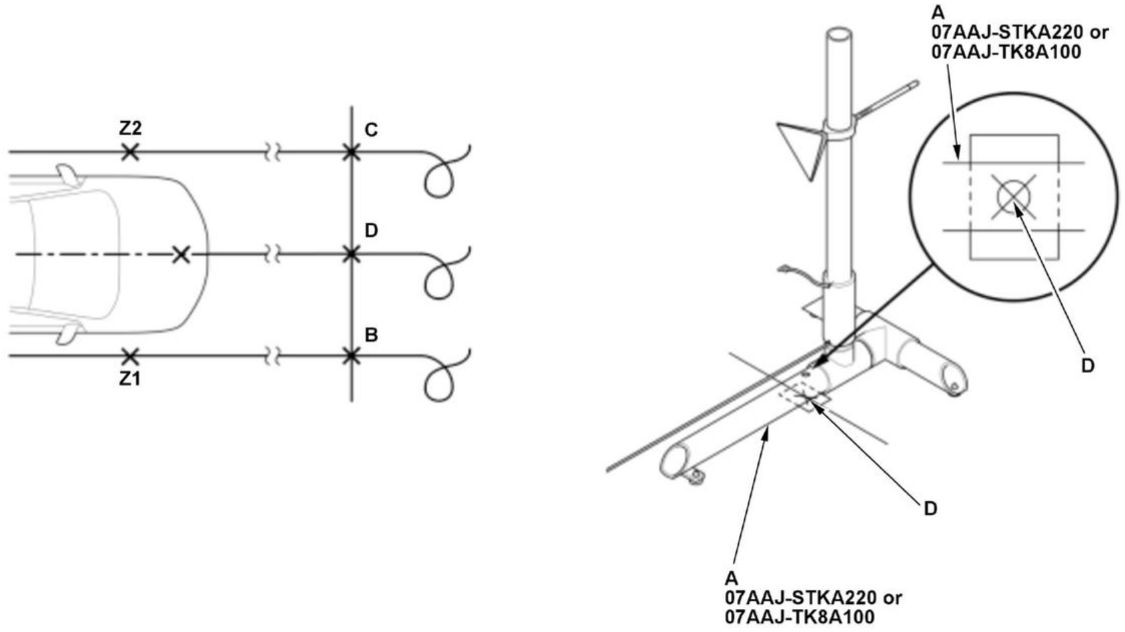
 Y1 B 07AAJ-STKA200 or 07AAJ-STKA220 22 mm (0.87 in) Y A 07AAJ-STKA220 or 07AAJ-TK8A100	11. Draw a line (Y1) on the pole (A) of the stand set as shown. 12. Slide the corner reflector (B) upward to position Y1.

2. Millimeter Wave Radar - Aim

 MID MID NO TARGET	1. **Connect the HDS** . **NOTE:** Keep the aiming target away from the vehicle until you are instructed in a later step. 2. Check for DTCs with the HDS. **NOTE:** Troubleshoot any DTCs first before proceeding. If DTC P2583-54 is indicated, proceed with the aiming procedure. 3. In the DRIVING SUPPORT menu, select INTEGRATED DRIVER SUPPORT SYSTEM, ADJUSTMENT, then Radar Aiming and follow the screen prompts.

	4. Press ENTER on the HDS to enter the aiming mode. **NOTE:** ACC, LKAS, CMBS and RDM indicators (amber) blink when aiming mode is activated. 5. The MID will display NO TARGET. 6. Make sure the MID indicates NO TARGET on the display. **NOTE:** If NO TARGET is not indicated, the stand set is placed in front of the vehicle or there is an unwanted radar reflection in front of the vehicle in the range of the radar. Make sure the stand set is set aside away from the range of the radar until you are instructed to place it in front of the vehicle. If you are still getting an unwanted radar reflection, stack tires about 1.5 m (4.9 ft) in height in front of either the immovable object, such as a pole, or in front of any object causing the unwanted reflections. The tires will block the radar reflections. Make sure NO TARGET appears on the MID. If it still does not appear, move the vehicle to a different location until NO TARGET appears on the MID.

7. Place the stand set (A) on the mark (D).



8. Press ENTER on the HDS to calculate the alignment angles.

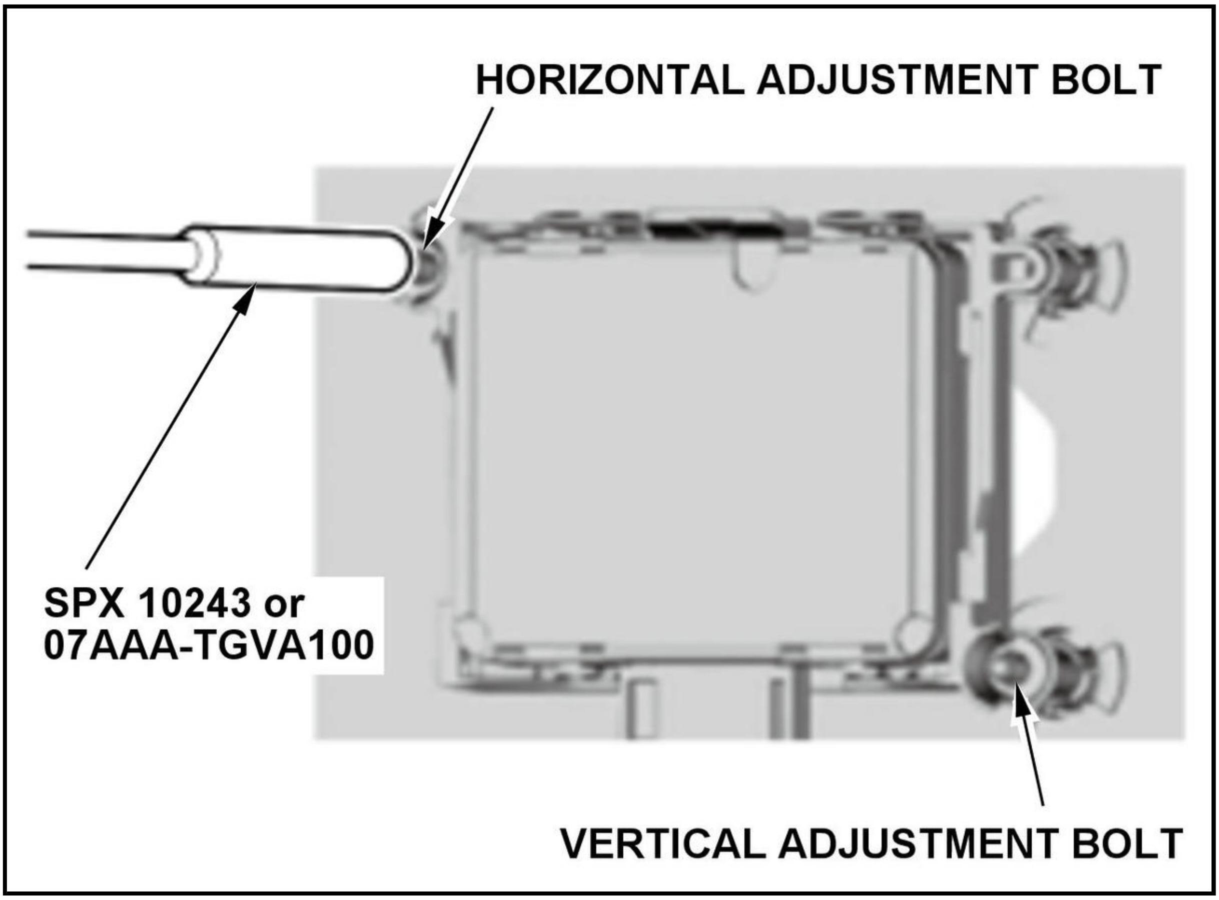
9. Check the vertical and horizontal alignment angles on the HDS display. If the angles displayed on the HDS are out of the specified angle range, turn the adjustment bolt using the 3.5 mm hex socket driver (from the Adaptive Speed Control Alignment Tool SPX 10243 or 07AAA-TGVA100)) as necessary (counterclockwise or clockwise) to bring the displayed angle to the specified angle range. Watch the HDS display while performing the adjustment as the values will change.

Specified Angle:

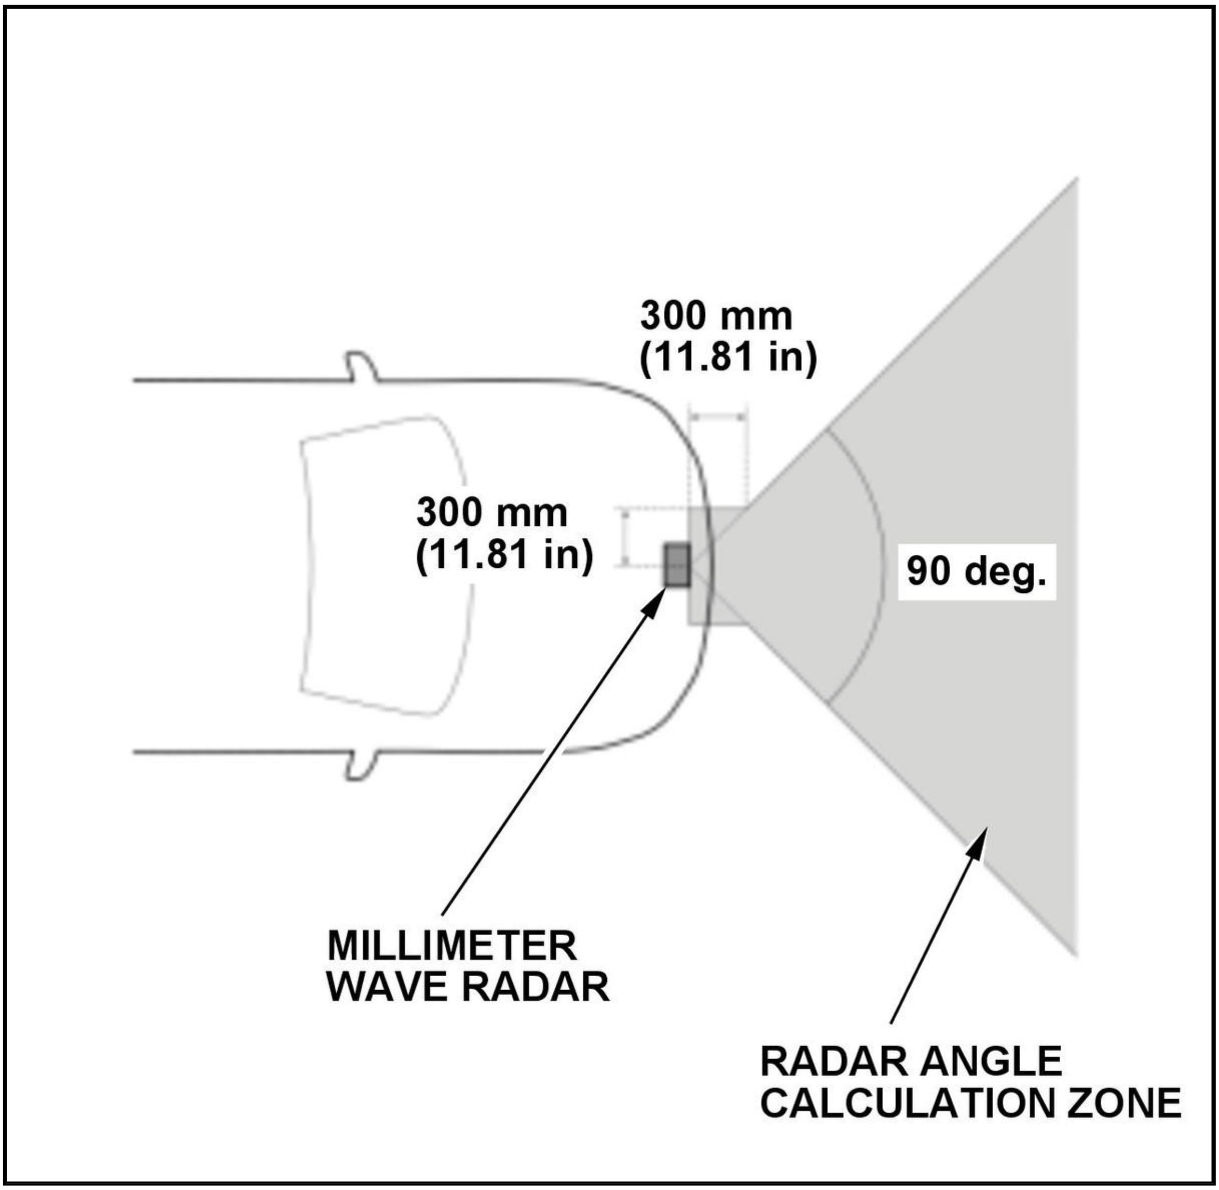
Millimeter wave angle	Specified angle range
Horizontal	0 ± 0.1 deg.
Vertical	0 ± 0.1 deg.

Adjustment Method:

Angle shown on the HDS display	Rotate the screwdriver as follows
More than +0.1 deg.	Counterclockwise
Less than -0.1 deg.	Clockwise



HORIZONTAL ADJUSTMENT BOLT
SPX 10243 or
07AAA-TGVA100
VERTICAL ADJUSTMENT BOLT



NOTE:

- The values on the HDS display will fluctuate as the adjustment is being performed. Wait until the values stabilize to confirm the adjustment.
- When checking the angle and recording the calculated angle on the HDS screen, do not enter or obstruct the radar wave zone.
- A value of 12.8 degrees on the HDS display indicates that the millimeter wave radar is being obstructed and cannot receive the radar wave.
- If the value of 12.8 degrees remains on the HDS screen for 15 seconds continuously, the aiming will stop.
- If the specified angle cannot be obtained with the adjustment bolts, confirm the millimeter wave radar mounting position.

NOTE: If the failure code and the message in the following list are displayed, solve the problem, and then perform the millimeter wave radar aiming again.

Failure codes and messages:

Failure code (on the MID)	Failure message (on the HDS)	How to solve
120	Multiple Aiming Target Detected	Remove all reflective objects except the correct special tools.

Failure code (on the MID)	Failure message (on the HDS)	How to solve
122	The Distance between Radar and Aiming Target is Out of Specification.	Set the specified distance to the aiming target.
124	Detected Some Obstacles	Remove all obstacles.
125	There is no Aiming Target	Set the aiming target at the correct position.
129	A Vehicle Speed is not 0 km/h.	Stop the vehicle completely.

Failure code (on the MID)	Failure message (on the HDS)	How to solve
132	Internal Software Error	Update the millimeter wave radar.
134	High Temperature Error	Cool down the millimeter wave radar to the proper operating temperature.
135	Internal Hardware Error	Replace the millimeter wave radar.

10. When the angle is at the specified value, press ENTER to record the angle.

NOTE: The aiming information obtained is stored in the millimeter wave radar.

11. Confirm THE RADAR AIMING HAS BEEN COMPLETED on the HDS.

12. Press ENTER on the HDS, and turn the vehicle to the OFF (LOCK) mode.

13. Reinstall the radar cover.

NOTE: If the radar cover is damaged or cracked, replace it.

MULTIPURPOSE CAMERA AIMING

Special Tools Required

Image	Description/Tool Number
	Alignment Set 07AAJ-STKA210

Image	Description/Tool Number
	Target Set 07AAK-5K0A100
	Stand Pole (Aluminum) 07AAK-5K0A120*
	Target Adjuster 07AAK-5K0A110
	Stand 07AAJ-TK8A100*

Image	Description/Tool Number
	Stand Set 07AAJ-STKA220*

*: Switch out the included PVC pole for the 07AAK-5K0A120 Aluminum Stand Pole, and use Stand 07AAJ-TK8A100 or Stand Set 07AAJ-STKA220 for aiming.

Adjustment

NOTE:

- The multipurpose camera unit must be re-aimed if the multipurpose camera unit or windshield is removed or replaced. The LKAS and ACC indicators (amber) will blink if the aiming process is not completed correctly. If DTCs are indicated, do the indicated DTC troubleshooting first. If the DTCs are not repaired, you cannot complete the multipurpose camera aiming procedure. However, if you have the following DTC, proceed with the aiming procedure:
-
    - -

      Static Camera Aiming Incomplete: **DTC B2A60-54**
- If the vehicle you are aiming was involved in a collision or if you suspect the alignment is out of specifications, you must perform a wheel alignment prior to aiming the multipurpose camera unit.
- Conditions for the aiming environment:
-
    - -

      Aiming should be done on a flat space.
    - -

      Amount of space required in front of the vehicle: 7 m (23 ft) measured from the front bumper 4 m (13 ft) in width 1.5 m (4.9 ft) in height, measured from the floor
    - -

      Make sure the vehicle is not facing any direct light sources as this will affect the static camera aiming.
    - -

      Make sure there are no black and white checkered or dark and light alternating patterns directly behind the targets as this will affect the static camera aiming.
- Set up the vehicle:
-

  - -

    Do not put any objects on the dashboard.

  - -

    Remove all cargo from the vehicle except the tool kit and the spare tire.

  - -

    Make sure that there are no stains, dust, or dirt on the lens of the multipurpose camera unit and the windshield area where the camera is mounted.

  - -

    Make sure that all doors are closed.

  - -

    Make sure the suspension has not been modified.

  - -

    Make sure all the tire sizes are correct and that their pressure is correct.

  - -

    Make sure the fuel tank is full.

  - -

    Make sure the steering wheel is pointed straight ahead, and do not turn it after setting the vehicle.

  - -

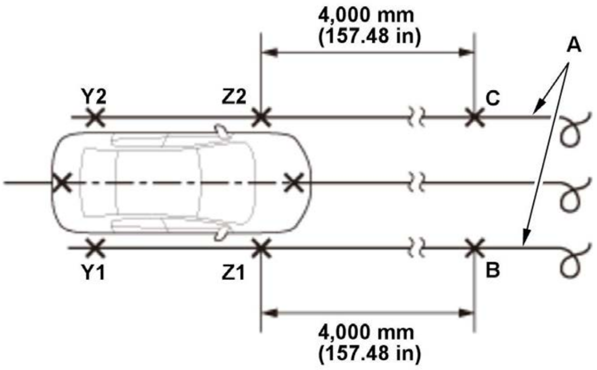
    Shift the transmission to P position/mode, and apply the parking brake.

- When marking on the floor surface, use suitable tape to mark the exact locations.

Prepare these items:

- HDS
- Tape measure and ruler
- Felt-tip pen
- Tape
- String
- Plumb bob

1. Before Aiming - Set



4,000 mm
(157.48 in)
A
Y2
Z2
C
Y1
Z1
B
4,000 mm
(157.48 in)

Marking of the Target Position

1. **Make points (Z1, Y1, Z2, Y2) and set the cord along the center-Line of the vehicle.**

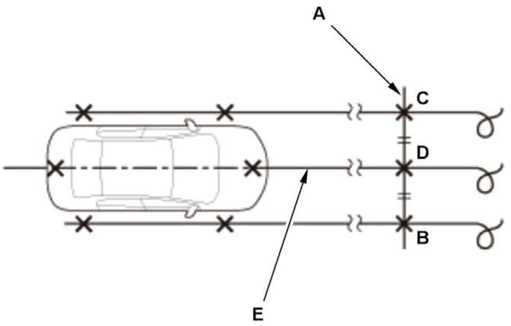
2. Place a string (A) between point Z1 and point Y1, and tape both ends of the string on the floor surface.

NOTE: Repeat this step for the opposite side for points Z2 and Y2.

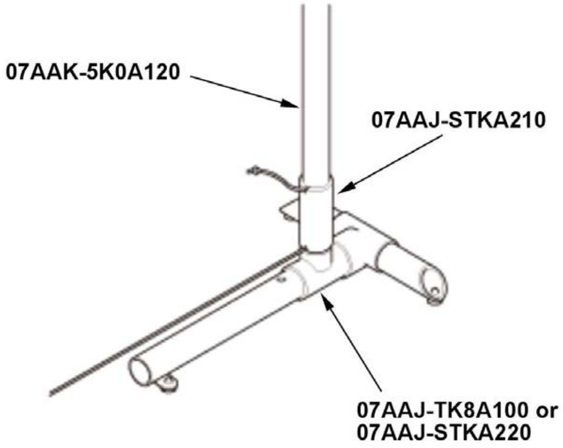
3. Measure and make a new point B on the floor surface in front of the vehicle, 4, 000 mm (157.48 in) from point Z1.

4. Pull one end of the string to point B and tape it to the floor surface.

NOTE: Repeat these steps for the opposite side, and mark a new point C.



5. Set the string (A) between point B and point C, and tape both ends of the string on the floor surface. Mark a new point D where the string crosses with the center-line (E).



07AAK-5K0A120
07AAJ-STKA210
07AAJ-TK8A100 or
07AAJ-STKA220

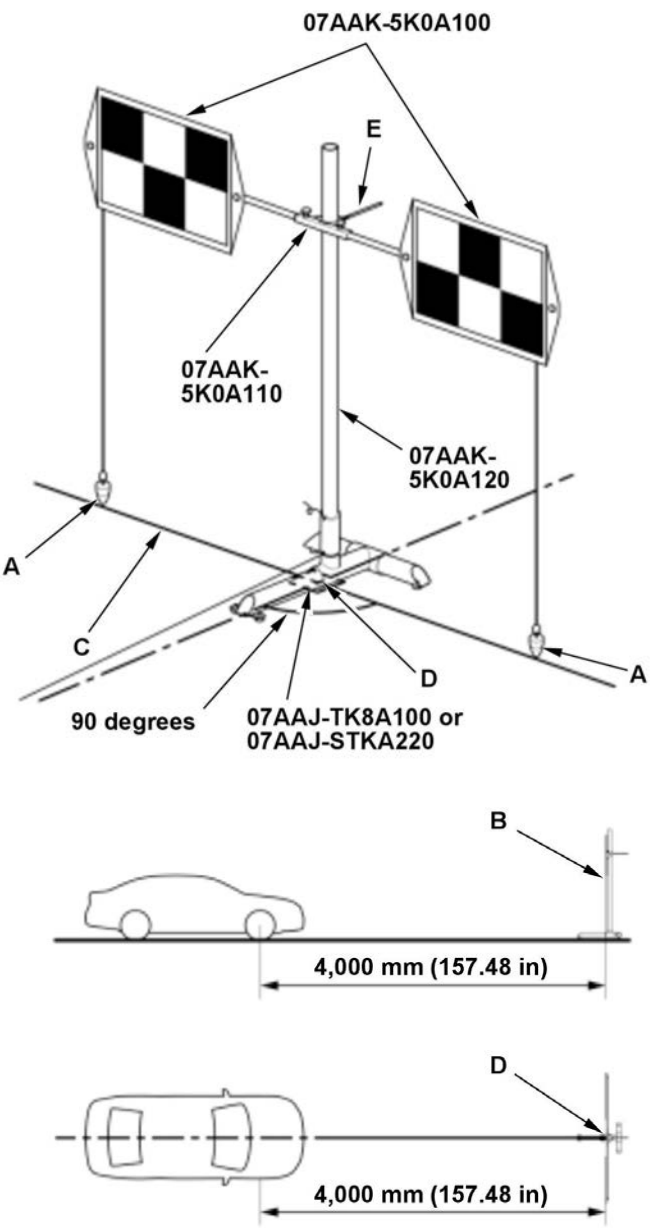
Special Tools Set-Up, Target Pattern Surface Height Adjustment, and Positioning:

NOTE: Switch out the included PVC stand pole for 07AAK-5K0A120 Aluminum Stand Pole.

6. Use the stand pole (aluminum).

NOTE: The PVC stand pole is too low to align the camera.

7. Route the cord through the collar and place it on the aiming stand.



07AAK-5K0A100
E
07AAK-5K0A110
07AAK-5K0A120

90 degrees
07AAJ-TK8A100 or 07AAJ-STKA220
B
4,000 mm (157.48 in)
D
4,000 mm (157.48 in)

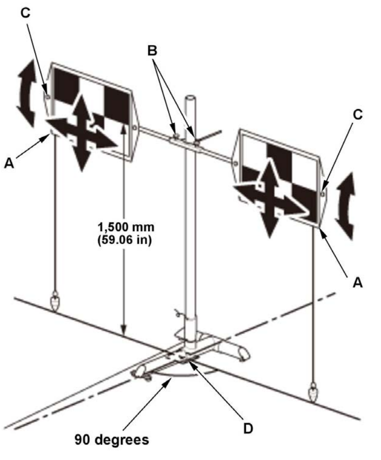
8. Assemble the aiming target.

NOTE: For correct orientation of the aiming target panels, make sure the target patterns match the illustration.

9. Dangle two plumb bobs (A) from the lower corners of the target to the floor and secure the plumb bob string to the target with tape.

10. Position the aiming target assembly (B) at point D.

11. Make sure that both plumb bobs touch directly on the line (C). If they do not, loosen the pointer (E) and rotate the target assembly as necessary.



C
B
C
A
1,500 mm (59.06 in)
A
90 degrees
D

12. Adjust the aiming target panel (A).

-1. Put the level on the target panel surface. Loosen the adjustable screws (B), and adjust the vertical angle of the target panel surface so that the air bubble in the level is centered. Tighten the adjustable screw once the adjustment is completed.

-2. Put the level on the top edge of the target panel. Loosen the adjustable screws (C), and adjust the horizontal angle of the target panel surface so that the air bubble in the level is centered. Tighten the adjustable screw once the adjustment is completed.

-3. Adjust the height of the target panel and make sure to have 1, 500 mm (59.06 in) between the floor surface and the horizontal center line of the panel.

NOTE: The horizontal center line is a horizontal division line on the panel where the black and white boxes meet.

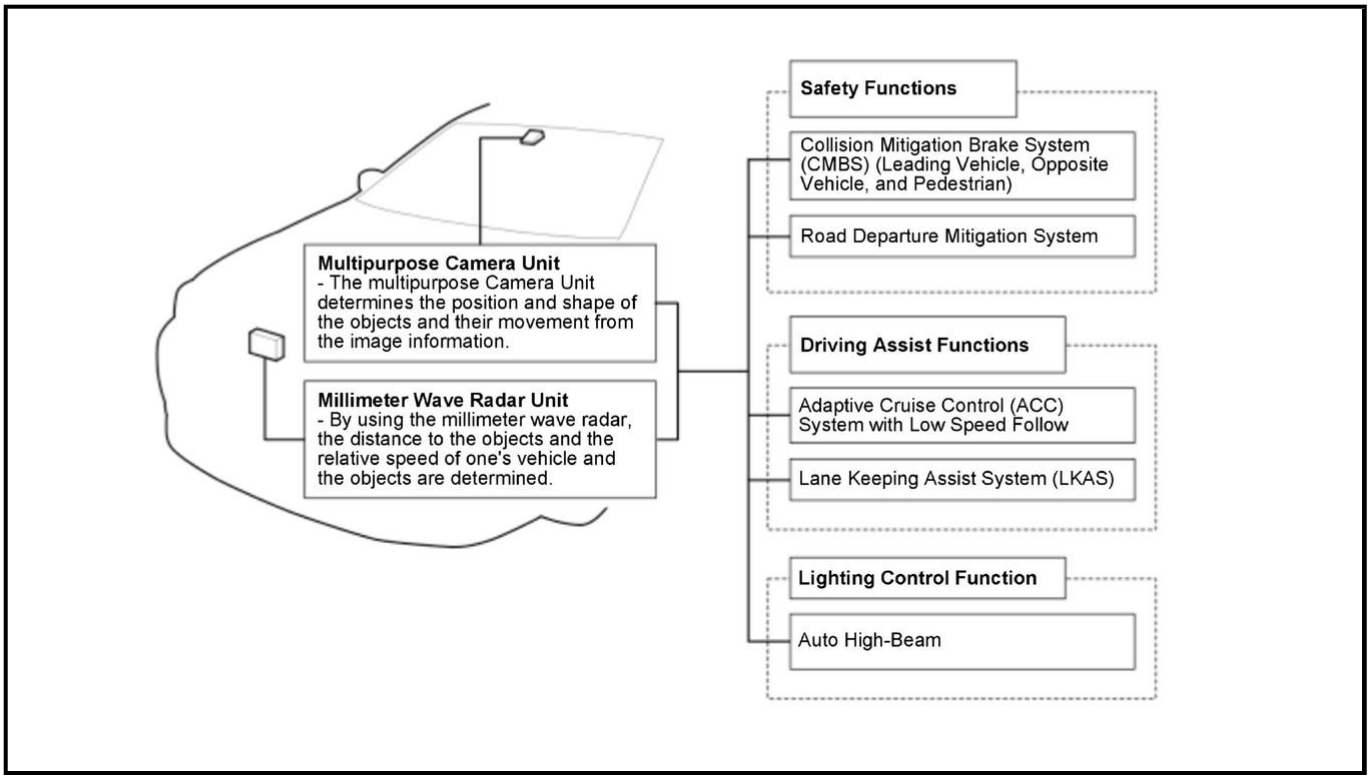
	1. Apply the parking brake. 2. Connect the HDS 3. Check for DTCs with the HDS. **NOTE:** Troubleshoot any DTCs first before proceeding. If DTC B2A60-54 is indicated, proceed with the aiming procedure. 4. In the DRIVING SUPPORT MENU, select INTEGRATED DRIVER SUPPORT SYSTEM, ADJUSTMENT, then STATIC CAMERA AIMING. 5. Press ENTER on the HDS to enter the aiming mode. **NOTE:** A "□" will be displayed on the MID, then the ACC and LKAS indicators will flash alternately during camera aiming. 6. Confirm STATIC CAMERA AIMING IS COMPLETE on the HDS and then press ENTER. **NOTE:** If the aiming has failed, you must start the static camera aiming procedure again. 7. Turn the vehicle to the OFF (LOCK) mode.

DESCRIPTION & OPERATION

DRIVING SUPPORT SYSTEM DESCRIPTION

Integrated Driver Support System

This vehicle is equipped with the integrated driver support system, which analyzes information from the monocular camera (multipurpose camera) and millimeter wave radar in a comprehensive manner to recognize an object.



Safety Functions
Collision Mitigation Brake System (CMBS) (Leading Vehicle, Opposite Vehicle, and Pedestrian)
Road Departure Mitigation System
Multipurpose Camera Unit
- The multipurpose Camera Unit determines the position and shape of the objects and their movement from the image information.
Millimeter Wave Radar Unit
- By using the millimeter wave radar, the distance to the objects and the relative speed of one's vehicle and the objects are determined.
Driving Assist Functions
Adaptive Cruise Control (ACC) System with Low Speed Follow
Lane Keeping Assist System (LKAS)
Lighting Control Function
Auto High-Beam

Roles of Each Function

The Integrated Driver Support System has three main categories of functions: Safety, Driving Assist and Lighting control functions. When the integrated driver support system detects a hazard, an alarm and/or warning notification is triggered. The system provides safety functions that perform a hazard evasion assistance if the driver does not (or cannot) respond to the warning notification or alarm. The system also provides driving assist and lighting control functions controlling the vehicle behavior according to the road conditions to assist the driver.

Safety Functions	Driving Assist Functions	Lighting Control Function
CMBS, Road Departure Mitigation (RDM)	ACC with Low Speed Follow, LKAS	Auto High-Beam
The driver can turn on and off these functions using the switch*	The function is selectable by the driver	The function is ON by turning the combination light switch to the AUTO position

*: The status of these functions will be kept even after the vehicle is turned to OFF (LOCK) and ON mode again.

Operational priority of each function

Operation priority of each function is set among systems. The CMBS gets activated when a risk of collision becomes greater while the ACC control is in operation. Once the CMBS becomes active, the ACC will be cancelled. When the RDM System is activated, its operation has higher priority than LKAS. Between CMBS and RDM System, the brake control of the CMBS has higher priority.

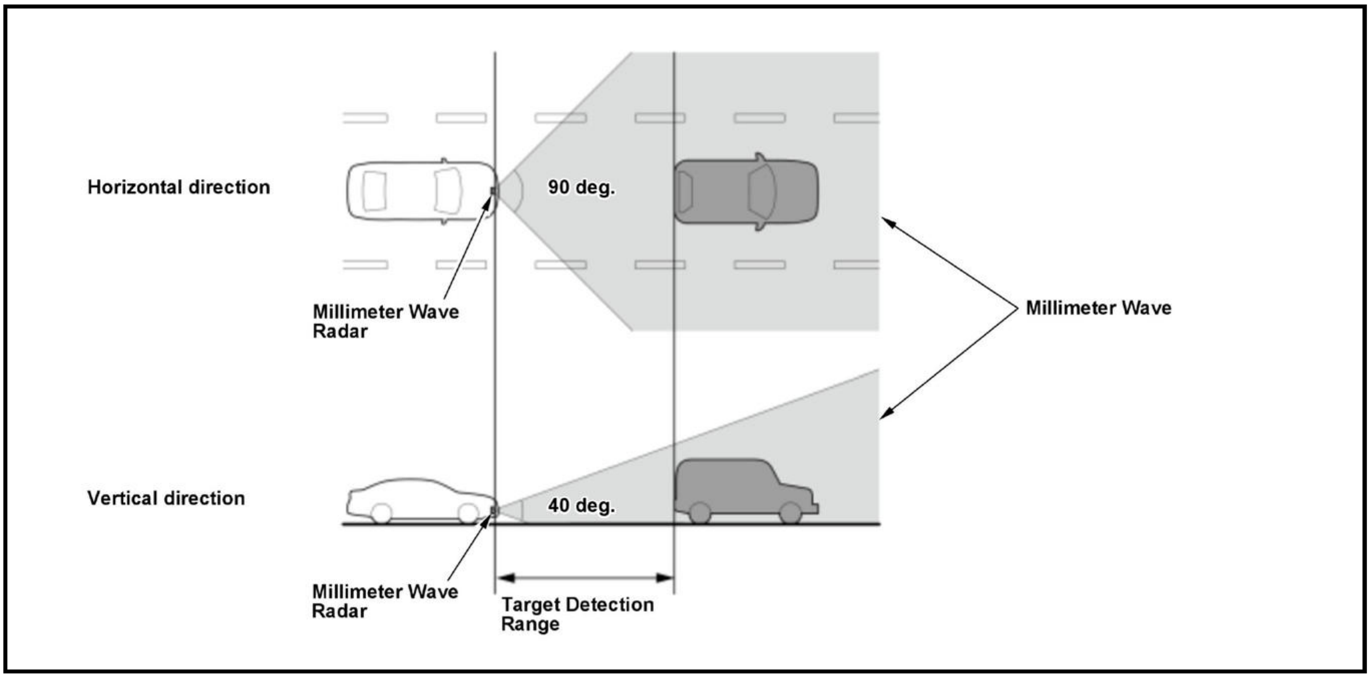
Operation of the Millimeter Wave Radar

The millimeter wave radar uses millimeter wave bands to detect vehicles and pedestrians (vehicle ahead, opposite vehicles and pedestrian) in front of the vehicle. The radar also calculates the relative speed of the objects and the distance between the objects and the vehicle by transmitting and receiving the millimeter waves.

Operation Conditions

Item	Leading Vehicle
Target Detection Range	0.5 - 120 m (1.6 - 394 ft)

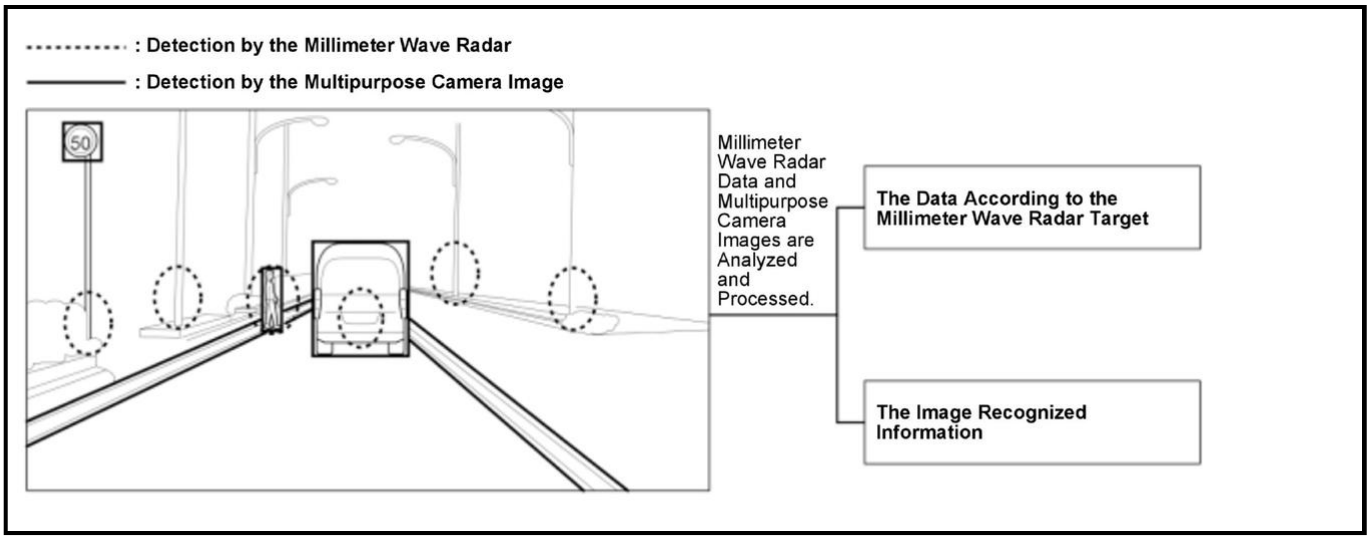
Millimeter waves are emitted within an angle range of 40 degrees in the vertical direction and an angle of 90 degrees in the horizontal direction.



Horizontal direction
90 deg.
Millimeter Wave Radar
Millimeter Wave
Vertical direction
40 deg.
Millimeter Wave Radar
Target Detection Range

Vehicle/Object Detection Process

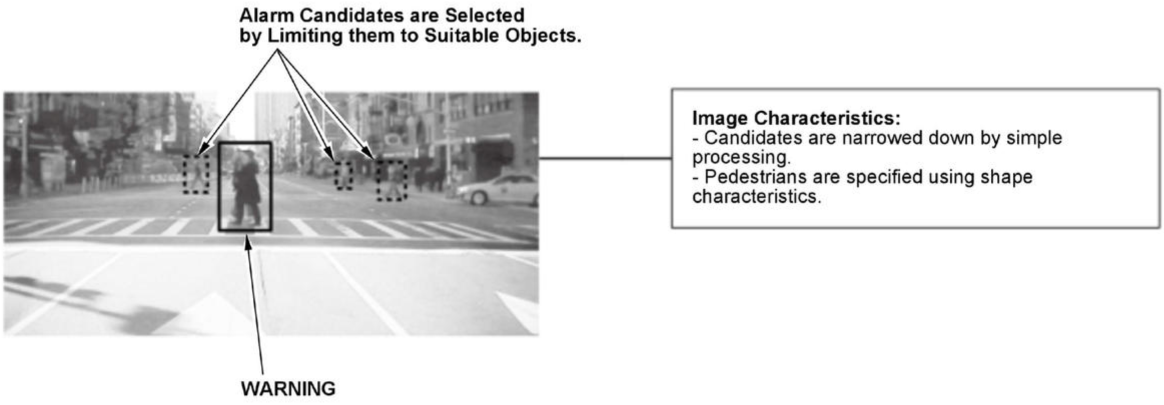
- The multipurpose camera unit determines if there is any leading vehicle and/or detected objects that are moving based on the outlines of the objects, relative position and speed of the objects. In order to distinguish between leading vehicles and pedestrians, the system uses the recognition result received from both the millimeter wave radar and the multipurpose camera as follows.
- The lane lines are recognized by managing the width, length, continuity of the line from the image captured by the multipurpose camera.
- The road sign is recognized by comparing the image captured by the multipurpose camera with the sign information registered in the system.



: Detection by the Millimeter Wave Radar
: Detection by the Multipurpose Camera Image
50
Millimeter Wave Radar Data and Multipurpose Camera Images are Analyzed and Processed.
The Data According to the Millimeter Wave Radar Target
The Image Recognized Information

Pedestrian Image Processing

When the system detects an object that could be a pedestrian, the system compares the object's characteristics against programmed characteristics for the system to determine if the object is likely a pedestrian or other object.



Alarm Candidates are Selected by Limiting them to Suitable Objects.
WARNING
Image Characteristics:
- Candidates are narrowed down by simple processing.
- Pedestrians are specified using shape characteristics.

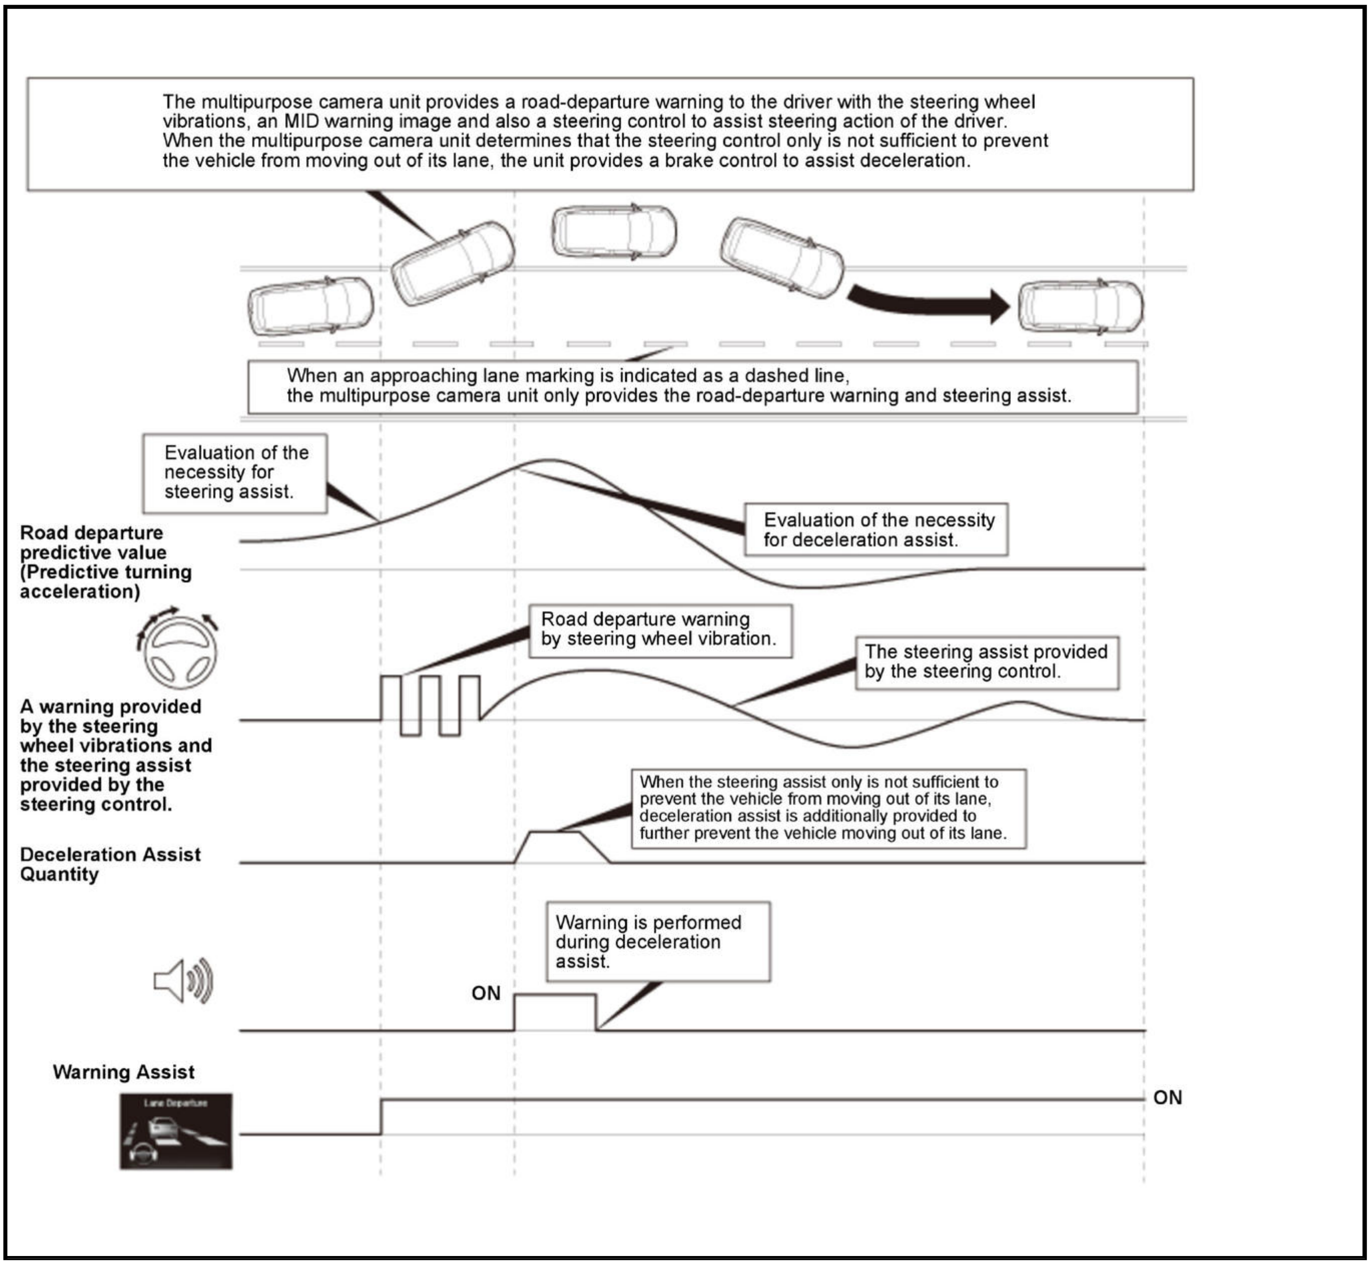
Function Failure Indication

System Temporary Stop	The system detects that the electric wave of the millimeter wave radar is blocked (such as dirt attached on the radar surface/radar cover)	ACC with LSF, CMBS, and RDM stop functioning, CMBS indicator (amber) and RDM indicator (amber) come on, and a fault indication is triggered on the MID. After the dirt has been removed, the system recovers and the indicators turn off.	 Some Driver Assist Systems Cannot Operate: Radar Obstructed
	The system detects the image of the multipurpose camera is covered (foggy/dirty windshield)	LKAS, CMBS, RDM, and Auto High-Beam stop functioning, CMBS indicator (amber) and RDM indicator (amber) come on, and a fault indication is triggered on the MID. After the obstruction has been removed, the system recovers and the indicators turn off.	 Some Driver Assist Systems Cannot Operate: Clean Front Windshield
	The temperature in the multipurpose camera unit becomes upper limit of the operating temperature or higher because of a temperature increase in the vehicle interior.(temperature rise caused by sunlight)	LKAS, CMBS, RDM, and Auto High-Beam stop functioning, CMBS indicator (amber) and RDM indicator (amber) come on, and a fault indication is triggered on the MID. When the inside temperature drops, the system recovers and the indicators turn off.	 Some Driver Assist Systems Cannot Operate: Camera Temperature Too High

			Function	Fault Indicator (on the MID)
System Failure	Millimeter wave radar or multipurpose camera unit failure, communication failure between the millimeter wave radar and multipurpose camera unit, or communication failure between the millimeter wave radar and another unit	Stop of all functions, system indicator and brake system indicator (amber) come on, and fault indication appears on the MID.	**ACC with LSF**	ACC Adaptive Cruise Control Problem
			CMBS	Collision Mitigation System Problem
			LKAS	LKAS Lane Keeping Assist Problem
			RDM	Road Departure Mitigation System Problem
			Auto High-Beam	Auto High-Beam Problem

ROAD DEPARTURE MITIGATION SYSTEM DESCRIPTION

The Road Departure Mitigation (RDM) system uses image information from the multipurpose camera to recognize the lane markings on the road. The multipurpose camera unit monitors the lane markings and detects risks of the vehicle moving out of its lane. When the unit determines that the vehicle begins to move out of its lane, the unit warns the driver by vibrating the steering wheel, showing a road-departure warning image on the multi information display (MID) and also provides a steering control to assist steering the vehicle back in its lane to prevent the vehicle from moving out of its lane. When the multipurpose camera unit determines that a steering control is not sufficient to prevent the vehicle moving out if its lane and the approaching lane marking on the road is indicated as a solid line, the unit also provides a brake control to assist decelerating the vehicle. When the vehicle goes out of a lane or the multipurpose camera unit determines that the vehicle begins to move out of its lanes for the third time after moving out of its lane twice in a row without the driver's steering action, the unit warns the driver with only an MID warning image and a buzzer sound without providing steering control.



The multipurpose camera unit provides a road-departure warning to the driver with the steering wheel vibrations, an MID warning image and also a steering control to assist steering action of the driver. When the multipurpose camera unit determines that the steering control only is not sufficient to prevent the vehicle from moving out of its lane, the unit provides a brake control to assist deceleration.
When an approaching lane marking is indicated as a dashed line, the multipurpose camera unit only provides the road-departure warning and steering assist.
Evaluation of the necessity for steering assist.
Road departure predictive value (Predictive turning acceleration)
Evaluation of the necessity for deceleration assist.
Road departure warning by steering wheel vibration.
The steering assist provided by the steering control.
A warning provided by the steering wheel vibrations and the steering assist provided by the steering control.
When the steering assist only is not sufficient to prevent the vehicle from moving out of its lane, deceleration assist is additionally provided to further prevent the vehicle moving out of its lane.
Deceleration Assist Quantity
Warning is performed during deceleration assist.
ON
Warning Assist
Lane Departure
ON

Operation Conditions

System Operation Conditions	The Road Departure Mitigation (RDM) system works as long as an approaching lane marking is recognizable (lane markings may not be recognizable under some conditions such as bad weather, backlit, and on snowy roads).		
	Operation vehicle speed	45 - 90 mph (72 - 145 km/h)	
	Object lane line types	Broken lines on the road	The road-departure warning image on the multi information display (MID) and steering wheel assist control.
		Solid lines on the road	The road-departure warning image on the multi information display (MID), steering wheel assist control and brake control to assist decelerating the vehicle.
	Driver operation	The RDM system does not operate when the driver's intention to control the vehicle, such as intentional steering wheel operation, acceleration pedal operation, brake pedal	

		operation, high speed wiper operation, and turn signal operation, is recognized.

ROAD DEPARTURE MITIGATION SYSTEM DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the RDM system is shown below.

For locations of each component on the vehicle, refer to Component Location Index:

- **Millimeter wave radar**
- **Multipurpose camera unit**
- **Gauge control module**
- **PCM**
- **VSA modulator-control unit**
- **EPS control unit**
- **SRS unit**
- **Electric servo brake control unit/pedal feel simulator**

The RDM system for this vehicle uses the multipurpose camera unit to calculate camera image information, and sends the RDM system indicated value to the control unit via the millimeter wave radar.

INSPECTION

MILLIMETER WAVE RADAR MOUNTING POSITION INSPECTION

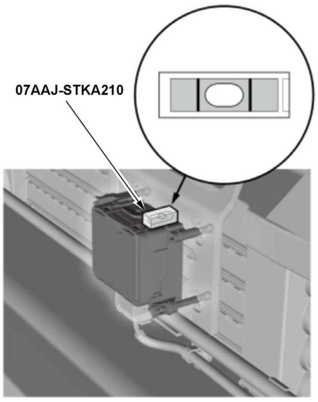
Special Tools Required

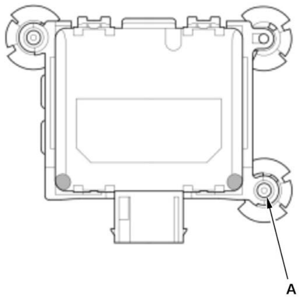
Image	Description/Tool Number
	Alignment Set 07AAJ-STKA210

Inspection

NOTE: If millimeter wave radar aiming cannot be completed, follow the procedure below to check that the millimeter wave radar is installed properly and the radar bracket is not deformed. Based on the check results, replace the faulty parts and perform the millimeter wave radar aiming again.

1. **Front Bumper - Remove**
2. Millimeter Wave Radar Mounting Position - Inspect





NOTE:

- When the millimeter wave radar is adjusted on a floor surface that has more than one degree of horizontal slope (drainage slope), the vertical radar aiming cannot be adjusted correctly. Check the levelness of the floor surface, but if there is a continuous slope, then adjust the angle of millimeter wave radar so it is parallel to the floor surface. Lay a ruler or other flat straight object on the floor surface and put the level on top to confirm the levelness of the floor surface.
- Make sure the steering wheel is pointed straight ahead, and do not turn it after setting up the vehicle.

1. Put the level on the millimeter wave radar.

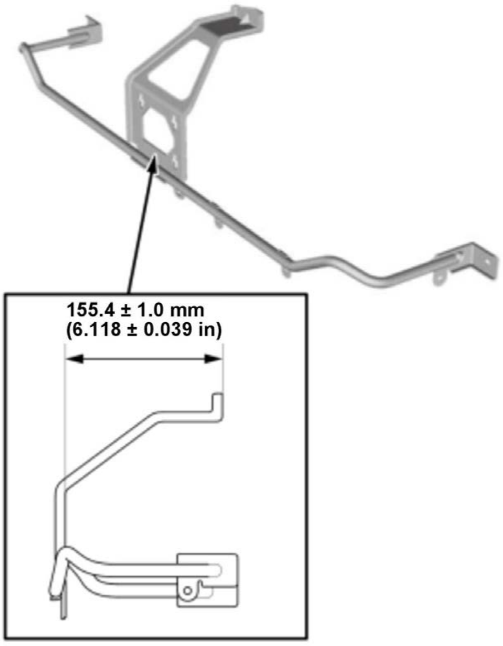
NOTE: Use the level included in the alignment set.

2. Confirm if the bubble in the level is between the lines.

NOTE: If the bubble is not within the lines, adjust the mounting position using the vertical adjustment bolt (A).

3. Remove the level.

3. Millimeter Wave Radar Bracket - Inspect



1. **Remove the millimeter wave radar assembly** .

2. **Measure the distance between the millimeter wave radar and the radar bracket, and adjust the distance to the standard value** .

3. Measure the distance of the radar bracket as shown. The distance should be 155.4 +/- 1.0 mm (6.118 +/- 0.039 in):

NOTE: If the distance is out of the standard value, replace the radar bracket.

4. **Install the millimeter wave radar assembly** .

4. **Front Bumper - Install**
5. **Millimeter Wave Radar - Update**
6. **Millimeter Wave Radar - Aim**

REWRITE

MILLIMETER WAVE RADAR UPDATE

Procedure

1. Millimeter Wave Radar - Update

NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

MULTIPURPOSE CAMERA UNIT UPDATE

Procedure

1. Multipurpose Camera Unit - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

Symptom	Diagnostic procedure	Also check for
RDM indicator (on the MID) does not go off, and no DTCs are stored	**NOTE:** If any of the CAN communication failure DTC is indicated in another system, troubleshoot the DTC first. - Check for an open or a short in the F-CAN circuit; - - Between the gauge control module and the CAN gateway (F-CAN D_H, F-CAN D_L) - - Between the millimeter wave radar and the CAN gateway (F-CAN C_H, F-CAN C_L) - Check the millimeter wave radar power circuit (IG1_OPTION). - Check the millimeter wave radar ground circuit (GND). - Do to the gauge control module self-diagnostic function .	Refer to the followings about the indicator operating condition; - General troubleshooting information Refer to the followings about the circuit troubleshooting; - Gauge control Module connector for inputs and outputs - Millimeter wave radar connector for inputs and outputs - Road Departure Mitigation Circuit Diagram - Fuse to components index - Ground to components index
RDM indicator (on the MID) does not come on	Symptom troubleshooting	Â
RDM warning buzzer does not sound	Do the gauge control module self-diagnostic function .	Â
RDM system warns when warning is unnecessary	Aim the multipurpose camera.	- Weather condition - Road condition - Driving condition
RDM system does not warn when warning is necessary	Aim the multipurpose camera.	- Weather condition - Road condition - Driving condition

SYMPTOM TROUBLESHOOTING

ROAD DEPARTURE MITIGATION SYMPTOM TROUBLESHOOTING - RDM INDICATOR (ON THE MID) DOES NOT COME ON

1. Gauge control module operation check

   -1. Turn the vehicle to the ON mode.

   Check the following indicators in the gauge control module:

   - Malfunction indicator lamp (MIL)
   - Brake system indicator
   - 12 volt charging system indicator

   Do the indicators come on?

   YES

   Go to the gauge control module self-diagnostic function .

   NO

   Go to step 2.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. D7**

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 3.

   NO

   Replace the fuse. Turn the vehicle to the ON mode then the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D7 fuse circuit.

3. Open wire check (IG1_METER line)

   -1. Disconnect the following connector.

Gauge control module connector A (32P)

   -2. Turn the vehicle to the ON mode.

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 17**
Test point 2	Body ground

Is there battery voltage?

YES

Replace the gauge control module .

NO

Repair an open in the wire between the under-dash fuse/relay box and the gauge control module.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

RDM INDICATOR (ON THE MID) DOES NOT COME ON

Diagnostic procedure

- Symptom troubleshooting

RDM INDICATOR (ON THE MID) DOES NOT GO OFF, AND NO DTCS ARE STORED

Diagnostic procedure

NOTE: If any of the CAN communication failure DTC is indicated in another system, troubleshoot the DTC first.

- Check for an open or a short in the F-CAN circuit;
-
    - -

      Between the gauge control module and the CAN gateway (F-CAN D_H, F-CAN D_L)
    - -

      Between the millimeter wave radar and the CAN gateway (F-CAN C_H, F-CAN C_L)
- Check the millimeter wave radar power circuit (IG1_OPTION).
- Check the millimeter wave radar ground circuit (GND).
- Do to the gauge control module self-diagnostic function .

Also check for

Refer to the followings about the indicator operating condition;

- General troubleshooting information

Refer to the followings about the circuit troubleshooting;

- Gauge control Module connector for inputs and outputs
- Millimeter wave radar connector for inputs and outputs
- Road Departure Mitigation Circuit Diagram
- Fuse to components index
- Ground to components index

RDM SYSTEM DOES NOT WARN WHEN WARNING IS NECESSARY

Diagnostic procedure

- Aim the multipurpose camera.

Also check for

- Weather condition
- Road condition
- Driving condition

RDM SYSTEM WARNS WHEN WARNING IS UNNECESSARY

Diagnostic procedure

- **Aim the multipurpose camera**.

Also check for

- Weather condition
- Road condition
- Driving condition

RDM WARNING BUZZER DOES NOT SOUND

Diagnostic procedure

- **Do the gauge control module self-diagnostic function** .

ADJUSTMENT

BEFORE AIMING SETTING

Special Tools Required

Image	Description/Tool Number
	Alignment Set 07AAJ-STKA210

Adjustment

1. Before Aiming - Set

   NOTE:

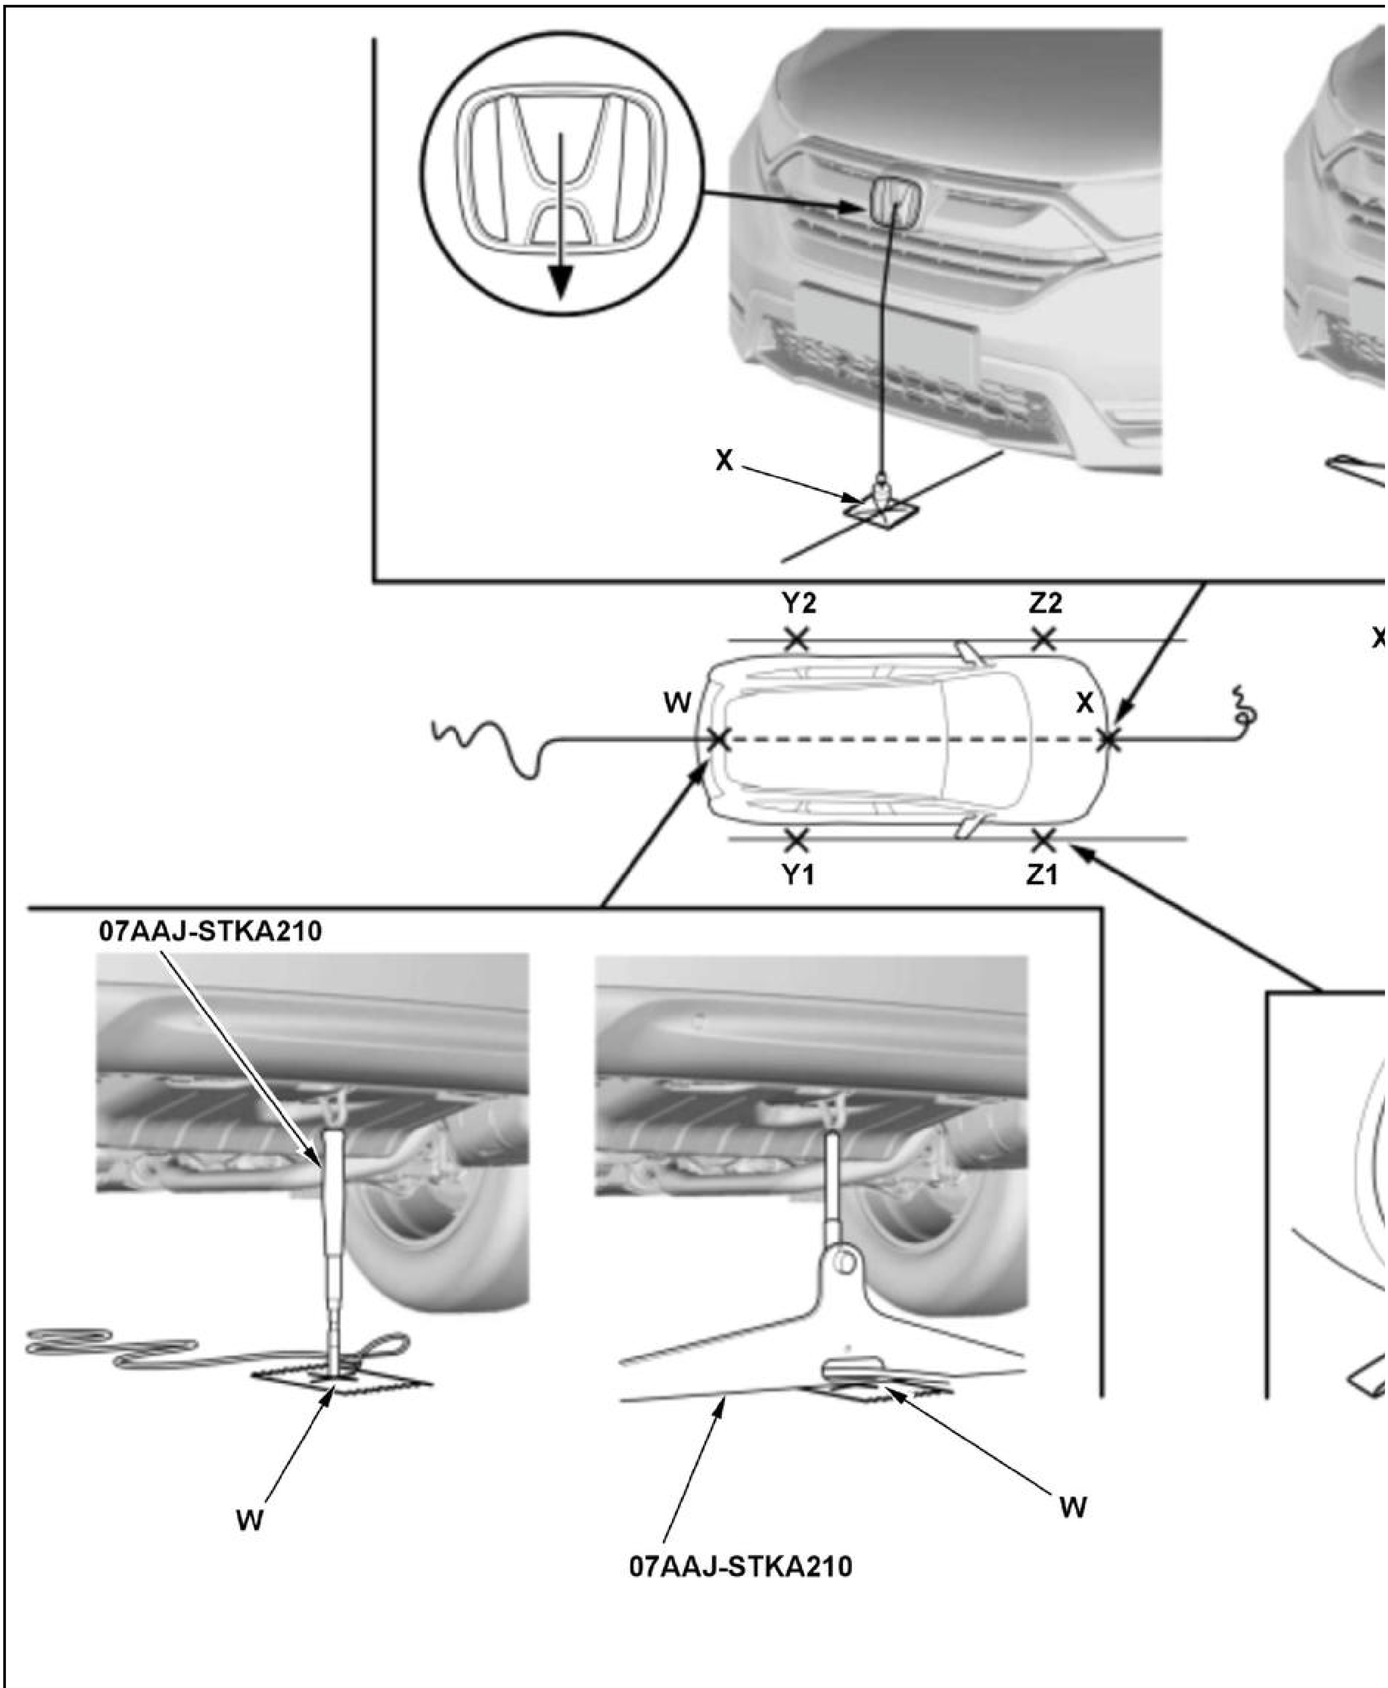
   - Aiming should be done in a well-lighted area.
   - There should be no bright objects at the back of the target (sunlight, windows, illumination, or reflectors) or designs similar to the target pattern.
   - Make sure the suspension has not been modified.
   - Make sure all the tire sizes are correct and that their pressure is correct.
   - Make sure the fuel tank is full.
   - Remove all cargo from the vehicle except the tool kit and the spare tire.
   - Make sure the steering wheel is pointed straight ahead, and do not turn it after setting the vehicle.
   - Shift the shift lever to P, and apply the parking brake.
   - When marking on the floor surface, use suitable tape to mark the exact locations.

   Prepare these items:

   - Tape measure and ruler
   - Felt-tip pen
   - Tape
   - String
   - Plumb bob

   Measure the Lines along the Sides of the Vehicle

   1. Find the center of one wheel (A) using the centering stand and mark it.



This illustration shows how to install the aiming tools on the front, rear and sides of the vehicles.

2. Measure 76.2 mm (3.00 in) from the edge of the centering stand and mark a new spot, Z1 that intersects the wheel's center-line.

NOTE: Repeat this step for each wheel (Z2, Y1, and Y2).

Set the Cord along the Center-Line of the Vehicle

NOTE:

- When installing a cord along the center-line of the vehicle, install the cord using these items as reference points.
- The reference items may vary by vehicle.
-
    - -

    Front and rear jack-up brackets

  - -

    Towing hook

  - -

    Front emblem

  - -

    Scribe lines of the front subframe part

  - -

    Center bumper clip on the bulkhead

- When installing an aiming target at the rear of the vehicle, use the centering stand in the rear.
- When installing an aiming target at the front of the vehicle, use the centering stand in the front.

3. Hang the plumb bob from the center of the front emblem, and mark a new spot X on the floor where the tip of the plumb bob touches the floor.

4. Place the centering stand under the rear jack-up bracket, then mark a new spot W at the center-line of the centering stand.

For targets at the front of the vehicle

5. Position the gas strut holder of the alignment set between the floor and the rear jack-up bracket at mark W.

6. Place the center-line of the centering stand at mark X and run the cord through it.

7. Attach the cord to the collar of the alignment set, then place the alignment set about 2.0 m (6.6 ft) in front of the vehicle.

NOTE: Make sure the cord is tight and not lying on the floor surface, then align the cord in the center of the alignment set.

For targets at the rear of the vehicle

8. Place one end of the cord on mark X and firmly tape it to the floor.

NOTE: Lightly pull on the cord to make sure that it is secured and apply additional tape as necessary.

9. Place the center-line of the centering stand at mark W and run the cord through it.

10. Attach the cord to the collar of the alignment set, then place the alignment set about 2.0 m (6.6 ft) behind the vehicle.

NOTE: Make sure the cord is tight and not lying on the floor surface, then align the cord in the center of the alignment set.

Adjustment

NOTE:

- The millimeter wave radar must be re-aimed if the millimeter wave radar is removed or replaced. The ACC indicator comes on if the aiming process is not compl
-
    - The millimeter wave radar has a self-diagnosis function and if the mounting angle of the millimeter wave radar is outside of the horizontal auto-aiming rang
- If DTCs are indicated, do the indicated DTCs first. If the DTCs are not repaired, you cannot complete the millimeter wave radar aiming procedure. However, if y
-
    - -

      Millimeter Wave Radar Aiming Incomplete: DTC P2583-54
- If the vehicle you are aiming was involved in a collision or if you suspect the alignment is out of specifications, you must perform a wheel alignment prior to aimi
- Conditions for the aiming environment:
-
    - -

      Aiming should be on level ground in a wide open space to avoid errors caused by reflecting objects.
    - -

      Amount of space require in front of the vehicle:

      10 m (33 ft) measured from the front bumper

      5 m (16 ft) in width

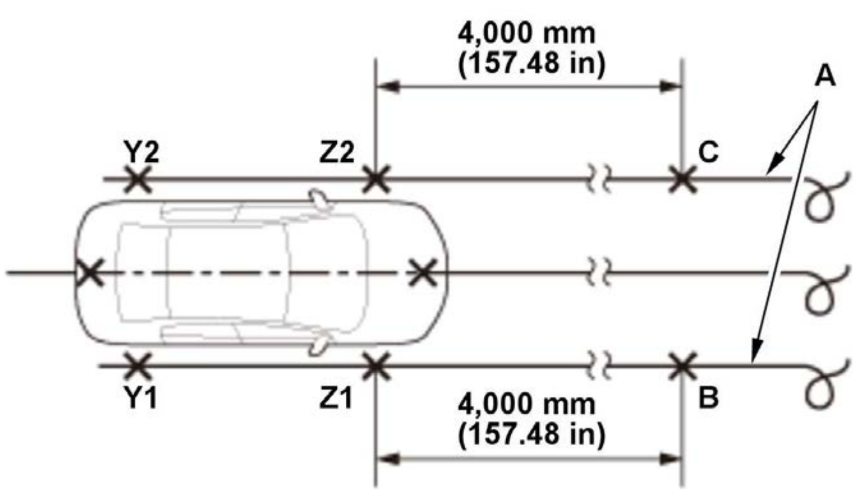
      3 m (10 ft) in height, measured from the floor

- The vehicle must be parked on a horizontal floor in order to adjust the vertical radar aiming correctly. Check the levelness of the floor surface, but if there is a con it is parallel to the floor surface. Lay a ruler or other flat straight object on the floor surface and put the level on top to confirm the levelness of the floor surface.
- When marking on the floor surface, use suitable tape to mark the exact locations.

Prepare these items:

- HDS
- Tape measure and ruler
- Felt-tip pen
- Tape
- String

1. Before Aiming - Set



NOTE: Make sure the steering wheel is pointed straight a vehicle.

Marking of the Target Position

1. **Make points (Z1, Y1, Z2, Y2) and set the cord along**

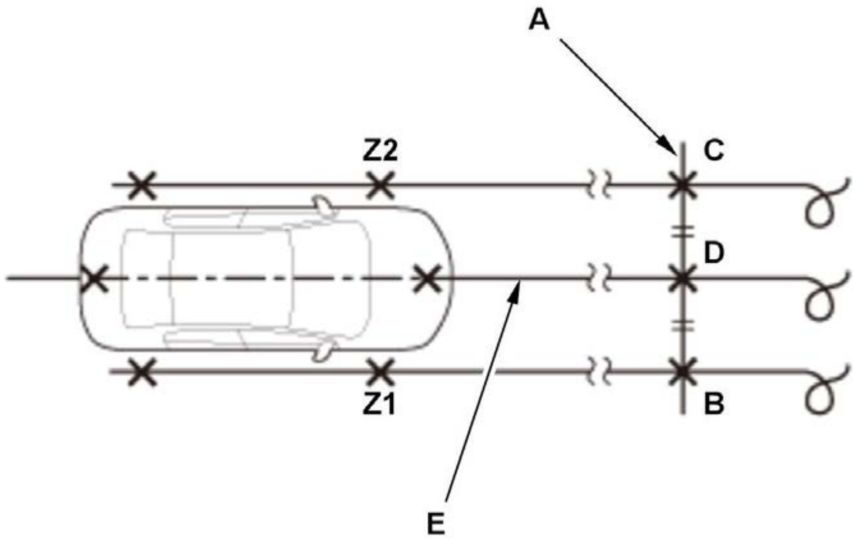
2. Place a string (A) between point Z1 and point Y1, and surface.

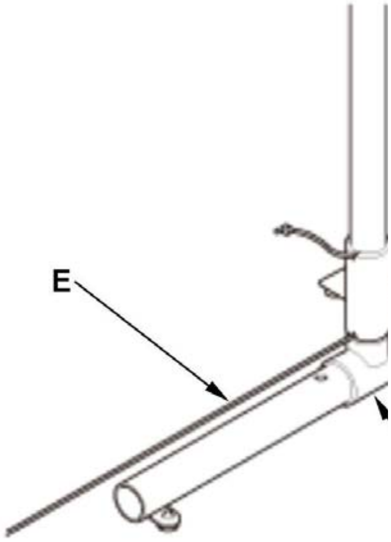
NOTE: Repeat this step for the opposite side for points Z

3. Measure and make a new point B on the floor surface i from point Z1.

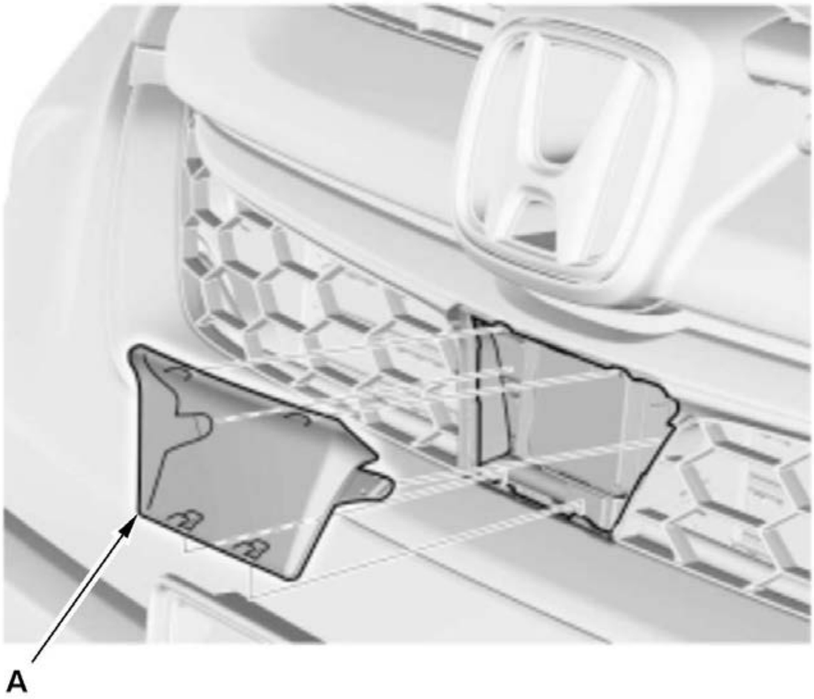
4. Pull one end of the string to point B and tape it to the f

NOTE: Repeat these steps for the opposite side, and mar

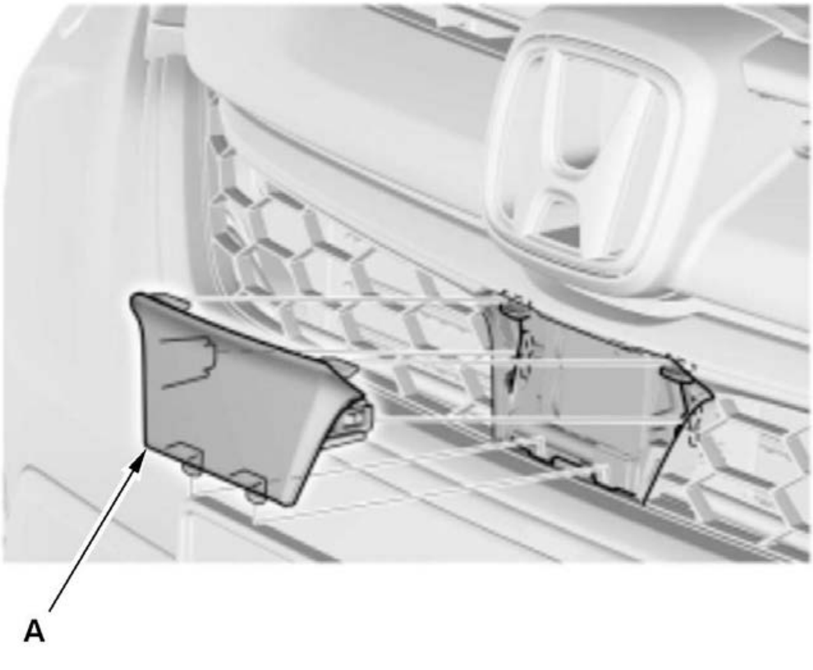




Type A



Type B

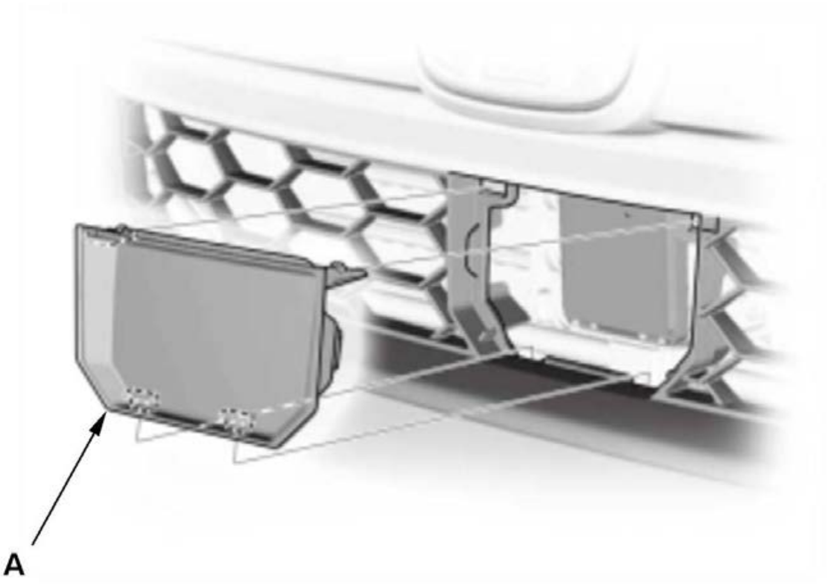


Type C

8. Remove the radar cover (A).

NOTE:

- Clean the surface of the millimeter wave radar.
- If the radar cover is damaged or cracked, replace th radar assembly and subassembly for any damages b



9. Align the lower edge of the millimeter wave radar with

10. Draw a line (Y) on the pole of the stand set as shown.

Operate:
Radar Obstructed

9. Check the vertical and horizontal alignment angles on the HDS display. If the angles displayed on the HDS are out of the specified angle range, turn the adjustr Adaptive Speed Control Alignment Tool SPX 10243 or 07AAA-TGVA100)) as necessary (counterclockwise or clockwise) to bring the displayed angle to the spec the adjustment as the values will change.

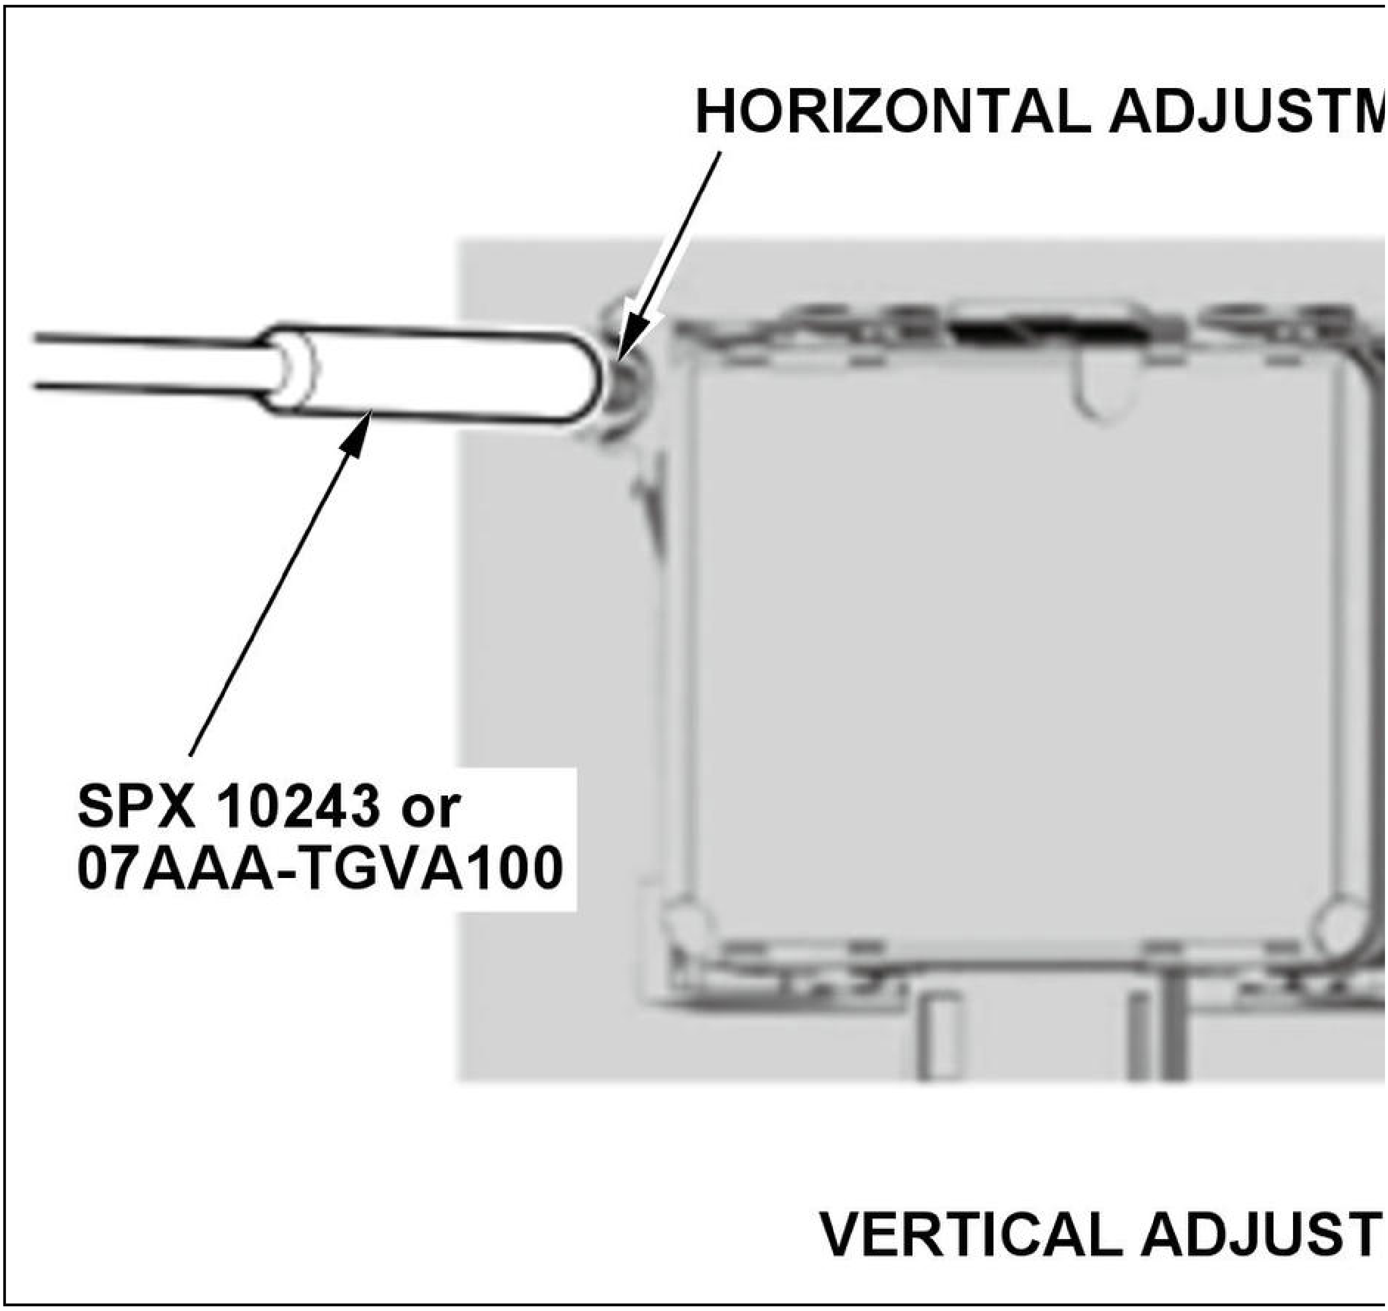
Specified Angle:

Millimeter wave angle	Specified angle range
Horizontal	0 ± 0.1 deg.
Vertical	0 ± 0.1 deg.

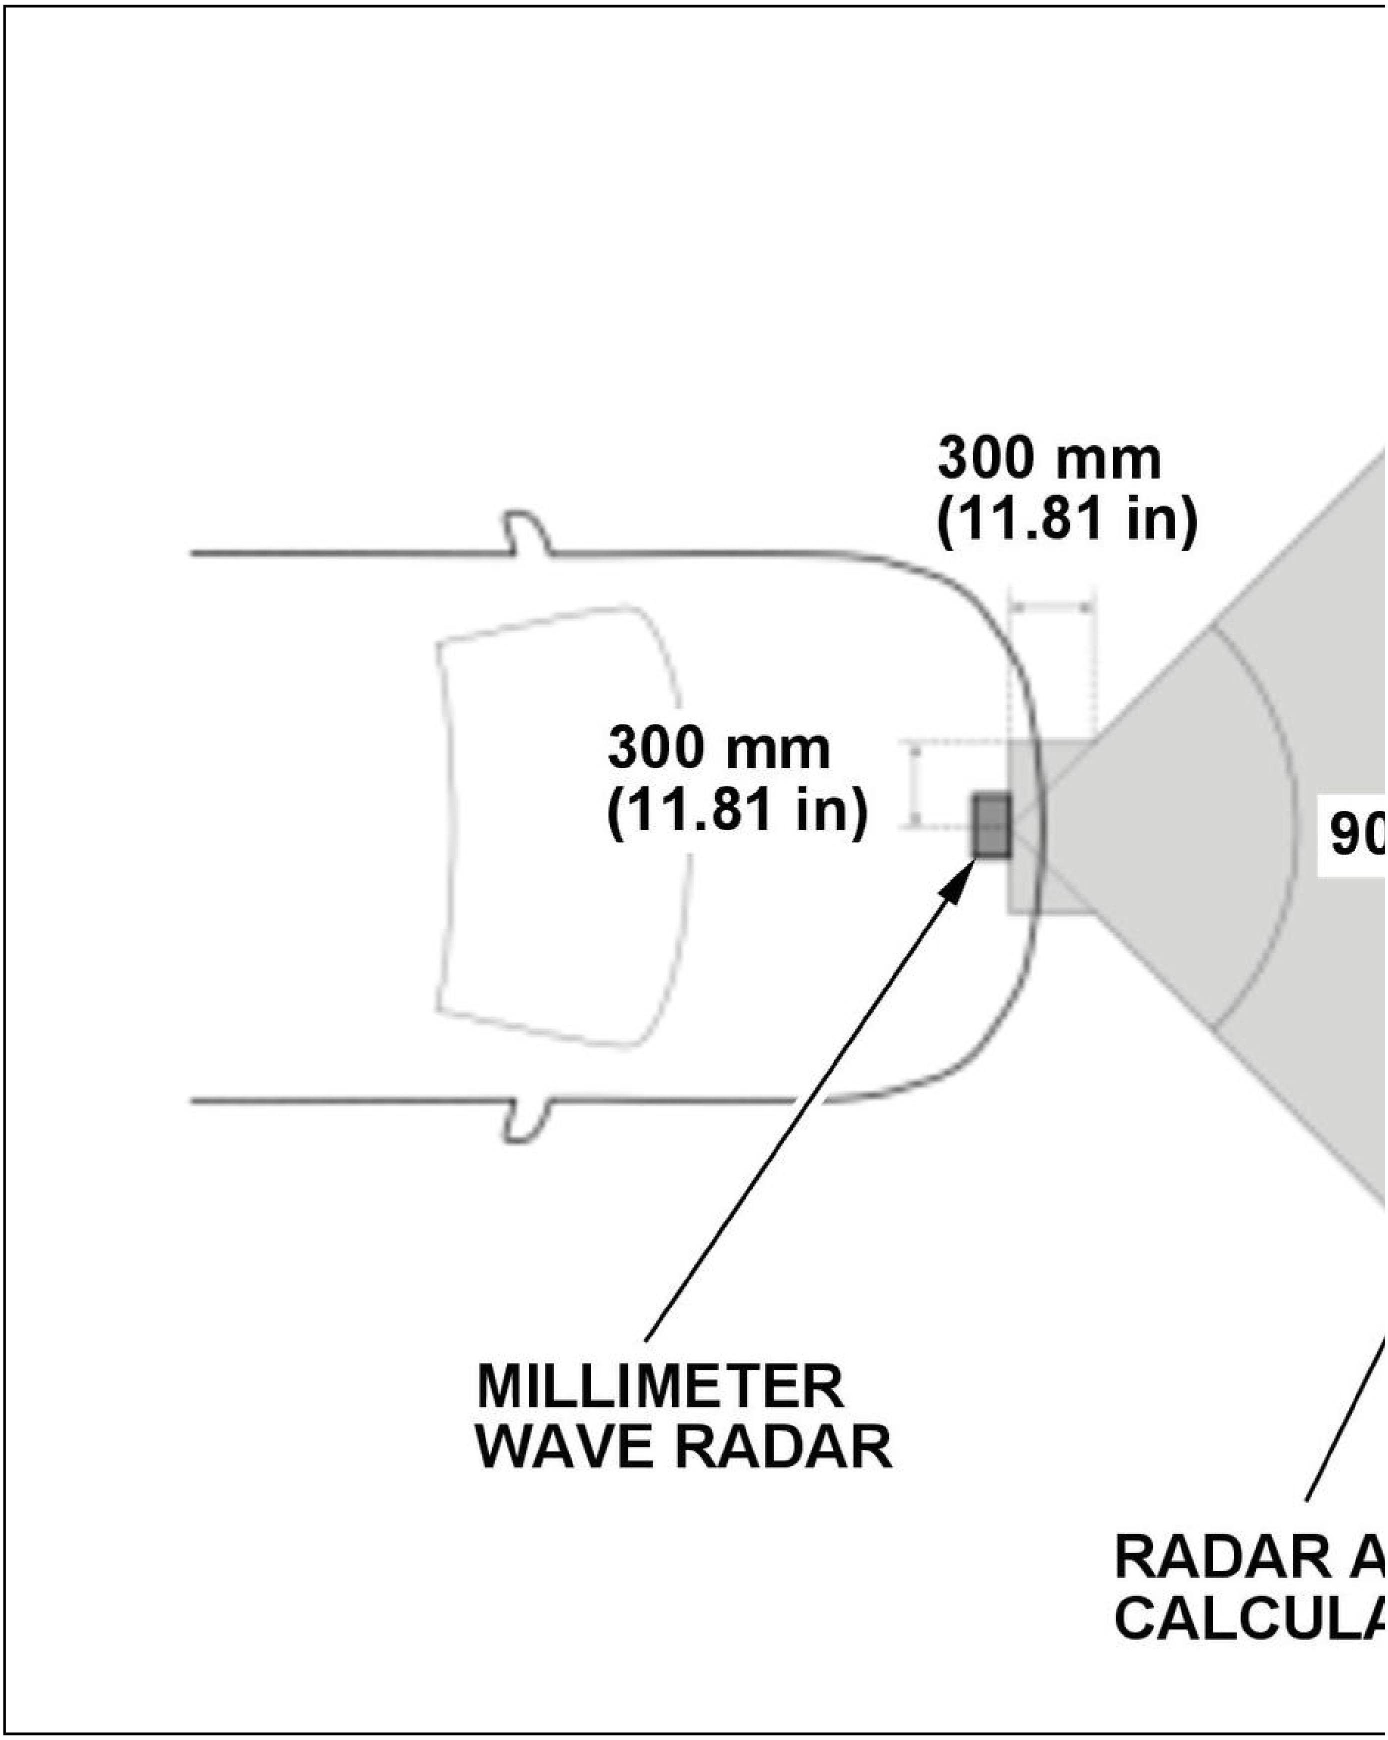
Adjustment Method:

Angle shown on the HDS display	Rotate the screwdriver as follows
More than +0.1 deg.	Counterclockwise

Angle shown on the HDS display	Rotate the screwdriver as follows
Less than -0.1 deg.	Clockwise



HORIZONTAL ADJUSTM
SPX 10243 or
07AAA-TGVA100
VERTICAL ADJUST



NOTE:

- The values on the HDS display will fluctuate as the adjustment is being performed. Wait until the values stabilize to confirm the adjustment.
- When checking the angle and recording the calculated angle on the HDS screen, do not enter or obstruct the radar wave zone.
- A value of 12.8 degrees on the HDS display indicates that the millimeter wave radar is being obstructed and cannot receive the radar wave.
- If the value of 12.8 degrees remains on the HDS screen for 15 seconds continuously, the aiming will stop.
- If the specified angle cannot be obtained with the adjustment bolts, **confirm the millimeter wave radar mounting position**.

NOTE: If the failure code and the message in the following list are displayed, solve the problem, and then perform the millimeter wave radar aiming again.

Failure codes and messages:

Failure code (on the MID)	Failure message (on the HDS)	How to solve
120	Multiple Aiming Target Detected	Remove all reflective objects except the correc

Failure code (on the MID)	Failure message (on the HDS)	How to solve
122	The Distance between Radar and Aiming Target is Out of Specification.	Set the specified distance to the aiming target.
124	Detected Some Obstacles	Remove all obstacles.
125	There is no Aiming Target	Set the aiming target at the correct position.
129	A Vehicle Speed is not 0 km/h.	Stop the vehicle completely.
132	Internal Software Error	Update the millimeter wave radar.
134	High Temperature Error	Cool down the millimeter wave radar to the pr
135	Internal Hardware Error	Replace the millimeter wave radar.

10. When the angle is at the specified value, press ENTER to record the angle.

NOTE: The aiming information obtained is stored in the millimeter wave radar.

11. Confirm THE RADAR AIMING HAS BEEN COMPLETED on the HDS.

12. Press ENTER on the HDS, and turn the vehicle to the OFF (LOCK) mode.

13. Reinstall the radar cover.

NOTE: If the radar cover is damaged or cracked, replace it.

Adjustment

NOTE:

- The multipurpose camera unit must be re-aimed if the multipurpose camera unit or windshield is removed or replaced. The LKAS and ACC indicators (amber) wi DTCs are indicated, do the indicated DTC troubleshooting first. If the DTCs are not repaired, you cannot complete the multipurpose camera aiming procedure. H aiming procedure:
-
    - Static Camera Aiming Incomplete: **DTC B2A60-54**
- If the vehicle you are aiming was involved in a collision or if you suspect the alignment is out of specifications, you must perform a wheel alignment prior to aimi
- Cautions for the operation environment:
-
    - Multipurpose camera aiming should be done on a flat place.
    - To aim the multipurpose camera, you need the following amount of open space in front of the vehicle: 7 m (23 ft) measured from the front bumper, 4 m (13
    - Make sure the vehicle is not facing any direct light sources as this will affect the static camera aiming.
    - Make sure there are no black and white checkered or dark and light alternating patterns directly behind the targets as this will affect the static camera aimin
- Set up the vehicle:
-
    - Aiming the multipurpose camera requires the HDS.
    - Do not put any objects on the instrument panel.
    - Remove all cargo from the vehicle except the tool kit and the spare tire.
    - Make sure that there are no stains, dust, or dirt on the lens of the multipurpose camera unit and the windshield area where the camera is mounted.
    - Make sure that all doors are closed.
    - Make sure the suspension has not been modified.
    - Make sure all the tire sizes are correct and that their pressure is correct.
    - Make sure the fuel tank is full.
    - Make sure the steering wheel is pointed straight ahead, and do not turn it after setting the vehicle.
    - Shift the shift lever to P position, and apply the parking brake.

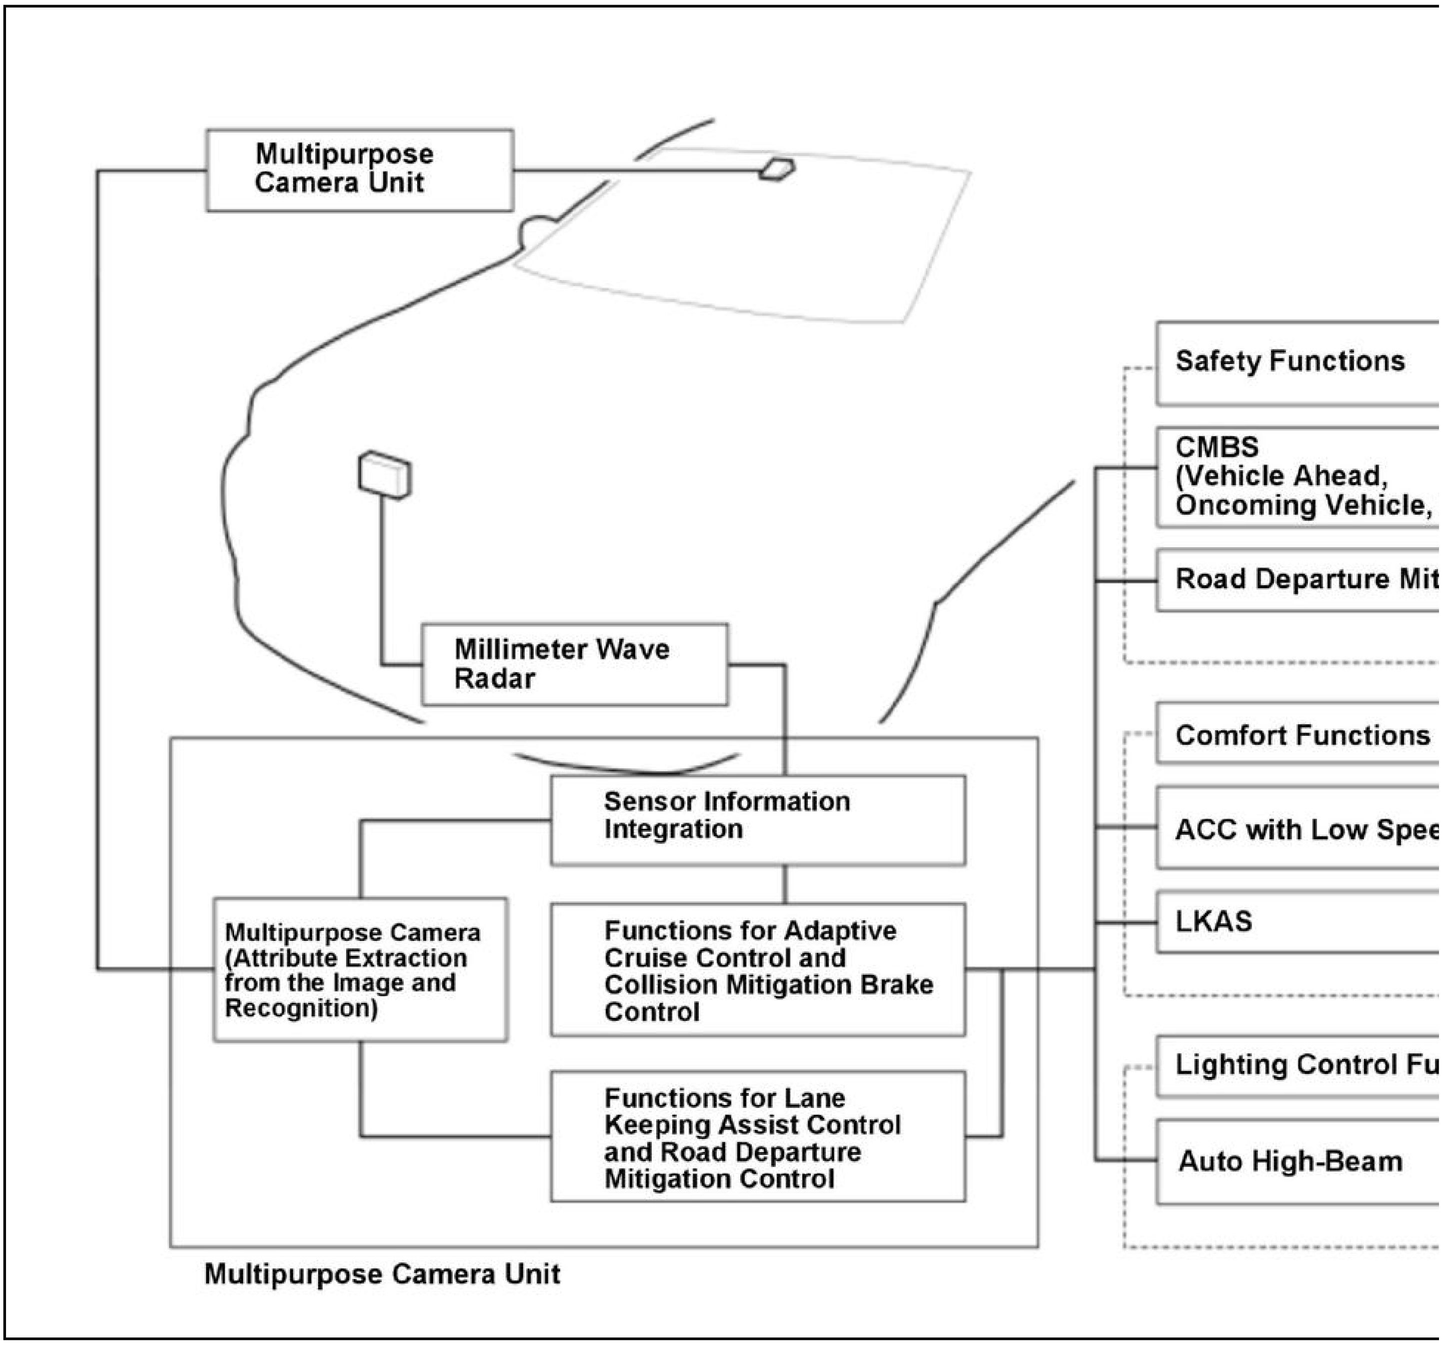
DESCRIPTION AND OPERATION

DRIVING SUPPORT SYSTEM DESCRIPTION

Integrated Driver Support System

This vehicle is equipped with the integrated driver support system, which analyzes information from the monocular camera (multipurpose camera) and millimeter wave millimeter wave radar analyzes and processes the image of the monocular camera and information for control.



Multipurpose Camera Unit
Safety Functions
CMBS (Vehicle Ahead, Oncoming Vehicle,

Millimeter Wave Radar
Comfort Functions
Sensor Information Integration
ACC with Low Spee
Multipurpose Camera (Attribute Extraction from the Image and Recognition)
Functions for Adaptive Cruise Control and Collision Mitigation Brake Control
LKAS
Lighting Control Fu
Functions for Lane Keeping Assist Control and Road Departure Mitigation Control
Auto High-Beam
Multipurpose Camera Unit

Roles of Each Function

The integrated Driver Support System has three main categories of functions: Safety, Comfort and Lighting control functions. When the Integrated Driver Support Syste triggered. The system provides safety functions that perform a hazard evasion assistance if the driver does not (or cannot) respond to the warning notification or alarm. controlling the vehicle behavior according to the road conditions to assist the driver.

Safety Functions	Comfort Functions	Lighting Control Fu
CMBS, Road Departure Mitigation (RDM)	ACC with Low Speed Follow, LKAS	Auto High-Beam
The function is basically ON all the time (can be turned off by switch operation)	The function is selectable by the users	The function is ON AUTO position

Operational priority of each function

Operation priority of each function is set among systems. The CMBS gets activated when a risk of collision becomes greater while the ACC control is in operation. Onc the RDM System is activated, its operation has higher priority than LKAS. Between CMBS and RDM System, the brake control of the CMBS has higher priority.

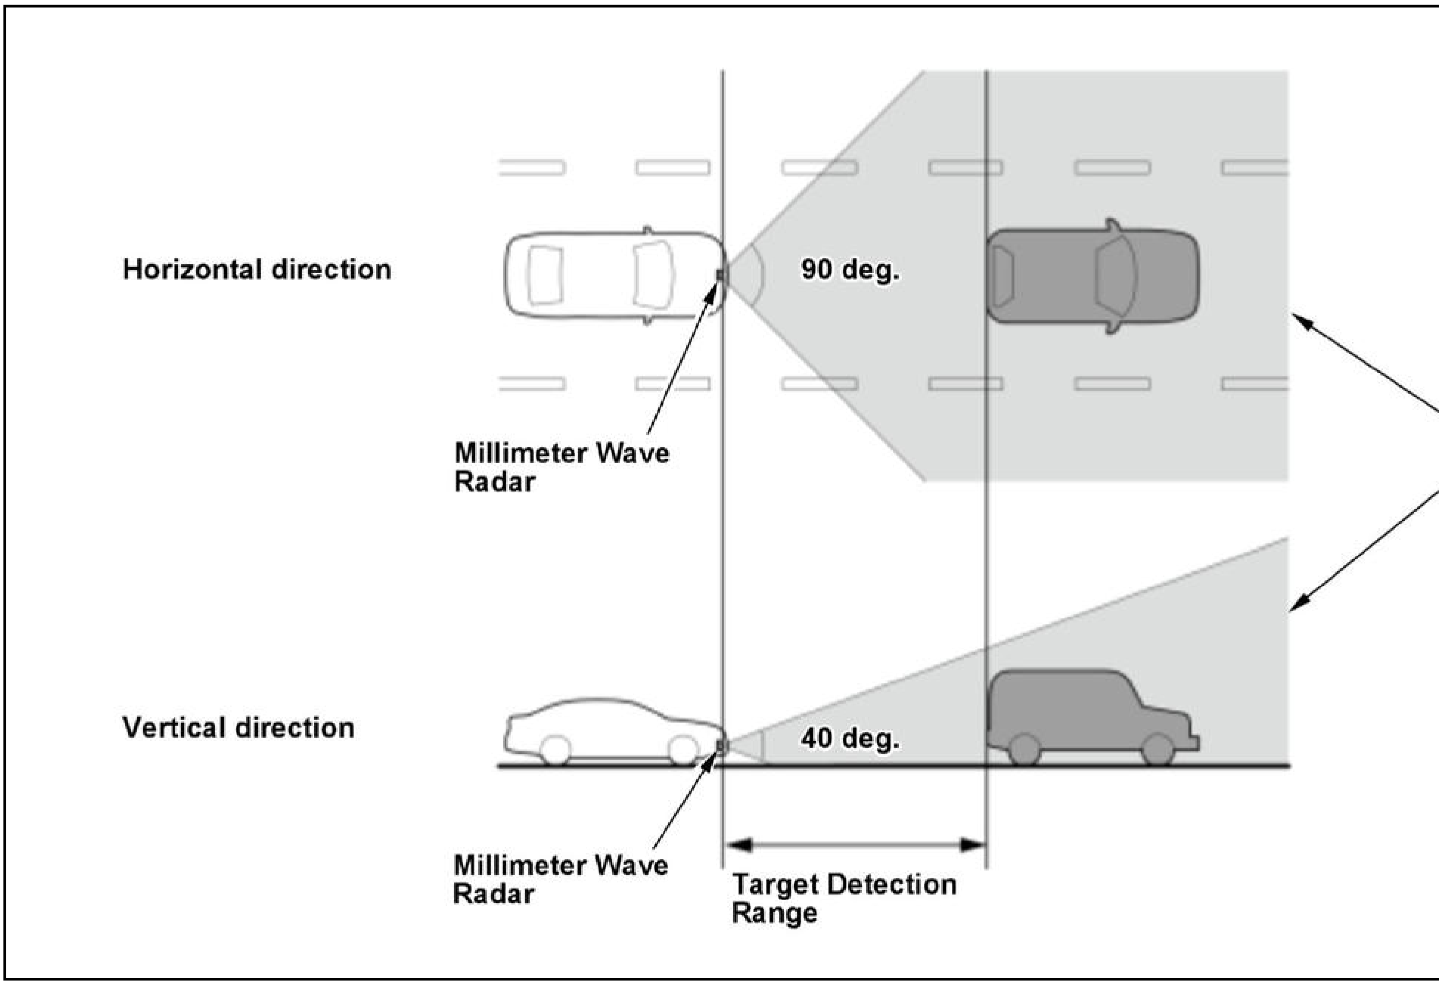
Operation of the Millimeter Wave Radar

The millimeter wave radar uses millimeter wave bands to detect vehicles and pedestrians (vehicle ahead, oncoming vehicles and pedestrian) in front of the vehicle. The distance between the objects and the vehicle by transmitting and receiving the millimeter waves.

Operation Conditions

Item	Leading Vehicle
Target Detection Range	0.5 - 120 m (1.6 - 394 ft)

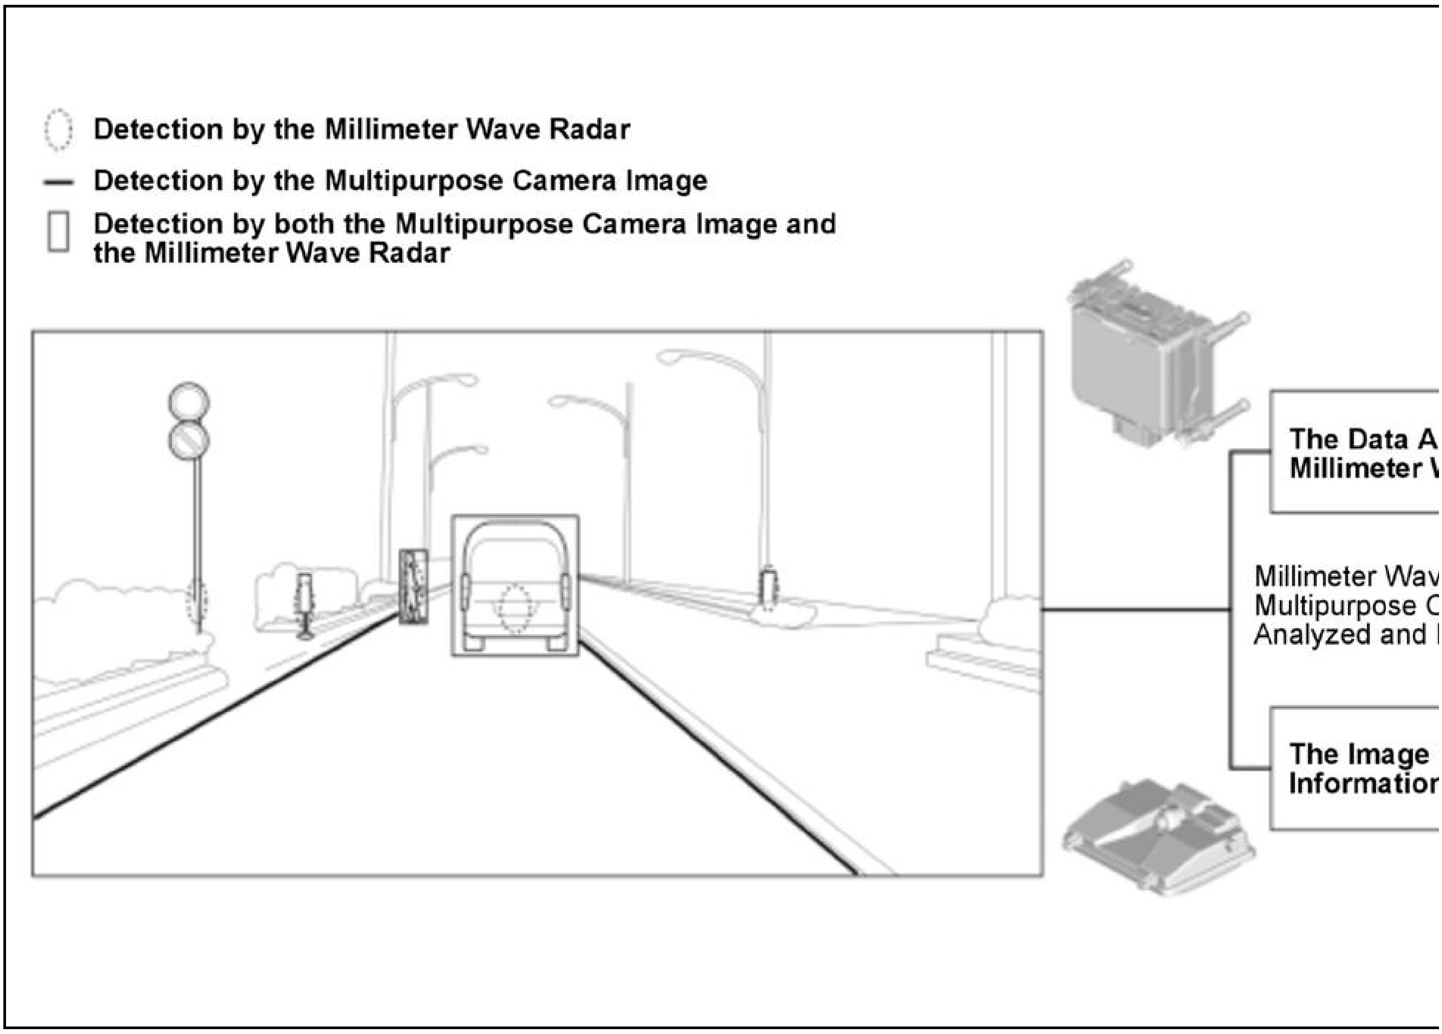
Millimeter waves are emitted within an angle range of 40 degrees in the vertical direction and an angle of 90 degrees in the horizontal direction.



Horizontal direction
90 deg.
Millimeter Wave Radar
Vertical direction
40 deg.
Millimeter Wave Radar
Target Detection Range

Vehicle/Object Detection Process

The multipurpose camera unit determines if there is any leading vehicle and/or detected objects that are moving based on the outlines of the objects, relative position an vehicles and pedestrians, the system uses the recognition result received from both the millimeter wave radar and the multipurpose camera as follows.



Detection by the Millimeter Wave Radar

	Driver operation	The RDM system does not operate when the driver's intention to control the vehicle, acceleration pedal operation, brake pedal operation, and turn signal operation, is reco

ROAD DEPARTURE MITIGATION SYSTEM DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the RDM system is shown below.

For locations of each component on the vehicle, refer to Component Location Index:

- **EPS motor/control unit**
- **Gauge control module**
- **Millimeter wave radar**
- **Multipurpose camera unit**
- **PCM**
- **SRS unit**
- **VSA modulator-control unit**

The RDM system for this vehicle uses the multipurpose camera unit to calculate camera image information, and sends the RDM system indicated value to the control ur

F-CAN Communication Data

Millimeter Wave Radar Receiving Signal:

Originating Unit	Signal Name
EPS motor/control unit	• EPS system failure information • Steering angle neutral position learning information • Steering angle signal • Torque sensor signal

Originating Unit	Signal Name
Gauge control module	• Customization signal • Gauge control module failure information • Turn signal lights operating status • Wiper operating status
PCM	• Accelerator pedal position (APP) sensor signal • Brake pedal position switch signal • PCM failure information • Vehicle speed signal
SRS unit	• Yaw rate sensor signal • Yaw rate sensor failure information
VSA modulator-control unit	• Master cylinder pressure signal • VSA system actuation information • VSA system failure information • Wheel speed sensor signals

Millimeter Wave Radar Transmitting Signal:

Destination Unit	Signal Name
EPS motor/control unit	• Integrated driver support system failure information • RDM control instruction
Gauge control module	• Buzzer request signal • Customization information • Integrated driver support system failure information • Multi information display (MID) screen requirement: • • - RDM indicator • - RDM system indicates for self-diagnostic function
PCM	---
SRS unit	RDM operating information
VSA modulator-control unit	• Automatic brake actuation request signal • Brake light relay actuation request signal • Integrated driver support system failure information

DTC TROUBLESHOOTING INDEX

DRIVING SUPPORT DTC TROUBLESHOOTING INDEX

NOTE:

- The DTC troubleshooting index shows DTCs that is stored in the integrated driver support system. Each function of the integrated driver support system operates the integrated driver support system that operate in condition when these DTCs are stored can be confirmed with the table below:

  O: Indicator ON, and operation stop

  o: Operation stop

  Δ: Indicator blink, and operation stop

- For the millimeter wave radar, different indicators may be lit for the same DTCs depending on which functions are in operation at the time of DTC stores. Make s them.

NOTE: For details on the functions of indicator, and operation stop, refer to "How to Troubleshooting Information."

- How to Troubleshoot the Adaptive Cruise Control (ACC)
- How to Troubleshoot the Collision Mitigation Braking System (CMBS)
- How to Troubleshoot the Lane Keeping Assist System (LKAS)
- How to Troubleshoot the Road Departure Mitigation
- Brake System (How to Troubleshoot the VSA System)
- How to Troubleshoot the Auto High-Beam

*1: When the system detects the ACC and the RDM failure while operating.

*2: When the system detects the CMBS failure while operating.

*3: When the millimeter wave radar receives gauge control module failure information.

*4: When related B-CAN system or switch failure information (judged by the gauge control module) is received.

*5: After the DTC is stored, the message (Radar Obstructed) is displayed on the MID at the initial stage in some models, and then the indicators come on.

INSPECTION

MILLIMETER WAVE RADAR MOUNTING POSITION INSPECTION

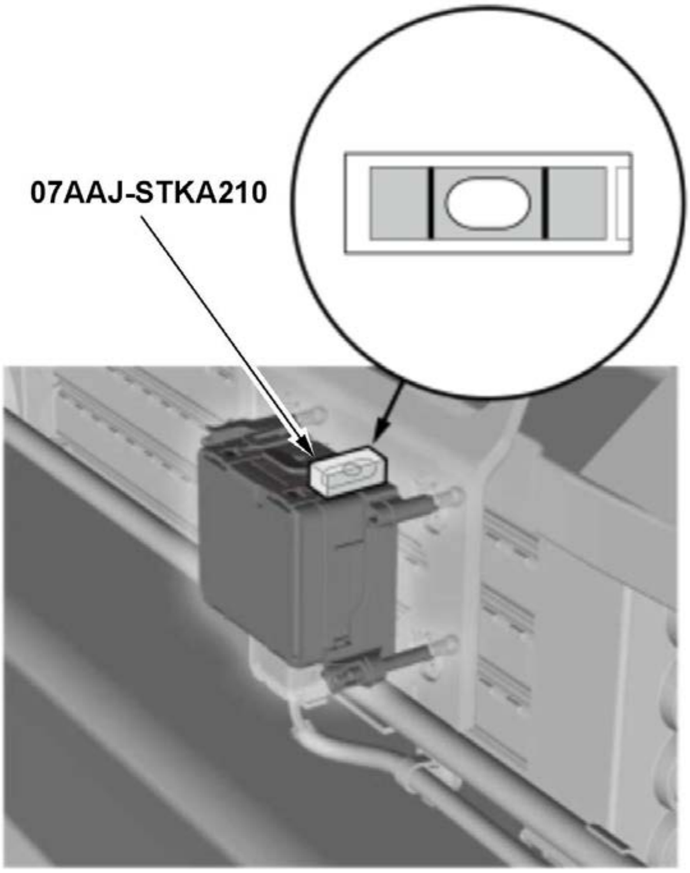
Special Tools Required

Image	Description/Tool Number
	Alignment Set 07AAJ-STKA210

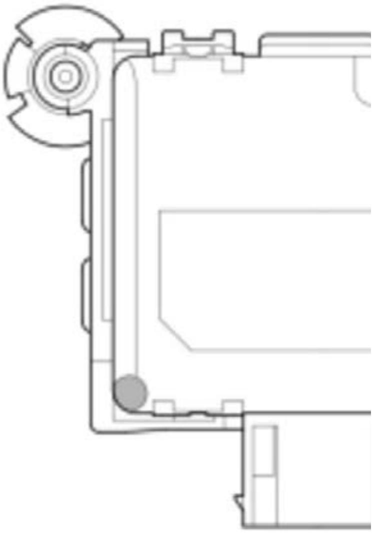
Inspection

NOTE: If millimeter wave radar aiming cannot be completed, follow the procedure below to check that the millimeter wave radar is installed properly and the radar bra faulty parts and perform the millimeter wave radar aiming again.

1. Front Bumper - Remove
2. Millimeter Wave Radar Mounting Position - Inspect



07AAJ-STKA210



3. Millimeter Wave Radar Bracket - Inspect

	1. **Remove the millimeter wave radar assembly** . 2. **Measure the distance between the millimeter wave the distance to the standard value** . 3. Measure the distance of the radar bracket as shown. Th +/- 0.039 in): **NOTE:** If the distance is out of the standard value, replac 4. **Install the millimeter wave radar assembly** .

4. **Front Bumper - Install**
5. **Millimeter Wave Radar - Aim**

REWRITE

MILLIMETER WAVE RADAR UPDATE

Procedure

1. Millimeter Wave Radar - Update

NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for n

MULTIPURPOSE CAMERA UNIT UPDATE

Procedure

1. Multipurpose Camera Unit - Update

NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for n

SYMPTOM TROUBLESHOOTING

ROAD DEPARTURE MITIGATION SYMPTOM TROUBLESHOOTING

RDM indicator (on the MID) does not come on

NOTE:

*1: Without auto idle stop system

*2: With auto idle stop system

1. Gauge control module operation check

   -1. Turn the vehicle to the ON mode.

   Check the following indicators in the gauge control module:

   - Malfunction indicator lamp (MIL)
   - Brake system indicator
   - 12 volt charging system indicator

   Do the indicators come on?

   YES

   Go to the gauge control module self-diagnostic function .

   NO

   Go to step 2.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. D7 (10 A) *1No. F6 (5 A) *2
Location	Under-dash fuse/relay box *1Auxiliary under-dash fuse/relay box *2

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 3.

   NO

   Replace the fuse. Turn the vehicle to the ON mode, then the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D7 (10 A) *1/F6 (5

3. Open wire check (IG1 METER *1/IG1 VST *2 line):-1.

   Disconnect the following connector.

Gauge control module connector A (32P)

   -2. Turn the vehicle to the ON mode.

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 17**
Test point 2	Body ground

   Is there battery voltage?

   YES

   Replace the gauge control module .

   NO

   Repair an open in the IG1 METER *1/IG1 VST *2 wire between the under-dash fuse/relay box *1/auxiliary under-dash fuse/relay box *2 and the gauge control m

RDM indicator (on the MID) does not go off

NOTE: *1: Without auto idle stop system *2: With auto idle stop system *3: CAN gateway 12P connector type *4: CAN gateway 16P connector type

1. DTCs check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
Â	Â

   DTC (IDAS)

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

Go to step 2.

2. CAN gateway system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	**DTC**
U0029-00 CAN Gateway F-CAN ch A Bus Off	Â
U0047-00 CAN Gateway F-CAN ch B Bus Off	Â
U3000-49 CAN Gateway Internal Failure	Â

Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

YES

Go to the indicated DTCs troubleshooting .

NO

Go to step 3.

3. Fuse check1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D5 (10 A) *1No. F7 (7.5 A) *2
Location	Under-dash fuse/relay box *1Auxiliary under-dash fuse/relay box *2

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 4.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D5 (10 A) *1/F7

4. Fuse check 2

-1. Check the following fuse.

Fuse	No. D7 (10 A) *1No. F6 (5 A) *2
Location	Under-dash fuse/relay box *1Auxiliary under-dash fuse/relay box *2

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 5.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D7 (10 A) *1/F6

5. Gauge control module operation check

-1. Turn the vehicle to the ON mode.

-2. Check if all of the gauge indicators come on for a few seconds.

Do the indicators come on?

YES

Go to step 6.

NO

Go to the gauge control module self-diagnostic function .

6. Open wire check (IG1 OPTION *1/IG1 EBB *2 line):-1.

Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Millimeter wave radar 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Â	Millimeter wave radar 8P connector: disconnected

Test point 1	**Millimeter wave radar 8P connector No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 OPTION *1/IG1 EBB *2 wire is OK. Go to step 7.

NO

Repair an open in the wire between the millimeter wave radar and the under-dash fuse/relay box *1/auxiliary under-dash fuse/relay box *2.

7. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	Millimeter wave radar 8P connector: disconnected
Test point 1	**Millimeter wave radar 8P connector No. 8**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 8.

NO

Repair an open in the wire between the millimeter wave radar and the body ground (G251).

8. F-CAN circuit communication check

-1. Reconnect the following connector.

Millimeter wave radar 8P connector

-2. Turn the vehicle to the ON mode.

-3. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Gauge control module (Bus A) is Not Available

Go to step 9.

Millimeter wave radar (Bus B) is Not Available

Go to step 10.

Millimeter wave radar and gauge control module are Detected

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

9. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

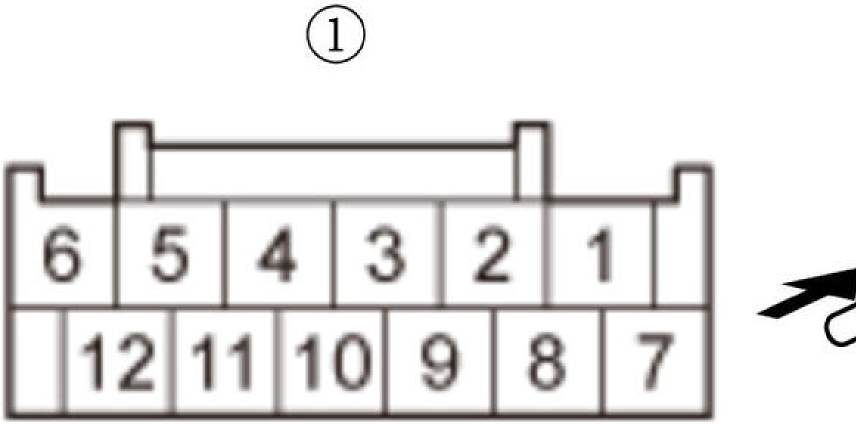
-2. Disconnect the following connectors.

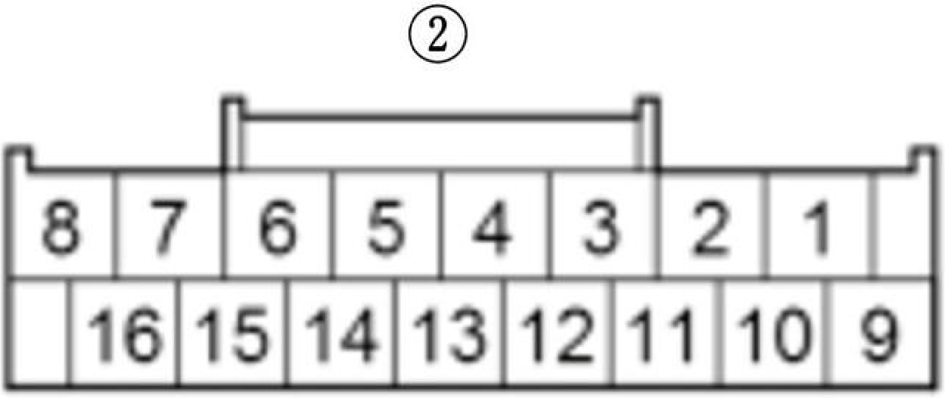
CAN gateway 12P connector *3CAN gateway 16P connector *4
Gauge control module connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Â	CAN gateway 12P connector *3: disconnectedCAN gateway 16P connector *4: disconnected
Â	Gauge control module connector A (32P): disconnected
Test point 1	CAN gateway 12P connector *3 (female terminals) No. 3: ① CAN gateway 16P connector *4 (female terminals) No. 3:
Test point 2	**Gauge control module connector A (32P) No. 19**

Test point 1	CAN gateway 12P connector *3 (female terminals) No. 9: ① CAN gateway 16P connector *4 (female terminals) No. 11:
Test point 2	**Gauge control module connector A (32P) No. 20**





Is there continuity?

YES

Check for loose terminals in the CAN gateway 12P *3/16P *4 connector and gauge control module connector A (32P). If they are OK, **substitute a known-good** then go off after substitution, **replace the original gauge control module** .

NO

Repair an open in the wire between the gauge control module and the CAN gateway.

10. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

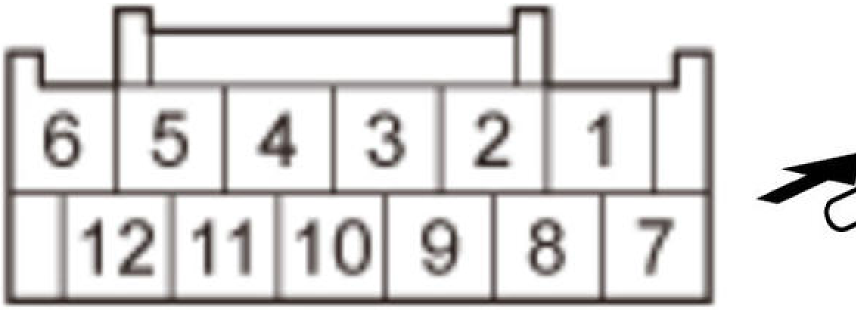
CAN gateway 12P connector *3CAN gateway 16P connector *4
Millimeter wave radar 8P connector

-3. Check for continuity between test points 1 and 2.

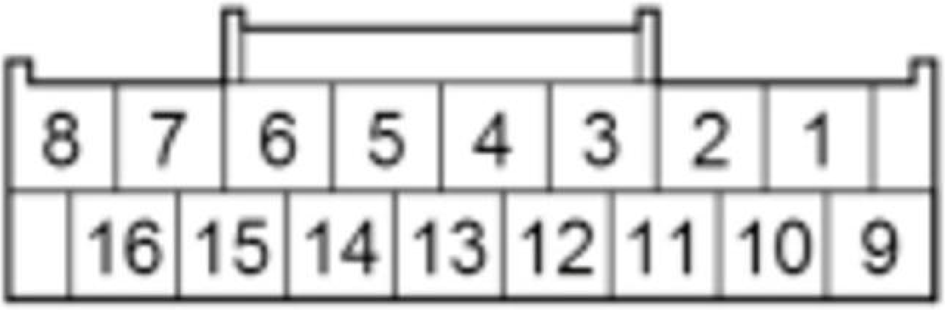
Test condition	Vehicle OFF (LOCK) mode
Â	CAN gateway 12P connector *3: disconnectedCAN gateway 16P connector *4: disconnected
Â	Millimeter wave radar 8P connector: disconnected
Test point 1	CAN gateway 12P connector *3 (female terminals) No. 12: ① CAN gateway 16P connector *4 (female terminals) No. 6:
Test point 2	**Millimeter wave radar 8P connector No. 7**

Test point 1	CAN gateway 12P connector *3 (female terminals) No. 5: ① CAN gateway 16P connector *4 (female terminals) No. 14:
Test point 2	**Millimeter wave radar 8P connector No. 6**

①



②



Is there continuity?

YES

Check for loose terminals and poor connections in the millimeter wave radar 8P connector. Check for any authorized service information related to the DTCs or s **millimeter wave radar** .

NO

Repair an open in the wire between the millimeter wave radar and the CAN gateway.

SYMPTOM TROUBLESHOOTING INDEX

- Driving condition

RDM WARNING BUZZER DOES NOT SOUND

Diagnostic procedure

- **Gauge control module self-diagnostic function**

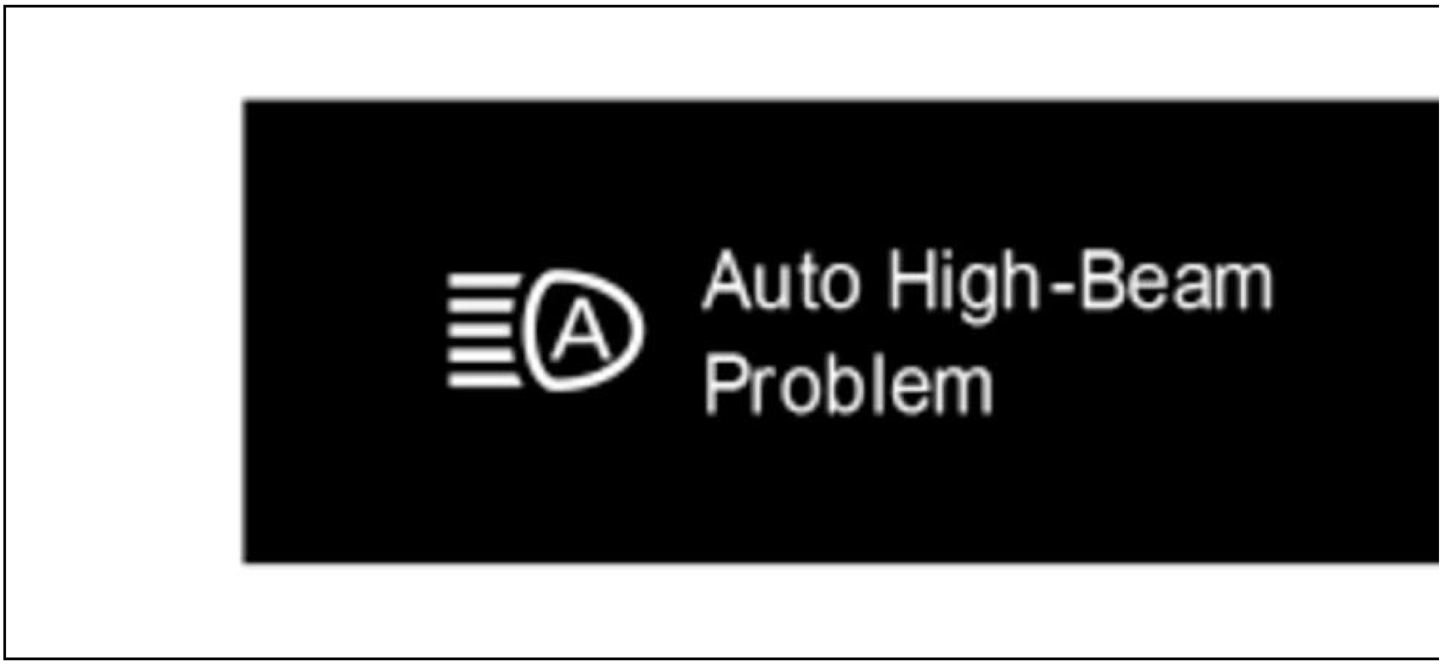
TEST

AUTO HIGH-BEAM (HIGH-BEAM SUPPORT SYSTEM) FUNCTION TEST

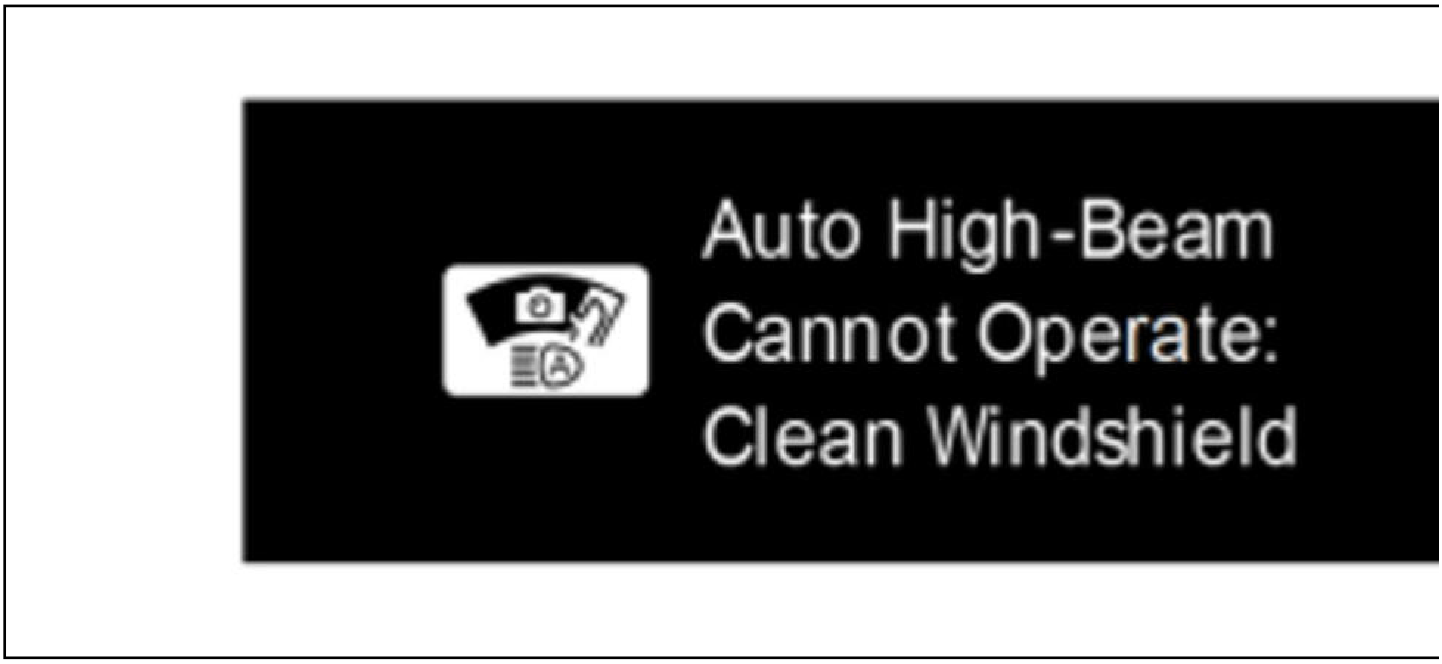
NOTE:

- This test is only used to confirm if the auto high-beam system is operating correctly.
- Certain vehicle and environmental conditions will affect how the auto high-beam system operates. Refer to the owner's manual or **Auto High-Beam (High-Beam**

1. Turn the vehicle to the ON mode and confirm there are no auto high-beam messages on the multi-information display (MID). If a message is present, check for DTC' **the How to Troubleshoot the Auto High-Beam (High-Beam Support System)** .



Auto High-Beam Problem



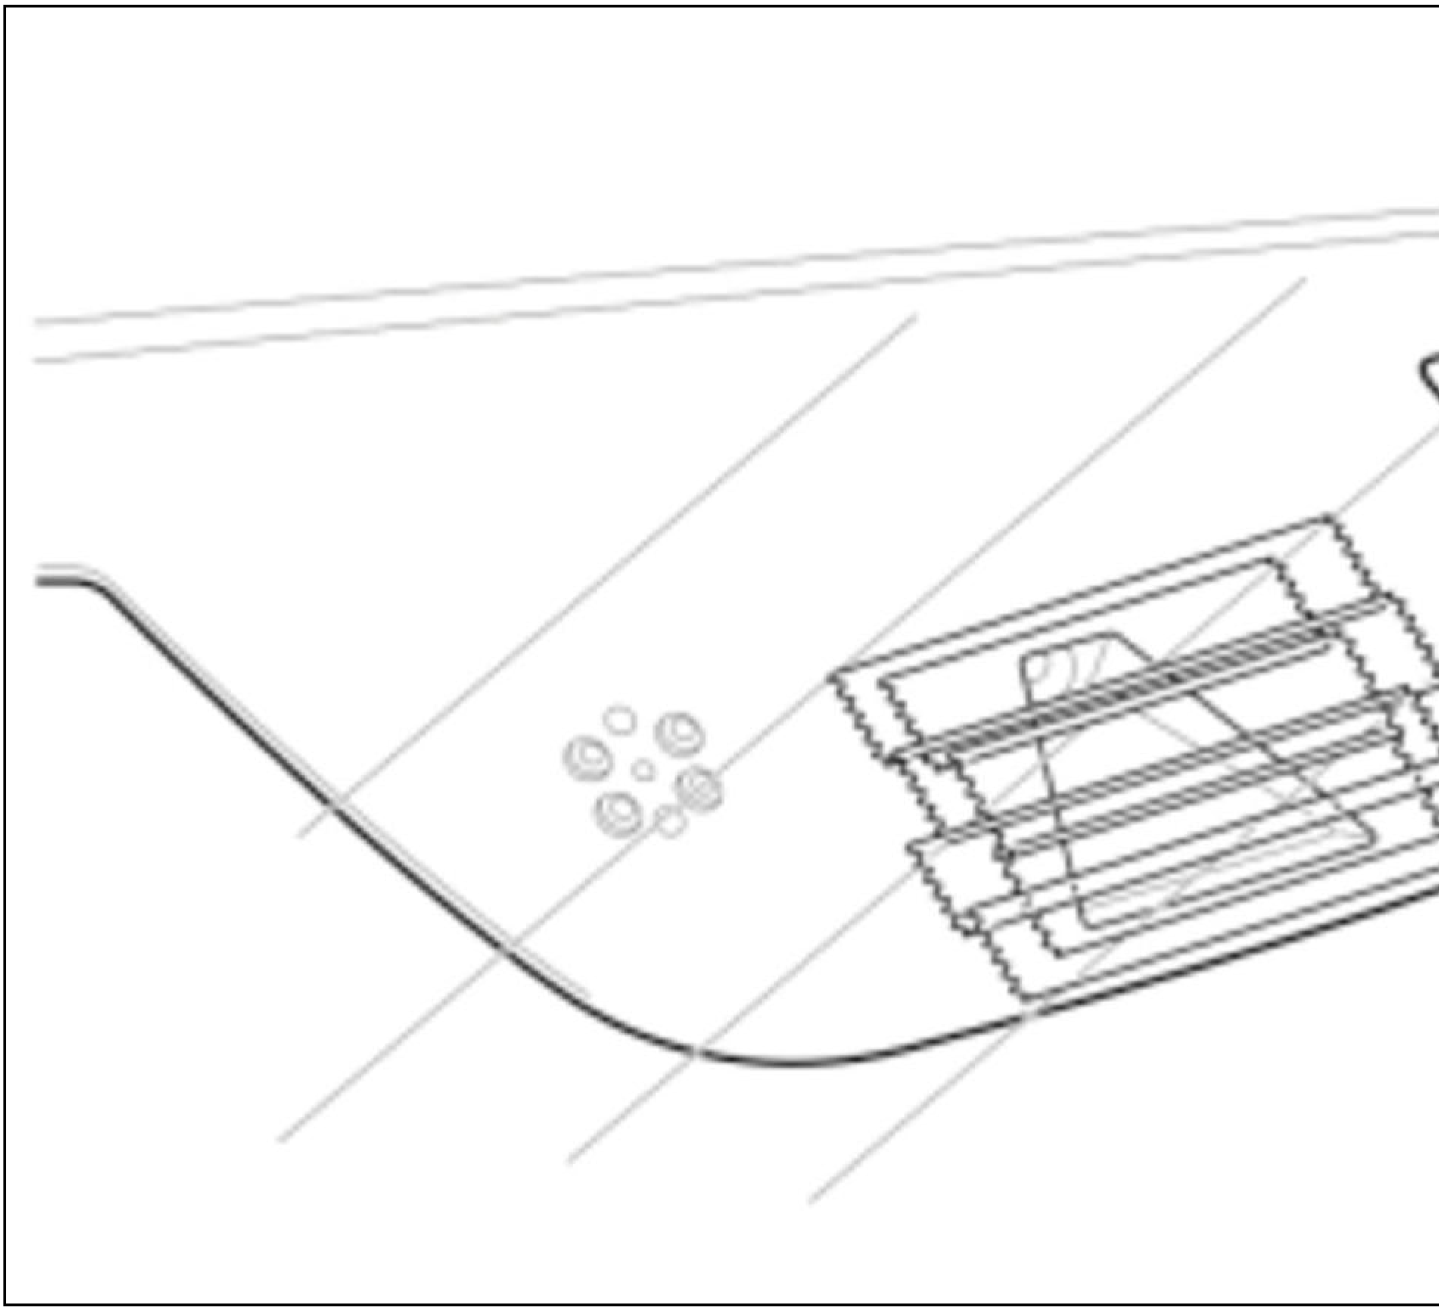
Auto High-Beam Cannot Operate: Clean Windshield

Cover the following areas with masking tape:

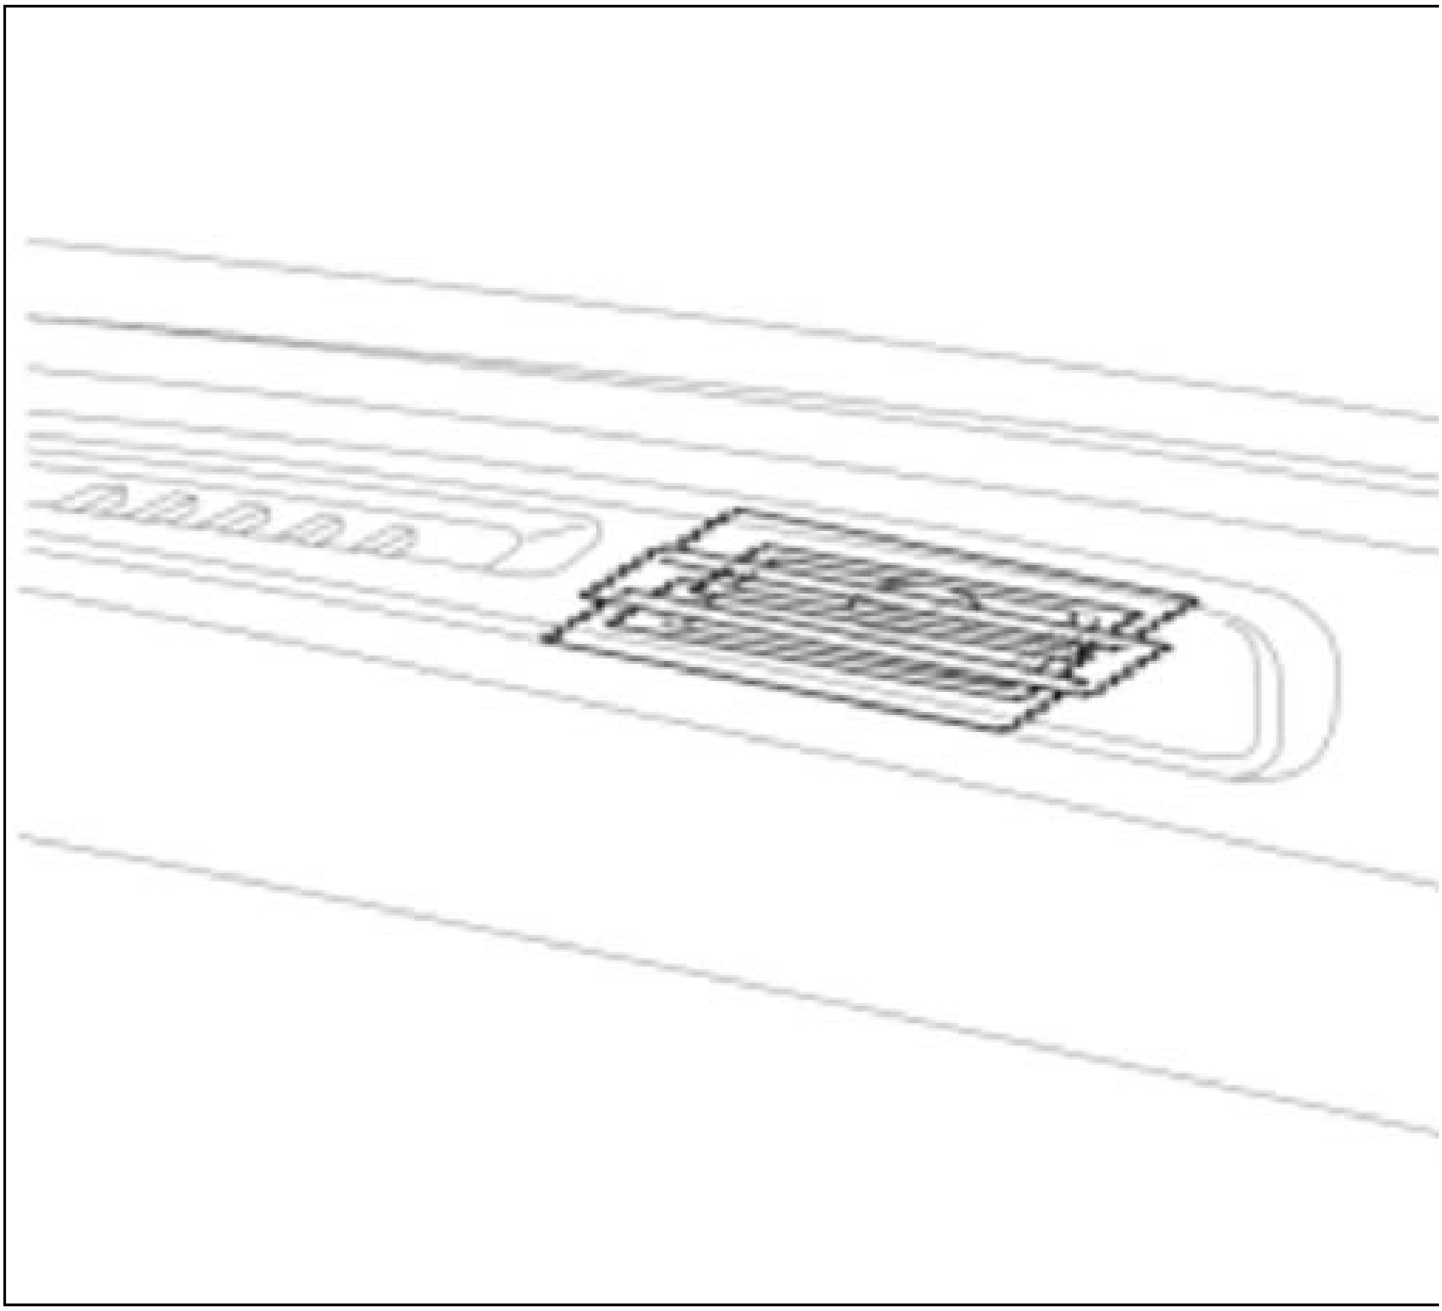
NOTE:

- The images shown are examples and may not match your vehicle.
- Apply two layers of masking tape to insure that the sensor and camera is blocked.

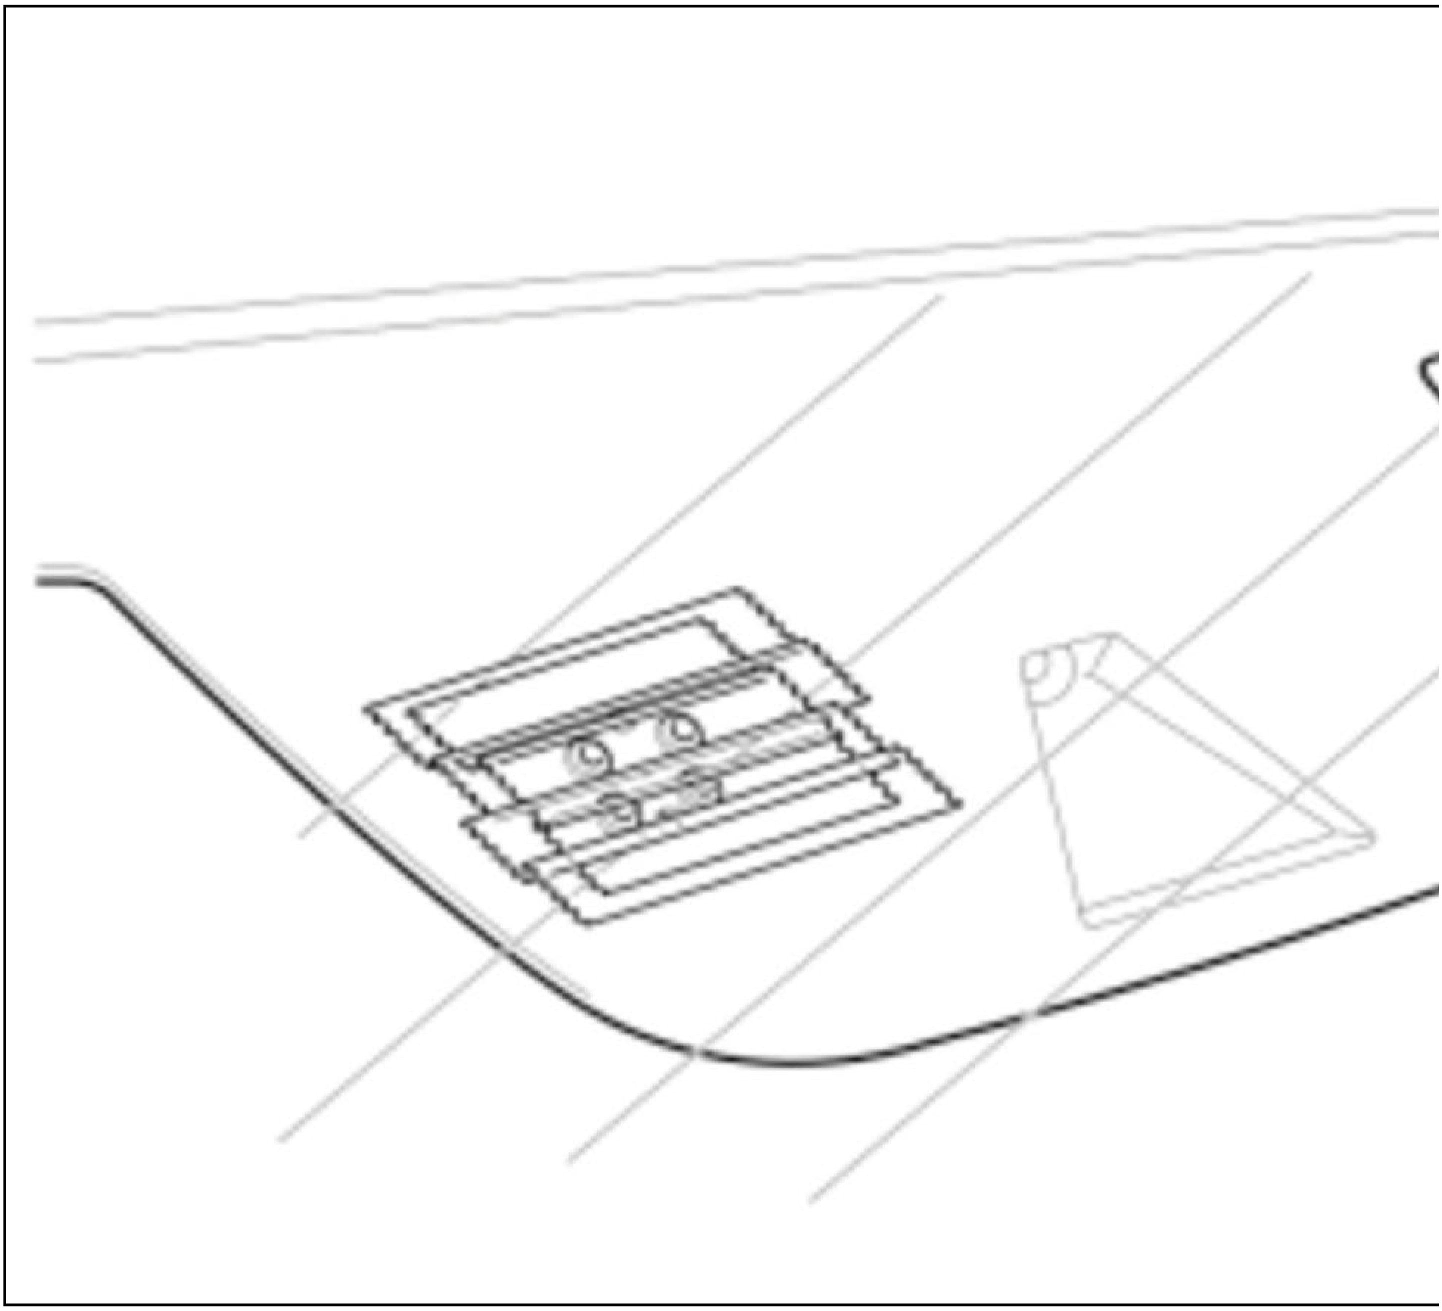
Multipurpose Camera (opening on the front windshield)



Automatic Lighting Control Unit-Sensor / Sunlight Sensor (entire sensor)



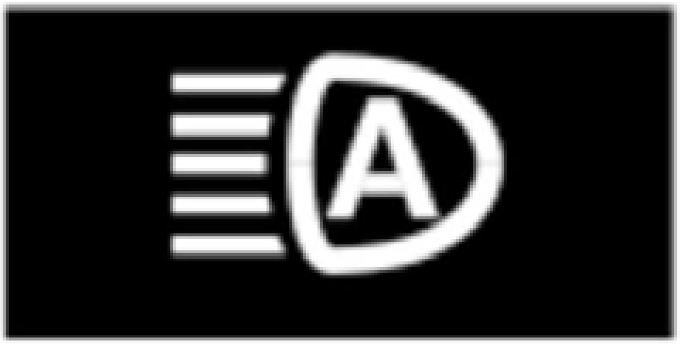
Automatic Lighting / Rain Sensor (opening on the front windshield)



3. Set the headlight switch to the low beam and AUTO positions.

4. Start the engine and confirm that the headlight low beam is on.Check the gauge control assembly.

- If the auto high-beam activation indicator is on, the system is normal and the test is complete.
- If the auto high-beam activation indicator is off, pull back the headlight switch lever back for at least 30 seconds until the auto high-beam activation indicator blin



A

DESCRIPTION & OPERATION

DRIVING POSITION MEMORY SYSTEM DESCRIPTION

Overview

The driving position memory system (DPMS) can automatically store the driver's seat position to one of two memorized presets. Drivers can activate the system using the driving position memory switch or the remote.

Along with the seat, the power door lock settings will also be memorized based on which remote (Driver 1 or Driver 2) is used.

Memorizing a Seat Position

Turn the vehicle to the ON mode, and then move the seat to the desired position. Press the SET button on the driving position memory switch, then both of the green LED will begin to flash. Press No. 1 or No. 2 to match the remote that is to be used. There will be two more beeps confirming that the seat position have been memorized. The LED will remain lit, unless the seat is moved from the memorized position.

Memorized Position Recall with the Remotes

After the seat position is memorized, the seat moves to the memorized position when the appropriate remote UNLOCK button is pressed and the driver's door is opened. When the seat moves to the memorized position, the green LED corresponding with that remote stays lit until the position is changed or the vehicle is turned to the OFF (LOCK) mode.

Memorized Customized Setting Recall with the Remotes

Customize settings are controlled independently between the Driver 1 and 2 remotes.

Failsafe Function

If a failure occurs related to the power supply and B-CAN inputs, the control unit detects an abnormal condition and enters a failsafe mode stopping control of the functions.

DRIVING POSITION MEMORY SYSTEM DESCRIPTION - COMPONENTS

Power Seat Control Unit/Power Seat Adjustment Switch

The power seat adjustment switch is located in the recline cover and combines the slide, recline, and the height switch.

Power Seat Motors/Seat Position Sensors

Each motor has a sensor that detects motor rotation and sends a pulse to the power seat control unit when the motor rotates. The control unit stores the number of pulses in its memory and uses it to memorize the seat position.

DRIVING POSITION MEMORY SYSTEM DESCRIPTION - SYSTEM DIAGRAM

MULTIPLEX INTEGRATED CONTROL SYSTEM DESCRIPTION

Overview

The body control module is one of the F-CAN and the B-CAN components. The body control module controls many systems related to the body controller area and security system, and also works as a gateway to diagnose the other B-CAN connected ECUs with the HDS.

Self-Diagnostic Function

The body control module provides the self-diagnostic function for checking the communication and input systems.

Communication Check (Test Mode 1):

When the B-CAN BUS or the connection to the gauge control module is disconnected, an error code is shown with the number of blinks of the individual map light.

Switch Input Check (Test Mode 2):

When the input of a switch or a sensor to the body control module has changed, diagnosis of the input system can be performed on the basis of the individual map light flashing count.

HDS Diagnostics

The HDS connects to the data link connector (DLC) to communicate with the vehicle's control units. This allows the HDS to retrieve DTCs, diagnostic data, or transmit forced commands during output function tests.

Customize Memory Function

The body control module has a feature that allows the settings of certain outputs to be customized to user preferences with the HDS.

Failsafe Function

Hardware Failsafe Control

When a CPU problem or an abnormal power supply voltage is detected, the body control module moves to the hardware failsafe mode, and each system output load is set to the pre-programmed failsafe value.

Software Failsafe Control

When any of the data from the B-CAN circuit cannot be received within a specified time, or an unusual combination of the data is recognized, the body control module moves to the software failsafe mode. The data that cannot be received is forced to a pre-programmed value.

REWRITE

BODY CONTROL MODULE UPDATE

Procedure

1. Body Control Module - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Refer to available service information for the latest information on update devices.

TEST

DRIVER'S POWER SEAT MOTOR TEST

Test

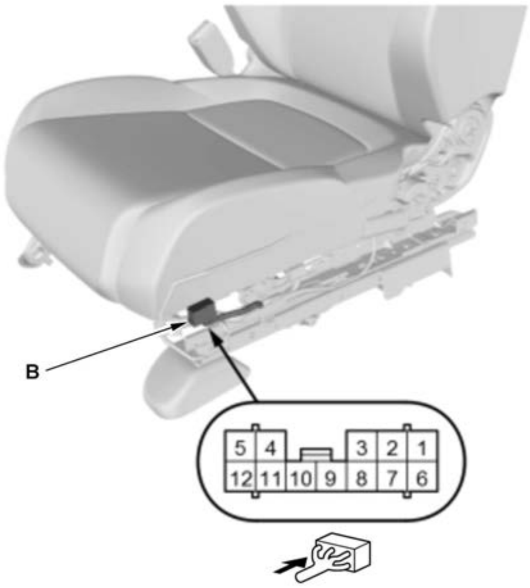
SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: After checking or replacing the power seat motors, **clear the driving position memory**.

1. **Driver's Seat Recline Cover - Remove**

   NOTE: When removing the driver's seat recline cover, you do not need to remove the driver's seat.

2. Driver's Power Seat Motor - Test



Terminal Direction		1	3
SLIDE MOTOR	Forward	⊖	⊕
	Backward	⊕	⊖

Terminal Direction		11	8
RECLINE MOTOR	Forward	⊖	⊕
	Backward	⊕	⊖

Terminal Direction		7	10
FRONT UP-DOWN MOTOR	UP	⊖	⊕
	DOWN	⊕	⊖

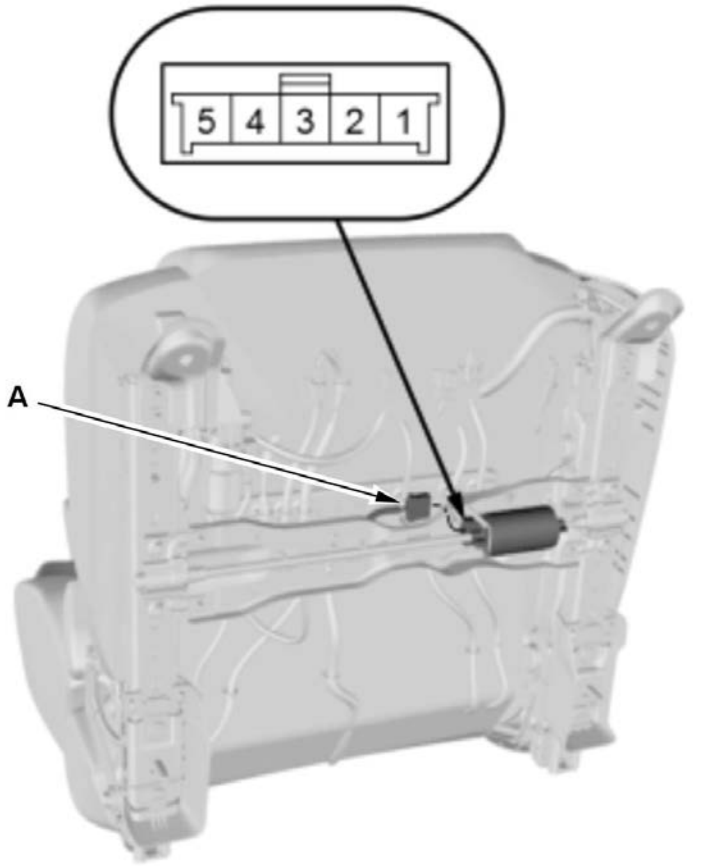
Terminal Direction		9	4
REAR UP-DOWN MOTOR	UP	⊕	⊖
	DOWN	⊖	⊕

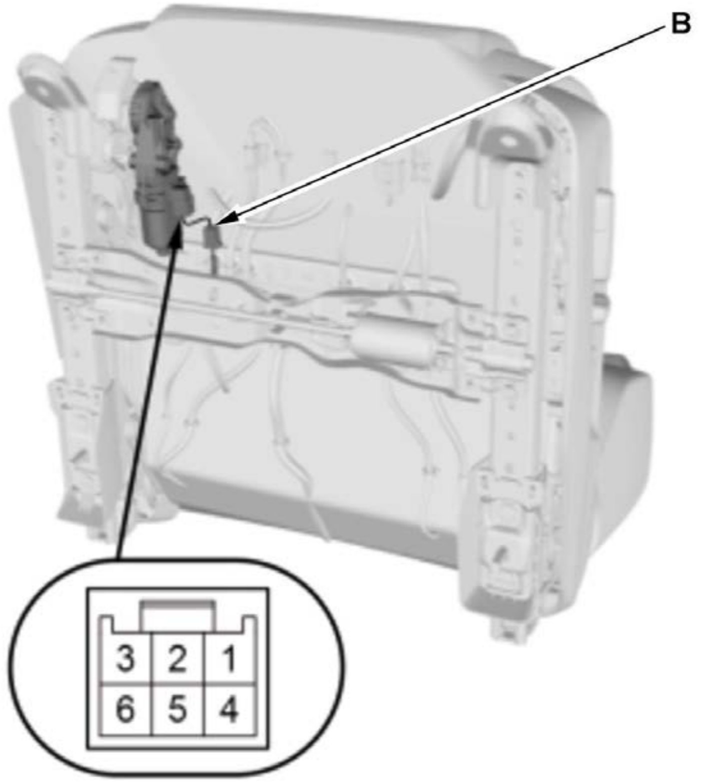
NOTE: Before testing, make sure not to short the power seat circuit.

1. Test the motor by applying power and ground at the power seat control unit/power seat adjustment switch connector B (12P) on the seat harness according to the table. When the motor stops running, disconnect 12 volt battery power immediately.

2. If the motor does not run or fails to run smoothly, **remove the driver's seat**

, go to step 3.

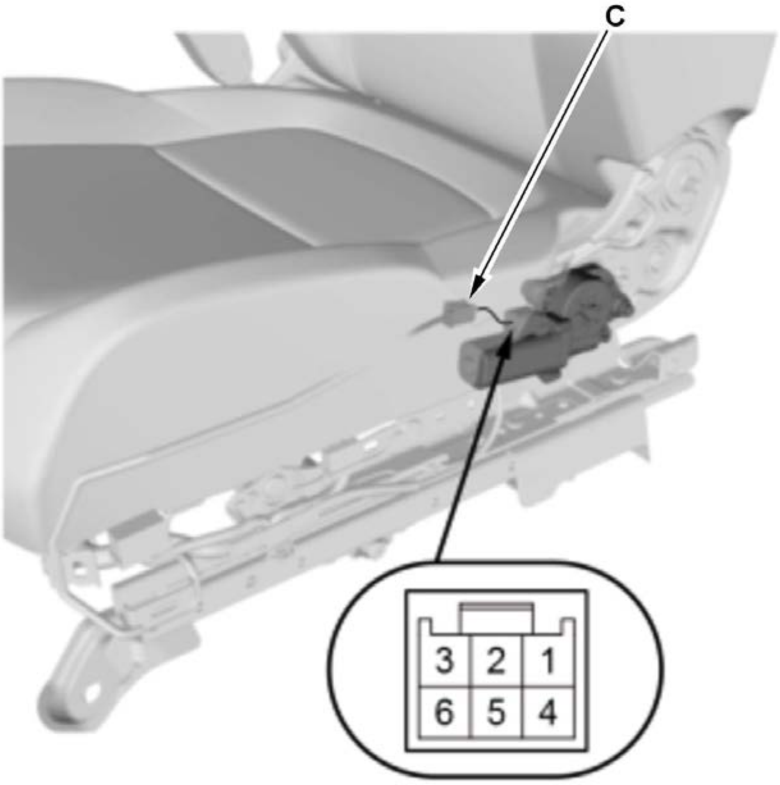




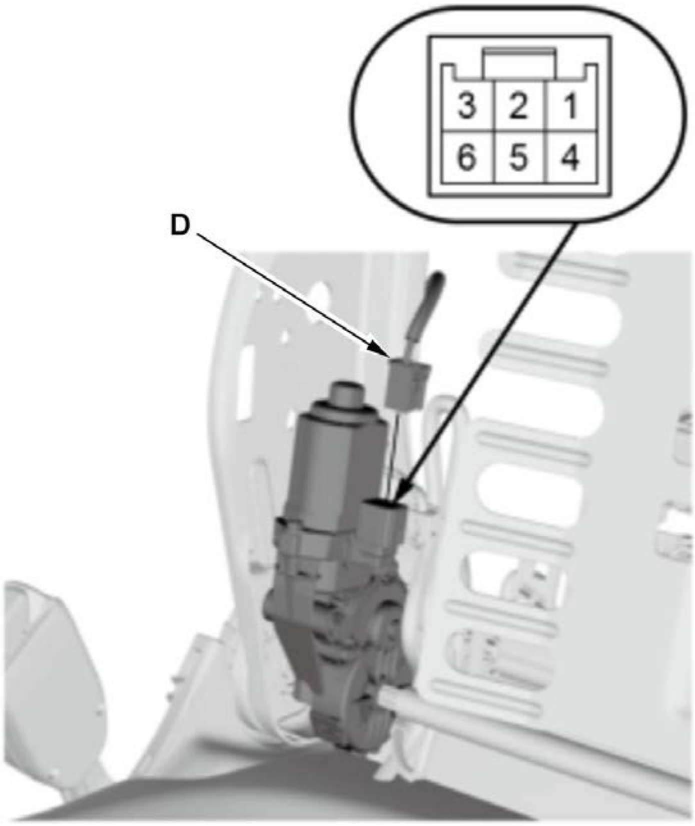
3. **Remove the driver's seat-back cover/pad as needed** .

4. Disconnect the following connectors:

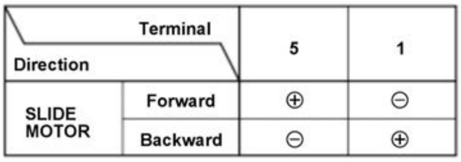
- Slide motor 5P connector (A)
- Front up-down motor 6P connector (B)
- Rear up-down motor 6P connector (C)
- Recline motor 6P connector (D)



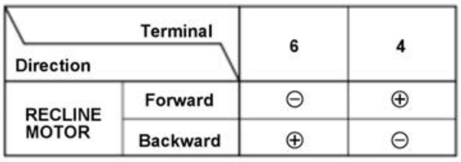
C



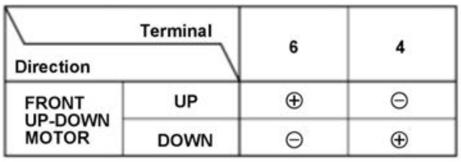
D



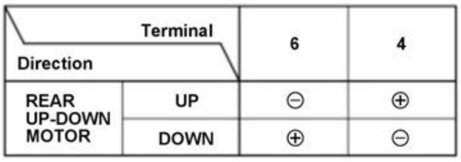
Terminal Direction		5	1
SLIDE MOTOR	Forward	⊕	⊖
	Backward	⊖	⊕



Terminal Direction		6	4
RECLINE MOTOR	Forward	⊖	⊕
	Backward	⊕	⊖



Terminal Direction		6	4
FRONT UP-DOWN MOTOR	UP	⊕	⊖
	DOWN	⊖	⊕



Terminal Direction		6	4
REAR UP-DOWN MOTOR	UP	⊖	⊕
	DOWN	⊕	⊖

5. Test each motor in each direction by connecting power and ground according to the table. When the motor stops running, disconnect 12 volt battery power immediately.

6. **If any motor fails to run or run smoothly, replace the seat frame** .

If the motor runs smoothly, replace the driver's seat wire harness.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. Driving Position Memory - Clear

1. After testing, **clear the driving position memory**.

MULTIPLEX INTEGRATED CONTROL SYSTEM SLEEP AND WAKE-UP MODE TEST

Shift to the sleep mode: Close all doors. Turn the vehicle to the OFF (LOCK) mode, then open and close the driver's door. If the body control module receives no signals from the inputs listed below, it will go into sleep mode in less than 40 seconds.

- IG1 power supply
- IG2 power supply
- B-CAN data
- Hazard warning switch (ON)

2. Confirm sleep mode:

NOTE: Check the official Honda service website for more service information about parasitic draw at the 12 volt battery. Check the parasitic draw at the 12 volt battery while entering sleep mode; amperage should change from about 200 mA to less than 35 mA in less than 40 seconds. Shift to wake-up mode: When turning the vehicle to the ON mode, the body control module, the gauge control module, the power window master switch, and the PCM will wake-up at the same time without "talking" to each other through the communication lines. When any switch in the multiplex integrated control system is turned on, it wakes up its related control unit which, in turn, wakes up the other units. After confirming the sleep mode, look in the following table for the switch most related to the problem. Operate that switch and see if its control unit wakes up.

NOTE: If any control unit is faulty and does not wake up, several circuits in the system malfunction at the same time. Below is a list of the switches and input signals that wake them up.

- IG1 power supply
- IG2 power supply
- ACC power supply
- B-CAN data
- F-CAN data
- Driver's door lock switch (LOCK/UNLOCK)
- Front passenger's door lock switch (LOCK/UNLOCK)
- Driver's door switch (door open)
- Front passenger's door switch (door open)
- Left rear door switch (door open)
- Right rear door switch (door open)
- Tailgate latch switch (tailgate open)
- Tailgate opener switch (ON)
- Tailgate outer handle switch (ON)
- Hood latch switch (hood closed)
- Driver's door key cylinder switch (LOCK/UNLOCK)
- Driver's door lock knob switch (LOCK/UNLOCK)
- Front passenger's door lock knob switch (LOCK/UNLOCK)
- Left rear door lock knob switch (UNLOCK)
- Right rear door lock knob switch (UNLOCK)
- Hazard warning switch (ON)
- Combination light switch (Parking, Headlight, Dimmer, Passing, Fog ON)
- SBW shifter control module (P)
- Audio security switch (ON)

LEARNING RESET CLEAR

DRIVING POSITION MEMORY CLEAR

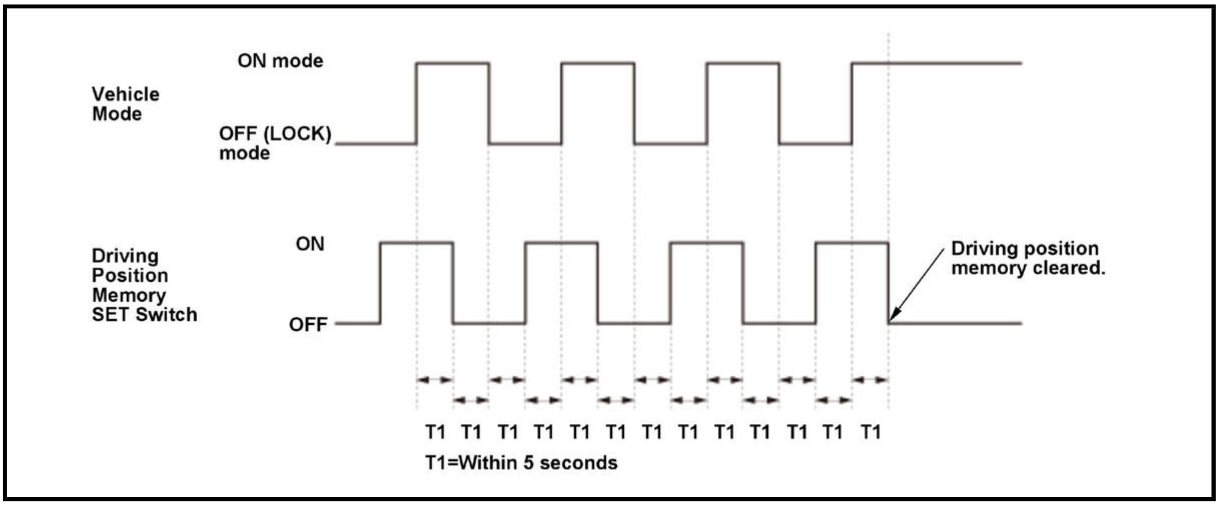
Procedure

Clear the driving position memory after doing any of the following actions:

- Power seat motor test or replacement.
- Substituting a known-good power seat control unit.

NOTE: When the driving position is cleared from the power seat control unit, the driving positions for both Position 1 and 2 are also cleared.

1. Driving Position Memory - Clear
    1. Turn the vehicle to the OFF (LOCK) mode.



Vehicle Mode
ON mode
OFF (LOCK) mode
Driving Position Memory SET Switch
ON
OFF
Driving position memory cleared.
T1 T1 T1 T1 T1 T1 T1 T1 T1 T1 T1 T1 T1
T1=Within 5 seconds

2. Press and hold the SET button of the driving position memory switch.

3. Turn the vehicle to the ON mode.

4. Release the SET button of the driving position memory switch.

5. Repeat steps 1-4 three more times.

NOTE:

- Once the memory is successfully cleared, the driving position memory switch indicator 1 and 2 turn on for 3 seconds.
- If the indicators do not turn on, go back to step 1 and repeat the procedure.

DTC TROUBLESHOOTING INDEX

DRIVING SUPPORT DTC TROUBLESHOOTING INDEX

NOTE:

- The DTC troubleshooting index shows DTCs that is stored in the integrated driver support system. Each function of the integrated driver support system operates differently according to which DTC is stored. The functions of the integrated driver support system that operate in condition when these DTCs are stored can be confirmed with the table below:

  x: Indicator ON, and operation stop

  o: Operation stop

  Δ: Indicator blink, and operation stop

- For the millimeter wave radar, different indicators may be lit for the same DTCs depending on which functions are in operation at the time of DTC stores. Make sure to check following DTCs with asterisks before troubleshoot them.

NOTE: For details on the functions of indicator, and operation stop, refer to "How to Troubleshooting Information".

- **How to Troubleshoot the Adaptive Cruise Control (ACC)**
- **How to Troubleshoot the Collision Mitigation Braking System (CMBS)**
- **How to Troubleshoot the Lane Keeping Assist System (LKAS)**
- **How to Troubleshoot the Road Departure Mitigation**
- **Brake System (How to Troubleshoot the VSA System)**
- **How to Troubleshoot the Auto High-Beam**

HOW TO INFORMATION

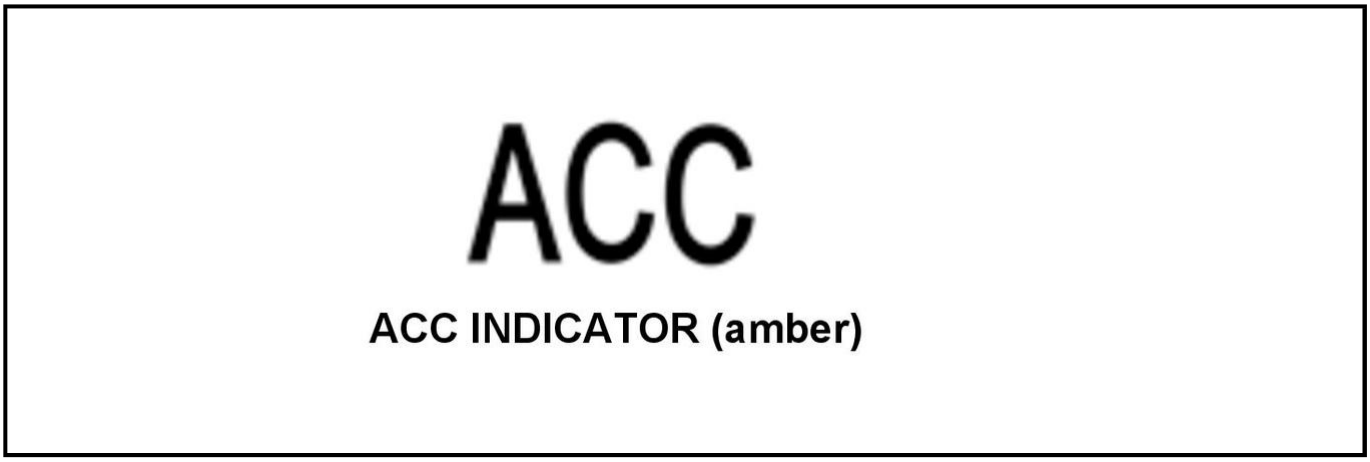
HOW TO TROUBLESHOOT THE ADAPTIVE CRUISE CONTROL (ACC)

ACC Indicator (Amber)

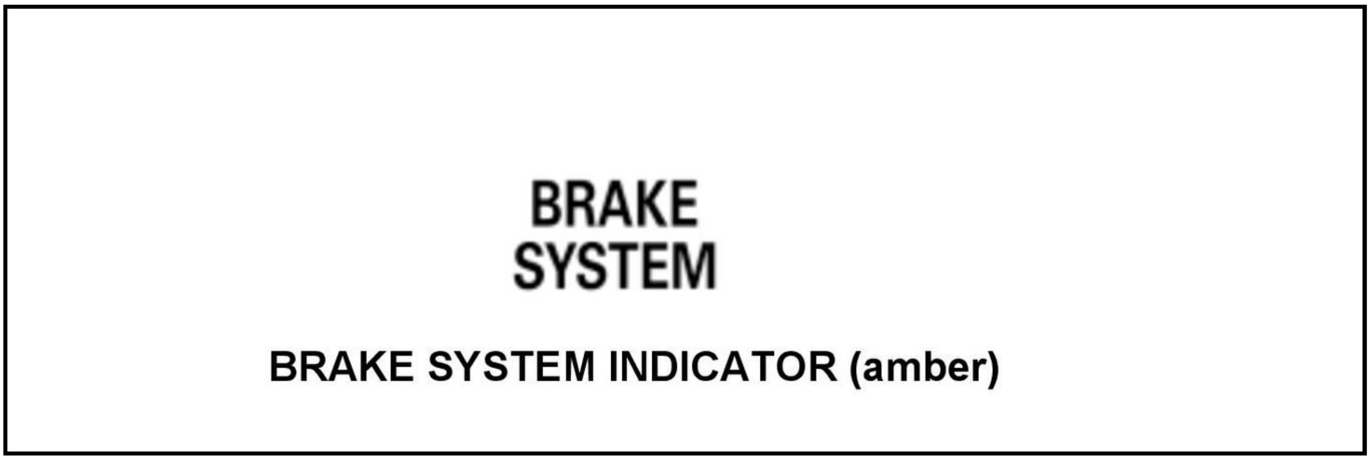
When the ACC system detects a problem, the ACC system stops working, then the ACC indicator and the brake system indicator (amber) stay on.

NOTE:

- For locations of each indicator, **refer to System Warning/Indicator Index** .
- For ACC function, **review the Adaptive Cruise Control (ACC) Description** .
- The ACC system communicates with other control units via F-CAN. For ACC system diagram, **review the ACC System Diagram** . If a connected unit malfunctions, the ACC system will not operate. In this case, both ACC indicator and connected unit indicator come on and stay on (except for the gauge control module).
- Some detected abnormalities may not turn on the brake system indicator.



ACC INDICATOR (amber)



BRAKE SYSTEM INDICATOR (amber)

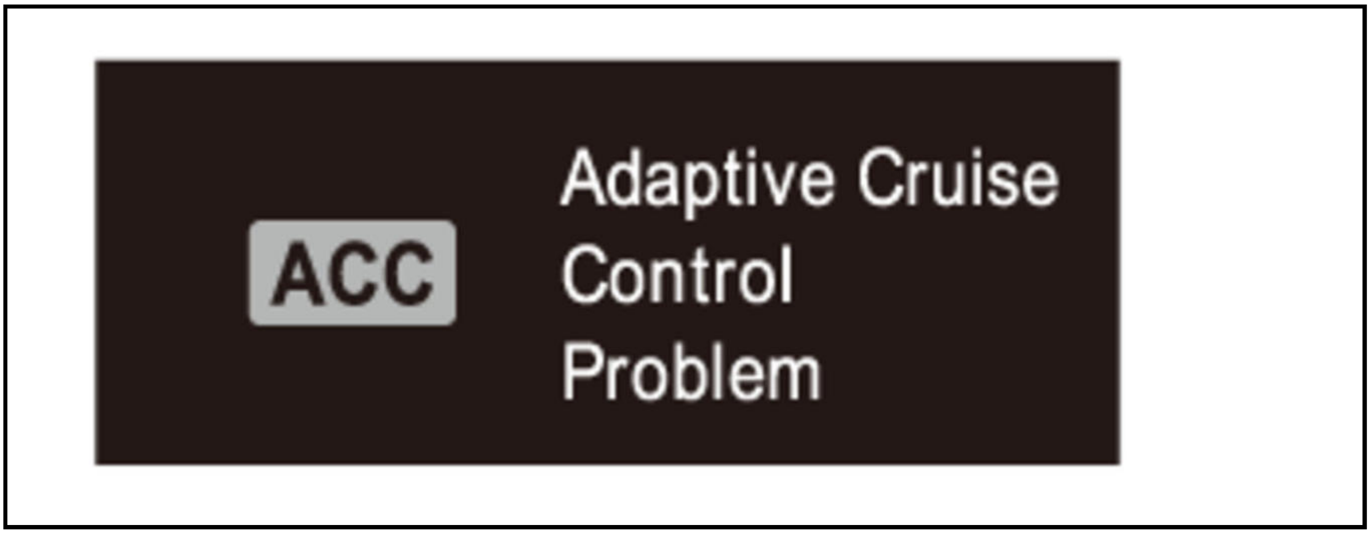
ACC Activation Indicator (Green)

If the ACC system is normal, the ACC activation indicator comes on when the function is on, and goes off when the function is off. If the system malfunctions, the indicator color changes from green to amber, and stays on.

Self-Diagnostic Function

The ACC system has a self-diagnostic function. When a problem is detected by the self-diagnostic function, the ACC system stops operating, turns on the ACC indicator, indicates the problem on the multi-information display (MID), and stores a DTC.

MID



Adaptive Cruise Control Problem

Millimeter Wave Radar

The millimeter wave radar measures the distance between your vehicle and the vehicle directly ahead to calculate the difference in speed between the vehicles.

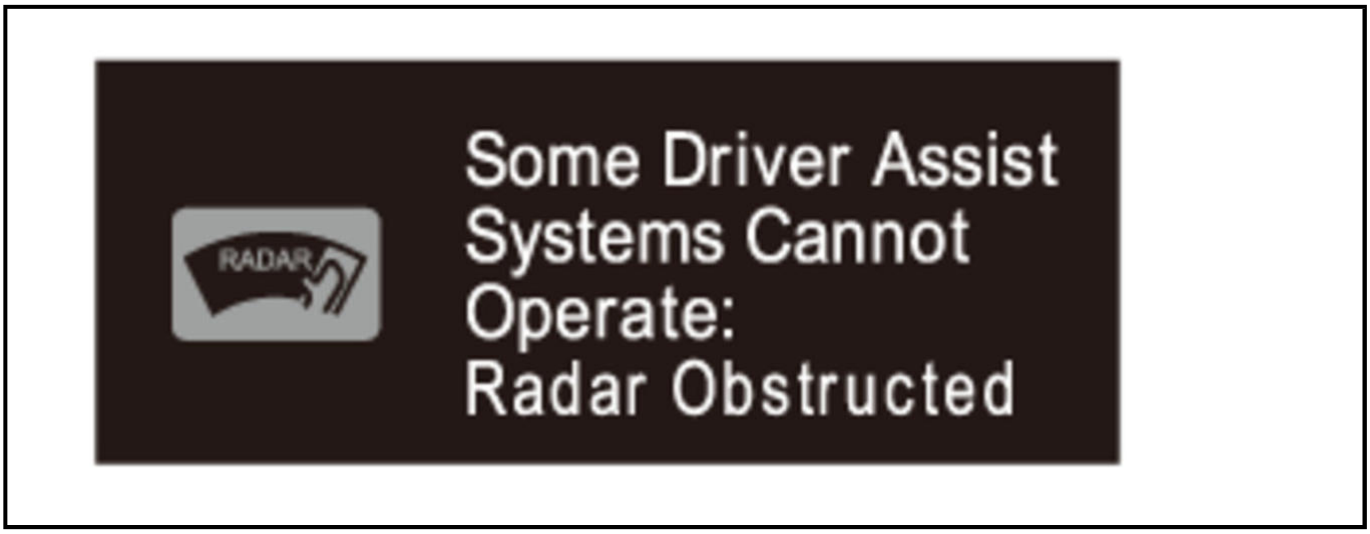
The millimeter wave radar has a self-diagnostic function. If the system detects a problem, it disables the ACC, and turns on the ACC indicator.

Dirt or Dust Detective Function (Clean Millimeter Wave Radar Indication)

If the millimeter wave radar or front grille gets dirty, the ACC system stops operating and the following message on the MID will appear. Clean the millimeter wave radar and the front grille surface. Once the millimeter wave radar and front grille surface are clean, the message on the MID disappears and the ACC system automatically turns on.

NOTE:

- The following MID message may come on temporarily when passing through an enclosed space, such as tunnel.
- Under the above conditions DTC P2583-97 is stored.
- When it is snowing, the radio waves transmitted and received by the millimeter wave radar may be refracted by the snow or ice attached around the millimeter wave radar such as the front grille. At this time, DTC P2583-76 is stored depending on the situation.
- After DTC P2583-76 is stored, the message (Radar Obstructed) is displayed on the MID at the initial stage, and then the indicators come on.



Some Driver Assist Systems Cannot Operate:
Radar Obstructed

Millimeter Wave Radar Aiming

If the millimeter wave radar is removed or replaced, you must do the millimeter wave radar aiming procedure, otherwise the ACC indicator blinks.

Multipurpose Camera Unit

The multipurpose camera unit uses inputs from the millimeter wave radar to maintain a constant distance between your vehicle and the vehicle directly ahead by accelerating and braking as needed.

The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected.

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the ACC indicator blinks.

CAN Communication

The ACC system communicates with other control units via F-CAN. For ACC system diagram, **review the ACC System Diagram** .

If the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the ACC system will not operate even though it is OK. In this case, both the ACC indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTCs. If intermittent failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check for DTCs with the HDS, then clear the DTC.

NOTE: For ACC system DTCs, **refer to the DTC troubleshooting index**.

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.

- If the symptom does not appear and the ACC indicator does not come on while test-driving, but if your troubleshooting was based on a DTC, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the ACC indicator does not come on.
- The ACC system sometimes stops operating because of certain environmental conditions (weather, road conditions, driving conditions, etc.). Intermittent failure DTCs or **ACC System Auto Stop Control Codes** may be stored in these cases.

How to Retrieve DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. Use the HDS to check for Integrated Driver Support System DTCs.

3. Read and record the DTC.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. In the Driving Support of the HDS, select Integrated Driver Support System, then DTCs, choose the clear DTCs icon, and follow the prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS.

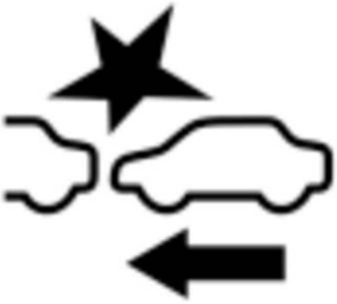
HOW TO TROUBLESHOOT THE COLLISION MITIGATION BRAKING SYSTEM (CMBS)

CMBS Indicator (Amber)

When the CMBS detects a problem, the CMBS stops working, then the CMBS indicator and the brake system indicator (amber) stay on.

NOTE:

- For locations of each indicator, **refer to System Warning/Indicator Index** .
- For CMBS function, **review the Collision Mitigation Braking System (CMBS) Description** .
- The CMBS communicates with other control units via F-CAN. For CMBS diagram, **refer to the System Diagram for CMBS** . If a connected unit malfunctions, the CMBS will not operate. In this case, both CMBS indicator and connected unit indicator come on and stay on (except for the gauge control module).
- Some detected abnormalities may not turn on the brake system indicator.



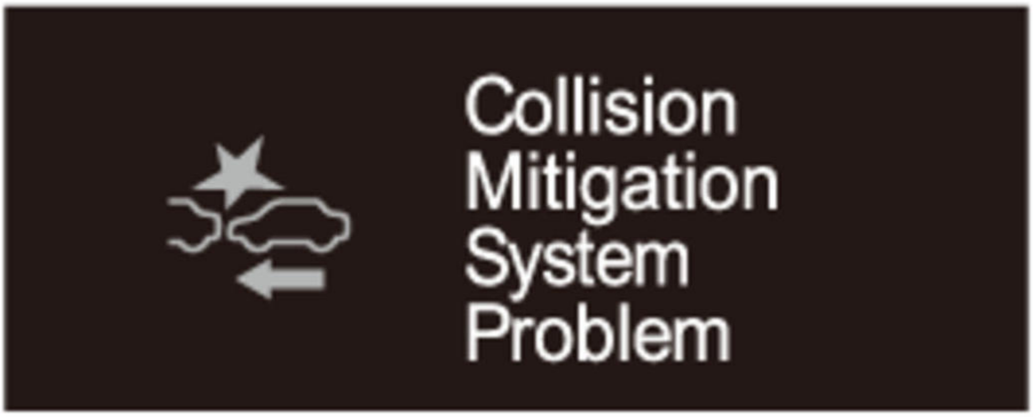
CMBS INDICATOR (amber)

BRAKE
SYSTEM

BRAKE SYSTEM INDICATOR (amber)

Self-Diagnostic Function

The CMBS has a self-diagnostic function. When a problem is detected by the self-diagnostic function, the CMBS stops operating, turns on the CMBS indicator, indicates the problem on the multi-information display (MID), and stores a DTC.



Collision
Mitigation
System
Problem

CMBS OFF Switch

Press and hold the CMBS OFF switch for at least 1 second to turn the CMBS off and on.

CMBS Indication

- When the CMBS is OK, the CMBS indicator comes on for a few seconds, then goes off after turning the vehicle to the ON mode.
- When you set the CMBS to OFF, the multipurpose camera unit turns on the CMBS indicator.

- When the system is activated, the MID indicates a brake system warning indicator and a warning buzzer sounds.
- If the system stops operating because of a problem, the MID indicates the problem.

Millimeter Wave Radar

The millimeter wave radar measures the distance between your vehicle and the vehicle directly ahead to calculate the difference in speed between the vehicles.

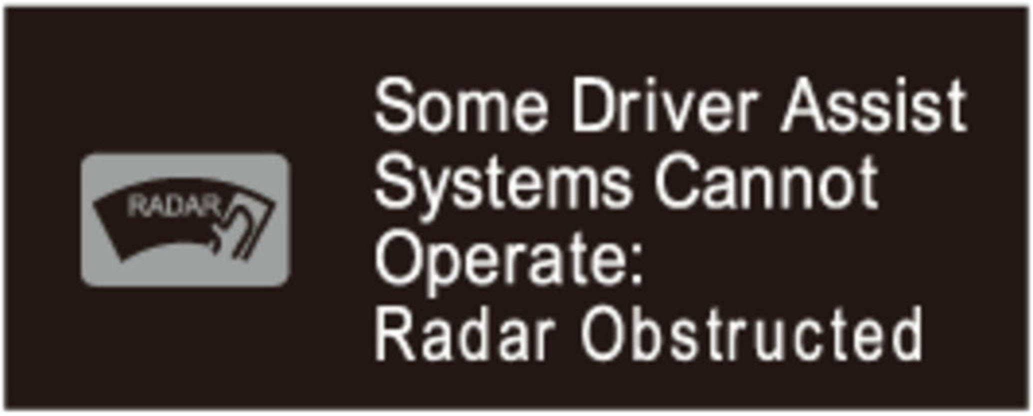
The millimeter wave radar has a self-diagnostic function. If the system detects a problem, it disables the CMBS, and turns on the CMBS indicator.

Dirt or Dust Detective Function (Clean Millimeter Wave Radar Indication)

If the millimeter wave radar or front grille gets dirty, the CMBS stops operating and the following message on the MID will appear. Clean the millimeter wave radar and the front grille surface. Once the millimeter wave radar and front grille surface are clean, the message on the MID disappears and the CMBS automatically turns on.

NOTE:

- The following MID message may come on temporarily when passing through an enclosed space, such as tunnel.
- Under the above conditions DTC P2583-97 is stored.
- When it is snowing, the radio waves transmitted and received by the millimeter wave radar may be refracted by the snow or ice attached around the millimeter wave radar such as the front grille. At this time, DTC P2583-76 is stored depending on the situation.
- After DTC P2583-76 is stored, the message (Radar Obstructed) is displayed on the MID at the initial stage, and then the indicators come on.



Some Driver Assist Systems Cannot Operate:
Radar Obstructed

Millimeter Wave Radar Aiming

If the millimeter wave radar is removed or replaced, you must do the millimeter wave radar aiming procedure, otherwise the CMBS indicator blinks.

Multipurpose Camera Unit

The multipurpose camera unit controls the brakes and the various driver warnings when the system recognizes the possibility of a collision.

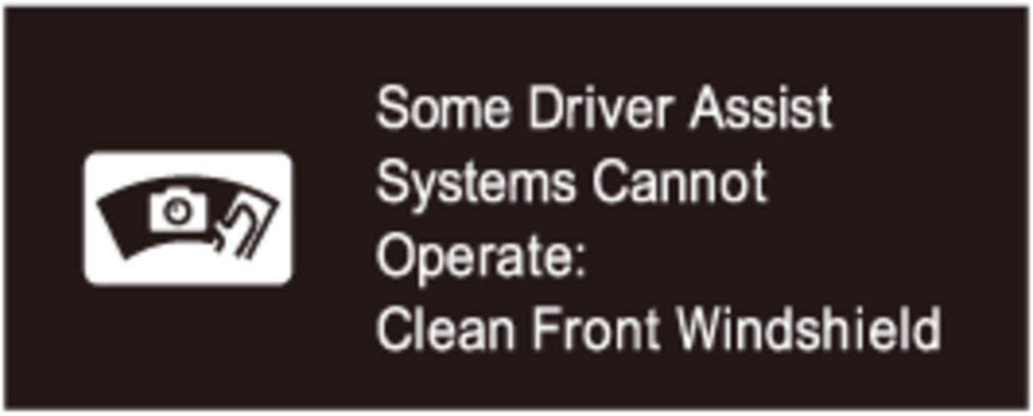
The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected. The millimeter wave radar receives this information from the multipurpose camera unit.

Dirt or Dust Detective Function (CLEAN FRONT WINDSHIELD Indication)

If the following message appears on the MID, the camera lens or the windshield has enough dirt so that the camera view is obstructed, the CMBS stops operating.

Clean any dirt or contamination on the camera lens or the windshield. Once the camera's view is unobstructed, the indicator on the MID turns off and the CMBS automatically turns back to ON.

NOTE: When millimeter wave radar detected dirt or dust on the multipurpose camera lens or the windshield surface, DTC B2A60-97 is stored as a past failure.

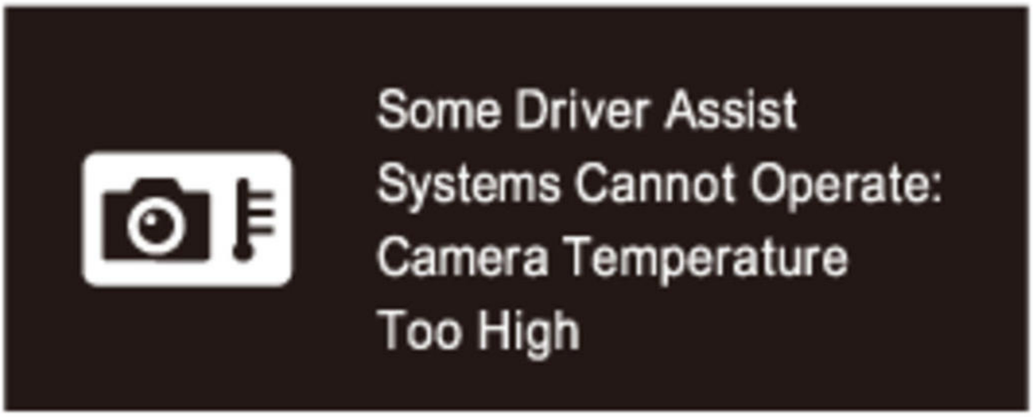


Some Driver Assist
Systems Cannot
Operate:
Clean Front Windshield

System Protect Function (High temperature) (MULTIPURPOSE CAMERA HOT Indication)

If the following message appears on the MID, the CMBS stops operating, and stores a DTC.

When the multipurpose camera temperature cools down to its proper operating temperature, the indicator on the MID turns off, and the CMBS automatically resumes operation.



Some Driver Assist
Systems Cannot Operate:
Camera Temperature
Too High

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the CMBS indicator blinks.

CAN Communication

The CMBS communicates with other control units via F-CAN. For CMBS diagram, refer to the System Diagram for CMBS .

If the millimeter wave radar and the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the CMBS system will not operate even though it is OK. In this case, both the CMBS indicator and the related unit indicator will come on and stay on.

How to Troubleshoot DTCs

Check for DTCs with the HDS, then clear the DTC.

NOTE: For CMBS DTCs, **refer to the DTC troubleshooting index**.

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the CMBS indicator does not come on while test-driving, but troubleshooting is done based on the DTC, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the CMBS indicator does not come on.
- The CMBS may sometimes stop control because of the environment (weather, road conditions, driving conditions, etc.). Intermittent failure DTCs may be stored in these cases.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTCs. If intermittent failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Retrieve DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. Use the HDS to check for Integrated Driver Support System DTCs.

3. Read and record the DTC.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. In the Driving Support of the HDS, select Integrated Driver Support System, then DTCs, choose the clear DTCs icon, and follow the prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS.

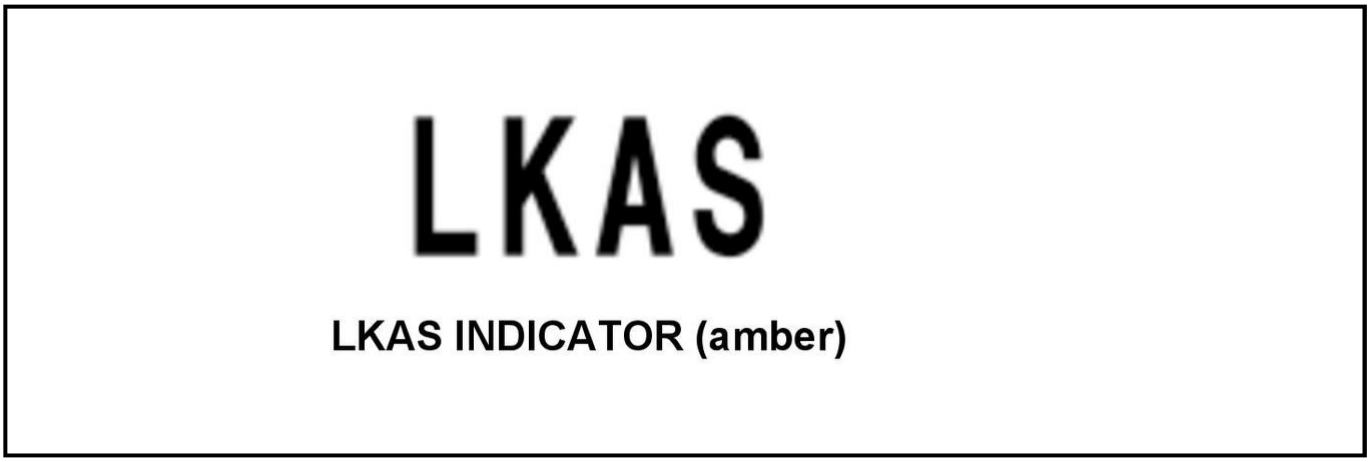
HOW TO TROUBLESHOOT THE LANE KEEPING ASSIST SYSTEM (LKAS)

LKAS Indicator (Amber)

When the LKAS detects a problem, the LKAS stops working, then the LKAS indicator stays on.

NOTE:

- For locations of the indicator, refer to System Warning/Indicator Index .
- For LKAS function, review the Lane Keeping Assist System (LKAS) Description .
- The LKAS communicates with other control units via F-CAN. For LKAS diagram, refer to the System Diagram for LKAS . If a connected unit malfunctions, the LKAS will not operate. In this case, both LKAS indicator and connected unit indicator come on and stay on (except for the gauge control module).

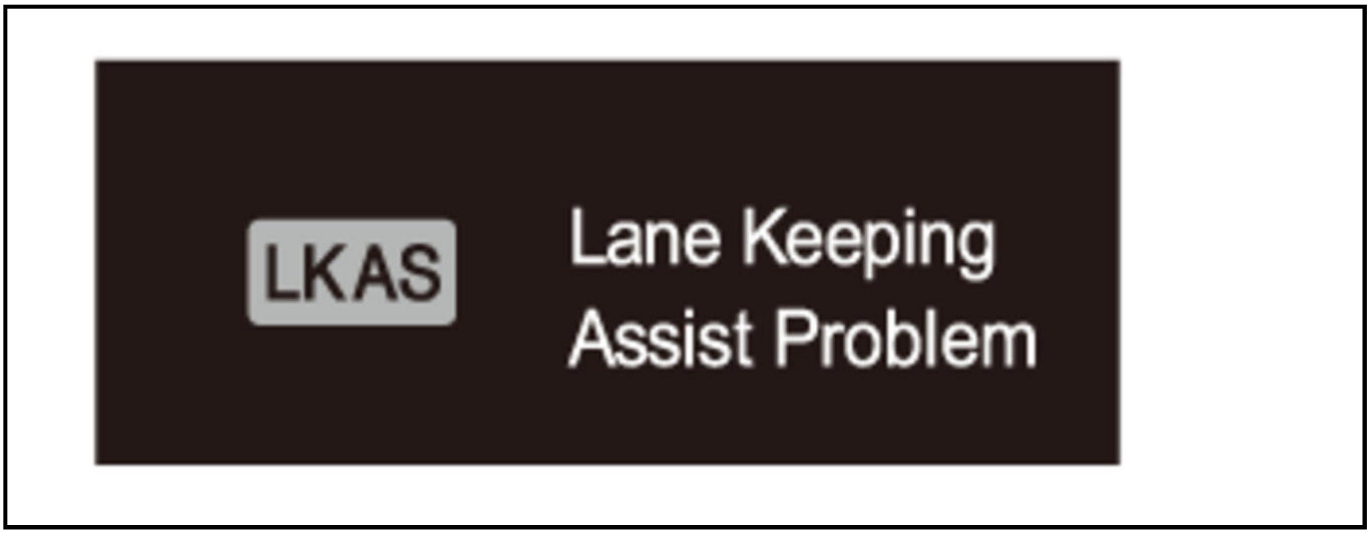


LKAS Activation Indicator (Green)

If the LKAS is normal, the LKAS activation indicator comes on when the function is on, and goes off when the function is off. If the system malfunctions, the indicator color changes from green to amber, and stays on.

Self-Diagnostic Function

The LKAS has a self-diagnostic function. When a problem is detected by the self-diagnostic function, the LKAS stops operating, turns on the LKAS indicator, indicates the problem on the multi-information display (MID), and stores a DTC.



LKAS

Lane Keeping Assist Problem

Millimeter Wave Radar

The millimeter wave radar measures the distance between your vehicle and the vehicle directly ahead to calculate the difference in speed between the vehicles.

The millimeter wave radar has a self-diagnostic function. If the system detects a problem, it disables the LKAS, and turns on the LKAS indicator.

Multipurpose Camera Unit

Multipurpose camera unit function sends the lane image which was received by the multipurpose camera to the multipurpose camera unit. Also, it is equipped with an error detection feature which sends error data to the multipurpose camera unit when a malfunction is detected.

The multipurpose camera unit communicates with the gauge control module to send a warning signal.

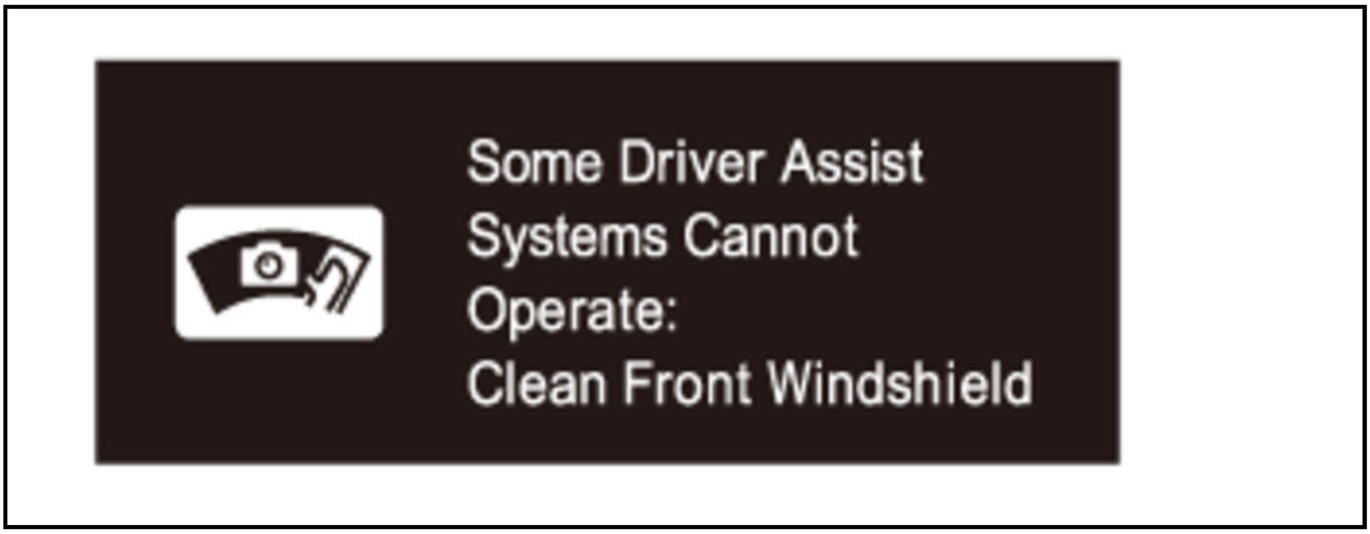
The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected. The millimeter wave radar receives this information from the multipurpose camera unit.

Dirt or Dust Detective Function (CLEAN FRONT WINDSHIELD Indication)

If the following message appears on the MID, the camera lens or the windshield has enough dirt so that the camera view is obstructed, the LKAS stops operating.

Clean any dirt or contamination on the camera lens or the windshield. Once the camera's view is unobstructed, the indicator on the MID turns off and the LKAS automatically turns back to ON.

NOTE: When millimeter wave radar detected dirt or dust on the multipurpose camera lens or the windshield surface, DTC B2A60-97 is stored as a past failure.

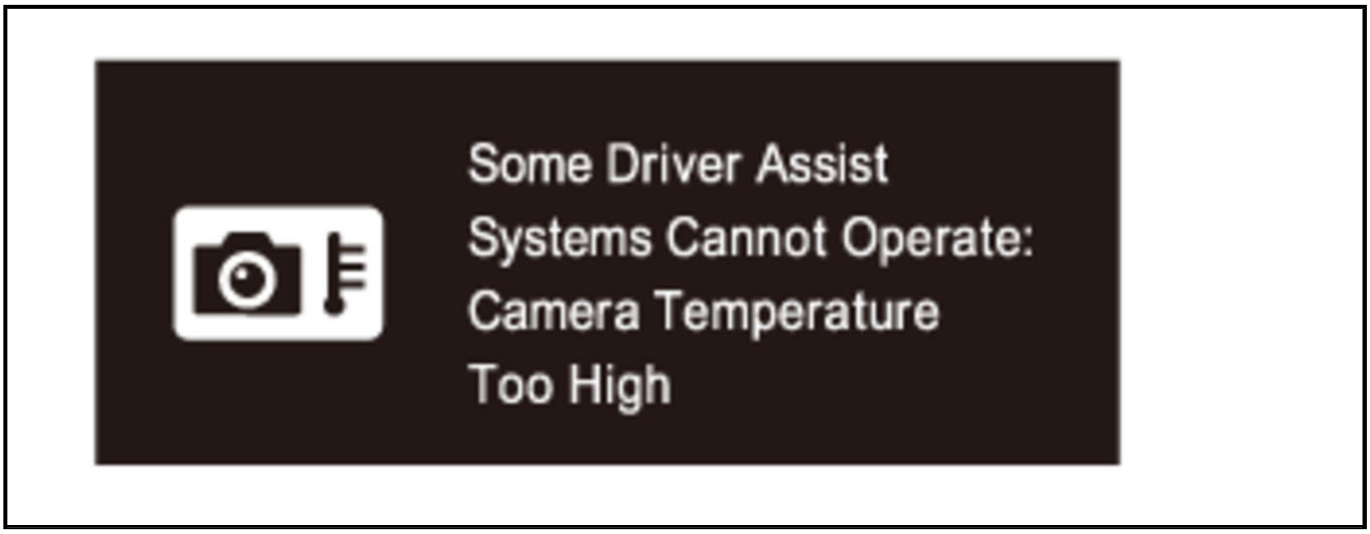


Some Driver Assist
Systems Cannot
Operate:
Clean Front Windshield

System Protect Function (High temperature) (MULTIPURPOSE CAMERA HOT Indication)

If the following message appears on the MID, the LKAS stops operating, and stores a DTC.

When the multipurpose camera temperature cools down to its proper operating temperature, the indicator on the MID turns off, and the LKAS automatically resumes operation.



Some Driver Assist Systems Cannot Operate: Camera Temperature Too High

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the LKAS indicator blinks.

CAN Communication

The LKAS communicates with other control units via F-CAN. For LKAS diagram, **refer to the System Diagram for LKAS** .

If the millimeter wave radar and the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the LKAS system will not operate even though it is OK. In this case, both the LKAS indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTCs. If intermittent failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check for DTCs with the HDS, then clear the DTC.

NOTE: For LKAS DTCs, **refer to the DTC troubleshooting index**.

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the LKAS indicator does not come on while test-driving and if your troubleshooting was based on a DTC, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the LKAS indicator does not come on.
- The LKAS sometimes stops operating because of the environment (weather, road conditions, driving conditions, etc.). A code may be stored in these cases.

How to Retrieve DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. Connect the HDS

2. Use the HDS to check for Integrated Driver Support System DTCs.

3. Read and record the DTC.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. Connect the HDS

2. In the Driving Support of the HDS, select Integrated Driver Support System, then DTCs, choose the clear DTCs icon, and follow the prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS.

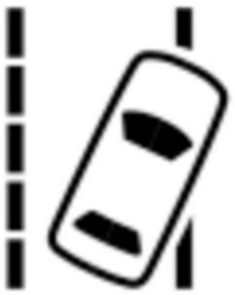
HOW TO TROUBLESHOOT THE ROAD DEPARTURE MITIGATION

RDM Indicator (Amber)

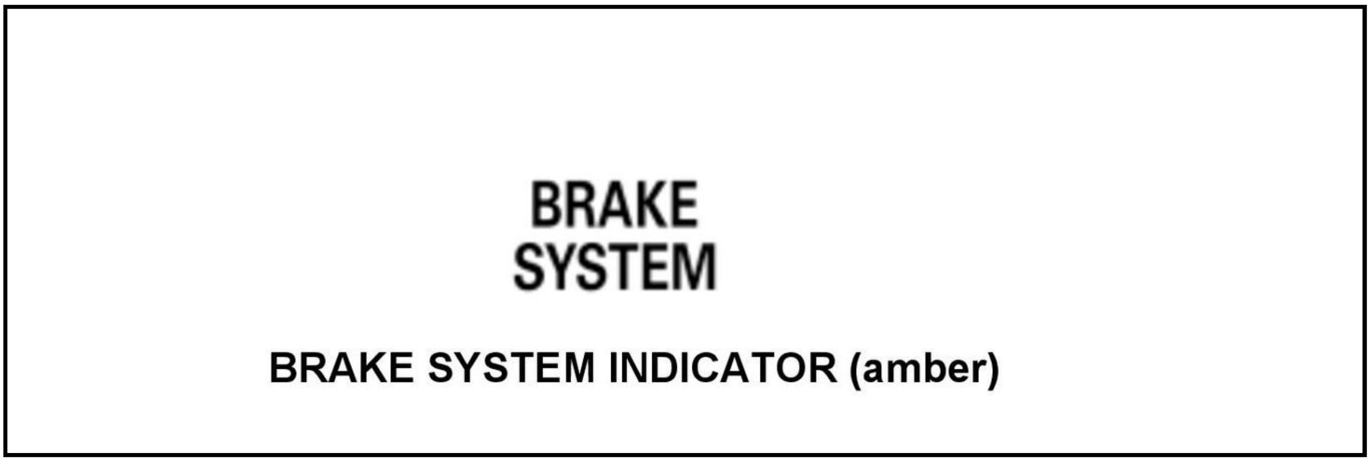
When the RDM system detects a problem, the RDM system stops working, then the RDM indicator and the brake system indicator (amber) stay on.

NOTE:

- For locations of each indicator, refer to System Warning/Indicator Index .
- For RDM system function, review the Road Departure Mitigation System Description .
- The RDM system communicates with other control units via F-CAN. For RDM system diagram, refer to the System Diagram for RDM . If a connected unit malfunctions, the RDM system will not operate. In this case, both RDM indicator and connected unit indicator come on and stay on (except for the gauge control module).
- Some detected abnormalities may not turn on the brake system indicator.

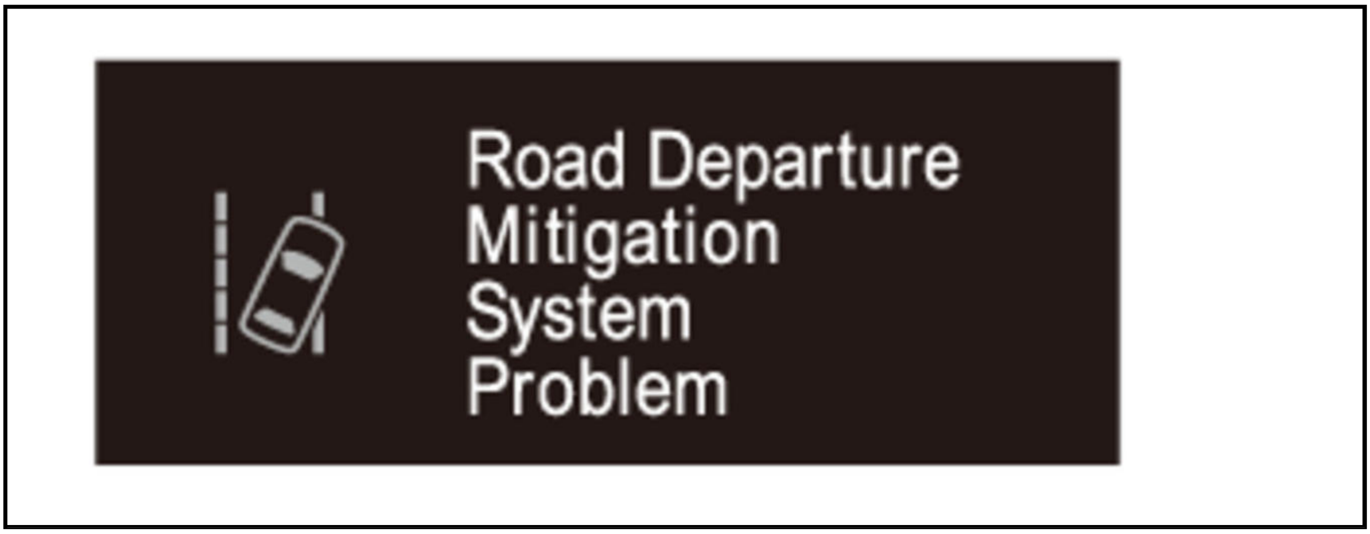


RDM INDICATOR (amber)



Self-Diagnostic Function

The RDM system has a self-diagnostic function. When a problem is detected by the self-diagnostic function, the RDM system stops operating, turns on the RDM indicator, indicates the problem on the multi-information display (MID), and stores a DTC.



RDM Switch

Press and hold the RDM switch for at least 1 second to turn the RDM system off and on.

Millimeter Wave Radar

The millimeter wave radar measures the distance between your vehicle and the vehicle directly ahead to calculate the difference in speed between the vehicles.

The millimeter wave radar has a self-diagnostic function. If the system detects a problem, it disables the RDM, and turns on the RDM indicator.

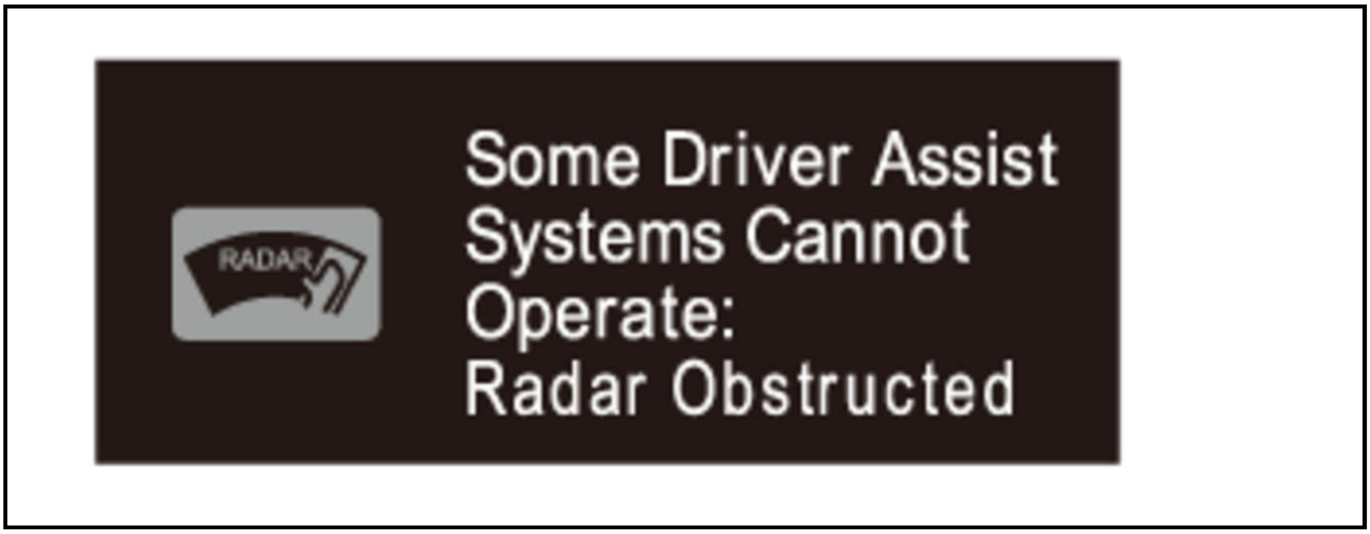
Dirt or Dust Detective Function (Clean Millimeter Wave Radar Indication)

If the millimeter wave radar or front grille gets dirty, the RDM system stops operating and the following message on the MID will appear. Clean the millimeter wave radar and the front grille surface. Once the millimeter wave radar and front grille surface are clean, the message on the MID disappears and the RDM system automatically turns on.

NOTE:

- The following MID message may come on temporarily when passing through an enclosed space, such as tunnel.
- Under the above conditions DTC P2583-97 is stored.

- When it is snowing, the radio waves transmitted and received by the millimeter wave radar may be refracted by the snow or ice attached around the millimeter wave radar such as the front grille. At this time, DTC P2583-76 is stored depending on the situation.
- After DTC P2583-76 is stored, the message (Radar Obstructed) is displayed on the MID at the initial stage, and then the indicators come on.



Some Driver Assist
Systems Cannot
Operate:
Radar Obstructed

Millimeter Wave Radar Aiming

If the millimeter wave radar is removed or replaced, you must do the millimeter wave radar aiming procedure, otherwise the RDM indicator blinks.

Multipurpose Camera Unit

The multipurpose camera unit uses input from the EPS control unit, the SRS unit, the PCM, and the VSA modulator-control unit to warn the driver when approaching the vehicle ahead. The multipurpose camera unit communicates with the gauge control module to send the warning signal.

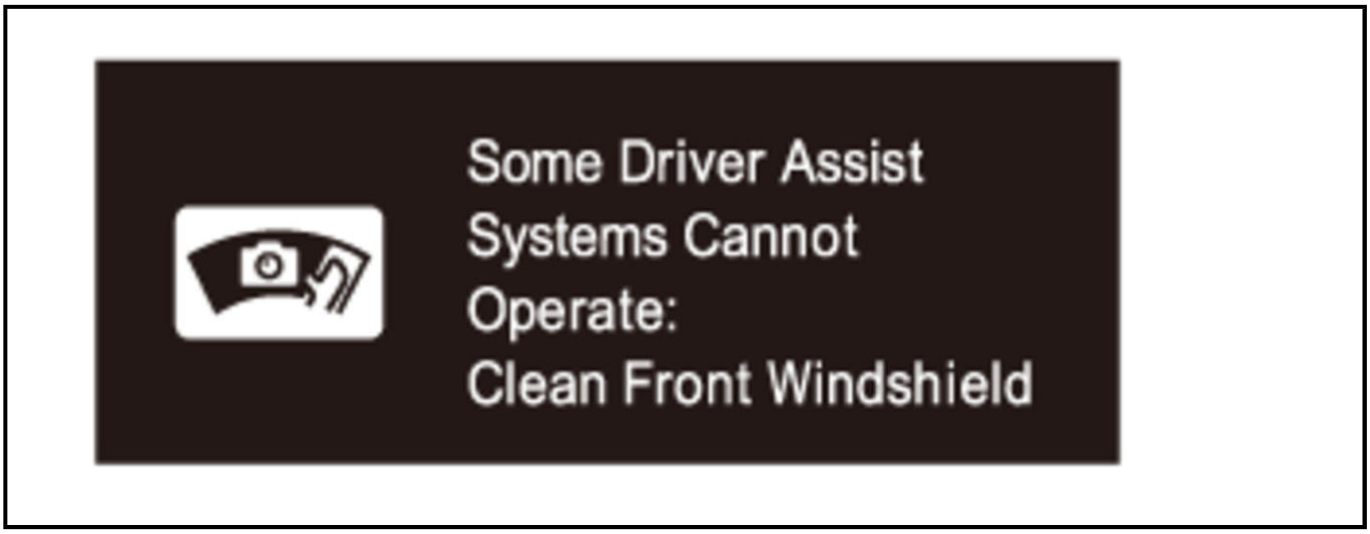
The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected. The millimeter wave radar receives this information from the multipurpose camera unit.

Dirt or Dust Detective Function (CLEAN FRONT WINDSHIELD Indication)

If the following message appears on the MID, the camera lens or the windshield has enough dirt so that the camera view is obstructed, the RDM system stops operating.

Clean any dirt or contamination on the camera lens or the windshield. Once the camera's view is unobstructed, the indicator on the MID turns off and the RDM system automatically turns back to ON.

NOTE: When millimeter wave radar detected dirt or dust on the multipurpose camera lens or the windshield surface, DTC B2A60-97 is stored as a past failure.

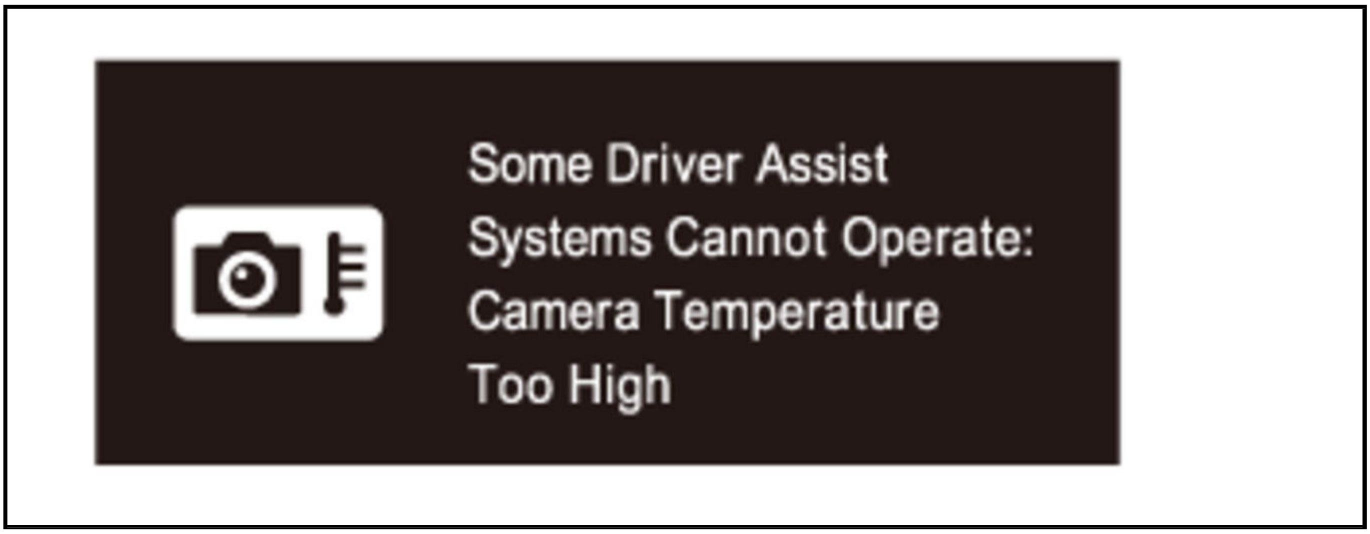


Some Driver Assist
Systems Cannot
Operate:
Clean Front Windshield

System Protect Function (High temperature) (MULTIPURPOSE CAMERA HOT Indication)

If the following message appears on the MID, the RDM system stops operating, and stores a DTC.

When the multipurpose camera temperature cools down to its proper operating temperature, the indicator on the MID turns off, and the RDM system automatically resumes operation.



Some Driver Assist
Systems Cannot Operate:
Camera Temperature
Too High

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the RDM indicator blinks.

CAN Communication

The RDM system communicates with other control units via F-CAN. For RDM system diagram, refer to the System Diagram for RDM .

If the millimeter wave radar and the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the RDM system will not operate even though it is OK. In this case, both the RDM indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTCs. If intermittent failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check for DTCs with the HDS, then clear the DTC.

NOTE: For RDM system DTCs, **refer to the DTC troubleshooting index**.

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the RDM indicator does not come on while test-driving, but your troubleshooting was based on the DTC, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the RDM indicator does not come on.
- The RDM system sometimes stops operating because of the environment (weather, road conditions, driving conditions, etc.). Intermittent failure DTCs may be stored in these cases.

How to Retrieve DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. Use the HDS to check for Integrated Driver Support System DTCs.

3. Read and record the DTC.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. In the Driving Support of the HDS, select Integrated Driver Support System, then DTCs, choose the clear DTCs icon, and follow the prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS.

DTC TROUBLESHOOTING

DTC B0050-F0, C0061-F0, C0062-F0 (MILLIMETER WAVE RADAR)

DTC B0050-F0 : (Driver's Seat Belt Buckle Switch (Subfault) Fault Detection By SRS Unit)

DTC C0061-F0 : Lateral Acceleration Sensor (Subfault) Fault Detection By Source Module

DTC C0062-F0 : Longitudinal Acceleration Sensor (Subfault) Fault Detection By Source Module

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.

- These DTCs are recorded when the millimeter wave radar receives the SRS unit failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **refer to the DTC troubleshoot for the SRS system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B0050-F0 (Driver's Seat Belt Buckle Switch (Subfault) Fault Detection By SRS Unit)	B
C0061-F0 Lateral Acceleration Sensor (Subfault) Fault Detection By Source Module	B
C0062-F0 Longitudinal Acceleration Sensor (Subfault) Fault Detection By Source Module	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B0050-F0 (Driver's Seat Belt Buckle Switch (Subfault) Fault Detection By SRS Unit)	B

DTC Description	DTC
C0061-F0 Lateral Acceleration Sensor (Subfault) Fault Detection By Source Module	B
C0062-F0 Longitudinal Acceleration Sensor (Subfault) Fault Detection By Source Module	B

Is DTC B0050-F0, C0061-F0, or C0062-F0 indicated?

YES

The failure is duplicated. **Go to the SRS troubleshooting** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B2A00-92

DTC B2A00-92 : Temporary stop of Integrated Driver Support System (Detected Abnormal Signals)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.

- This DTC is recorded when the millimeter wave radar and multipurpose camera receive an unexpected or out of range yaw rate, steering angle, or wheel speed sensor signal via F-CAN.
- The specific driving conditions that may cause this DTC to be recorded are as follows:
-
    - The vehicle is being driven in a manner that exceeds the capabilities and control of the driving support system. Question the customer about how and where the vehicle was being driven at the time of the warning.
    - Sharp turn, sudden steering, rapid acceleration or deceleration.
    - When the vehicle is driven in mountains or rough roads.
    - When the vehicle loses traction while driving (wheel spin or lock up).
- If input data from another system on F-CAN is out of range or incorrect. Inspect these systems for DTCs and/or OBS data and troubleshoot as needed.
- If this DTC is recorded, the integrated driver support system temporarily cancels its control.
- If this DTC is recorded, turn the vehicle OFF mode and ON mode again on the flat place or then test-drive for 10 minutes stably at 25 mph (40 km/h) or more to restore the vehicle to normal.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A00-92 Temporary stop of Integrated Driver Support System (Detected Abnormal Signals)	B

DTC (IDAS)

1. DTC check

-1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

Is there any DTC(s) other than DTC B2A00-92?

YES

Perform a troubleshooting for the recorded DTC.

NO

Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC B2A60-49, B2A60-96

DTC B2A60-49 : Multipurpose Camera Unit Internal Electronic Failure

DTC B2A60-96 : Multipurpose Camera Unit Hardware Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A60-49 Multipurpose Camera Unit Internal Electronic Failure	B
B2A60-96 Multipurpose Camera Unit Hardware Malfunction	B

DTC (IDAS)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to OFF (LOCK) mode and then ON mode repeatedly at least 3 times.

    -4. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-49 Multipurpose Camera Unit Internal Electronic Failure	B
B2A60-96 Multipurpose Camera Unit Hardware Malfunction	B

    Is DTC B2A60-49 or B2A60-96 indicated?

    YES

    The failure is duplicated. **Replace the multipurpose camera unit** .

    NO

    Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B2A60-54, P2583-54

DTC B2A60-54 : Static Camera Aiming Incomplete

DTC P2583-54 : Millimeter Wave Radar Aiming Incomplete

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when aiming is not performed or aiming is not successfully completed.
- If a DTC is recorded again after it is cleared with the HDS, perform the aiming procedure below:
-
    - B2A60-54: **Aim the multipurpose camera** .
    - P2583-54: **Aim the millimeter wave radar** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A60-54 Static Camera Aiming Incomplete	B
P2583-54 Millimeter Wave Radar Aiming Incomplete	B

DTC (IDAS)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-54 Static Camera Aiming Incomplete	B
P2583-54 Millimeter Wave Radar Aiming Incomplete	B

Is DTC B2A60-54 or P2583-54 indicated?

YES

The failure is duplicated. Aiming is incomplete. Aim **the millimeter wave radar** or **the multipurpose camera** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B2A60-57, U1387-4A, U1387-55, U3000-55 (MILLIMETER WAVE RADAR)

DTC B2A60-57 : Multipurpose Camera Unit Software Failure

DTC U1387-4A : Unmatch Combination of Millimeter Wave Radar-Multipurpose Camera Unit

DTC U1387-55 : Multipurpose Camera Unit Variant Incomplete

DTC U3000-55 : Millimeter Wave Radar Variant Incomplete

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If a DTC is recorded again after it is cleared with the HDS, confirm the part numbers compatible with the vehicle with the parts catalogue and replace the relevant parts.
- If DTC U1387-4A is recorded, confirm the part numbers of the multipurpose camera unit and the millimeter wave radar currently installed to the vehicle and replace the parts not compatible with the vehicle.
-
  - B2A60-57: **Replace the multipurpose camera unit** .
  - U1387-4A: **Replace the multipurpose camera unit** or **the millimeter wave radar** .
  - U1387-55: **Replace the multipurpose camera unit** .
  - U3000-55: **Replace the millimeter wave radar** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A60-57 Multipurpose Camera Unit Software Failure	B
U1387-4A Unmatch Combination of Millimeter Wave Radar-Multipurpose Camera Unit	B
U1387-55 Multipurpose Camera Unit Variant Incomplete	B
U3000-55 Millimeter Wave Radar Variant Incomplete	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-57 Multipurpose Camera Unit Software Failure	B
U1387-4A Unmatch Combination of Millimeter Wave Radar-Multipurpose Camera Unit	B
U1387-55 Multipurpose Camera Unit Variant Incomplete	B
U3000-55 Millimeter Wave Radar Variant Incomplete	B

   Is DTC B2A60-57, U1387-4A, U1387-55, or U3000-55 indicated?

   YES

   The failure is duplicated. Confirm the parts catalogue and replace the parts related to the DTC with compatible ones.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B2A60-97

DTC B2A60-97 : Dust or Dirt On The Camera

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A60-97 Dust or Dirt On The Camera	B

DTC (IDAS)

1. Multipurpose camera unit visual check

   -1. Check for dust or dirt at the multipurpose camera lens, and crack, dust, or interference at the windshield surface.

   Are the multipurpose camera lens and the windshield surface OK?

   YES

   Go to step 2.

   NO

Clean the multipurpose camera lens, or both sides of the windshield surface. If necessary, replace or repair the windshield.

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Test-drive the vehicle at 3 mph (5 km/h) or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-97 Dust or Dirt On The Camera	B

Is DTC B2A60-97 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the multipurpose camera unit 12P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the multipurpose camera unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC B2A60-98, P2583-98

DTC B2A60-98 : Multipurpose Camera Unit Temperature Too High

DTC P2583-98 : Millimeter Wave Radar Temperature Too High

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTC are recorded when the vehicle is left in the scorching heat, is in a traffic jam at high temperature, or is driving uphill continuously and the millimeter wave radar and the multipurpose camera unit gets extremely hot.
- The function automatically returns to normal when the internal temperatures of the millimeter wave radar and the multipurpose camera unit drop.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A60-98 Multipurpose Camera Unit Temperature Too High	B
P2583-98 Millimeter Wave Radar Temperature Too High	B

DTC (IDAS)

1. Inspecting the temperature in the control unit

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) of the internal temperatures of the millimeter wave radar and the multipurpose camera unit with the HDS.

Signal	Current conditions	
	Values	Unit
Radar temperature	B	B
Camera temperature	B	B

Is the temperature 185B°F (85B°C) or less?

YES

Go to step 2.

NO

Cool the control unit until the internal temperature is 167B°F (75B°C) or less. Clear the DTC with the HDS.

2. Problem verification:

NOTE: If the control unit has an internal temperature of 167B°F (75B°C) or more, cool the control unit until the internal temperature is 167B°F (75B°C) or less.

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-98 Multipurpose Camera Unit Temperature Too High	B
P2583-98 Millimeter Wave Radar Temperature Too High	B

Is DTC B2A60-98 or P2583-98 indicated?

YES

The failure is duplicated. Faulty a control unit, replace the control unit related to the DTC.

NO

Intermittent failure, the system is OK at this time. The control unit was temporarily in a high temperature state.

DTC B2A60-99

DTC B2A60-99 : Out of automatic correction range for Misalignment of Multipurpose Camera Unit image

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If this DTC is recorded, the following is suspected:
-
    - Improper installation of the multipurpose camera unit (aging of vehicle, incorrect assembly, etc.).
    - The multipurpose camera unit installing portion is deformed by a minor collision or strong impact.
    - The axis of the multipurpose camera unit is out of alignment due to abnormal wheel alignment, abnormal tire pressure, etc.

  - Altered suspension
- After inspecting, repairing, or adjusting a possible cause of the failure, be sure to **perform multipurpose camera unit aiming** . If the DTC cannot be deleted after multipurpose camera unit aiming, **replace the multipurpose camera unit** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A60-99 Out of automatic correction range for Misalignment of Multipurpose Camera Unit image	B

DTC (IDAS)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Test-drive the vehicle on a straight road at speeds 25 mph (40 km/h) or more for 15 minutes or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-99 Out of automatic correction range for Misalignment of Multipurpose Camera Unit image	B

   Is DTC B2A60-99 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Multipurpose camera unit visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check that the multipurpose camera unit and camera bracket are installed properly and check them for deformation and damage.

   Are the multipurpose camera unit and the camera bracket installed properly, and/or is there any no damage?

   YES

   Go to step 3.

   NO

   Repair or replace faulty parts, then **aim the multipurpose camera unit** .

3. Problem verification 2

-1. **Aim the multipurpose camera unit** .

-2. Test-drive the vehicle on a straight road at speeds 25 mph (40 km/h) or more for 15 minutes or more.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-99 Out of automatic correction range for Misalignment of Multipurpose Camera Unit image	B

Is DTC B2A60-99 indicated?

YES

If the multipurpose camera unit is installed properly but the DTC is recorded again after multipurpose camera unit aiming, **replace the multipurpose camera unit** .

NO

The system is OK at this time.

DTC B2A60-A2, U3006-16 (MILLIMETER WAVE RADAR)

DTC B2A60-A2 : Power Supply Voltage Too Low (Multipurpose Camera Unit)

DTC U3006-16 : Power Supply Voltage Too Low (Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- Before performing a troubleshooting, check the 12 volt battery voltage. If the voltage is less than 12 volt, charge the battery.
- These DTCs are recorded when the voltage supplied to the millimeter wave radar or the multipurpose camera unit drops below 9.5 volt while the vehicle is driving.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A60-A2 Power Supply Voltage Too Low (Multipurpose Camera Unit)	B
U3006-16 Power Supply Voltage Too Low (Millimeter Wave Radar)	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Test-drive the vehicle at speeds 5 mph (8 km/h) or more for at least 5 minutes.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-A2 Power Supply Voltage Too Low (Multipurpose Camera Unit)	B

DTC Description	DTC
U3006-16 Power Supply Voltage Too Low (Millimeter Wave Radar)	B

Is DTC B2A60-A2 or U3006-16 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. PGM-FI system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting in the PGM-FI system . After performing a DTC troubleshooting for the PGM-FI system, clear the DTC again.

NO

Check the control unit related to the DTC for loose terminals and poor connections. If no problem is found, replace the control unit related to the DTC.

DTC B2A60-A3, U3006-17 (MILLIMETER WAVE RADAR)

DTC B2A60-A3 : Power Supply Voltage Too High (Multipurpose Camera Unit)

DTC U3006-17 : Power Supply Voltage Too High (Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- Before starting a troubleshooting, check that a 12 volt battery of a capacity compatible with the vehicle is installed.
- These DTCs are recorded when a voltage of 17 volt or more is supplied to the millimeter wave radar or the multipurpose camera unit.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A60-A3 Power Supply Voltage Too High (Multipurpose Camera Unit)	B
U3006-17 Power Supply Voltage Too High (Millimeter Wave Radar)	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B2A60-A3 Power Supply Voltage Too High (Multipurpose Camera Unit)	B
U3006-17 Power Supply Voltage Too High (Millimeter Wave Radar)	B

Is DTC B2A60-A3 or U3006-17 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. PGM-FI system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting in the PGM-FI system . After performing a DTC troubleshooting for the PGM-FI system, clear the DTC again.

NO

Faulty a control unit, replace the control unit related to the DTC.

DTC B2A70-12

DTC B2A70-12 : LDW/RDM Switch Signal Circuit Short

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A70-12 LDW/RDM Switch Signal Circuit Short	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Press the RDM switch.

   -6. Check for DTCs with the HDS.

DTC Description	DTC
B2A70-12 LDW/RDM Switch Signal Circuit Short	B

   Is DTC B2A70-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. RDM switch internal resistance check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the RDM switch** .

   Is the RDM switch OK?

   YES

   RDM switch is OK. Go to step 3.

   NO

   Replace the RDM switch .

3. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. D5**

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 4.

   NO

Replace the fuse. Turn the vehicle to the ON mode, then the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D5 fuse circuit.

4. Open wire check (IG1_OPTION line)

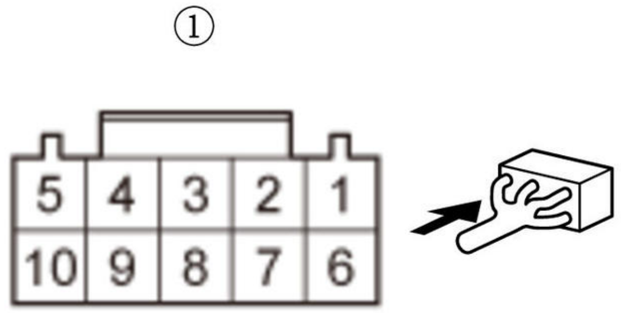
-1. Disconnect the following connector.

CMBS OFF/RDM switch 10P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMBS OFF/RDM switch 10P connector: disconnected
Test point 1	CMBS OFF/RDM switch 10P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there battery voltage?

YES

IG1_OPTION wire is OK. Go to step 5.

NO

Repair an open in the IG1_OPTION wire between the RDM switch and **No. D5** fuse.

5. Open wire check (LDW OFF SW line)

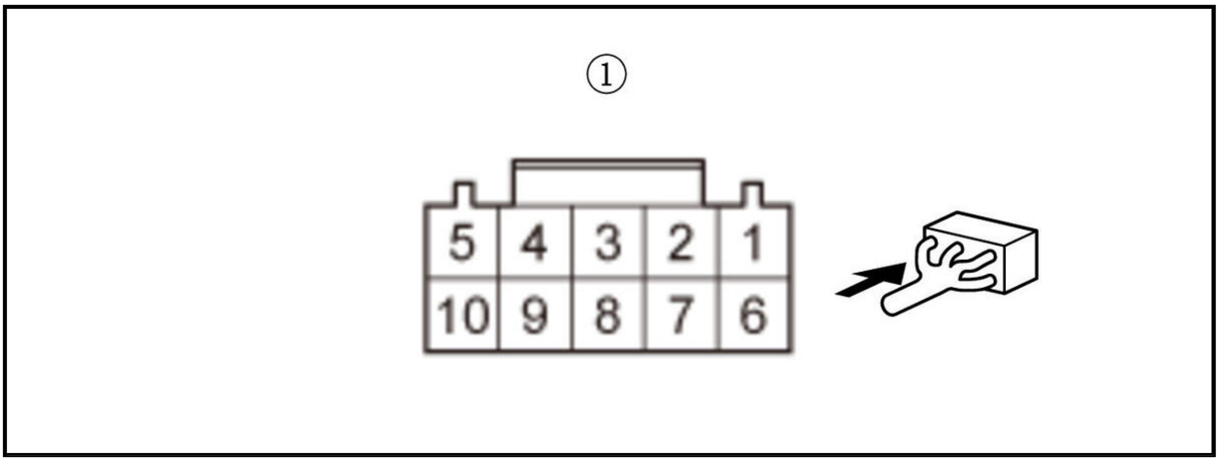
-1. Turn the vehicle to the vehicle OFF (LOCK) mode.

-2. Disconnect the following connector.

Multipurpose camera unit 12P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Multipurpose camera unit 12P connector: disconnected
Test point 1	**Multipurpose camera unit 12P connector No. 7**
Test point 2	CMBS OFF/RDM switch 10P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

Go to step 6.

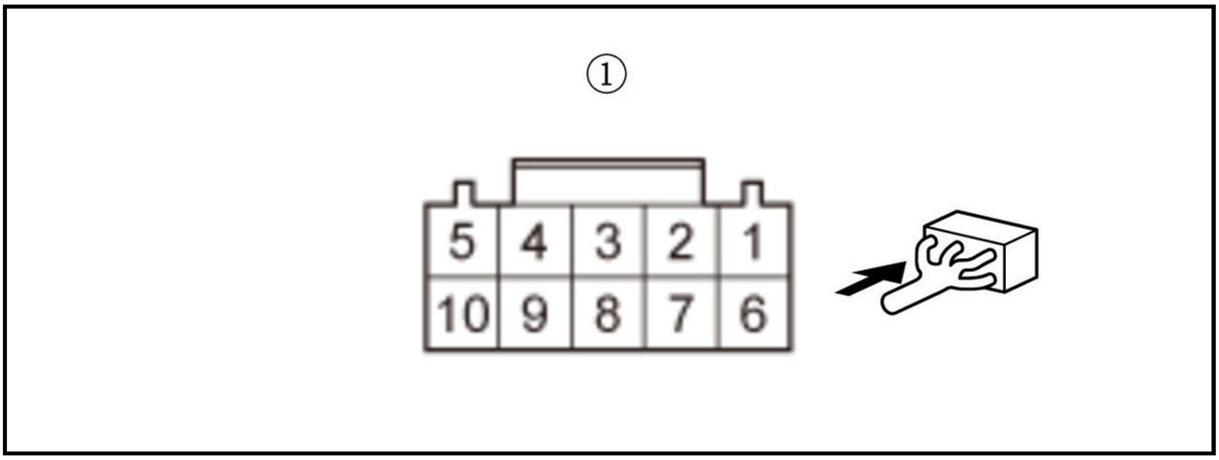
NO

Repair an open in the LDW OFF SW wire between the RDM switch and the multipurpose camera unit.

6. Open wire check (LDW OFF IND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Multipurpose camera unit 12P connector: disconnected
Test point 1	**Multipurpose camera unit 12P connector No. 8**
Test point 2	CMBS OFF/RDM switch 10P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Replace the multipurpose camera unit .

NO

Repair an open in the LDW OFF IND wire between the RDM switch and the multipurpose camera unit.

DTC B2A70-14

DTC B2A70-14 : LDW/RDM Switch Signal Circuit Short to Power

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
B2A70-14 LDW/RDM Switch Signal Circuit Short to Power	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
B2A70-14 LDW/RDM Switch Signal Circuit Short to Power	B

   Is DTC B2A70-14 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. RDM switch internal resistance check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the RDM switch** .

   Is the RDM switch OK?

   YES

   RDM switch is OK. Go to step 3.

   NO

   Replace the RDM switch .

3. Shorted wire check (LDW OFF SW line to power)

   -1. Disconnect the following connector.

Multipurpose camera unit 12P connector

CMBS OFF/RDM switch 10P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Multipurpose camera unit 12P connector: disconnected
B	CMBS OFF/RDM switch 10P connector: disconnected
Test point 1	**Multipurpose camera unit 12P connector No. 7**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the LDW OFF SW wire between the RDM switch and the multipurpose camera unit.

NO

Check for loose terminals and poor connections in the multipurpose camera unit 12P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the multipurpose camera unit** .

DTC C0023-F0, U0418-68 (MILLIMETER WAVE RADAR)

DTC C0023-F0 : Brake Light Drive Relay Circuit Malfunction

DTC U0418-68 : (Electric Servo Brake System Malfunction)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the millimeter wave radar receives electric servo brake system failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the electric servo brake system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C0023-F0 Brake Light Drive Relay Circuit Malfunction	B
U0418-68 (Electric Servo Brake System Malfunction)	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0023-F0 Brake Light Drive Relay Circuit Malfunction	B
U0418-68 (Electric Servo Brake System Malfunction)	B

Is DTC C0023-F0 or U0418-68 indicated?

YES

The failure is duplicated. **Go to the indicated DTC's troubleshooting in the electric servo brake system** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0031-62, C0034-62, C0037-62, C003A-62 (MILLIMETER WAVE RADAR)

DTC C0031-62 : (Left Front Wheel Speed Sensor Signal Error)

DTC C0034-62 : (Right Front Wheel Speed Sensor Signal Error)

DTC C0037-62 : (Left Rear Wheel Speed Sensor Signal Error)

DTC C003A-62 : (Right Rear Wheel Speed Sensor Signal Error)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the millimeter wave radar receives wheel speed sensor failure information from the VSA modulator-control unit via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the VSA system** .
- The functions of the integrated driver support system that will be temporarily canceled when these DTC are recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C0031-62 (Left Front Wheel Speed Sensor Signal Error)	B
C0034-62 (Right Front Wheel Speed Sensor Signal Error)	B
C0037-62 (Left Rear Wheel Speed Sensor Signal Error)	B
C003A-62 (Right Rear Wheel Speed Sensor Signal Error)	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Test-drive the vehicle on a straight road at speeds 25 mph (40 km/h) or more for 5 minutes.

NOTE: Check for abnormal tire diameter (low tire pressure, uneven wear, and spare tire) before test-driving.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0031-62 (Left Front Wheel Speed Sensor Signal Error)	B

DTC Description	DTC
C0034-62 (Right Front Wheel Speed Sensor Signal Error)	B
C0037-62 (Left Rear Wheel Speed Sensor Signal Error)	B
C003A-62 (Right Rear Wheel Speed Sensor Signal Error)	B

Is DTC C0031-62, C0034-62, C0037-62, or C003A-62 indicated?

YES

The failure is duplicated. **Go to the VSA system troubleshooting** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0041-14

DTC C0041-14 : Brake Switch Signal Circuit Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The specific conditions under which this DTC is recorded are as follows:
-
    - Brake switch signal is ON, but brake fluid pressure does not rise when vehicle running.
    - Brake switch signal is OFF, but brake fluid pressure rises when vehicle running.
- This vehicle obtains the brake operation information used for the control of the integrated driver support system from the PCM via the F-CAN.
- If the DTC is recorded again after problem verification, **perform a troubleshooting for the PGM-FI system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C0041-14 Brake Switch Signal Circuit Error	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Test-drive the vehicle at speeds 6 mph (10 km/h) for at least 30 seconds.

-5. Press the brake pedal for at least 2 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
C0041-14 Brake Switch Signal Circuit Error	B

Is DTC C0041-14 indicated?

YES

The failure is duplicated. **Go to the PGM-FI system troubleshooting** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0044-F0, U0415-68, U0416-68 (MILLIMETER WAVE RADAR)

DTC C0044-F0 : (Master Cylinder Pressure Sensor Failure)

DTC U0415-68 : (ABS Brake Actuator Malfunction)

DTC U0416-68 : (VSA Brake Actuator Malfunction)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the millimeter wave radar receives failure information from the VSA modulator-control unit via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, perform a troubleshooting for the VSA system.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C0044-F0 (Master Cylinder Pressure Sensor Failure)	B
U0415-68 (ABS Brake Actuator Malfunction)	B
U0416-68 (VSA Brake Actuator Malfunction)	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0044-F0 (Master Cylinder Pressure Sensor Failure)	B
U0415-68 (ABS Brake Actuator Malfunction)	B
U0416-68 (VSA Brake Actuator Malfunction)	B

Is C0044-F0, U0415-68, or U0416-68 indicated?

YES

The failure is duplicated. **Go to VSA system troubleshooting** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0051-54 (MILLIMETER WAVE RADAR)

DTC C0051-54 : Steering Angle Neutral Position Learning Incomplete

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded if VSA sensor neutral position memorization is not completed.
- This DTC is automatically deleted without using the HDS when VSA sensor neutral position memorization is successfully completed.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C0051-54 Steering Angle Neutral Position Learning Incomplete	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK).

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0051-54 Steering Angle Neutral Position Learning Incomplete	B

Is DTC C0051-54 indicated?

YES

The failure is duplicated. **Perform the VSA sensor neutral position memorization** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0051-96 (MILLIMETER WAVE RADAR)

DTC C0051-96 : Steering Angle Sensor Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.

- This DTC is recorded when the millimeter wave radar receives the EPS control unit failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the EPS system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C0051-96 Steering Angle Sensor Malfunction	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
C0051-96 Steering Angle Sensor Malfunction	B

   Is DTC C0051-96 indicated?

   YES

   The failure is duplicated. **Go to the EPS system troubleshooting** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C0061-9A, C0062-9A, C0063-9A

DTC C0061-9A : Temporary stop of Integrated Driver Support System (Unstable Lateral Acceleration Sensor Signal)

DTC C0062-9A : Temporary stop of Integrated Driver Support System (Unstable Longitudinal Acceleration Sensor Signal)

DTC C0063-9A : Temporary stop of Integrated Driver Support System (Unstable Yaw Rate Sensor Signal)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the sensor signal reliability temporarily decreases due to a drop in the power supply voltage supplied to the yaw rate sensor and lateral acceleration sensor built in the SRS unit or for other reason.
- If this DTC is recorded, some of the integrated driver support system functions are temporarily canceled but it is not a failure.
- When the power supply voltage supplied to the yaw rate sensor and lateral acceleration sensor built in the SRS unit return to normal, the temporarily cancelled integrated driver support system functions are re-

activated.

- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C0061-9A Temporary stop of Integrated Driver Support System (Unstable Lateral Acceleration Sensor Signal)	B
C0062-9A Temporary stop of Integrated Driver Support System (Unstable Longitudinal Acceleration Sensor Signal)	B
C0063-9A Temporary stop of Integrated Driver Support System (Unstable Yaw Rate Sensor Signal)	B

DTC (IDAS)

1. DTC check

-1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

Is there any DTC(s) other than DTC C0061-9A, C0062-9A, or C0063-9A?

YES

Perform a troubleshooting for the recorded DTC.

NO

Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC C0063-F0 (MILLIMETER WAVE RADAR)

DTC C0063-F0 : Yaw Rate Sensor (Subfault) Fault Detection By Source Module

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This vehicle's millimeter wave radar receives the failure information of the yaw rate sensor from the SRS unit. The SRS unit does not uses the yaw rate sensor for airbag deployment control, so the SRS system indicator does not come on even if the yaw rate sensor is faulty. If this DTC is stored, clear the DTC and then perform problem verification according to the troubleshooting flow. If this DTC is stored again, replace the SRS unit.
- If the DTC is recorded after it is cleared with the HDS, **replace the SRS unit** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C0063-F0 Yaw Rate Sensor (Subfault) Fault Detection By Source Module	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C0063-F0 Yaw Rate Sensor (Subfault) Fault Detection By Source Module	B

Is DTC C0063-F0 indicated?

YES

The failure is duplicated. **Replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C1040-00 (MILLIMETER WAVE RADAR)

DTC C1040-00 : Wheel Speed Signal Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the estimated yaw rate calculated based on the wheel speeds of the right and left wheels differs between the front and rear wheels.
- The specific conditions under which this DTC are as follows:
-
    - Abnormal tire diameter (low tire pressure, uneven wear, etc.)
    - Driving on a road having different road conditions on the right and left sides
- If this DTC is recorded, the integrated driver support system temporarily cancels its control to prevent the system from selecting an incorrect leading vehicle.
- When the difference in the estimated yaw rate between the front and rear wheels returns to normal, the integrated driver support system resumes its control.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C1040-00 Wheel Speed Signal Error	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Test-drive the vehicle on a straight road at speeds 25 mph (40 km/h) or more for 10 minutes or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1040-00 Wheel Speed Signal Error	B

Is DTC C1040-00 indicated?

YES

The failure is duplicated. Check the tire pressure and inspect for uneven wear.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC C1C00-F0, U0401-68 (MILLIMETER WAVE RADAR)

DTC C1C00-F0 : (APP Sensor Signal Failure)

DTC U0401-68 : (PCM (PGM-FI System) Malfunction)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the millimeter wave radar receives failure information for the PCM via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the PGM-FI system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
C1C00-F0 (APP Sensor Signal Failure)	B
U0401-68 (PCM (PGM-FI System) Malfunction)	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
C1C00-F0 (APP Sensor Signal Failure)	B
U0401-68 (PCM (PGM-FI System) Malfunction)	B

Is DTC C1C00-F0 or U0401-68 indicated?

YES

The failure is duplicated, **go to the PGM-FI system troubleshooting** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC P0564-11

DTC P0564-11 : ACC/LKAS Switch Signal Circuit Short

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
P0564-11 ACC/LKAS Switch Signal Circuit Short	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
P0564-11 ACC/LKAS Switch Signal Circuit Short	B

Is DTC P0564-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Shorted wire check (LKAS/DIST line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

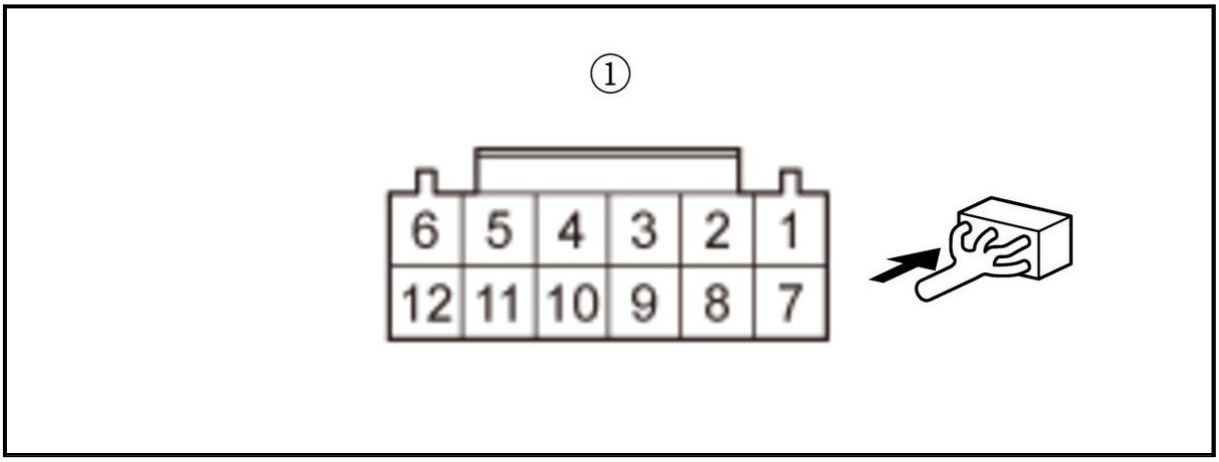
ACC combination switch 12P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 12: ①

Test point 2	Body ground



Is there about 5 V?

YES

Replace the ACC combination switch .

NO

Go to step 3.

3. Shorted wire check (LKAS/DIST line) 2

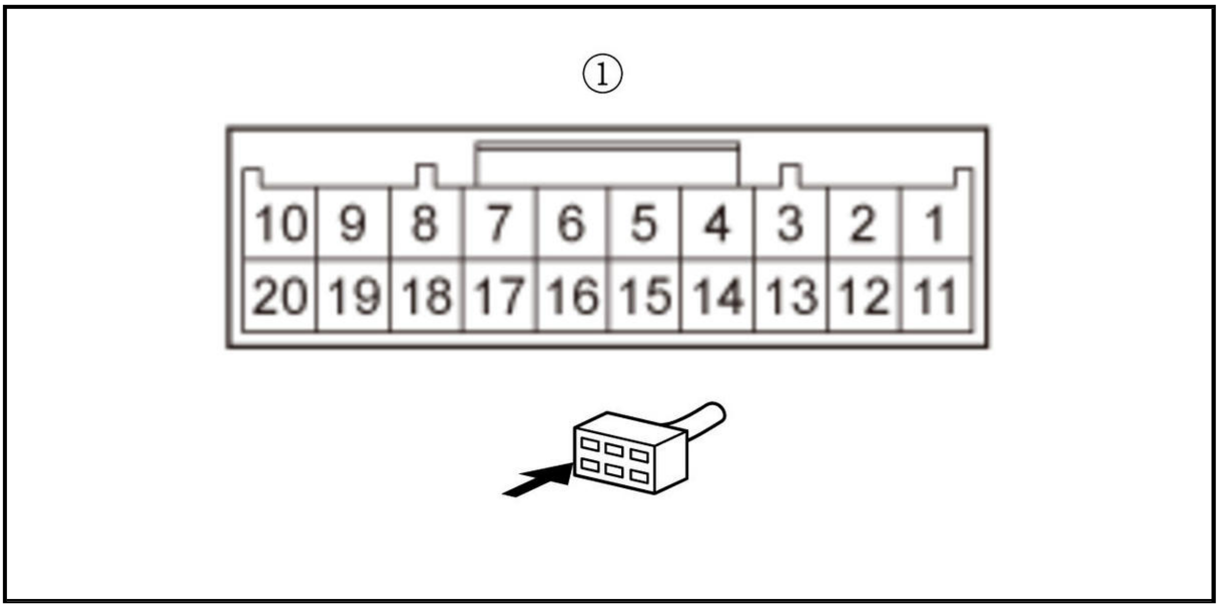
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector D (20P) (male terminals) No. 20: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Repair a short to ground in the LKAS/DIST wire between the ACC combination switch and the cable reel.

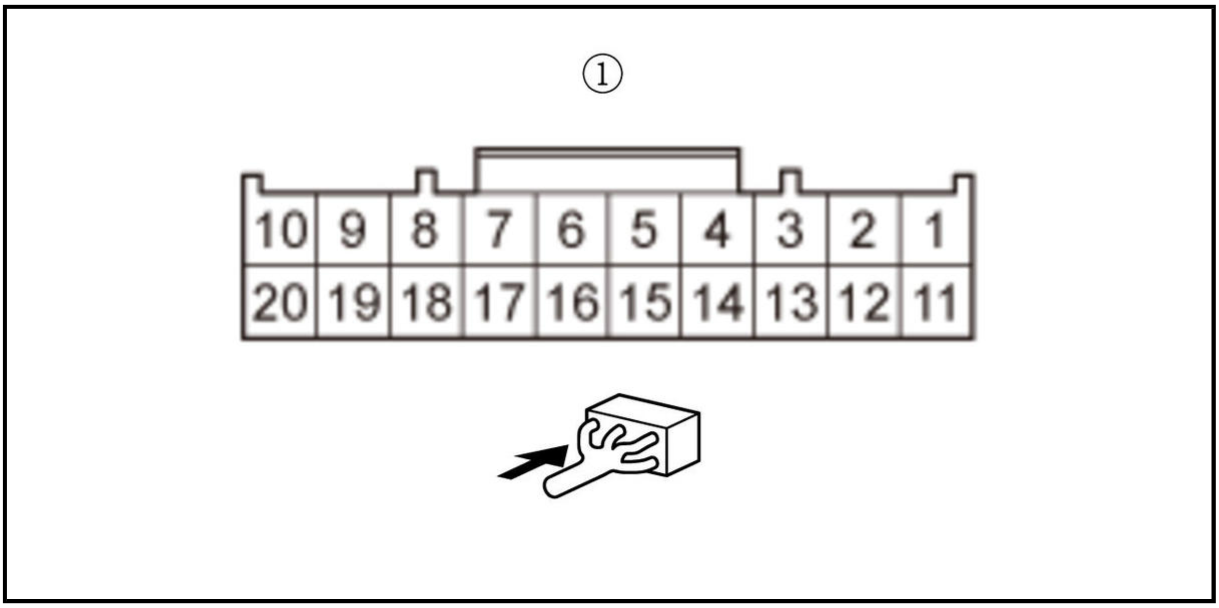
4. Shorted wire check (DISTANCE_SW line) 1

-1. Disconnect the following connector.

Cable reel connector A (20P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P): disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector A (20P) (female terminals) No. 8: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 5.

NO

Replace the cable reel .

5. Shorted wire check (DISTANCE_SW line) 2

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P): disconnected
B	Cable reel connector D (20P): disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 28**

Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the gauge control module .

NO

Repair a short to ground in the DISTANCE_SW wire between the gauge control module and the cable reel.

DTC P0564-15

DTC P0564-15 : ACC/LKAS Switch Signal Circuit Open

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
P0564-15 ACC/LKAS Switch Signal Circuit Open	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
P0564-15 ACC/LKAS Switch Signal Circuit Open	B

   Is DTC P0564-15 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Open wire check (LKAS/DIST line) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

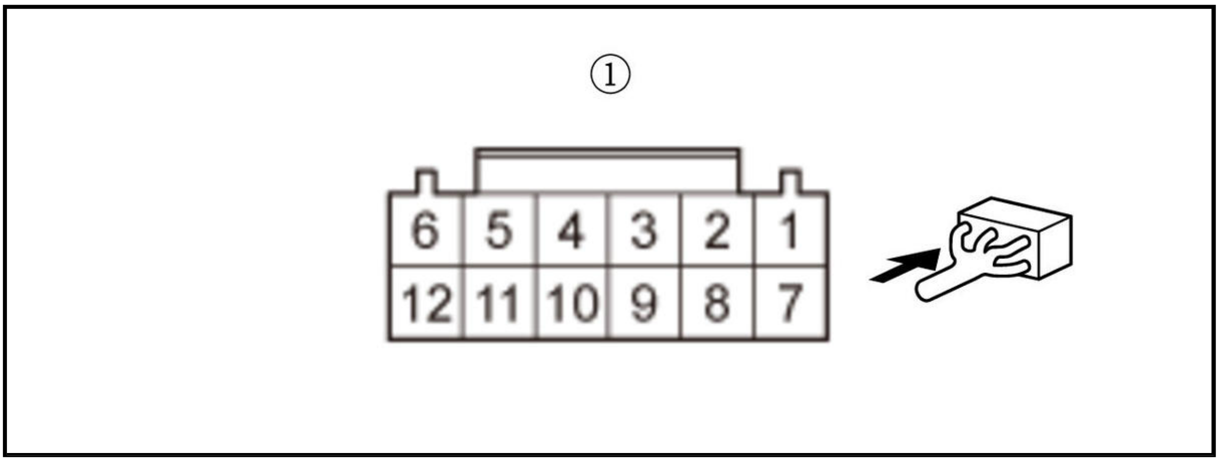
   -2. Disconnect the following connector.

ACC combination switch 12P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 12: ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 3.

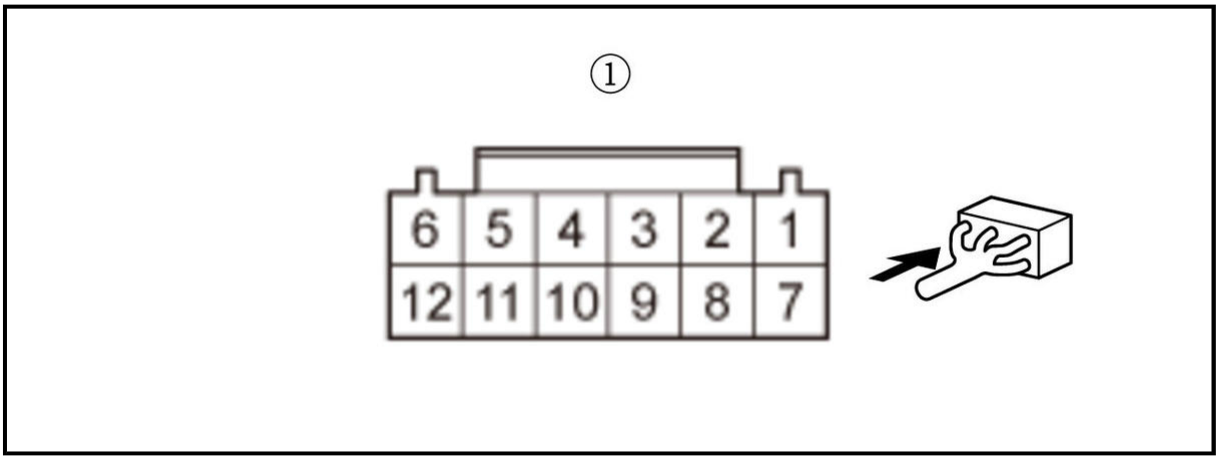
NO

Go to step 7.

3. Determine possible failure area (ACC combination switch, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 12: ①
Test point 2	ACC combination switch 12P connector (female terminals) No. 5: ①



Is there about 5 V?

YES

Replace the ACC combination switch .

NO

Go to step 4.

4. Open wire check (CRUISE_GND line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

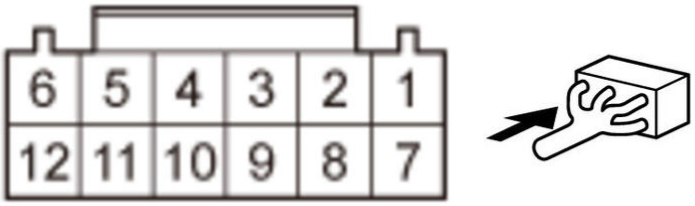
-2. Disconnect the following connector.

Cable reel connector D (20P)

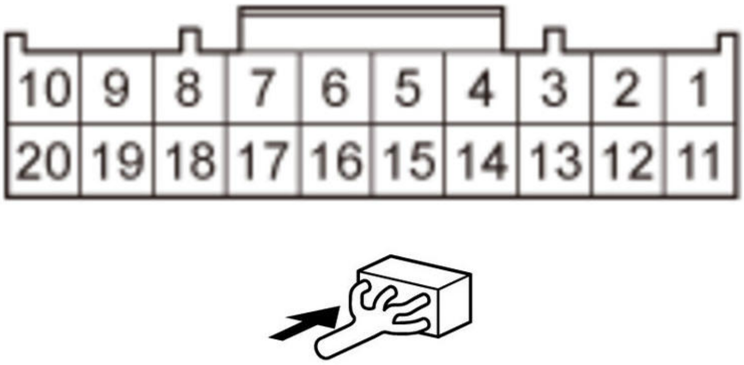
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 5: ①
Test point 2	Cable reel connector D (20P) (female terminals) No. 17: ②

①



②



Is there 1.0 Ω or less?

YES

Go to step 5.

NO

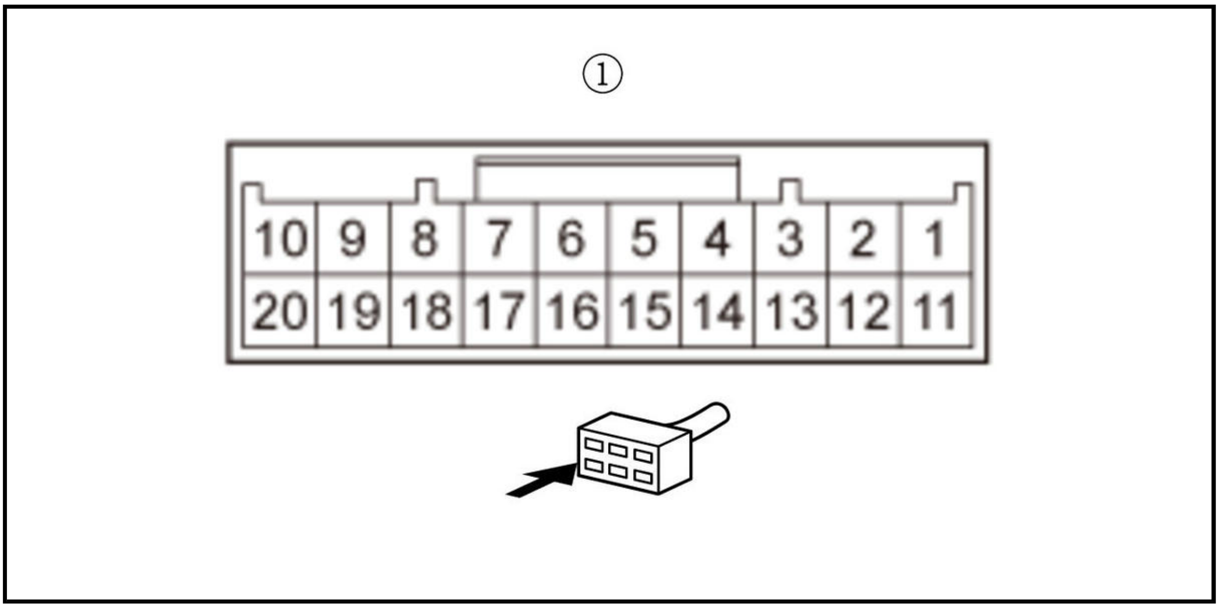
Repair an open in the CRUISE_GND wire between the ACC combination switch and the cable reel.

5. Cable reel check

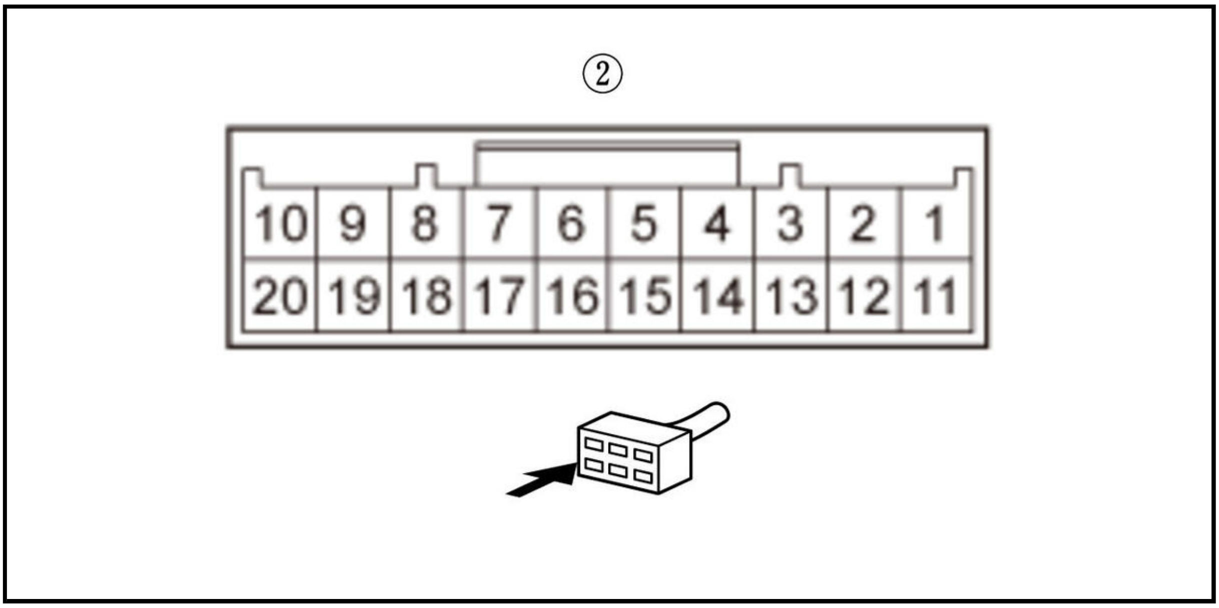
-1. **Remove the cable reel** .

-2. On the cable reel side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P): disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector A (20P) (male terminals) No. 5: ①
Test point 2	Cable reel connector D (20P) (male terminals) No. 17: ②



①
10 9 8 7 6 5 4 3 2 1
20 19 18 17 16 15 14 13 12 11



②
10 9 8 7 6 5 4 3 2 1
20 19 18 17 16 15 14 13 12 11

Is there 1.0 Ω or less?

YES

Go to step 6.

NO

Replace the cable reel .

6. Open wire check (CRUISE_GND line) 2

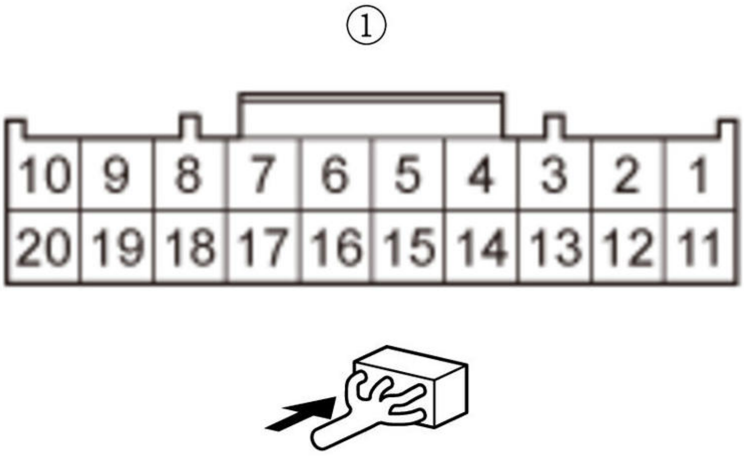
-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P): disconnected
B	Cable reel connector D (20P): disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	Gauge control module connector A (32P) No. 5

Test point 2	Cable reel connector A (20P) (female terminals) No. 5: ①



Is there 1.0 Ω or less?

YES

Replace the gauge control module .

NO

Repair an open in the CRUISE_GND wire between the gauge control module and the cable reel.

7. Open wire check (LKAS/DIST line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

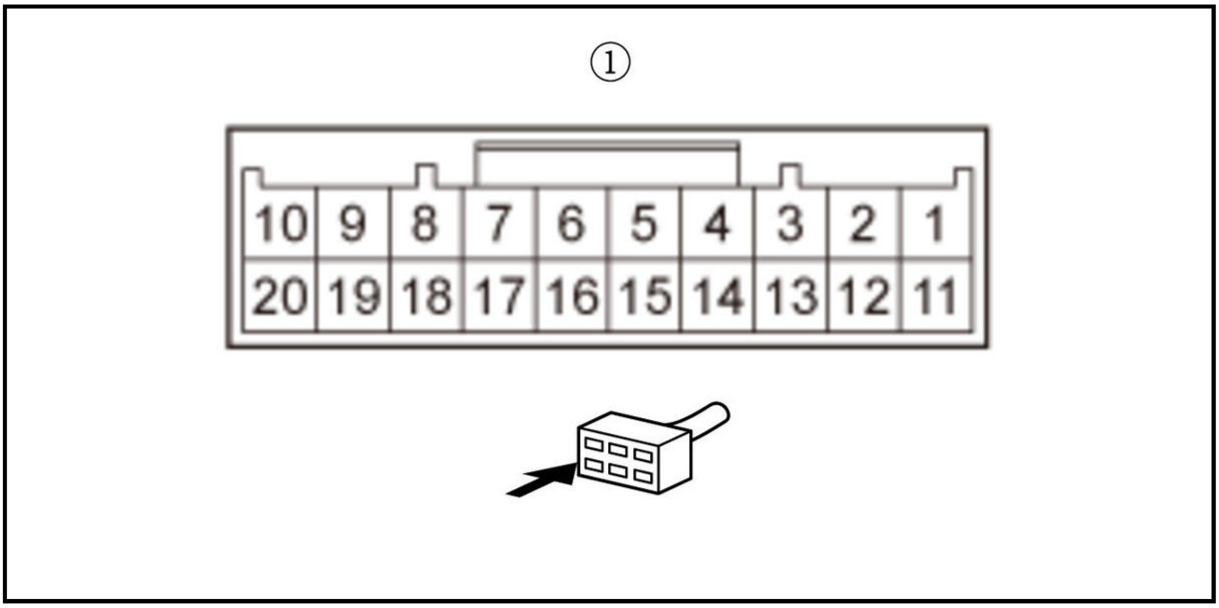
-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. Turn the vehicle to the ON mode.

-4. On the cable reel side, measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector D (20P) (male terminals) No. 20: ①
Test point 2	Body ground



Is there about 5 V?

YES

Repair an open in the LKAS/DIST wire between the ACC combination switch and the cable reel.

NO

Go to step 8.

8. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

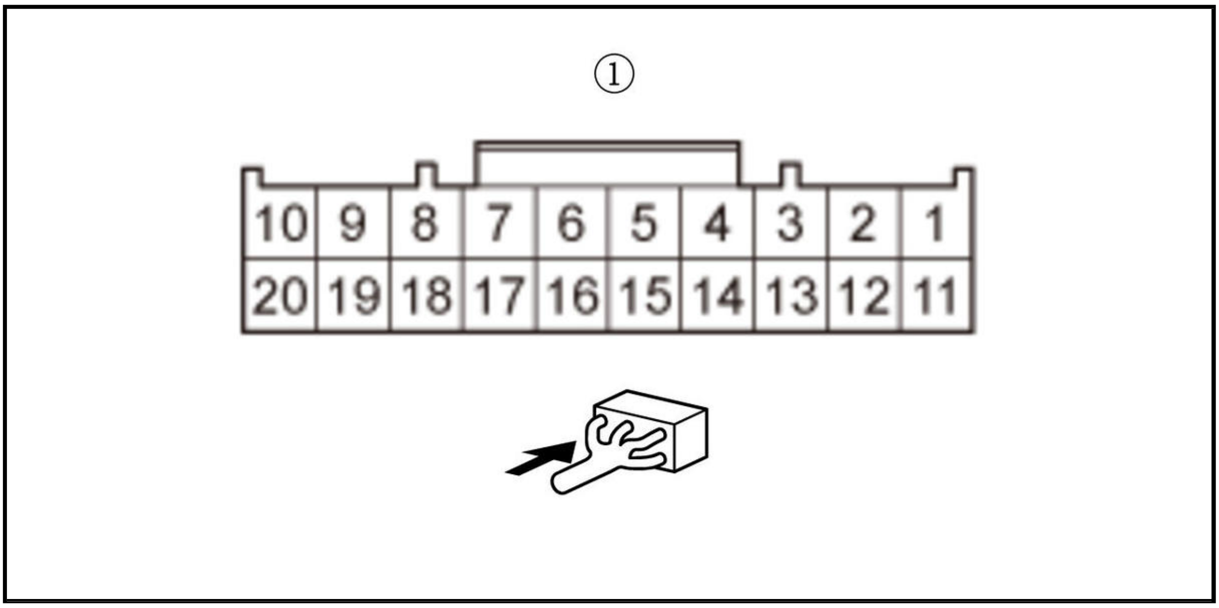
-2. Disconnect the following connector.

Cable reel connector A (20P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P): disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector A (20P) (female terminals) No. 8: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the cable reel .

NO

Go to step 9.

9. Open wire check (DISTANCE_SW line)

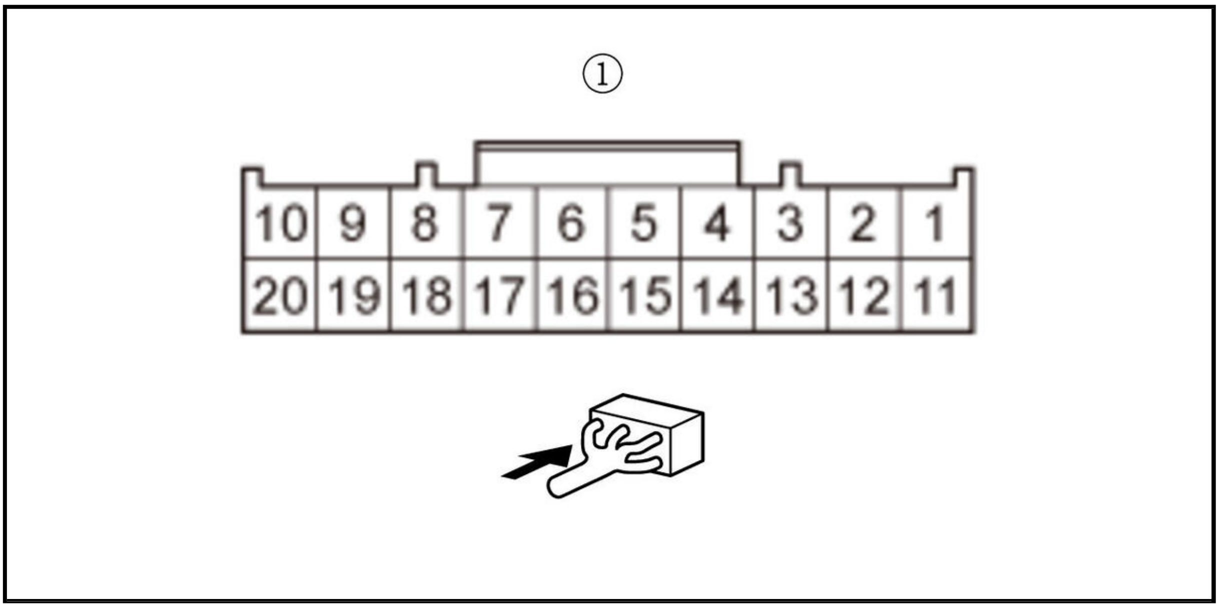
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
B	Cable reel connector A (20P): disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 28**
Test point 2	Cable reel connector A (20P) (female terminals) No. 8: ①



Is there 1.0 Ω or less?

YES

Replace the gauge control module .

NO

Repair an open in the DISTANCE_SW wire between the gauge control module and the cable reel.

DTC P0589-11

DTC P0589-11 : Main Switch Signal Circuit Short

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
P0589-11 Main Switch Signal Circuit Short	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
P0589-11 Main Switch Signal Circuit Short	B

Is DTC P0589-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Shorted wire check (CRUISE_SW line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

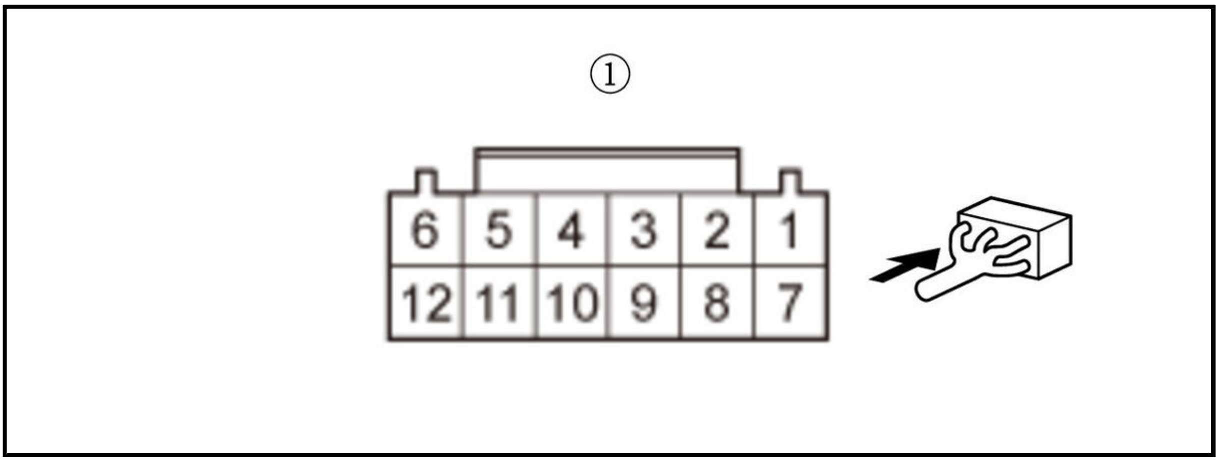
-2. Disconnect the following connector.

ACC combination switch 12P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the ACC combination switch .

NO

Go to step 3.

3. Shorted wire check (CRUISE_SW line) 2

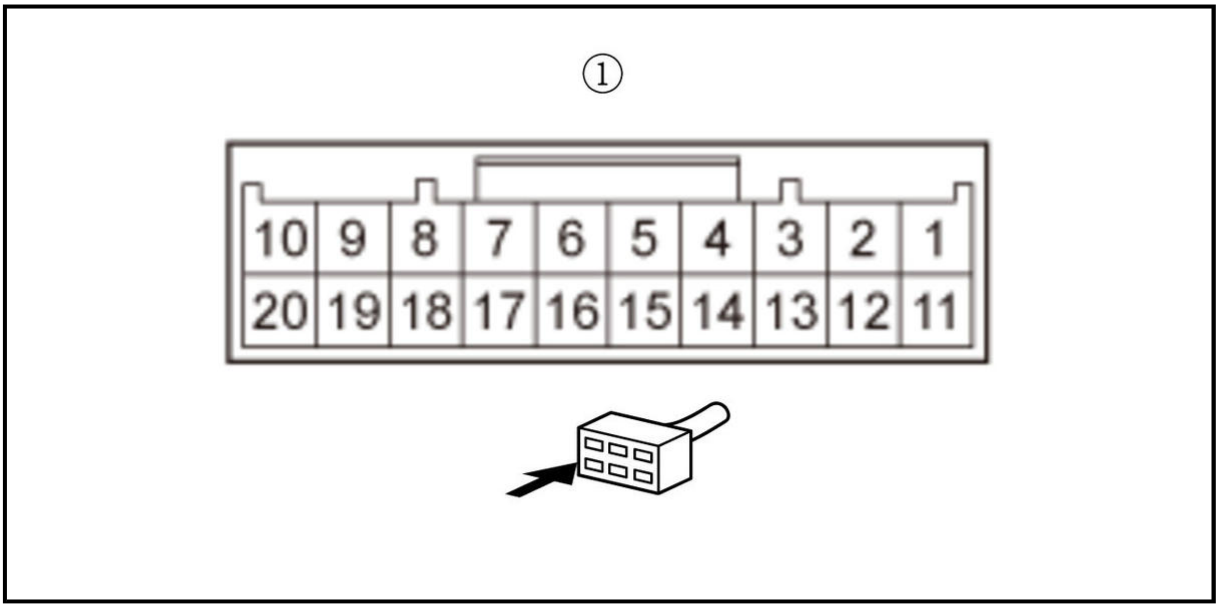
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. On the cable reel side, check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector D (20P) (male terminals) No. 16: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 4.

NO

Repair a short to ground in the CRUISE_SW wire between the ACC combination switch and the cable reel.

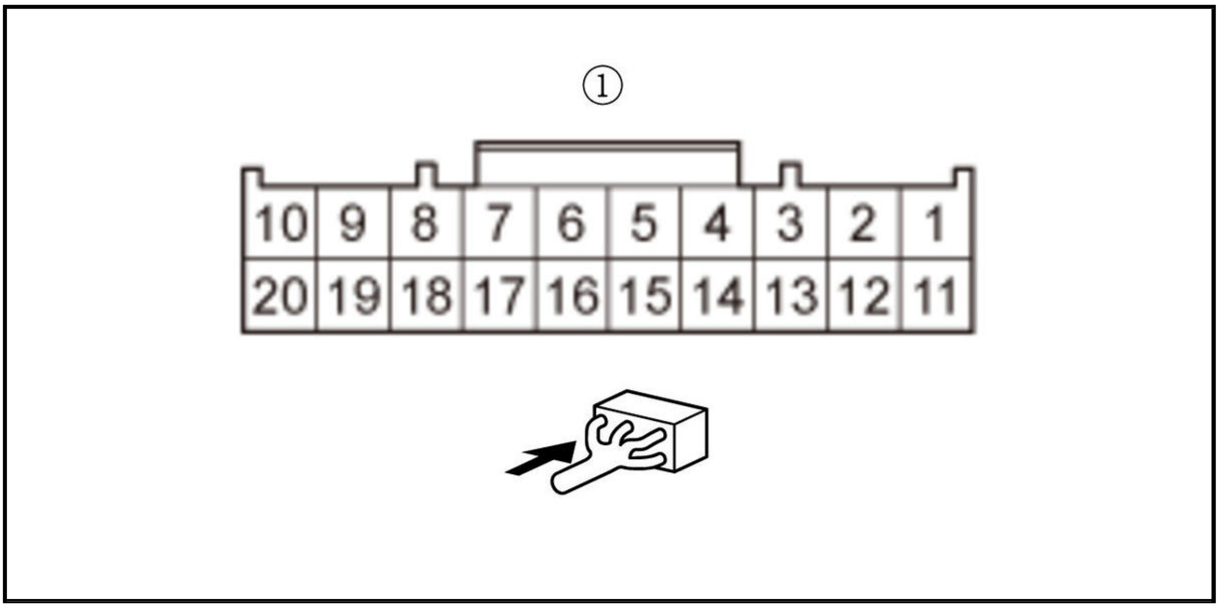
4. Shorted wire check (CRUISE_SW line) 3

-1. Disconnect the following connector.

Cable reel connector A (20P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P): disconnected
B	Cable reel connector D (20P): disconnected
Test point 1	Cable reel connector A (20P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Go to step 5.

NO

Replace the cable reel .

5. Shorted wire check (CRUISE_SW line) 4

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P): disconnected
B	Cable reel connector D (20P): disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 14**

Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

Replace the gauge control module .

NO

Repair a short to ground in the CRUISE_SW wire between the gauge control module and the cable reel.

DTC P0589-15

DTC P0589-15 : Main Switch Signal Circuit Open

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
P0589-15 Main Switch Signal Circuit Open	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
P0589-15 Main Switch Signal Circuit Open	B

   Is DTC P0589-15 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

2. Open wire check (CRUISE_SW line) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

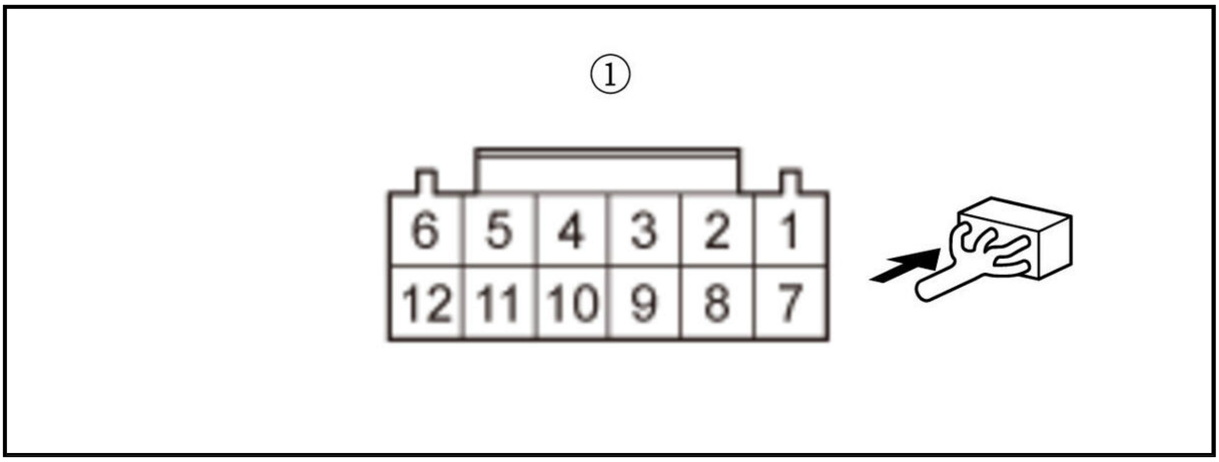
   -2. Disconnect the following connector.

ACC combination switch 12P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 3.

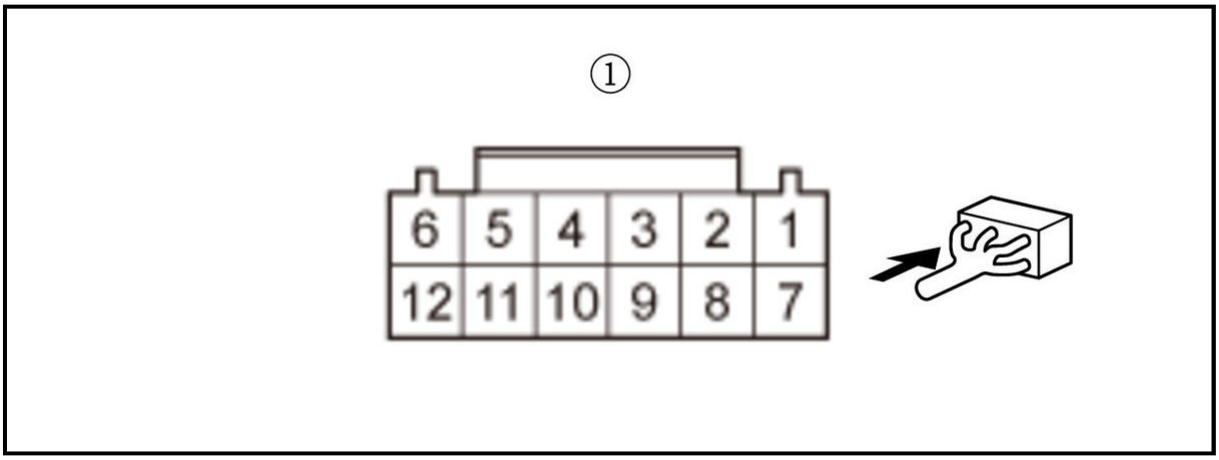
NO

Go to step 7.

3. ACC combination switch circuit check

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 6: ①
Test point 2	ACC combination switch 12P connector (female terminals) No. 5: ①



Is there about 5 V?

YES

Replace the ACC combination switch .

NO

Go to step 4.

4. Open wire check (CRUISE_GND line) 1

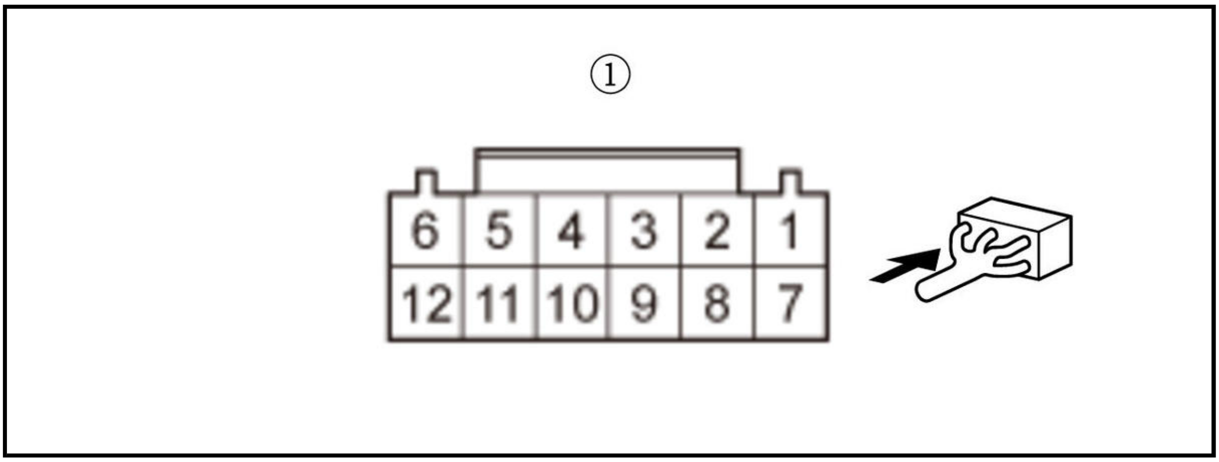
-1. Turn the vehicle to the OFF (LOCK) mode.

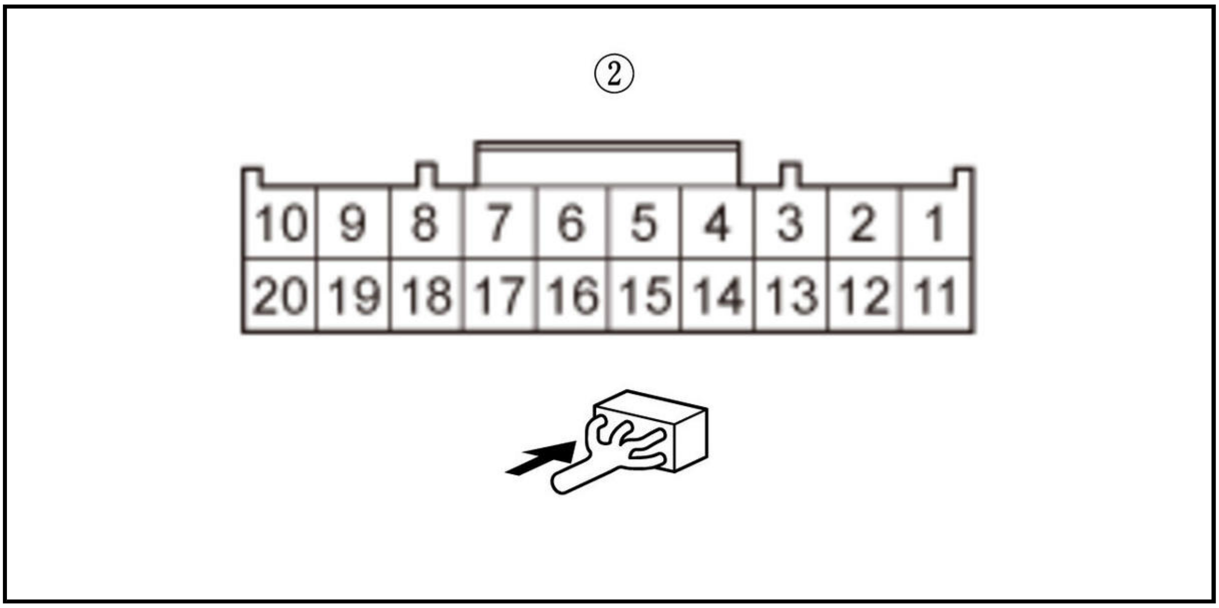
-2. Disconnect the following connector.

Cable reel connector D (20P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P) connector: disconnected
Test point 1	ACC combination switch 12P connector (female terminals) No. 5: ①
Test point 2	Cable reel connector D (20P) (female terminals) No. 17: ②





Is there 1.0 Ω or less?

YES

Go to step 5.

NO

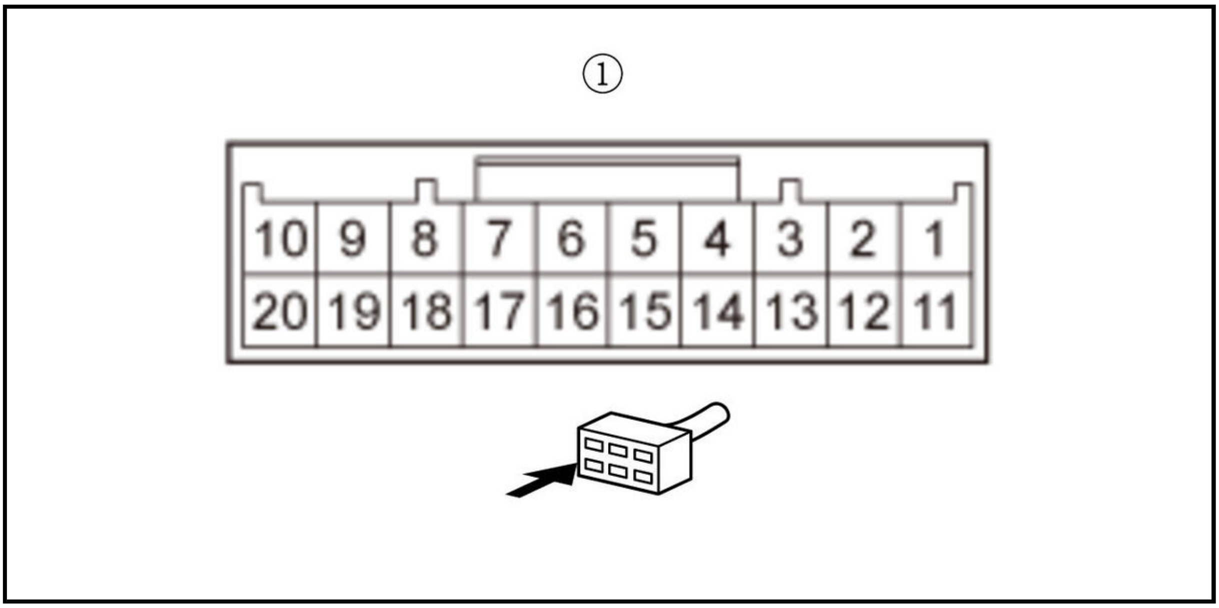
Repair an open in the CRUISE_GND wire between the ACC combination switch and the cable reel.

5. Cable reel check

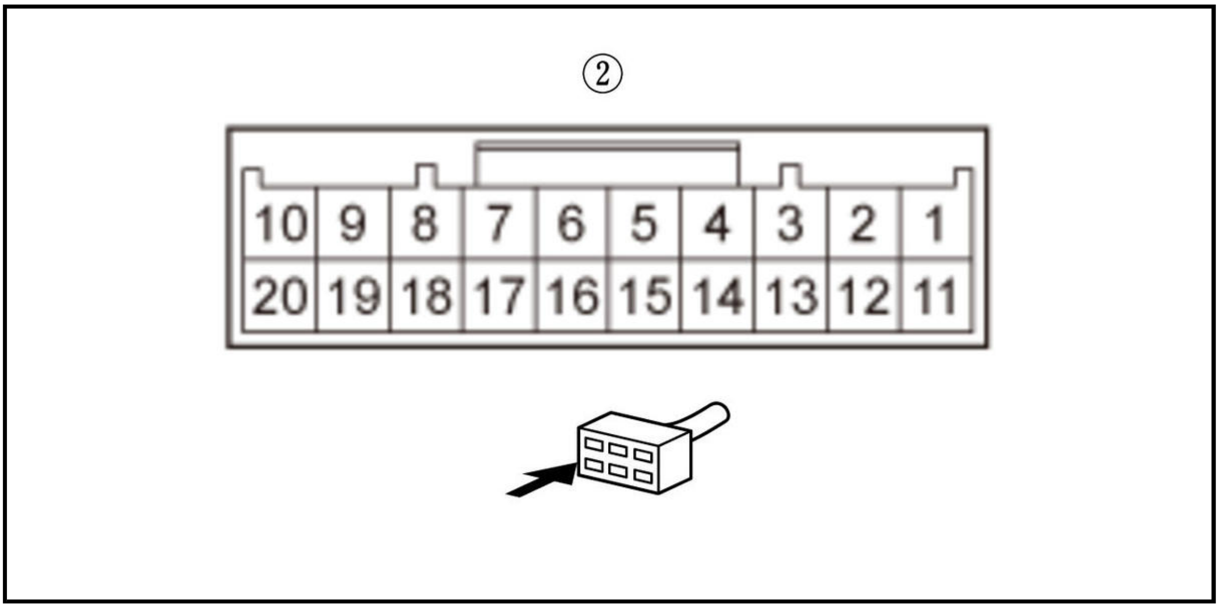
-1. **Remove the cable reel** .

-2. On the cable reel side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P) connector: disconnected
B	Cable reel connector D (20P) connector: disconnected
Test point 1	Cable reel connector A (20P) (male terminals) No. 5: ①
Test point 2	Cable reel connector D (20P) (male terminals) No. 17: ②



①
10 9 8 7 6 5 4 3 2 1
20 19 18 17 16 15 14 13 12 11



②
10 9 8 7 6 5 4 3 2 1
20 19 18 17 16 15 14 13 12 11

Is there 1.0 Ω or less?

YES

Go to step 6.

NO

Replace the cable reel .

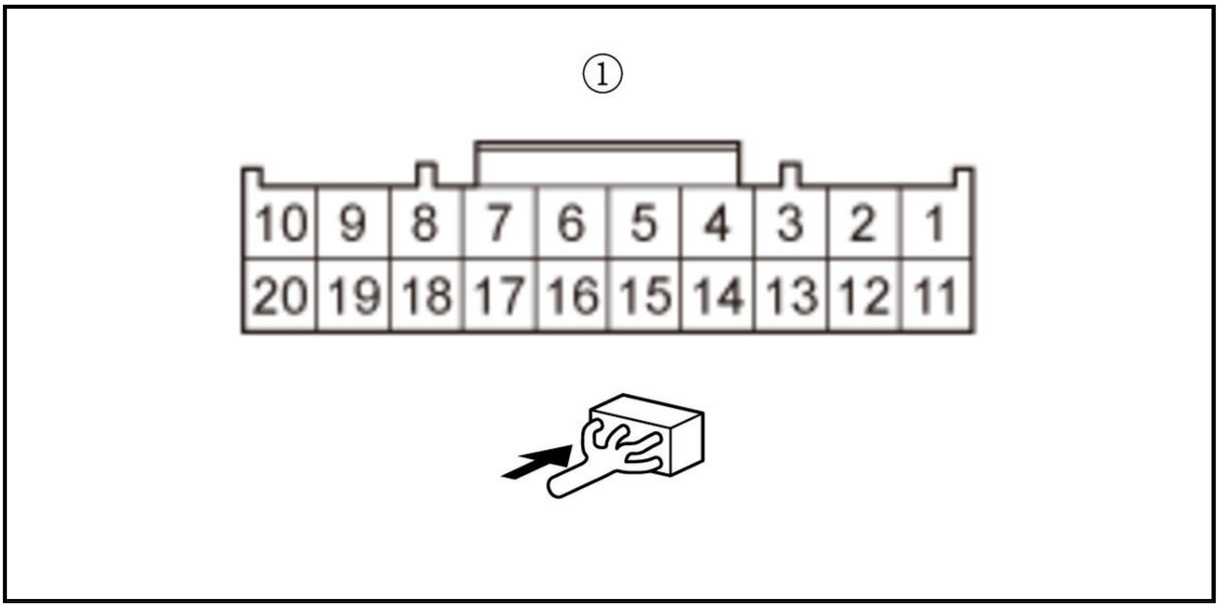
6. Open wire check (CRUISE_GND line) 2

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P) connector: disconnected
B	Cable reel connector D (20P) connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 5**
Test point 2	Cable reel connector A (20P) (female terminals) No. 5: ①



Is there 1.0 Ω or less?

YES

Replace the gauge control module .

NO

Repair an open in the CRUISE_GND wire between the gauge control module and the cable reel.

7. Open wire check (CRUISE_SW line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

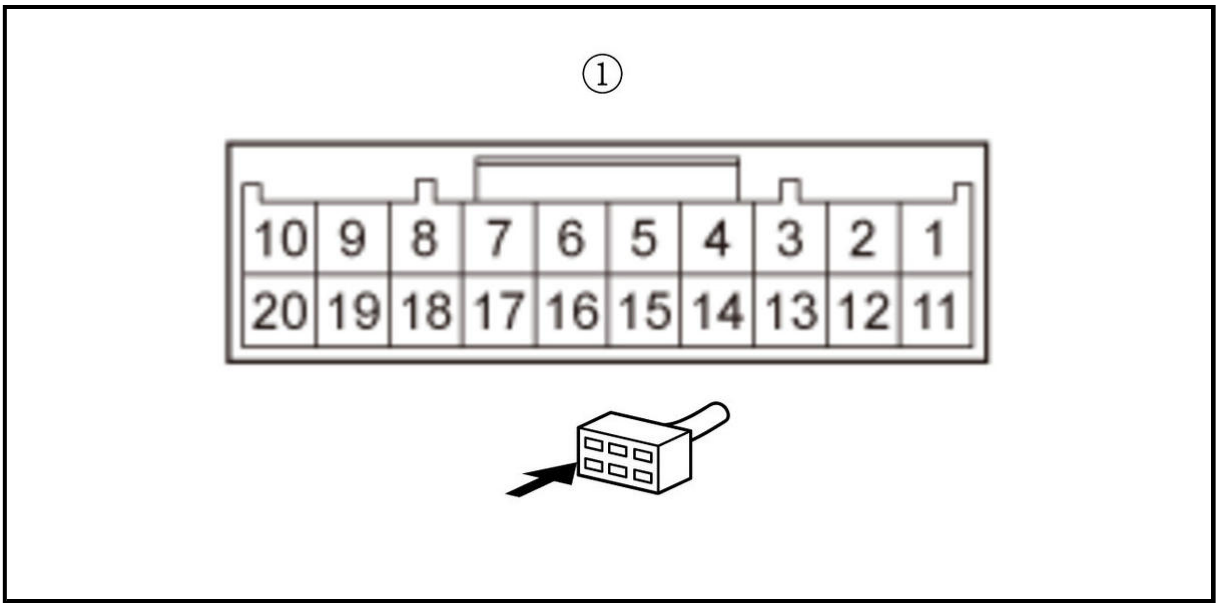
Cable reel connector D (20P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

B	ACC combination switch 12P connector: disconnected
B	Cable reel connector D (20P) connector: disconnected
Test point 1	Cable reel connector D (20P) (male terminals) No. 16: ①
Test point 2	Body ground



Is there about 5 V?

YES

Repair an open in the CRUISE_SW wire between the ACC combination switch and the cable reel.

NO

Go to step 8.

8. Open wire check (CRUISE_SW line) 3

-1. Turn the vehicle to the OFF (LOCK) mode.

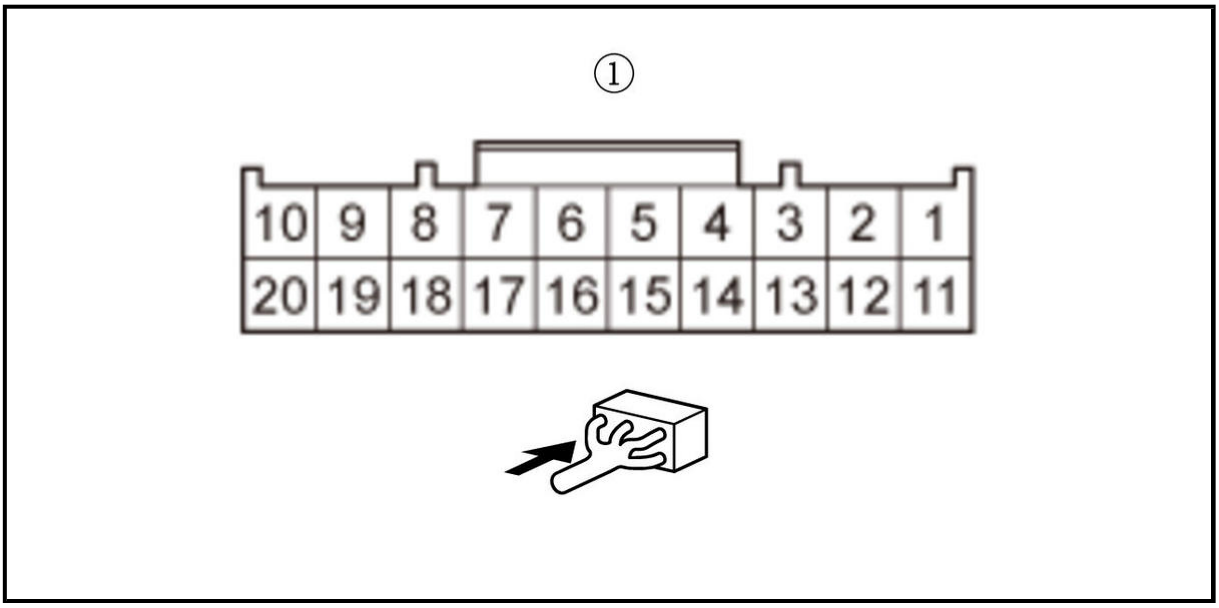
-2. Disconnect the following connector.

Cable reel connector A (20P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P) connector: disconnected
B	Cable reel connector D (20P) connector: disconnected
Test point 1	Cable reel connector A (20P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the cable reel .

NO

Go to step 9.

9. Open wire check (CRUISE_SW line) 4

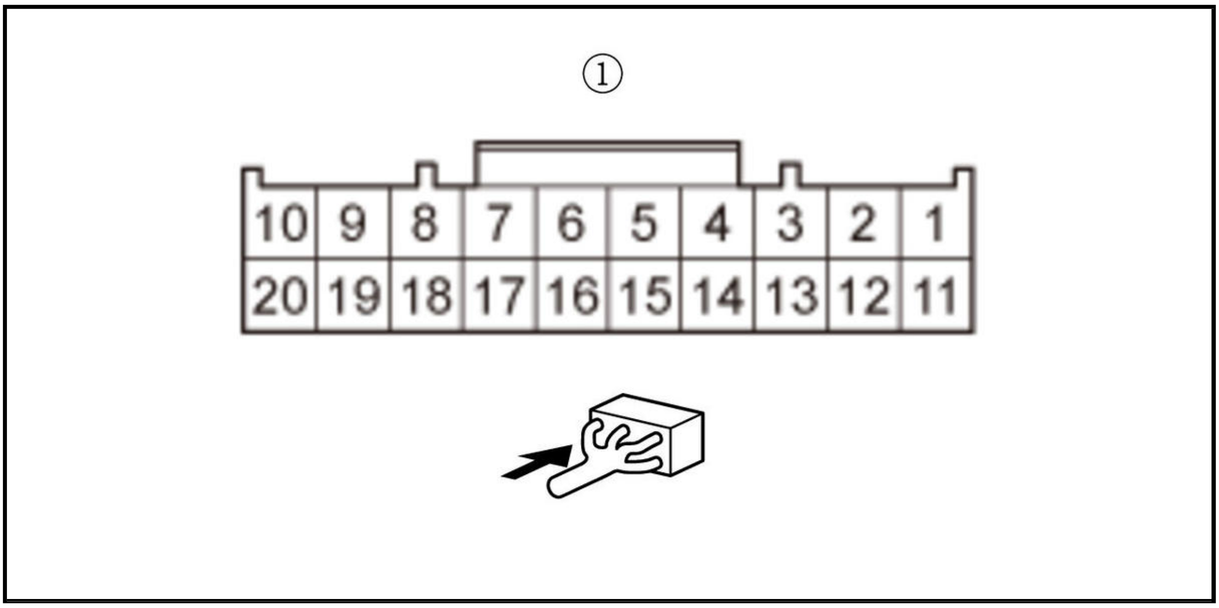
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF mode
B	ACC combination switch 12P connector: disconnected
B	Cable reel connector A (20P) connector: disconnected
B	Cable reel connector D (20P) connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 14**
Test point 2	Cable reel connector A (20P) (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

Replace the gauge control module .

NO

Repair an open in the CRUISE_SW wire between the gauge control module and the cable reel.

DTC P2583-49, U3000-49, U3000-57 (MILLIMETER WAVE RADAR)

DTC P2583-49 : Millimeter Wave Radar Internal Electronic Failure

DTC U3000-49 : Millimeter Wave Radar Internal Electronic Failure

DTC U3000-57 : Millimeter Wave Radar Software Failure

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
P2583-49 Millimeter Wave Radar Internal Electronic Failure	B
U3000-49 Millimeter Wave Radar Internal Electronic Failure	B
U3000-57 Millimeter Wave Radar Software Failure	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to OFF (LOCK) mode and then ON mode repeatedly at least 3 times.

-4. Check for DTCs with the HDS.

DTC Description	DTC
P2583-49 Millimeter Wave Radar Internal Electronic Failure	B
U3000-49 Millimeter Wave Radar Internal Electronic Failure	B
U3000-57 Millimeter Wave Radar Software Failure	B

Is DTC P2583-49, U3000-49, or U3000-57 indicated?

YES

The failure is duplicated. **Replace the millimeter wave radar** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC P2583-76

DTC P2583-76 : Temporary stop of Integrated Driver Support System (Misalignment Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- Before you troubleshoot, make sure all the tire pressures are correct, and remove all the cargo from the vehicle.
- This DTC is recorded if the beam axis of the millimeter wave radar gets out of alignment as follows while the vehicle is driving.
-
  - Vertical direction: 3.0 degrees or more
  - Horizontal direction: 2.5 degrees or more
- If this DTC is recorded, the following is suspected:
-
  - Change in the vehicle posture caused by an overload or the vehicle being towed.
  - It has been detected that the beam axis of the millimeter wave radar is out of alignment due to improper installation.
  - The millimeter wave radar installing portion is deformed by a minor collision or strong impact.
  - The beam axis of the millimeter wave radar is out of alignment due to abnormal wheel alignment, abnormal tire pressure, etc.
  - Altered suspension
  - When it is snowing, the radio waves transmitted and received by the millimeter wave radar may be refracted by the snow or ice attached around the millimeter wave radar such as the front grille, and are detected as a misalignment.
- If this DTC is recorded, the integrated drive support system temporarily cancels its control to prevent excessive operation or malfunction.
- Even when this DTC is recorded, the vehicle returns to normal if the misalignment of the detection axis of the millimeter wave radar is 1.5 degrees or less.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
P2583-76 Temporary stop of Integrated Driver Support System (Misalignment Millimeter Wave Radar)	B

1. Check the vehicle condition

   -1. Turn the vehicle to the ON mode.

   -2. Check if any integrated driver support system related indicator comes on in the gauge control module.

   Is any indicator currently comes on?

   YES

   The failure is duplicated. Go to step 2.

   NO

   The system is OK at this time. Clear the DTC with the HDS. If the indicator is turned off, and axis misalignment has been recorded, explain to the customer that the system detected a temporarily misaligned millimeter wave axis and stopped functioning.

2. Millimeter wave radar installation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the front bumper** .

   -3. Check that the millimeter wave radar and radar bracket are installed properly and check them for deformation and damage.

   Are the millimeter wave radar and the radar bracket installed properly, and/or is there any no damage?

   YES

   Aim the millimeter wave radar . After the millimeter wave radar aiming is complete, clear the DTC with the HDS.

   NO

   Repair or replace faulty parts, then **aim the millimeter wave radar** .

DTC P2583-92

DTC P2583-92 : CMBS or FCW Over Working

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the CMBS is activated five times in a single vehicle ON mode cycle.
- If this DTC is recorded, the CMBS function does not return to normal until the DTC is cleared with the HDS.
- If this DTC is recorded, the following is suspected:
-
    - The vehicle is responding to road signs, sign boards, guardrail, etc. installed along the road frequently depending on the surrounding environment.
    - The millimeter wave radar is installed improperly and close-range obstacles are detected frequently.
    - The millimeter wave radar installing portion is deformed by a minor collision or strong impact.
    - The beam axis of the millimeter wave radar is out of alignment due to abnormal wheel alignment, abnormal tire pressure, etc.

  - The CMBS is activated several times in a row intentionally by the driver.
- After inspecting, repairing, or adjusting a possible cause of the failure, be sure to **perform millimeter wave radar aiming** . If the DTC cannot be deleted after millimeter wave radar aiming, **replace the millimeter wave radar** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
P2583-92 CMBS or FCW Over Working	B

DTC (IDAS)

1. Millimeter wave radar installation check

   -1. **Remove the front bumper** .

   -2. Check that the millimeter wave radar and radar bracket are installed properly and check them for deformation and damage.

   Are the millimeter wave radar and the radar bracket installed properly, and/or is there any no damage?

   YES

   Go to step 2.

   NO

   Repair or replace faulty parts, then **aim the millimeter wave radar** .

2. Millimeter wave radar check (aiming)

   -1. **Install the front bumper** .

   -2. **Aim the millimeter wave radar** .

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
P2583-92 CMBS or FCW Over Working	B

   Is DTC P2583-92 indicated?

   YES

   If the millimeter wave radar is installed properly but the DTC is recorded again after millimeter wave radar aiming, **replace the millimeter wave radar** .

   NO

   The system is OK at this time.

DTC P2583-97

DTC P2583-97 : Dust or Dirt On The Millimeter Wave Radar

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is stored when the millimeter wave radar determines that the detection capability (sensitivity) has decreased. A decrease in the detection capability (sensitivity) of the millimeter wave radar does not always mean a there is an obstruction on the radar surface.
- This DTC may be stored when passing through an enclosed space such as a tunnel.
- Wipe off any dirt or dust off the millimeter wave radar surface and radar cover, and test drive the vehicle. If the DTC disappears, the millimeter wave radar is OK.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
P2583-97 Dust or Dirt On The Millimeter Wave Radar	B

DTC (IDAS)

1. Millimeter wave radar and radar cover visual check

   -1. Check for dirt and dust on the radar cover surface.

   -2. Remove the radar cover, and check for dirt and dust on the inner side of the radar cover.

   -3. Check for dirt and dust on the millimeter wave radar surface.

   Is it surface dirty?

   YES

   Clean the millimeter wave radar and/or the radar cover. After cleaning, install the radar cover, then go to step 2.

   NO

   Go to step 2.

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Test-drive the vehicle at speeds 25 mph (40 km/h) or more for 2 minutes.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
P2583-97 Dust or Dirt On The Millimeter Wave Radar	B

   Is DTC P2583-97 indicated?

   YES

   The failure is duplicated. **Replace the millimeter wave radar** .

   NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC P2583-9A

DTC P2583-9A : Temporary stop of Integrated Driver Support System (Jammed Millimeter Wave Radar)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the millimeter wave radar malfunctions due to the impact of external radio waves.
- If this DTC is recorded, the integrated driver support system temporarily cancels its control.
- If this DTC is recorded, the vehicle returns to normal if the factor causing the failure has disappeared when the vehicle is stopped (vehicle OFF mode) and is turned to the ON mode again.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
P2583-9A Temporary stop of Integrated Driver Support System (Jammed Millimeter Wave Radar)	B

DTC (IDAS)

1. DTC check

   -1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   Is there any DTC(s) other than DTC P2583-9A?

   YES

   Perform a troubleshooting for the recorded DTC.

   NO

   Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC U0029-00 (MILLIMETER WAVE RADAR)

DTC U0029-00 : F-CAN Malfunction (BUS-OFF)

NOTE:

- Before you troubleshoot, **review the how to troubleshooting information**.
- This DTC is stored by communication failure between the F-CAN line and the millimeter wave radar. When DTC U0029-00 is indicated, the F-CAN line has already returned to normal. Check for loose terminals and poor connections at the connectors. If the connectors are OK, clear the DTC and following this troubleshooting.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0029-00 F-CAN Malfunction (BUS-OFF)	B

DTC (IDAS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting in the CAN gateway system .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U0029-F1 (MILLIMETER WAVE RADAR)

DTC U0029-F1 : F-CAN Malfunction (BUS-OFF) (Multipurpose Camera Unit)

NOTE:

- Before you troubleshoot, **review the how to troubleshooting information**.
- This DTC is stored by communication failure between the F-CAN line and the multipurpose camera unit. When DTC U0029-F1 is indicated, the F-CAN line has already returned to normal. Check for loose terminals and poor connections at the connectors. If the connectors are OK, clear the DTC and following this troubleshooting.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0029-F1 F-CAN Malfunction (BUS-OFF) (Multipurpose Camera Unit)	B

DTC (IDAS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting in the CAN gateway system .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U0047-00, U0047-F1, U12B7-00 (MILLIMETER WAVE RADAR)

DTC U0047-00 : Millimeter Wave Radar Local-CAN Malfunction (BUS-OFF)

DTC U0047-F1 : Multipurpose Camera Unit Local-CAN Malfunction

DTC U12B7-00 : Millimeter Wave Radar Local-CAN Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If the transmitting control unit is malfunctioning, a DTC may be recorded. According to the recorded DTC, inspect the power circuits and ground circuits of the millimeter wave radar or the multipurpose camera unit.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0047-00 Millimeter Wave Radar Local-CAN Malfunction (BUS-OFF)	B
U0047-F1 Multipurpose Camera Unit Local-CAN Malfunction	B
U12B7-00 Millimeter Wave Radar Local-CAN Malfunction	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U0047-00 Millimeter Wave Radar Local-CAN Malfunction (BUS-OFF)	B

DTC Description	DTC
U0047-F1 Multipurpose Camera Unit Local-CAN Malfunction	B
U12B7-00 Millimeter Wave Radar Local-CAN Malfunction	B

Is DTC U0047-00, U0047-F1, or U12B7-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the millimeter wave radar and the multipurpose camera unit.

2. Open wire check (ACC-CAN_H line, ACC-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Millimeter wave radar 8P connector
Multipurpose camera unit 12P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Millimeter wave radar 8P connector: disconnected
B	Multipurpose camera unit 12P connector: disconnected

DTC	**Circuit name**	**Test point 1 (Receiving control unit)**		**Test point 2 (Transmitting control unit)**	
		Connector	**Terminal**	**Connector**	**Terminal**
U0047-00	ACC-CAN_H	**Millimeter wave radar 8P connector**	No. 4	**Multipurpose camera unit 12P connector**	No. 12
	ACC-CAN_L		No. 3		No. 6
U0047-F1	ACC-CAN_H	**Multipurpose camera unit 12P connector**	No. 12	**Millimeter wave radar 8P connector**	No. 4
	ACC-CAN_L		No. 6		No. 3
U12B7-00	ACC-CAN_H	**Millimeter wave radar 8P connector**	No. 4	**Multipurpose camera unit 12P connector**	No. 12
	ACC-CAN_L		No. 3		No. 6

Is there 1.0 Ω or less?

YES

Check for poor connections or loose terminals at the millimeter wave radar and the multipurpose camera unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace **the millimeter wave radar** or **the multipurpose camera unit** .

NO

Repair an open in the ACC-CAN_H wire or the ACC-CAN_L wire between the millimeter wave radar and the multipurpose camera unit.

DTC U0100-00, U0101-00, U0122-00, U0128-00, U0129-00, U0131-00, U0151-00, U0155-00 (MILLIMETER WAVE RADAR)

DTC U0100-00 : Lost Communication With The PCM (PGM-FI System)

DTC U0101-00 : Lost Communication With The PCM/TCM

DTC U0122-00 : Lost Communication With The VSA Modulator-Control Unit

DTC U0128-00 : Lost Communication With The Electric Parking Brake Control Unit

DTC U0129-00 : Lost Communication With The Electric Servo Brake Control Unit

DTC U0131-00 : Lost Communication With The EPS Control Unit

DTC U0151-00 : Lost Communication With The SRS Unit

DTC U0155-00 : Lost Communication With The Gauge Control Module

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If the transmitting control unit is malfunctioning, a DTC may be recorded. According to the recorded DTC, inspect the power circuits and ground circuits of the units with which the millimeter wave radar does not communicate.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0100-00 Lost Communication With The PCM (PGM-FI System)	B
U0101-00 Lost Communication With The PCM/TCM	B
U0122-00 Lost Communication With The VSA Modulator-Control Unit	B
U0128-00 Lost Communication With The Electric Parking Brake Control Unit	B
U0129-00 Lost Communication With The Electric Servo Brake Control Unit	B
U0131-00 Lost Communication With The EPS Control Unit	B
U0151-00 Lost Communication With The SRS Unit	B
U0155-00 Lost Communication With The Gauge Control Module	B

DTC (IDAS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Is any DTC indicated?

   YES

   Go to the indicated DTCs troubleshooting .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Does the millimeter wave radar detect the CAN gateway Bus channels C?

   Bus C is Not Available

   Go to step 3.

   Bus C is Available

Go to step 4.

3. Open wire check (F-CAN C_H line, F-CAN C_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

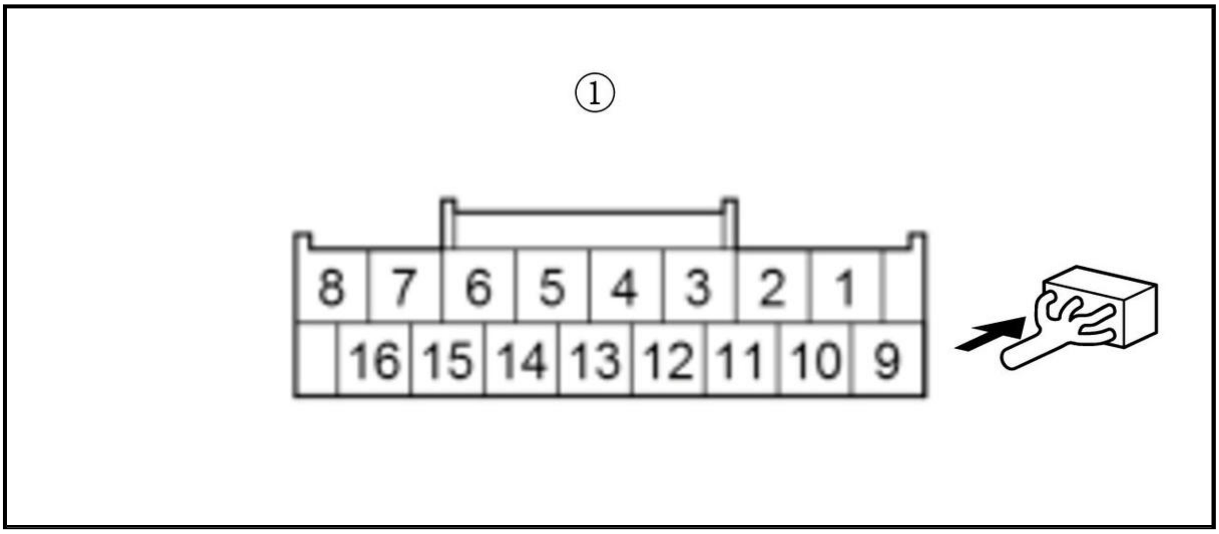
-2. Disconnect the following connectors.

CAN gateway 16P connector
Millimeter wave radar 8P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Millimeter wave radar 8P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 5: ①
Test point 2	**Millimeter wave radar 8P connector No. 7**

Test point 1	CAN gateway 16P connector (female terminals) No. 13: ①
Test point 2	**Millimeter wave radar 8P connector No. 6**



Is there 1.0 Ω or less?

YES

Check for poor connections or loose terminals at the CAN gateway and the millimeter wave radar. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the millimeter wave radar** .

NO

Repair an open in the F-CAN C_H wire or the F-CAN C_L wire between the millimeter wave radar and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100-00	PCM	A, B

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0101-00	PCM	A, B
U0122-00	VSA modulator-control unit	B, C
U0128-00	VSA modulator-control unit	B, C
U0129-00	Electric servo brake control unit	B, C
U0131-00	EPS control unit	C
U0151-00	SRS unit	C
U0155-00	Gauge control module	D

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-00: PCM is Not Available for Bus A

Go to step 5.

U0100-00: PCM is Not Available for Bus B

Go to step 6.

U0101-00: PCM is Not Available for Bus A

Go to step 5.

U0101-00: PCM is Not Available for Bus B

Go to step 6.

U0122-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0122-00: VSA modulator-control unit is Not Available for Bus C

Go to step 7.

U0128-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0128-00: VSA modulator-control unit is Not Available for Bus C

Go to step 7.

U0129-00: Electric servo brake control unit is Not Available for Bus B

Go to step 6.

U0129-00: Electric servo brake control unit is Not Available for Bus C

Go to step 7.

U0131-00: EPS control unit is Not Available for Bus C

Go to step 7.

U0151-00: SRS unit is Not Available for Bus C

Go to step 7.

U0155-00: Gauge control module is Not Available for Bus D

Go to step 8.

5. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector

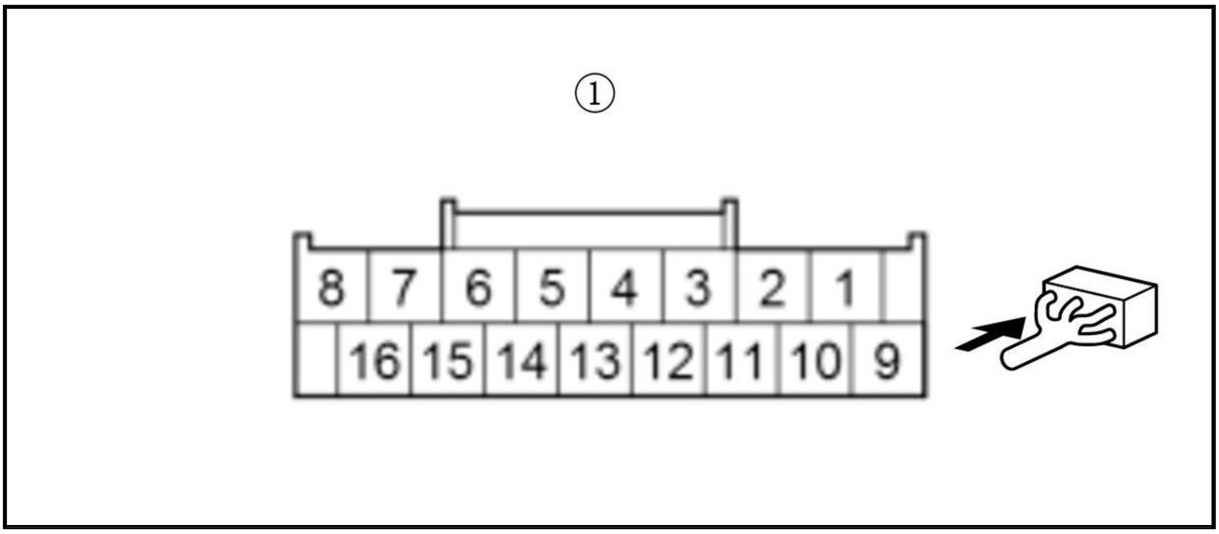
DTC	Connector
U0100-00	PCM connector A (50P)
U0101-00	PCM connector A (50P)

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36
U0101-00	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36



Is there 1.0 Ω or less?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0101-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0101-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector
U0128-00	VSA modulator-control unit 46P connector
U0129-00	Electric servo brake control unit 22P connector

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39

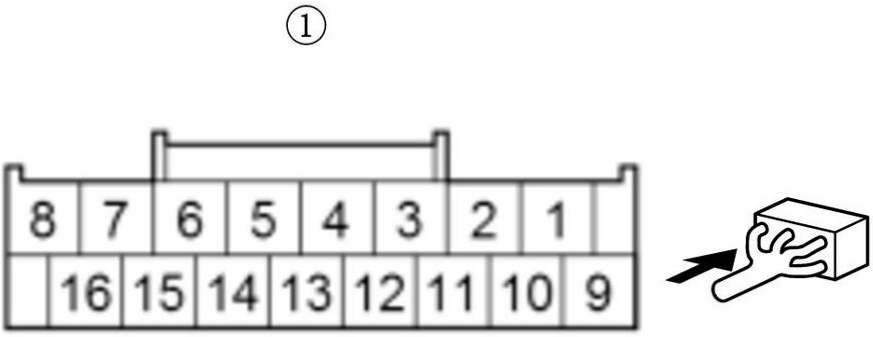
	F-CAN B_L		No. 14		No. 14



Is there 1.0 Ω or less?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0101-00	Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are

DTC	Operation for transmitting control unit
	troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0122-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0128-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

DTC	Operation for transmitting control unit
U0129-00	Check for poor connections or loose terminals at the CAN gateway and the electric servo brake control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

7. Open wire check (F-CAN C_H line, F-CAN C_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0122-00	VSA modulator-control unit 46P connector
U0128-00	VSA modulator-control unit 46P connector
U0129-00	Electric servo brake control unit 22P connector
U0131-00	EPS control unit connector B (6P)
U0151-00	SRS unit connector A (39P)

NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** and wait for at least 3 minutes.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0122-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**VSA modulator-control unit 46P connector**	No. 46

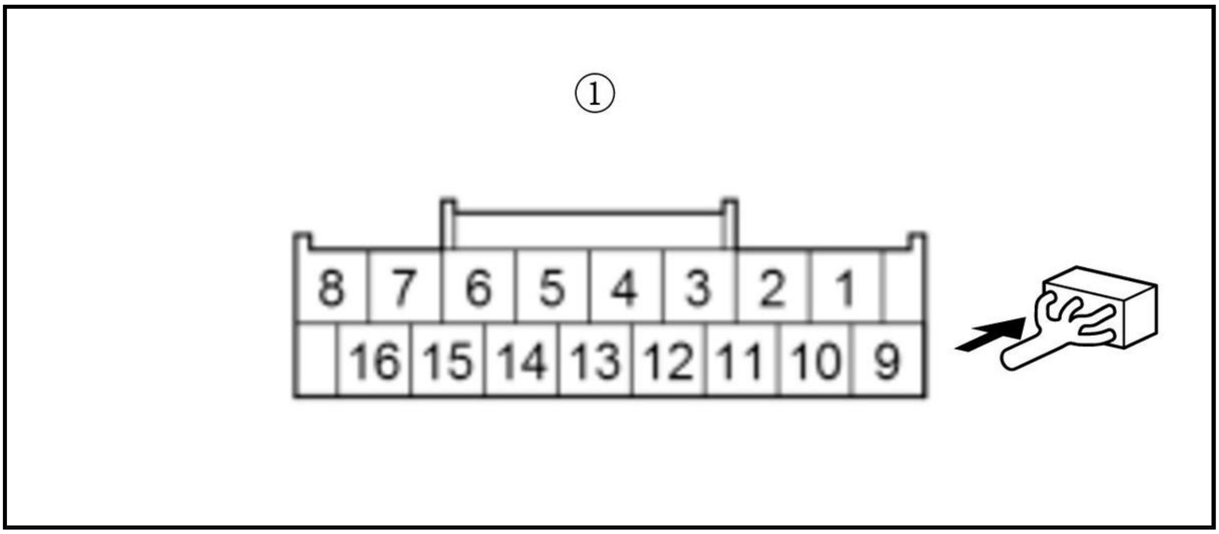
	F-CAN C_L		No. 13		No. 35



Is there 1.0 Ω or less?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0122-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0128-00	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0129-00	Check for poor connections or loose terminals at the CAN gateway and the electric servo brake control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .
U0131-00	Check for poor connections or loose terminals at the CAN gateway and the EPS control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .
U0151-00	Check for poor connections or loose terminals at the CAN gateway and the SRS unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the SRS unit** .

NO

Repair an open in the F-CAN C_H wire or the F-CAN C_L wire between the transmitting control unit and the CAN gateway.

8. Open wire check (F-CAN D_H line, F-CAN D_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

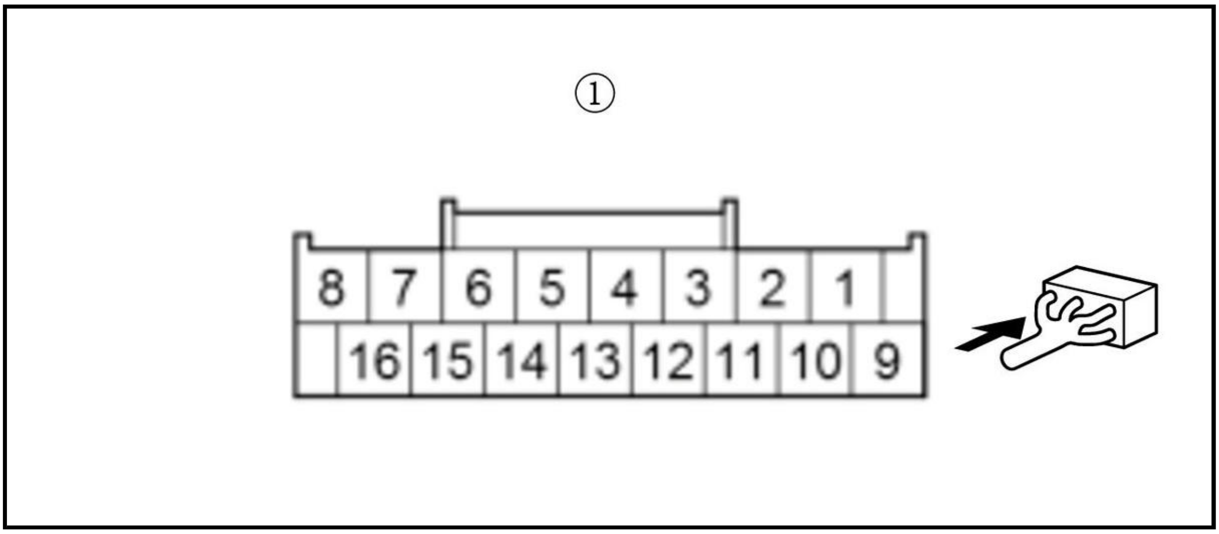
-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0155-00	Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0155-00	F-CAN D_H	CAN gateway 16P connector (female terminals): ①	No. 7	**Gauge control module connector A (32P)**	No. 19
	F-CAN D_L		No. 15		No. 20



Is there 1.0 Ω or less?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0155-00	Check for poor connections or loose terminals at the CAN gateway and the gauge control module. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good gauge control module** , then recheck. If they are OK, **replace the original gauge control module** .

NO

Repair an open in the F-CAN D_H wire or the F-CAN D_L wire between the transmitting control unit and the CAN gateway.

DTC U0100-F1, U0101-F1, U0122-F1, U0129-F1, U0131-F1, U0151-F1, U0155-F1 (MILLIMETER WAVE RADAR)

DTC U0100-F1 : Lost Communication With The PCM (PGM-FI System) (Multipurpose Camera Unit)

DTC U0101-F1 : Lost Communication With The PCM/TCM (Multipurpose Camera Unit)

DTC U0122-F1 : Lost Communication With The VSA Modulator-Control Unit (Multipurpose Camera Unit)

DTC U0129-F1 : Lost Communication With The Electric Servo Brake Control Unit (Multipurpose Camera Unit)

DTC U0131-F1 : Lost Communication With The EPS Control Unit (Multipurpose Camera Unit)

DTC U0151-F1 : Lost Communication With The SRS Unit (Multipurpose Camera Unit)

DTC U0155-F1 : Lost Communication With The Gauge Control Module (Multipurpose Camera Unit)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If the transmitting control unit is malfunctioning, a DTC may be recorded. According to the recorded DTC, inspect the power circuits and ground circuits of the units with which the multipurpose camera unit does not communicate.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0100-F1 Lost Communication With The PCM (PGM-FI System) (Multipurpose Camera Unit)	B
U0101-F1 Lost Communication With The PCM/TCM (Multipurpose Camera Unit)	B
U0122-F1 Lost Communication With The VSA Modulator-Control Unit (Multipurpose Camera Unit)	B
U0129-F1 Lost Communication With The Electric Servo Brake Control Unit (Multipurpose Camera Unit)	B
U0131-F1 Lost Communication With The EPS Control Unit (Multipurpose Camera Unit)	B
U0151-F1 Lost Communication With The SRS Unit (Multipurpose Camera Unit)	B
U0155-F1 Lost Communication With The Gauge Control Module (Multipurpose Camera Unit)	B

DTC (IDAS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Is any DTC indicated?

YES

Go to the indicated DTCs troubleshooting .

NO

Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the multipurpose camera unit detect the CAN gateway Bus channels C?

Bus C is Not Available

Go to step 3.

Bus C is Available

Go to step 4.

3. Open wire check (F-CAN C_H line, F-CAN C_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

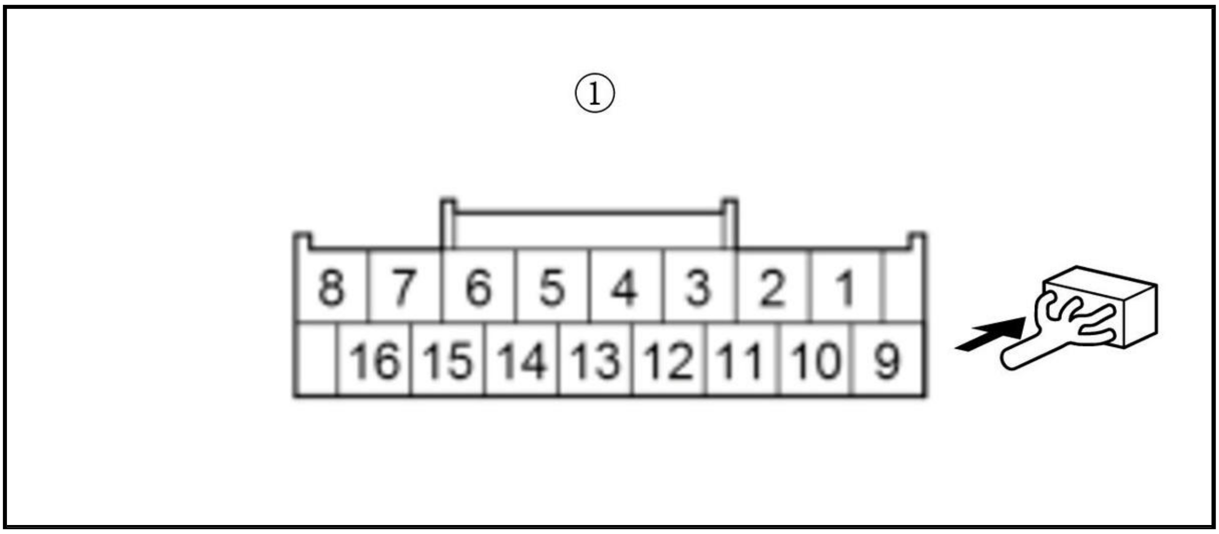
-2. Disconnect the following connectors.

CAN gateway 16P connector
Multipurpose camera unit 12P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Multipurpose camera unit 12P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 5: ①
Test point 2	**Multipurpose camera unit 12P connector No. 11**

Test point 1	CAN gateway 16P connector (female terminals) No. 13: ①
Test point 2	**Multipurpose camera unit 12P connector No. 5**



Is there 1.0 Ω or less?

YES

Check for poor connections or loose terminals at the CAN gateway and the multipurpose camera unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the multipurpose camera unit** .

NO

Repair an open in the F-CAN C_H wire or the F-CAN C_L wire between the multipurpose camera unit and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

-2. According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100-F1	PCM	A, B
U0101-F1	PCM	A, B
U0122-F1	VSA modulator-control unit	B, C
U0129-F1	Electric servo brake control unit	B, C
U0131-F1	EPS control unit	C
U0151-F1	SRS unit	C
U0155-F1	Gauge control module	D

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100-F1: PCM is Not Available for Bus A

Go to step 5.

U0100-F1: PCM is Not Available for Bus B

Go to step 6.

U0101-F1: PCM is Not Available for Bus A

Go to step 5.

U0101-F1: PCM is Not Available for Bus B

Go to step 6.

U0122-F1: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0122-F1: VSA modulator-control unit is Not Available for Bus C

Go to step 7.

U0129-F1: Electric servo brake control unit is Not Available for Bus B

Go to step 6.

U0129-F1: Electric servo brake control unit is Not Available for Bus C

Go to step 7.

U0131-F1: EPS control unit is Not Available for Bus C

Go to step 7.

U0151-F1: SRS unit is Not Available for Bus C

Go to step 7.

U0155-F1: Gauge control module is Not Available for Bus D

Go to step 8.

5. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0100-F1	PCM connector A (50P)

DTC	Connector
U0101-F1	PCM connector A (50P)

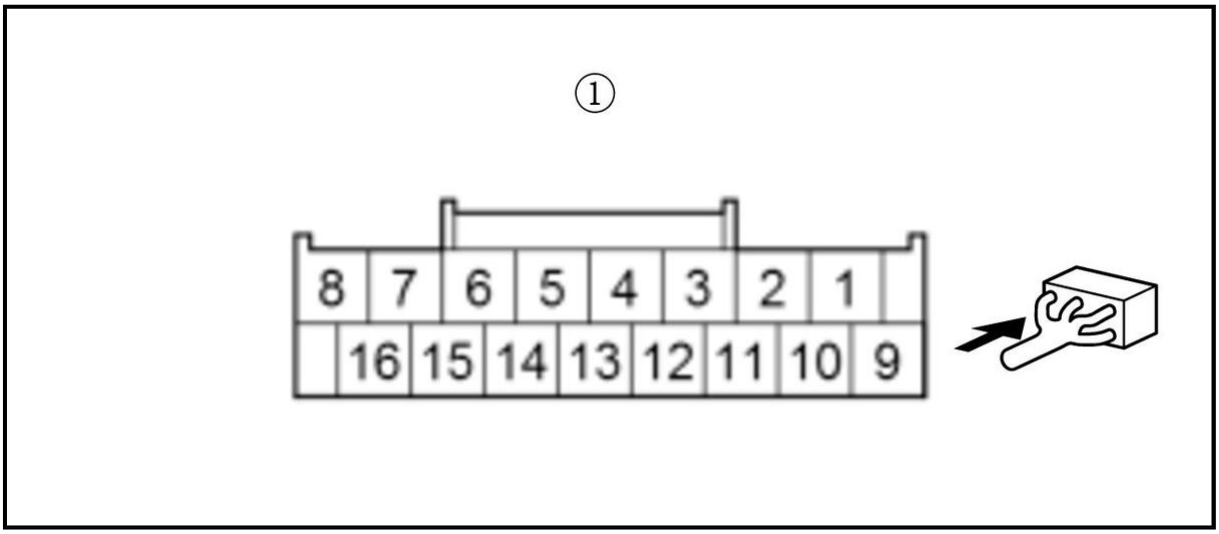
NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected

B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-F1	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A_L		No. 11		No. 36
U0101-F1	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A_L		No. 11		No. 36



Is there 1.0 Ω or less?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-F1	Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0101-F1	Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0100-F1	PCM connector A (50P)
U0101-F1	PCM connector A (50P)
U0122-F1	VSA modulator-control unit 46P connector
U0129-F1	Electric servo brake control unit 22P connector

NOTE: Before disconnecting the PCM connector, jump the SCS line with the HDS, and wait more than 1 minute.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected

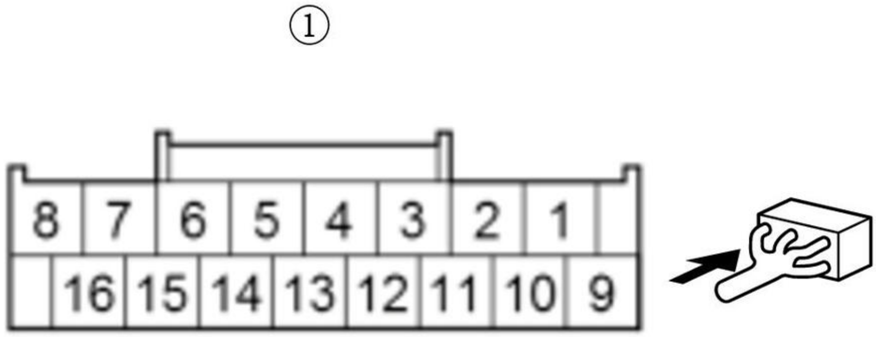
	F-CAN B_L		No. 14		No. 14



Is there 1.0 Ω or less?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100-F1	Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0101-F1	Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a good-known PCM** , then recheck. If they are OK, **replace the original PCM** .
U0122-F1	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0129-F1	Check for poor connections or loose terminals at the CAN gateway and the electric servo brake control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

7. Open wire check (F-CAN C_H line, F-CAN C_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0122-F1	VSA modulator-control unit 46P connector
U0129-F1	Electric servo brake control unit 22P connector
U0131-F1	EPS control unit connector B (6P)
U0151-F1	SRS unit connector A (39P)

NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** and wait for at least 3 minutes.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)

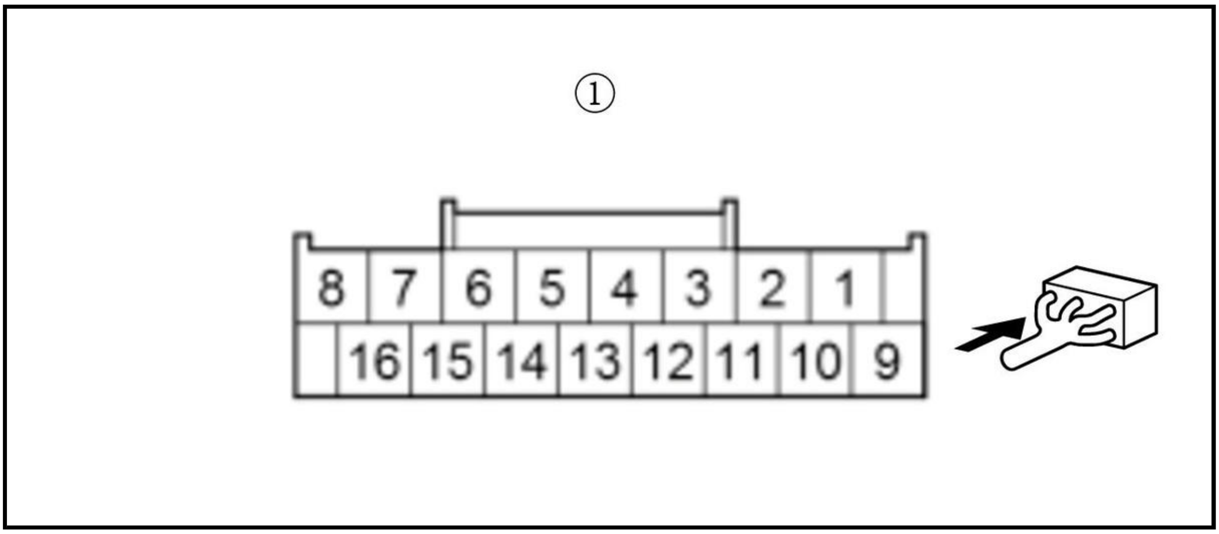
	F-CAN C_L		No. 13		No. 35



Is there 1.0 Ω or less?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0122-F1	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .
U0129-F1	Check for poor connections or loose terminals at the CAN gateway and the electric servo brake control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .
U0131-F1	Check for poor connections or loose terminals at the CAN gateway and the EPS control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

DTC	Operation for transmitting control unit
U0151-F1	Check for poor connections or loose terminals at the CAN gateway and the SRS unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the SRS unit** .

NO

Repair an open in the F-CAN C_H wire or the F-CAN C_L wire between the transmitting control unit and the CAN gateway.

8. Open wire check (F-CAN D_H line, F-CAN D_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

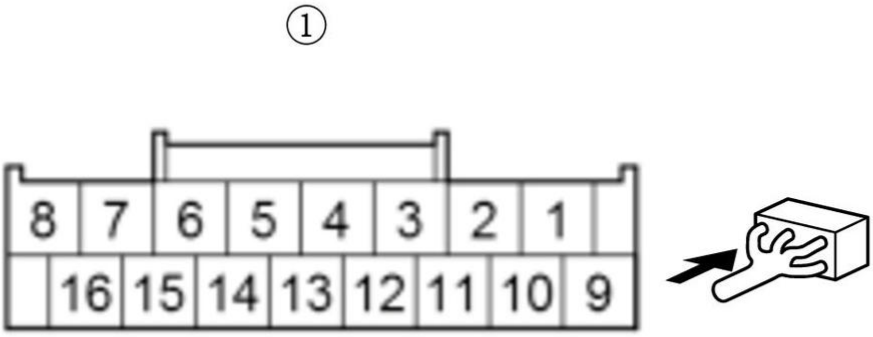
-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
B	CAN gateway 16P connector
U0155-F1	Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	**Circuit name**	**Test point 1 (Receiving control unit)**		**Test point 2 (Transmitting control unit)**	
		Connector	**Terminal**	**Connector**	**Terminal**
U0155-F1	F-CAN D_H	CAN gateway 16P connector (female terminals): ①	No. 7	**Gauge control module connector A (32P)**	No. 19
	F-CAN D_L		No. 15		No. 20



Is there 1.0 Ω or less?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0155-F1	Check for poor connections or loose terminals at the CAN gateway and the gauge control module. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good gauge control module** , then recheck. If they are OK, **replace the original gauge control module** .

NO

Repair an open in the F-CAN D_H wire or the F-CAN D_L wire between the transmitting control unit and the CAN gateway.

DTC U0401-53, U0401-92 (MILLIMETER WAVE RADAR)

DTC U0401-53 : Temporary stop of Integrated Driver Support System (Received stop request by PGM-FI System)

DTC U0401-92 : Temporary stop of Integrated Driver Support System (Rejected control request by PGM-FI System)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If these DTC are recorded, the following is suspected:
-
    - ACC operation is inhibited this way when there is a transmission malfunction, transmission and transmission fluid temperatures are too high, or if the PCM determines ACC is still active when the brake pedal is pressed.
    - The brake pedal position switch is failed or out of adjustment, or the brake pedal was pressed lightly while driving. (electric brake booster equipped models)
    - If this sets due to transmission fluid temperature, a warning will also be displayed in the MID.
- If these DTC are recorded, some of the integrated driver support system functions are temporarily canceled but it is not a failure.
- When the PCM becomes ready to receive a control request from the millimeter wave radar and the multipurpose camera unit, the temporarily cancelled integrated driver support system functions are re-activated.
- The functions of the integrated driver support system that will be temporarily canceled when these DTC are recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0401-53 Temporary stop of Integrated Driver Support System (Received stop request by PGM-FI System)	B
U0401-92 Temporary stop of Integrated Driver Support System (Rejected control request by PGM-FI System)	B

DTC (IDAS)

1. DTC check

    -1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

    -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

    Is there any DTC(s) other than DTC U0401-53 or U0401-92?

    YES

    Perform a troubleshooting for the recorded DTC.

    NO

    Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC U0416-9A (MILLIMETER WAVE RADAR)

DTC U0416-9A : Temporary stop of Integrated Driver Support System (Unstable Wheel Speed Sensor Signal)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- If this DTC is recorded, some of the integrated driver support system functions are temporarily canceled but it is not a failure.
- When the VSA modulator-control unit returns to normal, the temporarily cancelled integrated driver support system functions are re-activated.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0416-9A Temporary stop of Integrated Driver Support System (Unstable Wheel Speed Sensor Signal)	B

DTC (IDAS)

1. DTC check

   -1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   Is there any DTC(s) other than U0416-9A?

   YES

   Perform a troubleshooting for the recorded DTC.

   NO

   Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC U0417-68 (MILLIMETER WAVE RADAR)

DTC U0417-68 : (Electric Parking Brake Control Unit Malfunction)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTCs are recorded when the millimeter wave radar receives electric parking brake control unit failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the electric parking brake system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0417-68 (Electric Parking Brake Control Unit Malfunction)	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U0417-68 (Electric Parking Brake Control Unit Malfunction)	B

Is DTC U0417-68 indicated?

YES

The failure is duplicated. **Go to the electric parking brake system troubleshooting** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U0418-92, U0418-9A (MILLIMETER WAVE RADAR)

DTC U0418-92 : Temporary stop of Integrated Driver Support System (Rejected control request by ESB/EBB System)

DTC U0418-9A : Temporary stop of Integrated Driver Support System (Not Start-Up ESB/EBB Control Unit)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the electric servo brake control unit cannot temporarily accept brake request from the integrated driver support system.
- Examples of the situation where DTCs are recorded are as follows:
-
  - Reduction of the electric servo brake control unit power supply voltage.
  - The electric servo brake control unit cannot accept ACC brake request because the VSA system sets the brake pad high temperature information.
- If this DTC is recorded, some of the integrated driver support system functions are temporarily canceled but it is not a failure.
- When the electric servo brake control unit returns to normal, the temporarily cancelled integrated driver support system functions are re-activated.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0418-92 Temporary stop of Integrated Driver Support System (Rejected control request by ESB/EBB System)	B
U0418-9A Temporary stop of Integrated Driver Support System (Not Start-Up ESB/EBB Control Unit)	B

DTC (IDAS)

1. DTC check

   -1. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -2. Check for DTCs with the HDS.

DTC Description	DTC
B	B

   Is there any DTC(s) other than U0418-92 or U0418-9A?

   YES

   Perform a troubleshooting for the recorded DTC.

   NO

   Clear the DTC with the HDS and explain to the customer that it is not a failure.

DTC U0420-68 (MILLIMETER WAVE RADAR)

DTC U0420-68 : (EPS Control Unit Malfunction)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is recorded when the millimeter wave radar receives the EPS control unit failure information via the F-CAN.
- If a DTC is recorded again after it is cleared with the HDS, **perform a troubleshooting for the EPS system** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0420-68 (EPS Control Unit Malfunction)	B

DTC (IDAS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC
U0420-68 (EPS Control Unit Malfunction)	B

   Is DTC U0420-68 indicated?

   YES

   The failure is duplicated. **Go to the EPS system troubleshooting** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U0423-68, U1280-00, U1281-00, U128C-00 (MILLIMETER WAVE RADAR)

DTC U0423-68 : Gauge Control Module Malfunction/B-CAN Malfunction (BUS-OFF) Detection By Source Module

DTC U1280-00 : Lost Communication With The B-CAN Systems

DTC U1281-00 : Lost Communication with The MICU (Body Control Module)

DTC U128C-00 : Lost Communication with The Wiper Control Unit

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- These DTCs are recorded when the millimeter wave radar receives failure information for relevant B-CAN systems or switches judged by the gauge control module.
- B-CAN system information used to control the integrated driver support system of this vehicle is obtained from the gauge control module via the F-CAN.
- If a DTC is recorded after it is cleared with the HDS, **perform a troubleshooting for the gauge control module** .
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U0423-68 Gauge Control Module Malfunction/B-CAN Malfunction (BUS-OFF) Detection By Source Module	B
U1280-00 Lost Communication With The B-CAN Systems	B
U1281-00 Lost Communication with The MICU (Body Control Module)	B
U128C-00 Lost Communication with The Wiper Control Unit	B

DTC (IDAS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, then wait for at least 6 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
U0423-68 Gauge Control Module Malfunction	B
U1280-00 Lost Communication With The B-CAN Systems	B
U1281-00 Lost Communication with The MICU (Body Control Module)	B
U128C-00 Lost Communication with The Wiper Control Unit	B

Is DTC U0423-68, U1280-00, U1281-00, or U128C-00 indicated?

YES

The failure is duplicated. **Go to the gauge control module troubleshooting** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

DTC U3000-51 (MILLIMETER WAVE RADAR)

DTC U3000-51 : Millimeter Wave Radar Update Incomplete

NOTE:

- Before you troubleshoot, **review the general troubleshooting information**.
- This DTC is indicated when a millimeter wave radar update is not completed properly.
- This DTC is not deleted until the millimeter wave radar is updated.
- After the update is successfully completed, these DTCs are automatically deleted without using the HDS.
- The functions of the integrated driver support system that will be temporarily canceled when this DTC is recorded can be confirmed with the **DTC troubleshooting index**.

DTC Description	DTC
U3000-51 Millimeter Wave Radar Update Incomplete	B

DTC (IDAS)

1. Millimeter wave radar (update)

-1. **Update the millimeter wave radar** .

NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

-2. Check for DTCs with the HDS.

DTC Description	DTC
U3000-51 Millimeter Wave Radar Update Incomplete	B

Is DTC U3000-51 indicated?

YES

The failure is duplicated. **Replace the millimeter wave radar** .

NO

Update is complete.

DTC TROUBLESHOOTING

DTC B1175

DTC B1175 : Fuel level sensor (Fuel gauge sending unit) circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1175 Fuel level sensor (Fuel gauge sending unit) circuit malfunction	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 30 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1175 Fuel level sensor (Fuel gauge sending unit) circuit malfunction	B

   Is DTC B1175 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (FUEL_GAUGE+, FUEL_GAUGE- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

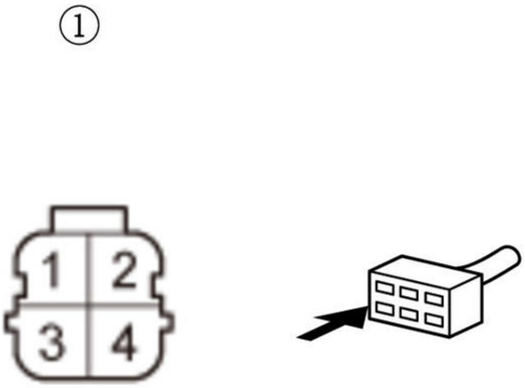
   -2. Disconnect the following connector.

Gauge control module connector A (32P) Fuel tank unit 4P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Fuel tank unit 4P connector: disconnected
Test point 1	Gauge control module connector A (32P) No. 22
Test point 2	Fuel tank unit 4P connector (female terminals) No. 2: ①

Test point 1	Gauge control module connector A (32P) No. 21
Test point 2	Fuel tank unit 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The FUEL_GAUGE+ and FUEL_GAUGE- wires are OK. Go to step 3.

NO

Repair an open or high resistance in the wire(s).

3. Fuel gauge sending unit check

-1. Do the fuel gauge sending unit test .

Is the unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC B1176

DTC B1176 : Fuel level sensor (Fuel gauge sending unit) circuit short

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
B1176 Fuel level sensor (Fuel gauge sending unit) circuit short	B

DTC (Gauge Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 30 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B1176 Fuel level sensor (Fuel gauge sending unit) circuit short	B

Is DTC B1176 indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Short wire check (FUEL_GAUGE+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P) Fuel tank unit 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Fuel tank unit 4P connector: disconnected
Test point 1	**Gauge control module connector A (32P) No. 22**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The FUEL_GAUGE+ wire is OK. Go to step 3.

NO

Repair a short to ground in the wire.

3. Fuel gauge sending unit check

-1. **Do the fuel gauge sending unit test** .

Is the unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC B1195

DTC B1195 : Gauge control module lost communication with Audio Remote Switch (LIN bus connected)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before troubleshooting, make sure the fuses and relays associated with the system is OK.

DTC Description	DTC
B1195 Gauge control module lost communication with Audio Remote Switch (LIN bus connected)	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 4 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B1195 Gauge control module lost communication with Audio Remote Switch (LIN bus connected)	B

   Is DTC B1195 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

2. Determine possible failure area (audio remote-HFL switch power and ground, LIN (START_SW) / STRG_SW_LIN line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Audio remote-HFL switch 12P connector

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Audio remote-HFL switch 12P connector: disconnected

Test point 1	Audio remote-HFL switch 12P connector No. 7
Test point 2	Audio remote-HFL switch 12P connector No. 10

Is there battery voltage?

YES

Go to step 4.

NO

Go to step 3.

3. Open wire check (+B line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Audio remote-HFL switch 12P connector: disconnected
Test point 1	Audio remote-HFL switch 12P connector No. 7
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the ground wire or poor ground (G401).

NO

Repair an open or high resistance in the wire.

4. Shorted wire check (LIN (START_SW) / STRG_SW_LIN line)

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Audio remote-HFL switch 12P connector: disconnected
Test point 1	Audio remote-HFL switch 12P connector No. 12
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The LIN (START_SW) / STRG_SW_LIN wire is not shorted. Go to step 5.

NO

Repair a short to ground in the wire.

5. Open wire check (LIN (START_SW) / STRG_SW_LIN line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Audio remote-HFL switch 12P connector: disconnected
Test point 1	Gauge control module connector A (32P) No. 23
Test point 2	Audio remote-HFL switch 12P connector No. 12

Is there 1.0 Ω or less?

YES

The LIN (START_SW) / STRG_SW_LIN wire is OK. Replace the audio remote-HFL switch . If the DTC is still present, replace the gauge control module .

NO

An open or poor connection in the wire.

DTC U0029 (GAUGE CONTROL MODULE)

DTC U0029 : F-CAN communication line error

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U0029 F-CAN communication line error	B

DTC (Gauge Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0029 F-CAN communication line error	B

Is DTC U0029 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Intermittent failure, the system is OK at this time.

DTC U0100, U0101, U0104, U0111, U0114, U0122, U0128, U0131, U0151, U129C, U12A0 (GAUGE CONTROL MODULE)

DTC U0100 : Gauge control module lost communication with ENG/AT

DTC U0101 : Gauge control module lost communication with AT

DTC U0104 : Gauge Control Module Lost Communication With Driving Support System Control Unit

DTC U0111 : Gauge control module lost communication with Battery Condition Monitor Module

DTC U0114 : Gauge control module lost communication with All Wheel Drive Control Module

DTC U0122 : Gauge control module lost communication with VSA modulator-control unit

DTC U0128 : Gauge control module lost communication with EPB

DTC U0131 : Gauge control module lost communication with EPS Unit

DTC U0151 : Gauge control module lost communication with SRS unit

DTC U129C : Gauge control module lost communication with multi purpose camera unit

DTC U12A0 : Gauge control module lost communication with Acoustic Vehicle Alert System (AVAS)

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.
- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U0100 Gauge control module lost communication with ENG/AT	B
U0101 Gauge control module lost communication with AT	B
U0104 Gauge Control Module Lost Communication With Driving Support System Control Unit	B
U0111 Gauge control module lost communication with Battery Condition Monitor Module	B
U0114 Gauge control module lost communication with All Wheel Drive Control Module	B
U0122 Gauge control module lost communication with VSA modulator-control unit	B
U0128 Gauge control module lost communication with EPB	B
U0131 Gauge control module lost communication with EPS Unit	B
U0151 Gauge control module lost communication with SRS unit	B
U129C Gauge control module lost communication with multi purpose camera unit	B
U12A0 Gauge control module lost communication with Acoustic Vehicle Alert System (AVAS)	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U0100 Gauge control module lost communication with ENG/AT	B
U0101 Gauge control module lost communication with AT	B
U0104 Gauge Control Module Lost Communication With Driving Support System Control Unit	B
U0111 Gauge control module lost communication with Battery Condition Monitor Module	B
U0114 Gauge control module lost communication with All Wheel Drive Control Module	B
U0122 Gauge control module lost communication with VSA modulator-control unit	B
U0128 Gauge control module lost communication with EPB	B
U0131 Gauge control module lost communication with EPS Unit	B
U0151 Gauge control module lost communication with SRS unit	B
U129C Gauge control module lost communication with multi purpose camera unit	B
U12A0 Gauge control module lost communication with Acoustic Vehicle Alert System (AVAS)	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. CAN gateway system DTC check

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U0056-00 CAN Gateway F-CAN ch C Bus Off	B
U0065-00 CAN Gateway F-CAN ch D Bus Off	B

DTC Description	DTC
U0038-00 CAN Gateway F-CAN ch E Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, U0056-00, U0038-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 3.

3. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the gauge control module detect the CAN gateway Bus channels D?

Bus D is Not Available

Go to step 4.

Bus D is Available

Go to step 5.

4. Open wire check (F-CAN D lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

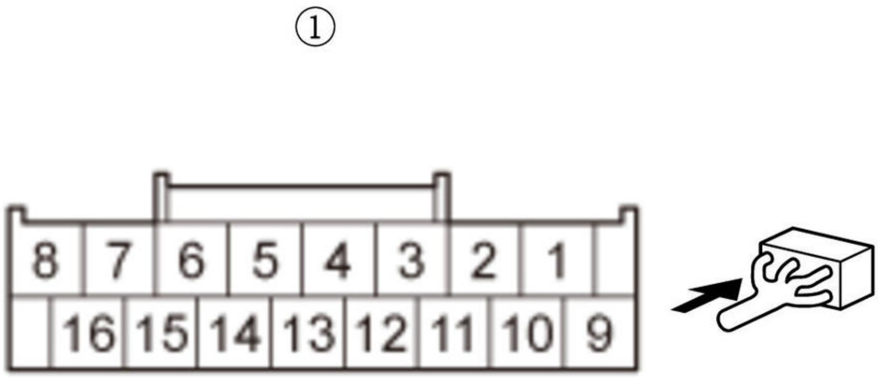
-2. Disconnect the following connectors.

CAN gateway 16P connector Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Gauge control module connector A (32P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 7: ①
Test point 2	**Gauge control module connector A (32P) No. 19**

Test point 1	CAN gateway 16P connector (female terminals) No. 15: ①
Test point 2	**Gauge control module connector A (32P) No. 20**



Is there 1.0 Ω or less?

YES

The F-CAN D_H and F-CAN D_L wires are OK. **Replace the gauge control module** .

NO

Repair an open in F-CAN D_H or F-CAN D_L wire.

5. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100	PCM	A, B, E
U0101	PCM	A, B, E
U0104	Millimeter wave radar	C
U0111	Battery condition monitor module	A, E
U0114	Real time AWD control unit	D
U0122	VSA modulator-control unit	B, C
U0128	VSA modulator-control unit	B, C
U0131	EPS control unit	C
U0151	SRS unit	C
U129C	Multipurpose camera unit	C
U12A0	Acoustic vehicle alerting control unit	B

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100: PCM is Not Available for Bus A

Go to step 6.

U0100: PCM is Not Available for Bus B

Go to step 7.

U0100: PCM is Not Available for Bus E

Go to step 10.

U0101: PCM is Not Available for Bus A

Go to step 6.

U0101: PCM is Not Available for Bus B

Go to step 7.

U0101: PCM is Not Available for Bus E

Go to step 10.

U0104: Millimeter wave radar is Not Available for Bus C

Go to step 8.

U0111: Battery condition monitor module is Not Available for Bus A

Go to step 6.

U0111: Battery condition monitor module is Not Available for Bus E

Go to step 10.

U0114: Real time AWD control unit is Not Available for Bus D

Go to step 9.

U0122: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0122: VSA modulator-control unit is Not Available for Bus C

Go to step 8.

U0128: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0128: VSA modulator-control unit is Not Available for Bus C

Go to step 8.

U0131: EPS control unit is Not Available for Bus C

Go to step 8.

U0151: SRS unit is Not Available for Bus C

Go to step 8.

U129C: Multipurpose camera unit is Not Available for Bus C

Go to step 8.

U12A0: Acoustic vehicle alerting control unit is Not Available for Bus B

Go to step 7.

6. Open wire check (F-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100, U0101: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

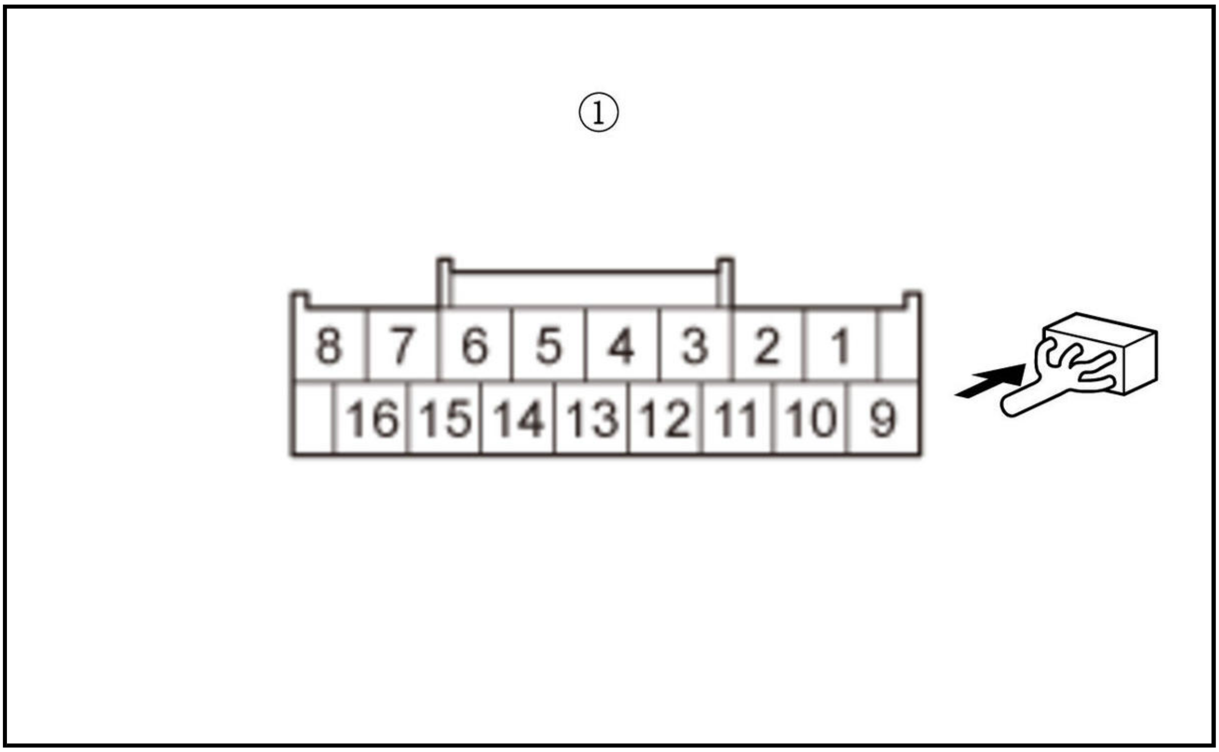
-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0100	PCM connector A (50P)
U0101	PCM connector A (50P)
U0111	Battery condition monitor module E (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36
U0101	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36
U0111	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	Battery condition monitor module E (32P)	No. 9
	F-CAN A_L		No. 11		No. 8



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	**PCM**
U0101	**PCM**
U0111	**Battery condition monitor module**

NO

Repair an open in F-CAN A_H or F-CAN A_L wire.

7. Open wire check (F-CAN B lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100, U0101: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

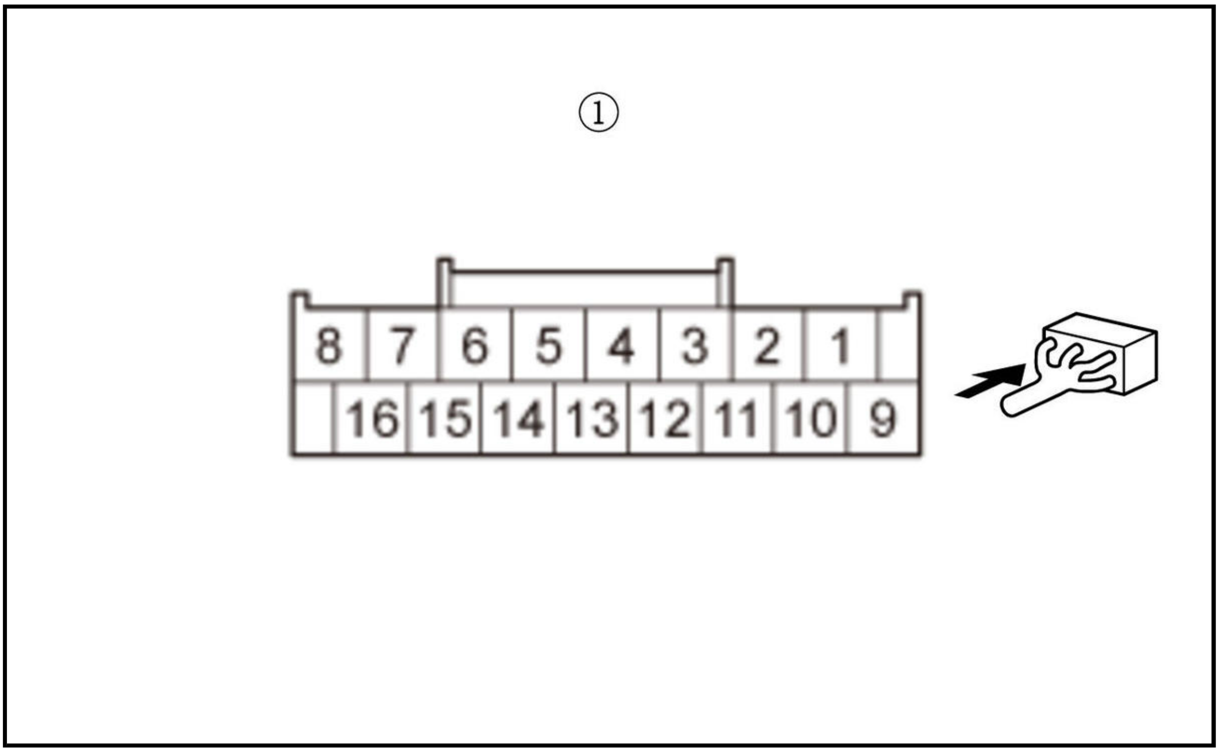
DTC	Connector
-	CAN gateway 16P connector
U0100	PCM connector A (50P)
U0101	PCM connector A (50P)
U0122	VSA modulator-control unit 46P connector
U0128	VSA modulator-control unit 46P connector
U12A0	Acoustic vehicle alerting control unit 12P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38
U0101	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**PCM connector A (50P)**	No. 39
	F-CAN B_L		No. 14		No. 38
U0122	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN B_L		No. 14		No. 28
U0128	F-CAN B_H	CAN gateway 16P connector (female	No. 6	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN B_L		No. 14		No. 28

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U12A0	F-CAN B_H	CAN gateway 16P connector (female terminals): ① terminals): ①	No. 6	**Acoustic vehicle alerting control unit 12P connector**	No. 5
	F-CAN B_L		No. 14		No. 6



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	**PCM**
U0101	**PCM**
U0122	**VSA modulator-control unit**
U0128	**VSA modulator-control unit**
U12A0	**Acoustic vehicle alerting control unit**

NO

Repair an open in F-CAN B_H or F-CAN B_L wire.

8. Open wire check (F-CAN C lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

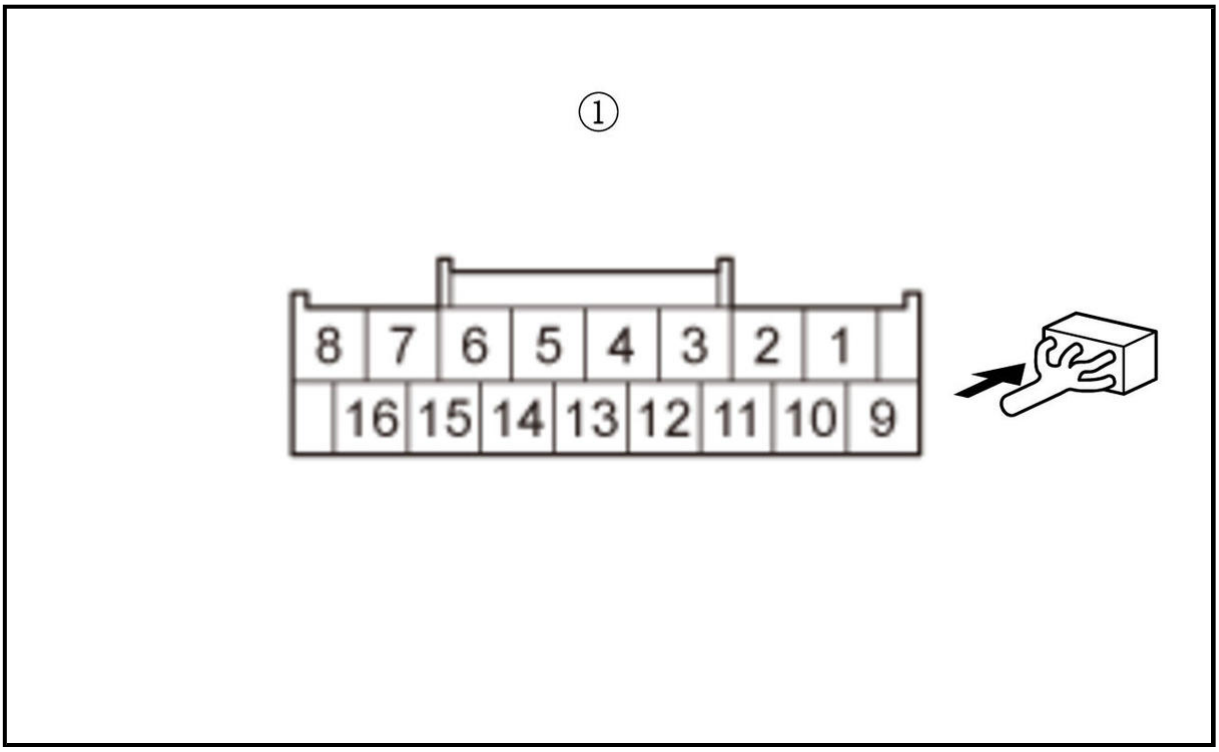
DTC	Connector
-	CAN gateway 16P connector
U0104	Millimeter wave radar 8P connector
U0122	VSA modulator-control unit 46P connector
U0128	VSA modulator-control unit 46P connector
U0131	EPS control unit connector B (6P)

DTC	Connector
U0151	SRS unit connector A (39P)
U129C	Multipurpose camera unit 12P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0104	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	Millimeter wave radar 8P connector	No. 7
	F-CAN C_L		No. 13		No. 6
U0122	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	VSA modulator-control unit 46P connector	No. 46
	F-CAN C_L		No. 13		No. 34
U0128	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	VSA modulator-control unit 46P connector	No. 46
	F-CAN C_L		No. 13		No. 34
U0131	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	EPS control unit connector B (6P)	No. 1
	F-CAN C_L		No. 13		No. 3
U0151	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	SRS unit connector A (39P)	No. 34
	F-CAN C_L		No. 13		No. 35
U129C	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	Multipurpose camera unit 12P connector	No. 11
	F-CAN C_L		No. 13		No. 5



Is there 1.0 Ω or less?

YES

The F-CAN C_H wire and the F-CAN C_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0104	**Millimeter wave radar**
U0122	**VSA modulator-control unit**
U0128	**VSA modulator-control unit**
U0131	**EPS control unit**
U0151	**SRS unit**
U129C	**Multipurpose camera unit**

NO

Repair an open in F-CAN C_H or F-CAN C_L wire.

9. Open wire check (F-CAN D lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

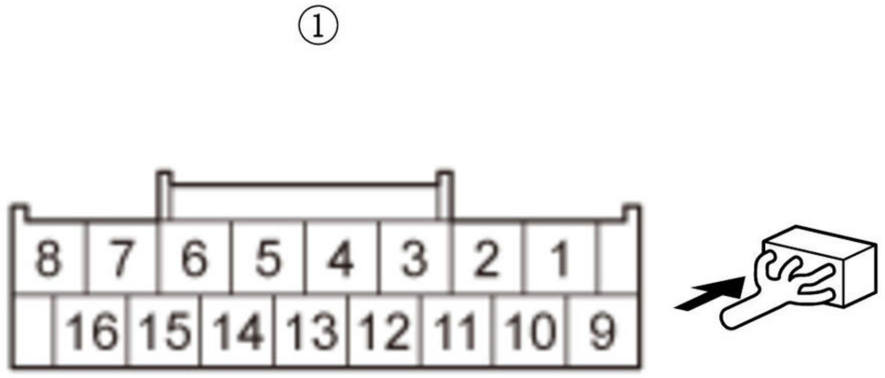
-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 16P connector
U0114	Real time AWD control unit 24P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0114	F-CAN D_H	CAN gateway 16P connector (female terminals): ①	No. 7	**Real time AWD control unit 24P connector**	No. 14
	F-CAN D_L		No. 15		No. 24



Is there 1.0 Ω or less?

YES

The F-CAN D_H wire and the F-CAN D_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0114	**Real time AWD control unit**

NO

Repair an open in F-CAN D_H or F-CAN D_L wire.

10. Open wire check (EP-CAN A lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100, U0101: Jump the SCS line with the HDS, and wait more than 1 minute.

SCS short

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

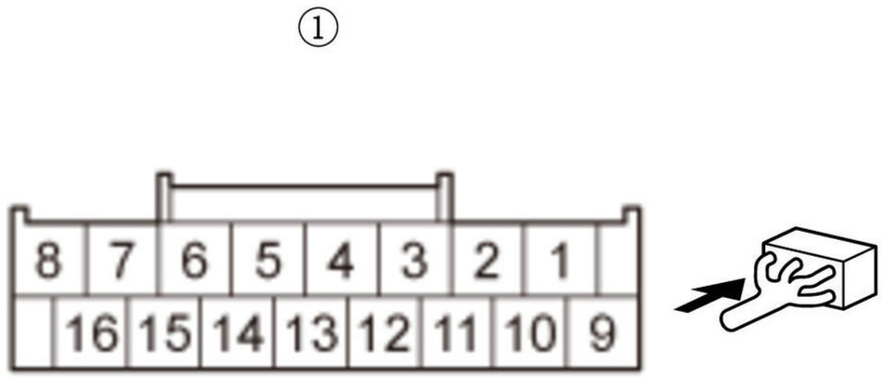
DTC	Connector
-	CAN gateway 16P connector

DTC	Connector
U0100	PCM connector A (50P)
U0101	PCM connector A (50P)
U0111	Battery condition monitor module E (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode CAN gateway 16P connector: disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	**Terminal**	**Connector**	**Terminal**
U0100	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	**PCM connector A (50P)**	No. 21
	EP-CAN A_L		No. 8		No. 20
U0101	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	**PCM connector A (50P)**	No. 21
	EP-CAN A_L		No. 8		No. 20
U0111	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	**Battery condition monitor module E (32P)**	No. 11
	EP-CAN A_L		No. 8		No. 10



Is there 1.0 Ω or less?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK.

According to the detected DTC on the following table replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	PCM
U0101	PCM
U0111	Battery condition monitor module

NO

Repair an open in EP-CAN A_H or EP-CAN A_L wire.

DTC U1280 (GAUGE CONTROL MODULE)

DTC U1280 : Communication bus line error (BUS-OFF)

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1280-00 Communication bus line error (BUS-OFF)	B

   Is DTC U1280 indicated?

   YES

   Go to body control module DTC U1280 troubleshooting .

   NO

   Intermittent failure, the system is OK at this time.

DTC U1281, U1288, U128F (GAUGE CONTROL MODULE)

DTC U1281 : Gauge control module lost communication with MICU (body control module) (MICU frame)

DTC U1288 : Gauge control module lost communication with PARKSR

DTC U128F : Gauge control module lost communication with BSI unit

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Refer to the DTC code shown on the display, and then inspect the connectors and terminals based on the instructions in the table below.

- The DTC may be stored due to the grounding failure or the power source failure at the transmitting control unit (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

DTC Description	DTC
U1281 Gauge control module lost communication with MICU (body control module) (MICU frame)	B
U1288 Gauge control module lost communication with PARKSR	B
U128F Gauge control module lost communication with BSI unit	B

DTC (Gauge Control Module)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Wait for at least 6 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
U1281 Gauge control module lost communication with MICU (body control module) (MICU frame)	B
U1288 Gauge control module lost communication with PARKSR	B
U128F Gauge control module lost communication with BSI unit	B

   Are any DTCs indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals.

2. Open wire check (B-CAN_H line, B-CAN_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the receiving control unit connector.

Gauge control module connector A (32P)

   -3. Disconnect the transmitting control unit connector(s).

   Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U1288	Parking and back-up sensor control unit 16P connector
U128F	Left side BSI radar unit 6P connector

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode Gauge control module connector A (32P): disconnected Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	Gauge control module connector A (32P)	No. 30	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 31		No. 21
U1288	B-CAN_H	Gauge control module connector A (32P)	No. 30	Parking and back-up sensor control unit 16P connector	No. 9
	B-CAN_L		No. 31		No. 2
U128F	B-CAN_H	Gauge control module connector A (32P)	No. 30	Left side BSI radar unit 6P connector	No. 3
	B-CAN_L		No. 31		No. 5

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and the B-CAN_L wire are OK.

Refer to the DTC shown on the display, then replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	Body control module
U128D	Parking and back-up sensor control unit

DTC	Operation for transmitting control unit
U128F	BSI radar unit

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire.

DTC U3000-49 (GAUGE CONTROL MODULE)

DTC U3000-49 : ECU internal circuit malfunction

NOTE: If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

DTC Description	DTC
U3000-49 ECU internal circuit malfunction	B

DTC (Gauge Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
U3000-49 ECU internal circuit malfunction	B

Is DTC U3000-49 indicated?

YES

Replace the gauge control module .

NO

Intermittent failure, the system is OK at this time.

DTC U3000-51 (GAUGE CONTROL MODULE)

DTC U3000-51 : Reprogramming error

NOTE:

- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before reprogramming the gauge control module, make sure the 12 volt battery in the vehicle is fully charged, and connect a 12 volt jumper battery (not a 12 volt battery charger) to maintain system voltage.
- Never turn the vehicle to the ACCESSORY mode or OFF (LOCK) mode, during the reprogramming. If there is a problem with the reprogramming, turn the vehicle to the ON mode.

DTC Description	DTC
U3000-51 Reprogramming error	B

DTC (Gauge Control Module)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC
U3000-51 Reprogramming error	B

Is DTC U3000-51 indicated?

YES

Reprogramming the gauge control module.

NO

Intermittent failure, the system is OK at this time.

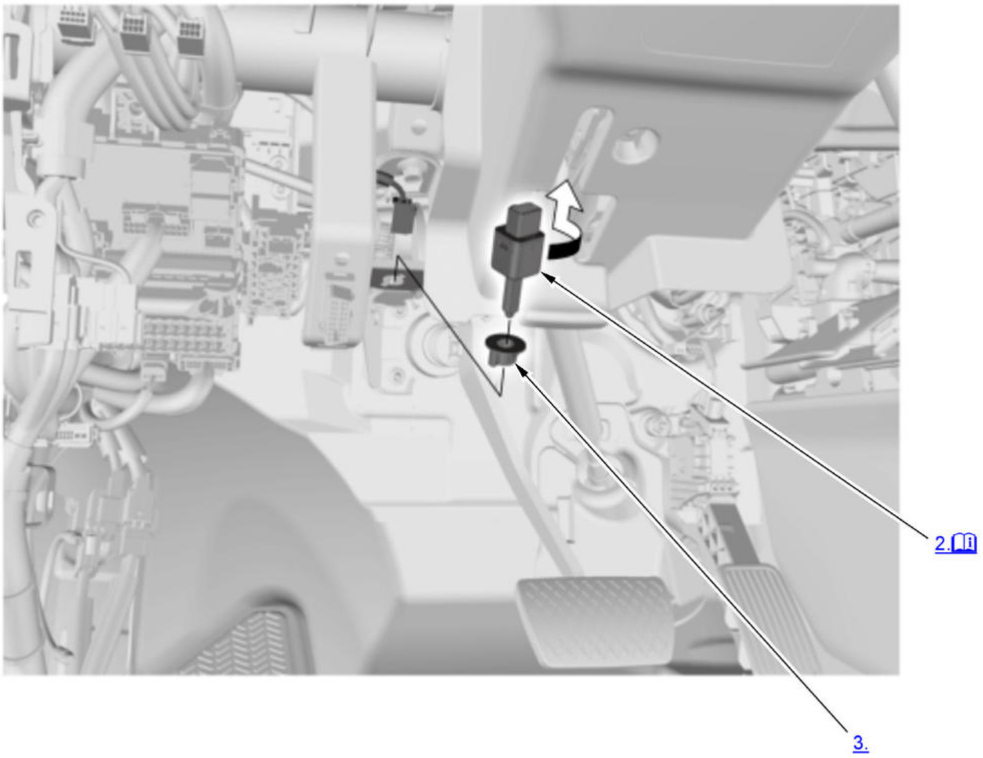
REMOVAL & INSTALLATION TEST

BRAKE PEDAL POSITION SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: 📖 Where icon is shown, further information shown below.

1



📖	Detailed information, notes, and precautions

1. Driver's Dashboard Lower Cover - Remove
2. Brake Pedal Position Switch - Remove

   WARNING:

   Do not connect the brake pedal position switch connector with the brake pedal position switch removed. The engine may start if the start/stop button is pressed as the system interprets that the brake pedal is depressed. Unintended starting of the engine is dangerous.

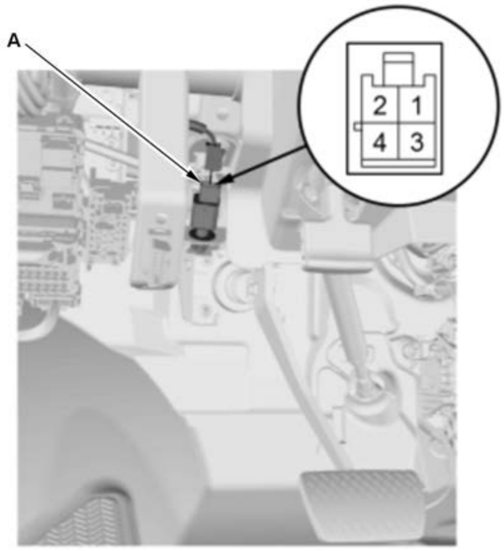
3. Attaching Piece - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. **Brake Pedal and Brake Pedal Position Switch - Adjust**

Test

1. Brake Pedal Position Switch - Test



Terminal / Position	1	2	3	4
Pressed	○	—○		
Released			○	—○

WARNING:

Do not connect the brake pedal position switch connector with the brake pedal position switch removed. The engine may start if the start/stop button is pressed as the system interprets that the brake pedal is depressed. Unintended starting of the engine is dangerous.

1. Check for continuity between the terminals in the brake pedal position switch position according to the chart.

2. If the test results are not as specified, **adjust the brake pedal position switch**

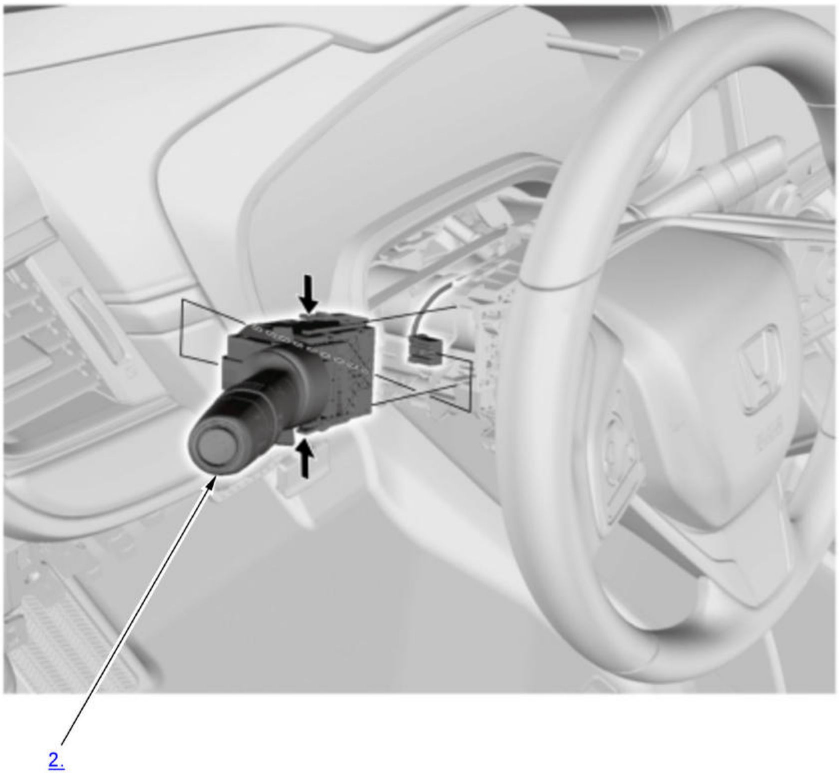
(A), then recheck. If the results are still not as specified, replace the brake pedal position switch.

COMBINATION LIGHT SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1



1. **Column Cover - Remove**
2. Combination Light Switch - Remove
3. All Removed Parts - Install

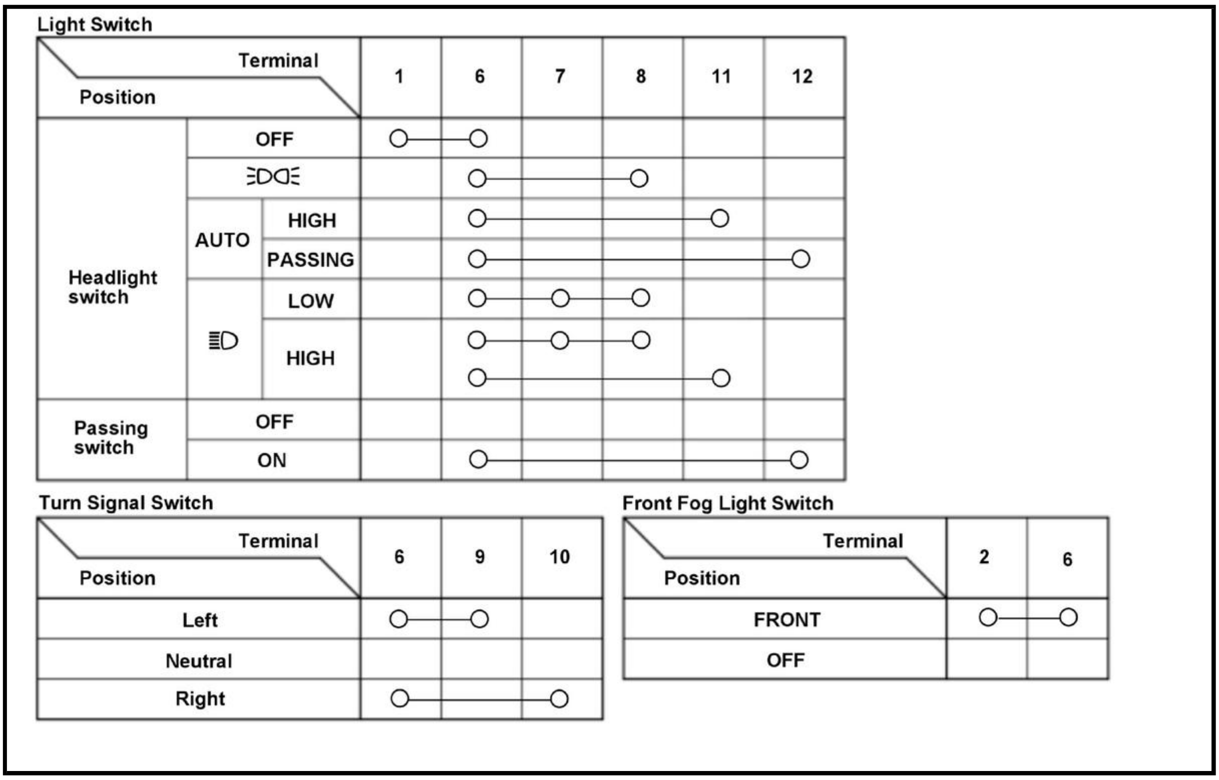
1. Install the parts in the reverse order of removal.

Test

1. Combination Light Switch - Test

	1. Inspect the connector terminals to be sure they are all making good contact. - If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system. - If the terminals are OK, go to step 2.

2. Check for continuity between the terminals in each switch position according to the charts.



Light Switch

Position			1	6	7	8	11	12
Headlight switch	OFF		○	○				
	ƎDŒ			○		○		
	AUTO	HIGH		○			○	
		PASSING		○				○
	≣D	LOW		○	○	○		
		HIGH		○ ○	○	○	○	
Passing switch	OFF							
	ON			○				○

Turn Signal Switch

Position	6	9	10
Left	○	○	
Neutral			
Right	○		○

Front Fog Light Switch

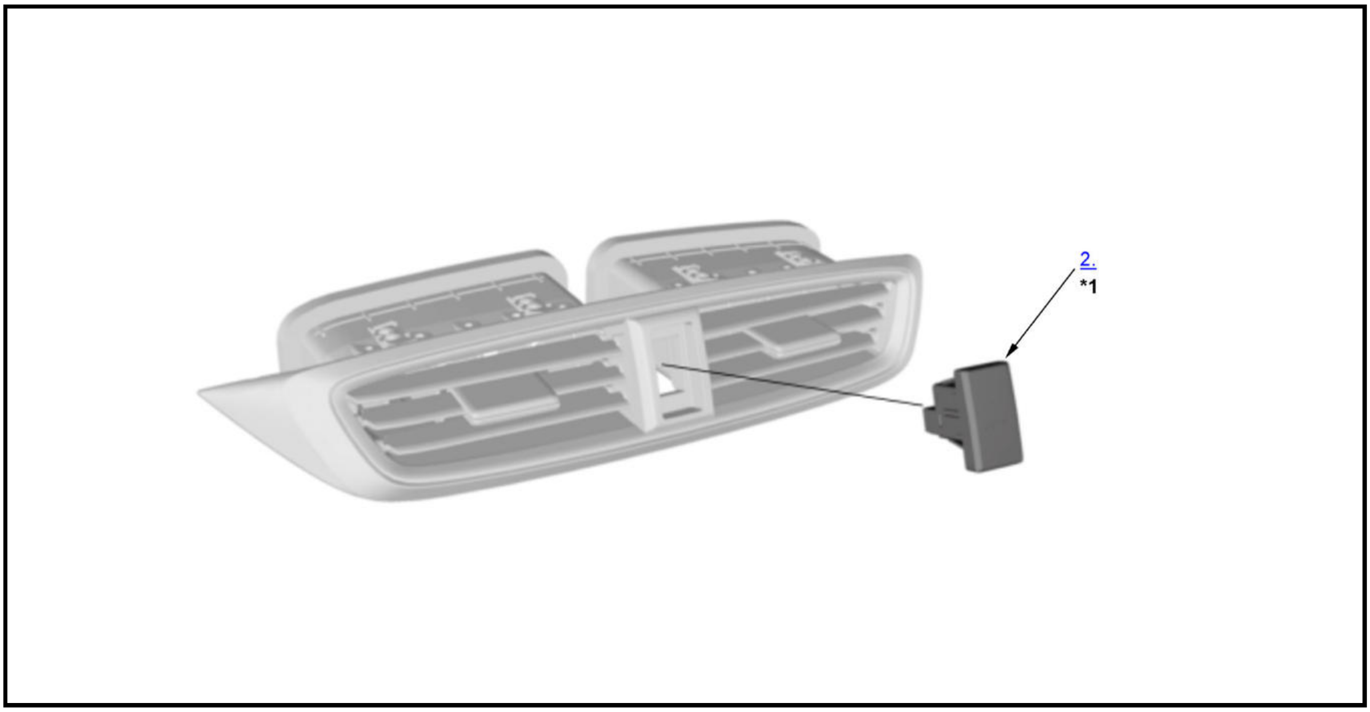
Position	2	6
FRONT	○	○
OFF		

3. If the continuity is not as specified, replace the combination light switch.

HAZARD WARNING SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1



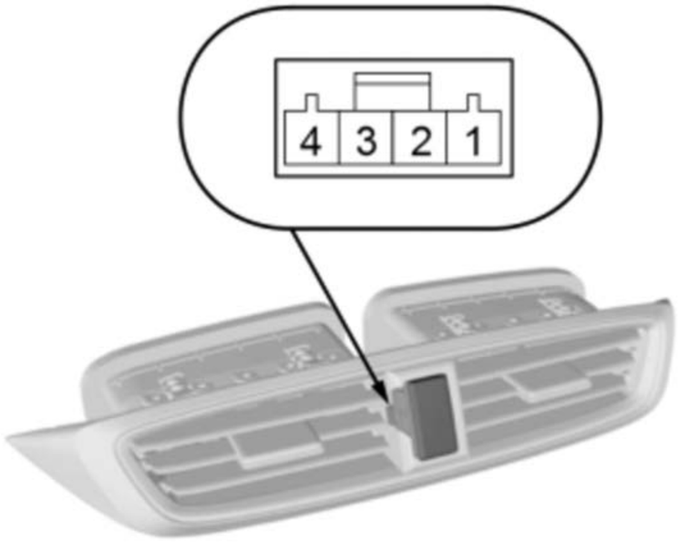
*1	Hazard Warning Switch: LED

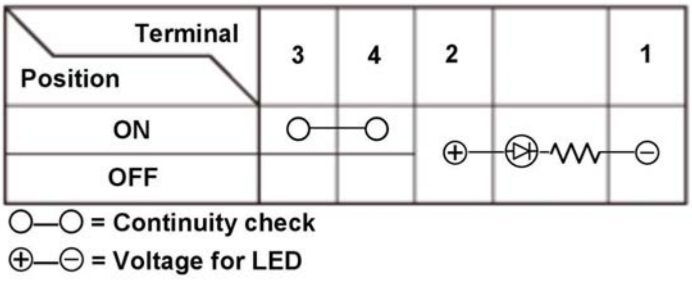
1. Center Outlet - Remove
2. Hazard Warning Switch - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. Hazard Warning Switch - Test





Terminal / Position	3	4	2		1
ON	○—	—○	⊕—	—⊳|—ʌʌʌ—	—⊖
OFF					

○—○ = Continuity check

⊕—⊖ = Voltage for LED

1. Check the hazard warning switch according to the chart.

NOTE:

- **Before testing, make sure not to short the hazard warning switch circuit.**
- **When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.**
- **Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).**

2. If the result is not as specified, replace the hazard warning switch.

REMOVAL AND INSTALLATION

AUTOMATIC LIGHTING CONTROL UNIT-SENSOR REMOVAL AND INSTALLATION

Removal and Installation

1. Automatic Lighting Control Unit-Sensor - Remove
2. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

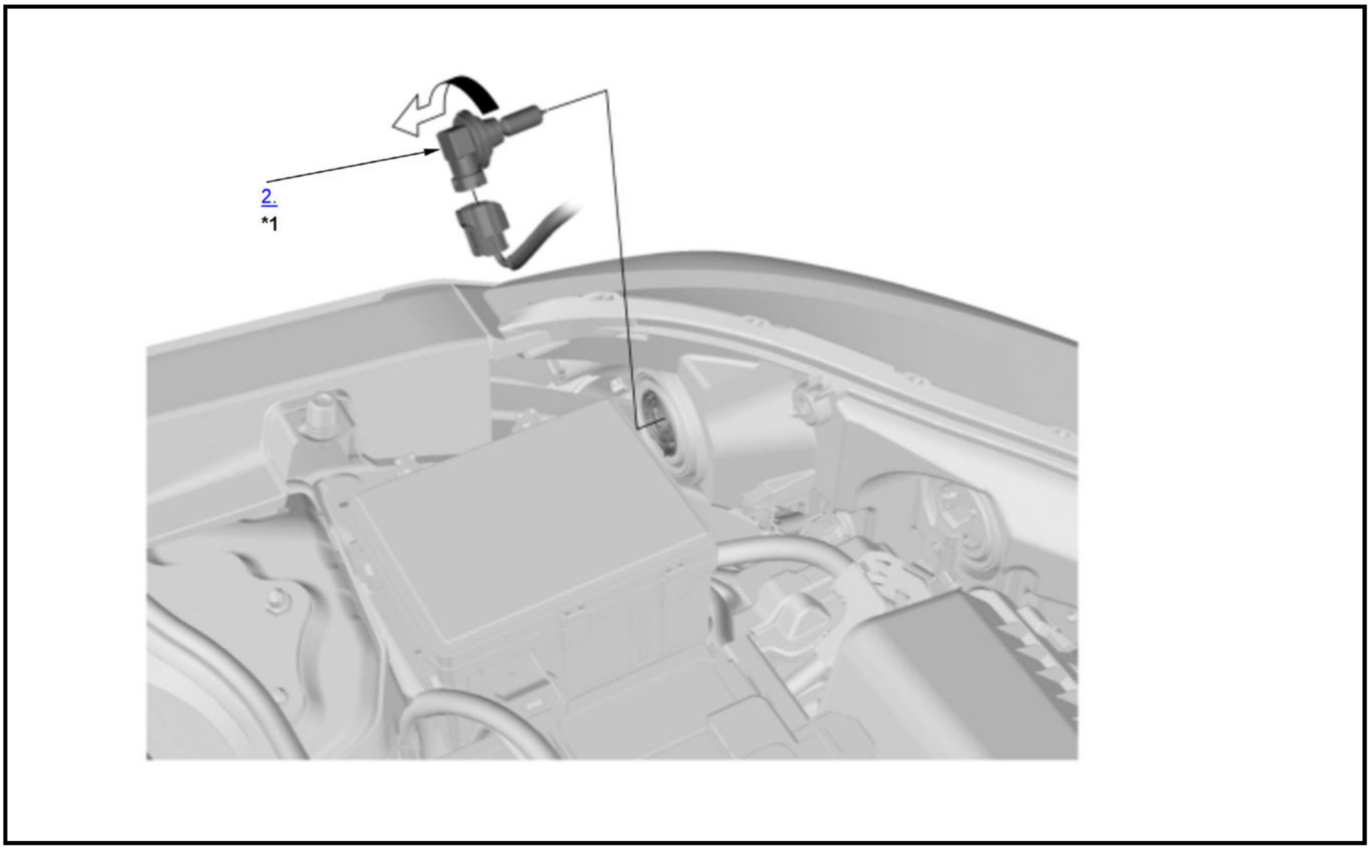
EXTERIOR LIGHTS BULB REMOVAL AND INSTALLATION

Removal and Installation

NOTE: 🕮 Where icon is shown, further information shown below.

1

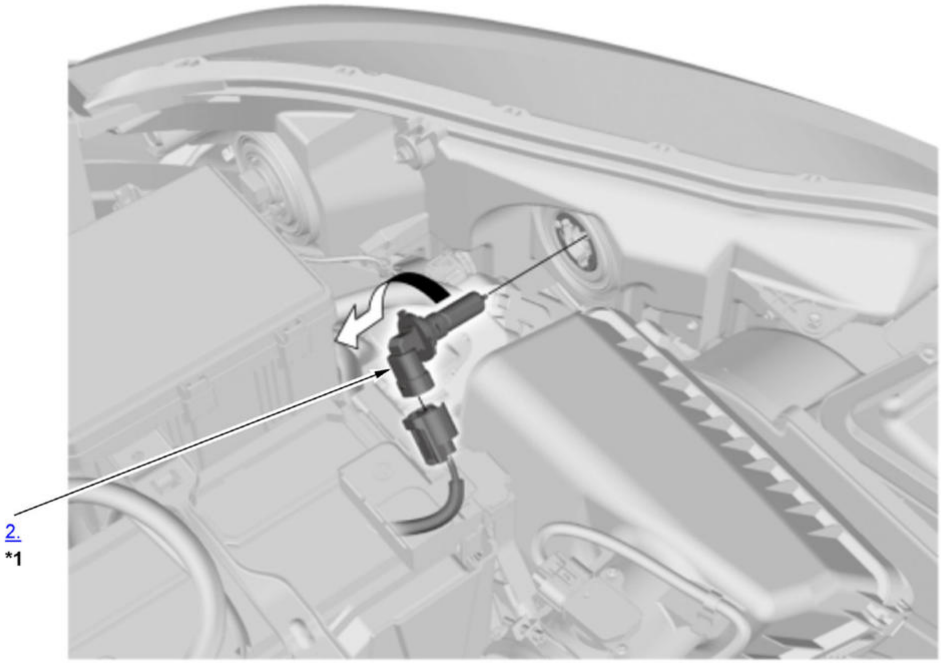
Headlight Low Beam (bulb type)



*1	Low beam: 55W

2

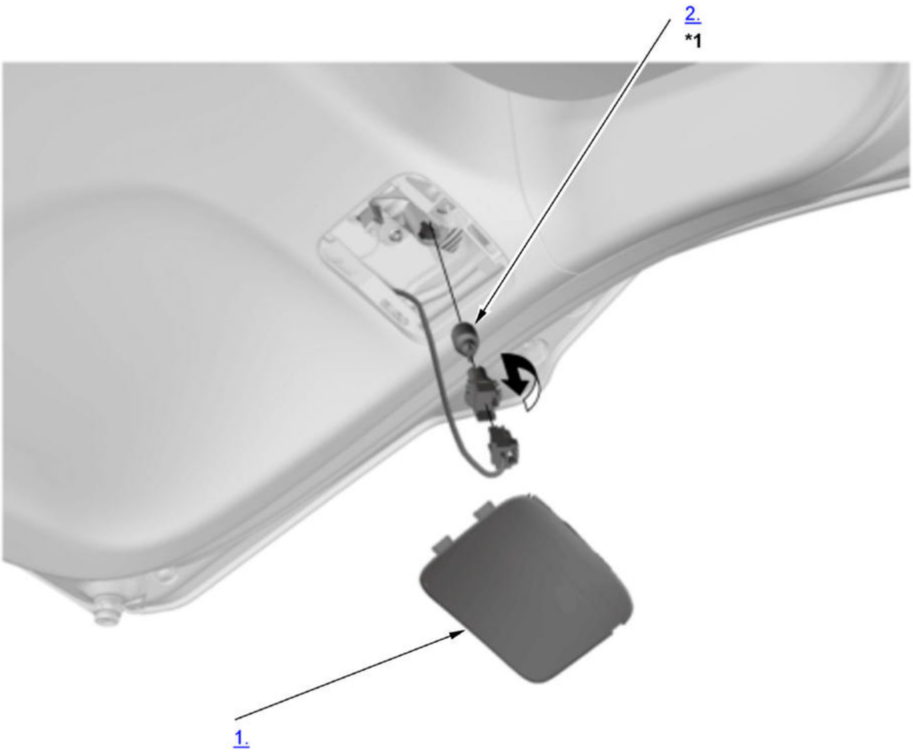
Headlight High Beam (bulb type)



*1	High beam : 60W

3

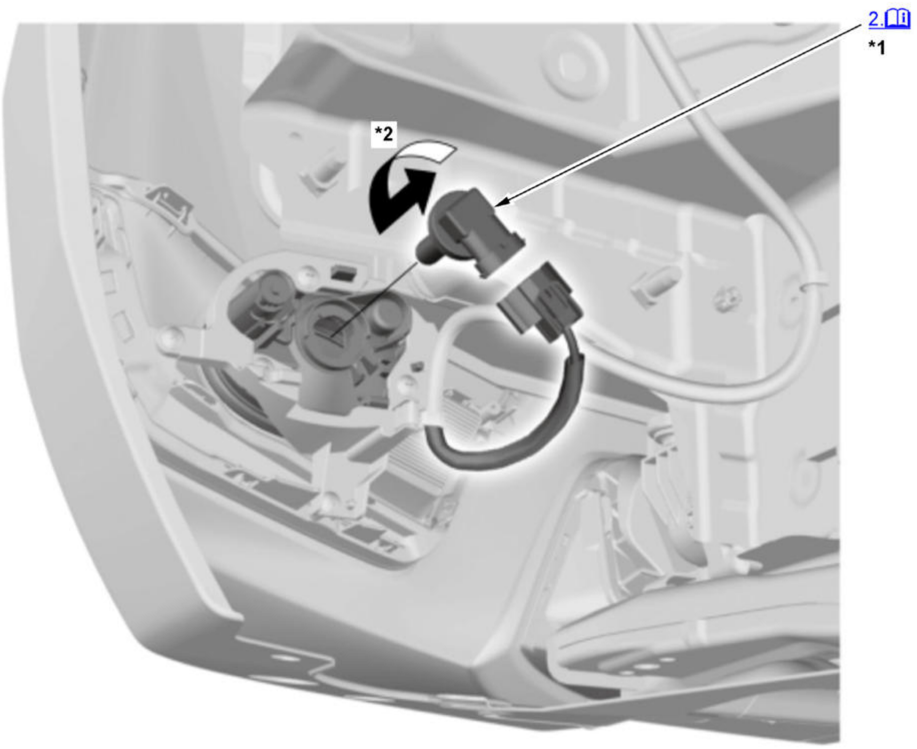
Back-Up Light



*1	Back-Up Light: 16W

4

Front Fog Light (With Front Fog Light (non-LED Type))



📖	Detailed information, notes, and precautions
*1	Front Fog Light: 35W
*2	Right side: Clockwise

Headlight (HIGH/LOW beam (bulb type))

1. **Washer Filler Neck - Remove** (Right Side Low Beam)
2. Headlight Bulb - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

   Back-Up Light

4. Tailgate Maintenance Side Lid - Remove
5. Back-Up Light Bulb - Remove
6. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

   Front Fog Light (With Front Fog Light (Non-LED Type))

7. Front Inner Fender - Remove

   1. **Remove the front inner fender as needed** .

8. Front Fog Light Bulb - Remove

   1. Turn the bulb counterclockwise (clockwise*) to remove it from the housing.*: Right side

9. All Removed Parts - Install

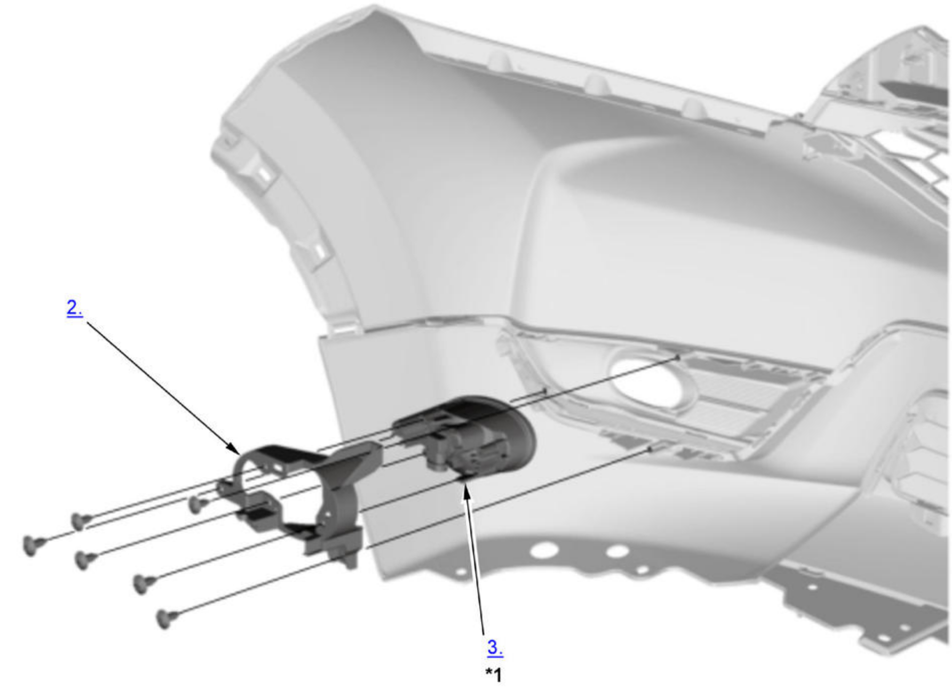
1. Install the parts in the reverse order of removal.

FRONT FOG LIGHT REMOVAL AND INSTALLATION

Removal and Installation

1

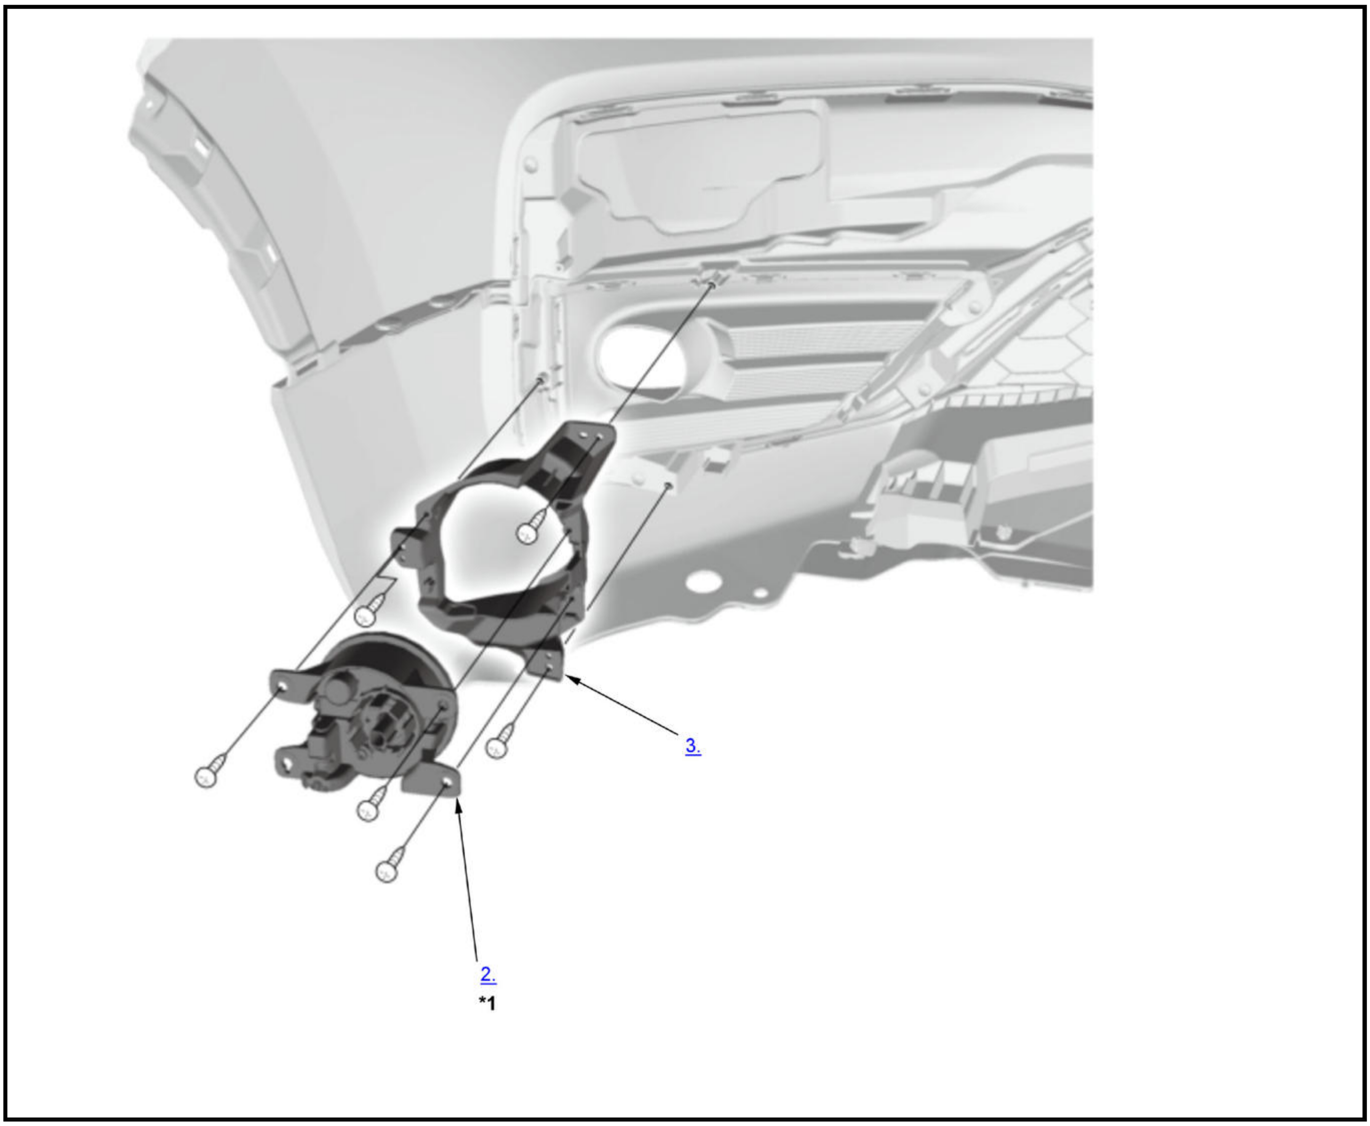
With Front Fog Light (non-LED Type)



*1	Front Fog Light: 35W

2

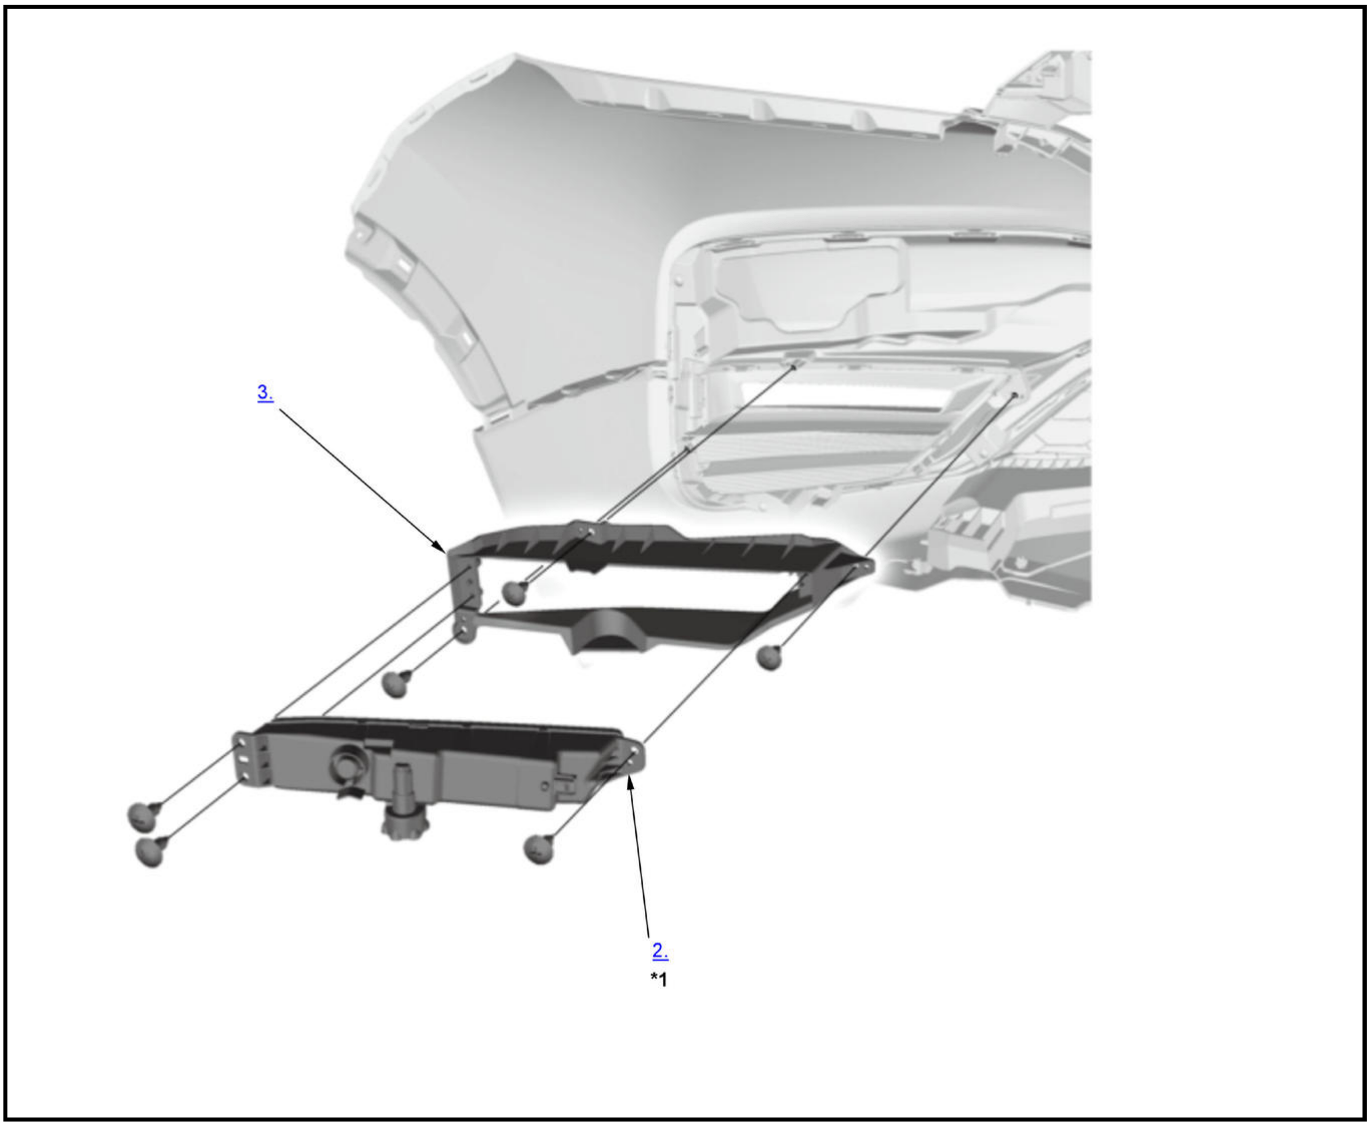
With Front Fog Light (Circle LED Type)



*1	Front Fog Light: LED

3

With Front Fog Light (5-LED type)



*1	Front Fog Light: LED

With Front Fog Light (Non-LED Type)

1. Front Bumper - Remove
2. Front Fog Light Trim - Remove
3. Front Fog Light - Remove
4. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.

With Front Fog Light (Circle LED Type and 5-LED type)

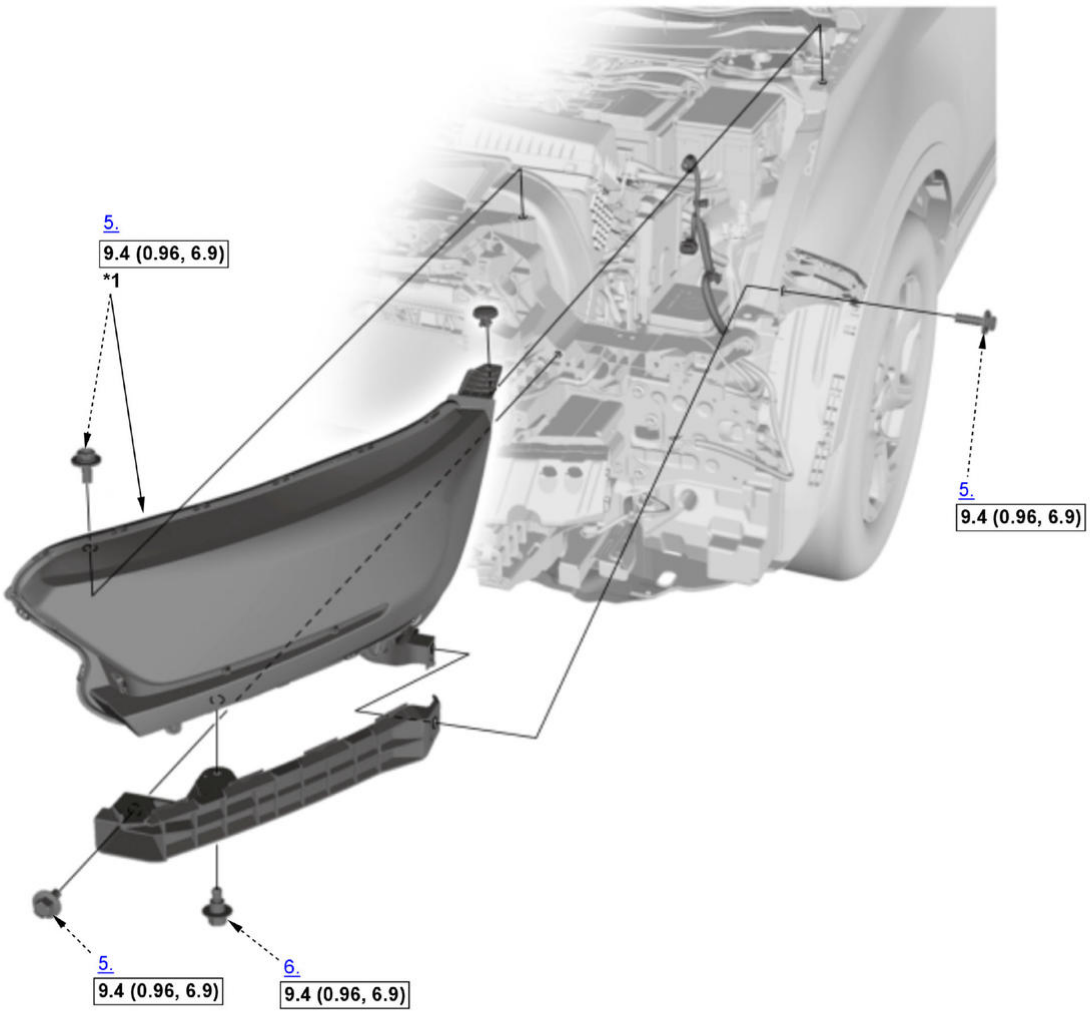
5. Front Bumper - Remove
6. Front Fog Light - Remove
7. Front Fog Light Trim - Remove
8. All Removed Parts - Install

> 1. Install the parts in the reverse order of removal.

HEADLIGHT REMOVAL AND INSTALLATION

Removal and Installation

1



▭	Torque: N.m (kgf.m, lbf.ft)
*1	Headlight (high beam): LED (LED type) Headlight (high beam): 60W (bulb type) Headlight (low beam): LED (LED type) Headlight (low beam): 55W (bulb type) Front Parking Light/Daytime Running Light: LEDFront Turn Signal Light: LED Side Marker Light: LED

1. **Front Bulkhead Cover - Remove**

3. **Front Grille Trim - Remove**
4. **Front Fender Trim - Remove**
5. Headlight - Remove
6. Corner Upper Beam - Remove
7. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

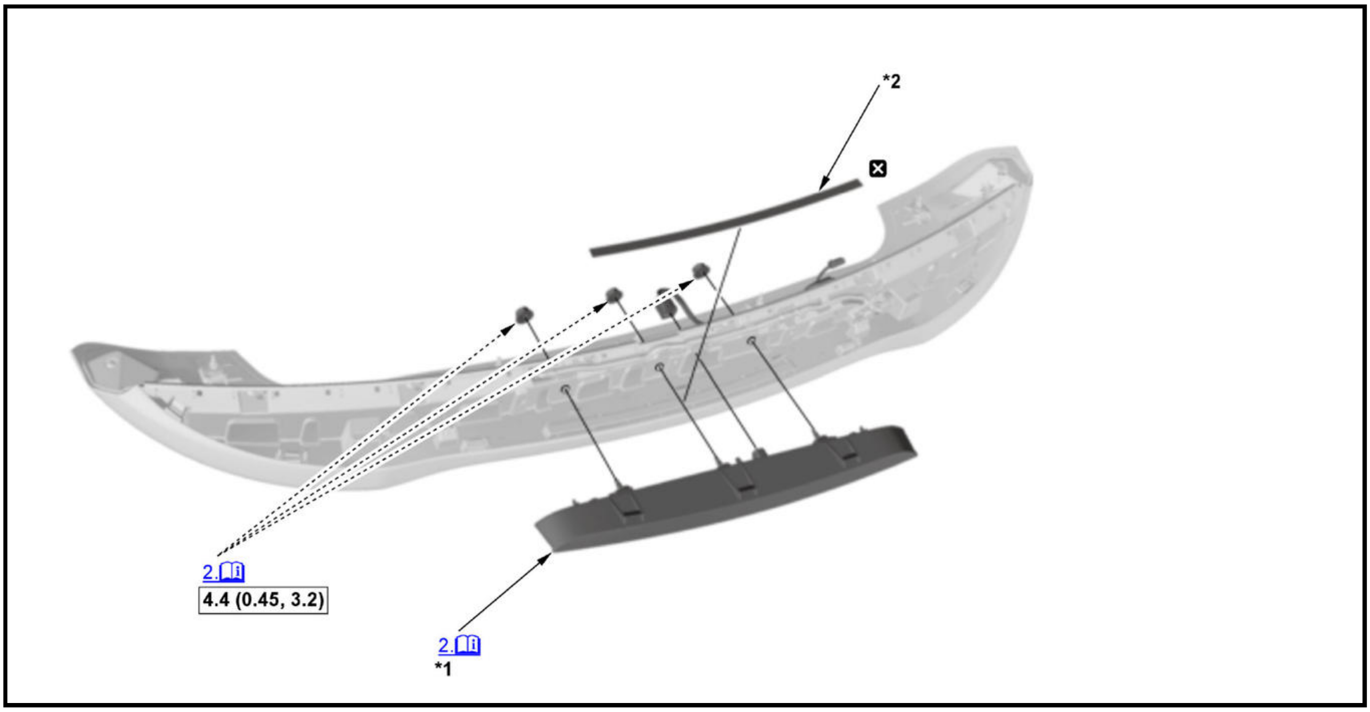
8. **Headlight - Adjust**

HIGH MOUNT BRAKE LIGHT REMOVAL AND INSTALLATION

Removal and Installation

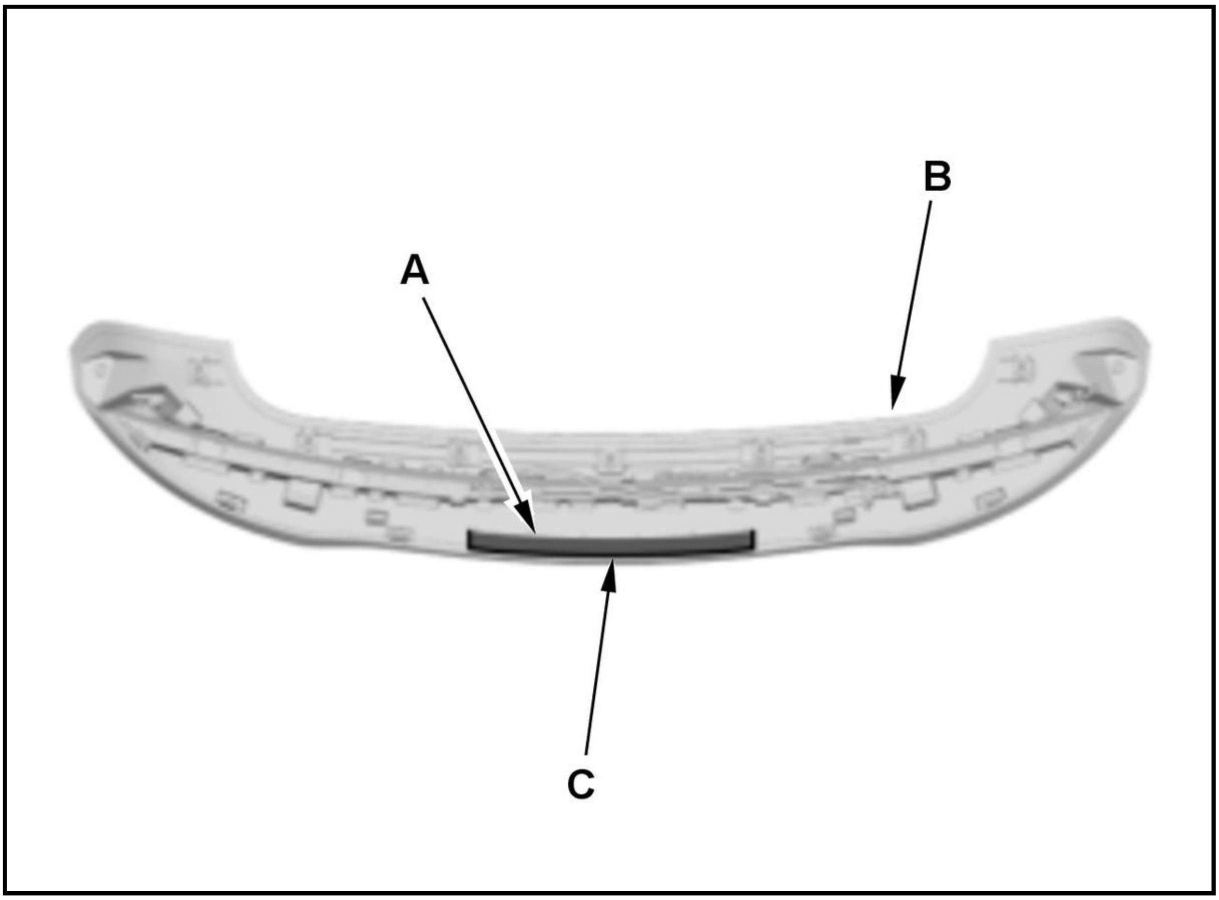
NOTE: 📖 Where icon is shown, further information shown below.

1



📖	Detailed information, notes, and precautions
▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	High Mount Brake Light: LED
*2	Double-sided adhesive tape

1. **Tailgate Spoiler Trim - Remove**
2. High Mount Brake Light - Remove



NOTE : If you going to reinstall the original high mount brake light, apply adhesive primer to the areas where the new double-sided adhesive tapes (A) will be applied, then attach the new double-sided adhesive tapes to the tailgate spoiler trim (B) on the scribes (C) as shown.

Double-sided adhesive tape (A)

Thickness	1.0 mm (0.039 in)

Width	10 mm (0.39 in)
Length	300 mm (11.8 in)

3. All Removed Parts - Install

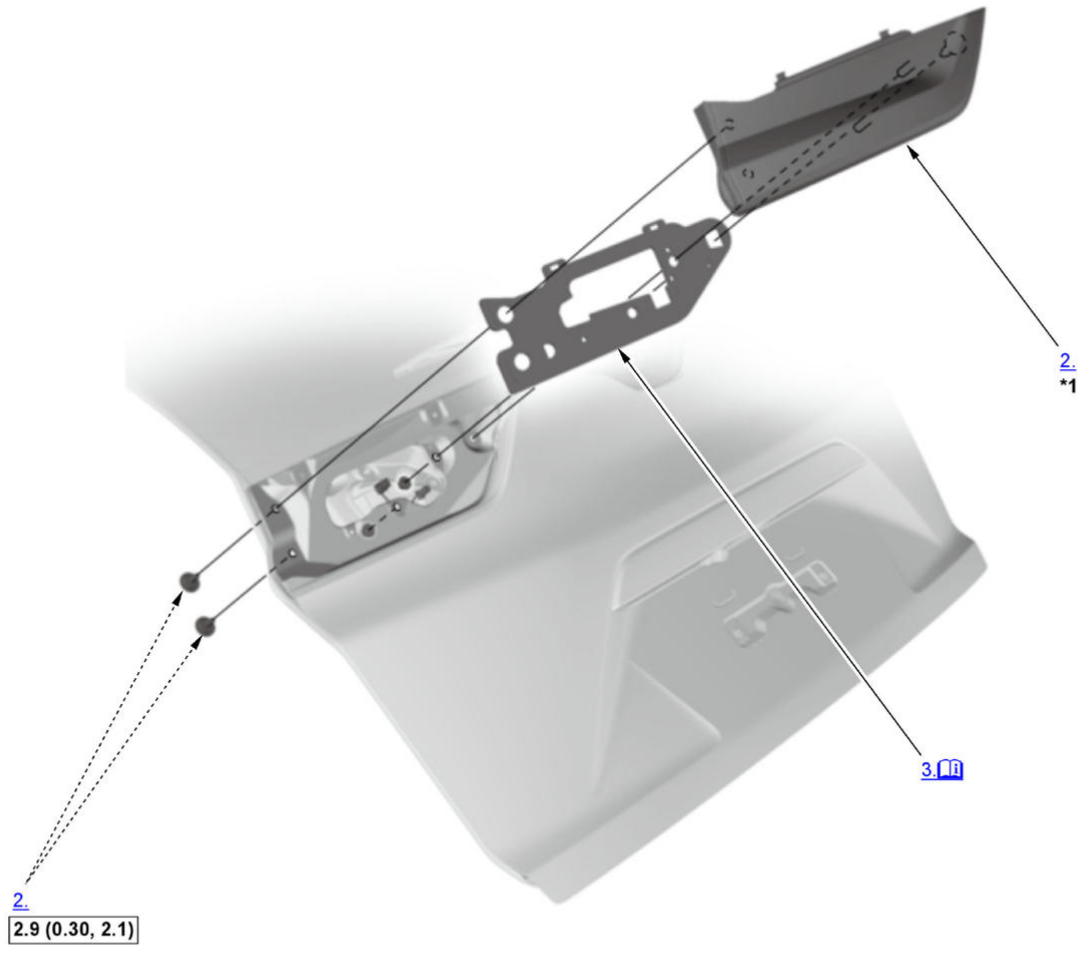
1. Install the parts in the reverse order of removal.

INNER TAILLIGHT REMOVAL AND INSTALLATION

Removal and Installation

NOTE: 🕮 Where icon is shown, further information shown below.

1



ℹ	Detailed information, notes, and precautions
▭	Torque: N.m (kgf.m, lbf.ft)
*1	Inner Taillight: LED

1. Tailgate Trim - Remove
2. Inner Taillight - Remove
3. Gasket - Remove

   NOTE: Inspect the gasket and replace it if it is distorted or stays compressed.

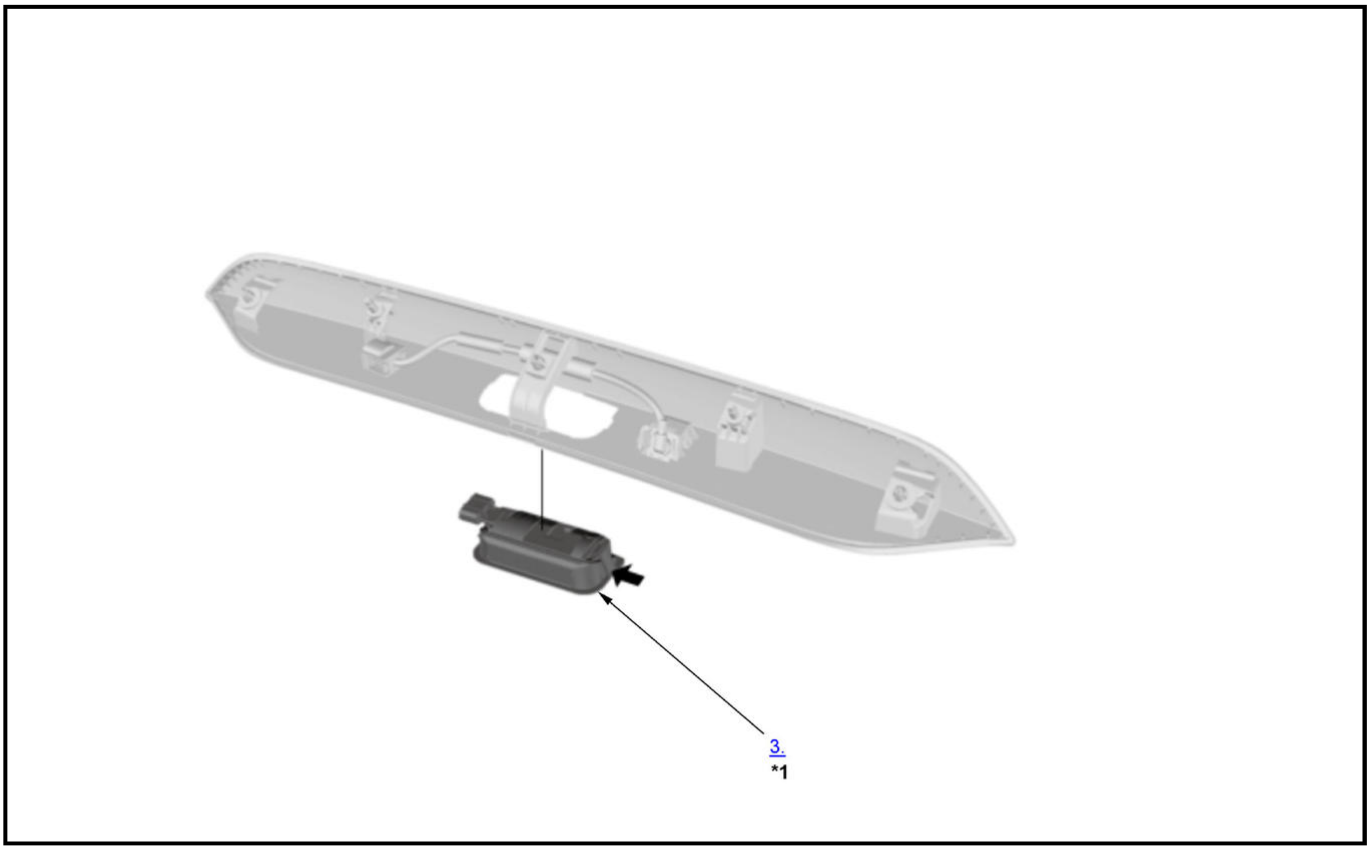
4. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

LICENSE PLATE LIGHT REMOVAL AND INSTALLATION

Removal and Installation

1



*1	License Plate Light: LED

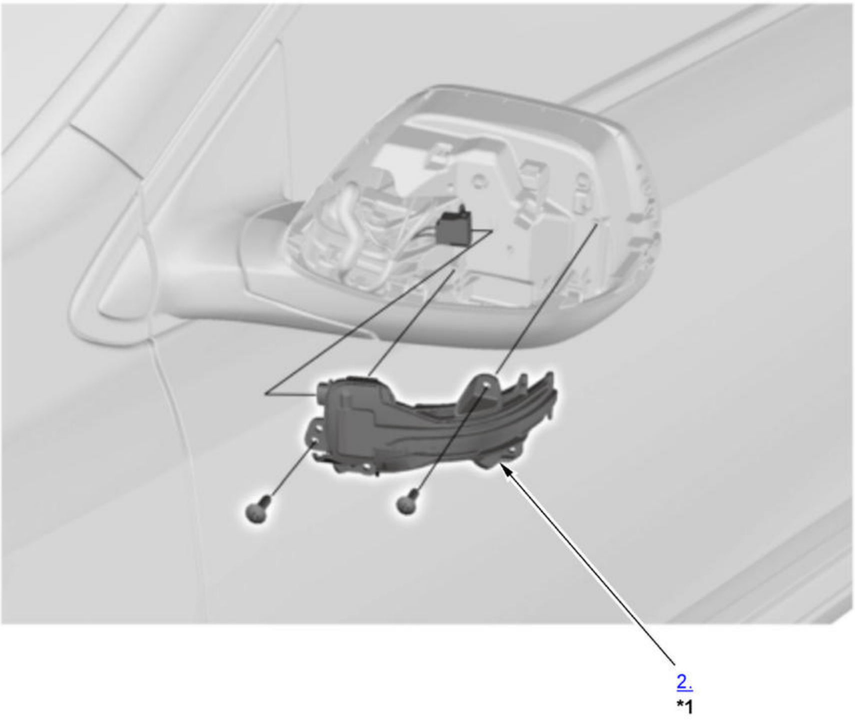
1. Tailgate Lower Trim Panel - Remove
2. Rear License Trim - Remove
3. License Plate Light - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SIDE TURN SIGNAL LIGHT REMOVAL AND INSTALLATION

Removal and Installation

1



*1	Side Turn Signal Light: LED

1. Mirror Housing Upper Cover - Remove
2. Side Turn Signal Light - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

TAILLIGHT REMOVAL AND INSTALLATION

Removal and Installation

NOTE: 📖 Where icon is shown, further information shown below.

*1	Hazard Warning Switch Light : LED

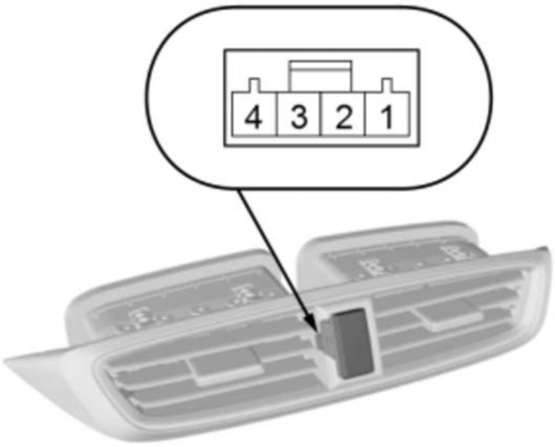
1. Center Outlet - Remove

2. Hazard Warning Switch - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. Hazard Warning Switch - Test



Terminal / Position/Light	3	4	2		1
Released					
Pressed	○—	—○			
Switch light			⊕—	—▷|—ʌʌʌ—	⊖

○—○ = Continuity check
⊕—⊖ = Voltage for LED

1. Check the hazard warning switch according to the table.

NOTE:

- When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.
- Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

2. If the result is not as specified, replace the hazard warning switch.

DESCRIPTION & OPERATION

AUTO HIGH-BEAM (HIGH-BEAM SUPPORT SYSTEM) DESCRIPTION - OVERVIEW

Overview

The system operates by switching the high beam and low beam automatically depending on the road condition of vehicles running ahead and opposite vehicles, using th camera unit.

Operating Conditions

NOTE: The auto high-beam indicator does not come on until the following conditions are met.

- The combination light switch is in the AUTO position.
- The headlight low beam is illuminated.
- White and red light sources are not detected ahead.
- 2 or more streetlights have not been detected.
- The vehicle speed is above 25 mph (40 km/h).
- There is no refracted light due to fog or other weather conditions.
- There is no manual operation input of the combination light switch.

NOTE: Weather and road conditions (undulation, curve, or environment illuminance etc.) may affect system operation.

Conditions When the System Stops Operating

The system stops operation under the following conditions.

- When the combination light switch is turned to other than the AUTO position.
- If the high beam or pass position of the combination switch was operated.
- When the vehicle speed is low:
-
    - -

      Less than 6 mph (10 km/h)
    - -

      Less than 15 mph (24 km/h) condition continues more than four seconds.

Conditions that the System Switches to Low Beam

- When there are objects that are emitting lights such as streetlights, house lights, advertising display lighting, signages, vending machines, or other reflecting light.
- When there are objects emitting lights on the road similar to the taillights of vehicles driving ahead or headlights of opposing vehicles.
- When the red lights of the traffic signals are detected.
- When the front wiper motor operates at HIGH for 5 seconds.

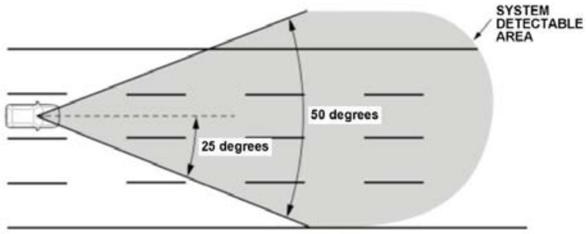
NOTE: There is no refracted light due to fog or other weather conditions.

Conditions that Switching Timing to Low Beam is Changed

- When the taillights of the vehicle driving ahead are excessively bright or dim.
- When the headlights of the opposite vehicle are excessively bright or dim.
- In rainy, snowy, and foggy weather.

Detection Range and Limits

The multipurpose camera unit recognizes and reacts within the range of 25 degrees horizontally (total 50 degrees).



Auto High-Beam Operation Indicator

When a system malfunction occurs, or when the camera lens or the windshield gets dirty, the warning message is shown on the multi-information display (MID). If the shown, the system stops operating.

 Auto High-Beam Problem	Some Driver Assis Systems Cannot Operate: Clean Front Winds
NOTE: The actual message may be different depending on your market.	

AUTO HIGH-BEAM (HIGH-BEAM SUPPORT SYSTEM) DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the Auto High-Beam is shown below.

Headlight Fault Detection Function (With LED Headlight)

When a low beam error is detected, the headlights send an error signal to the relay control module. When the relay control module receives the error signal, it sends an I system indicator signal to the gauge control module via B-CAN.

Turn Signal/Hazard Light Function

The turn signal/hazard warning lights are controlled by the body control module, using input from the combination light switch or hazard warning switch signal. When t module receives a left turn or right turn command from the combination light switch, it blinks the front and rear turn signal lights for the left or right side of the vehicle. control module receives a hazard warning command from the hazard warning switch, it blinks the front and rear turn signal lights for both sides of the vehicle. The syste wire break detection by monitoring the current values using the body control module. An abnormal value is registered as a wire break (open) or faulty LED. When this c control module increases the turn signal lighting frequency. If the break detection shows that the current value has returned to the correct value, the body control module normal frequency.

Daytime Running Lights Function

For daytime running light control, the relay control module controls the daytime running light control circuit based on the combination light switch signal, the parking b automatic lighting signal, and then turns on the light. When the combination light switch is in the OFF position or the AUTO position with the vehicle in the ON mode a brake released, the relay control module controls the daytime running light control circuit. When the combination light switch is in the ON position or the AUTO positic output signal from the automatic lighting control unit-sensor or the automatic lighting/rain sensor are inputted to the body control module, daytime running light control

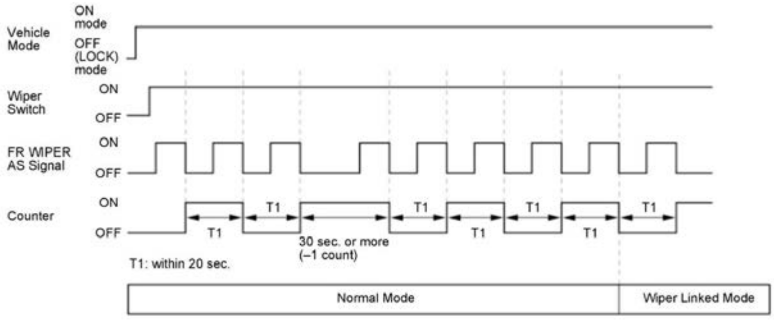
Wiper Linked Mode

When the wiper switch is in a position other than OFF, the automatic lighting control unit-sensor *1 or automatic lighting/rain sensor *2 counts and records the windshi WIPER AS signal (ON to OFF count within 20 seconds) from the body control module via B-CAN. After a total of 5 counts, it switches to wiper linked mode and turns the front parking lights, the taillights, inner taillights, daytime running lights, and the side marker lights. The ON/OFF signals at the time of windshield washer operatio

When a count is not received for 30 seconds or more, the count is reduced by 1, and shifting to normal mode is done when the count reaches 0. The wipers return to nor vehicle is stopped, or when the respective switch is set to OFF.

*1: Without automatic wiper

*2: With automatic wiper



Warning Function

The automatic lighting control unit-sensor *1 or the automatic lighting/rain sensor *2 sends an indicator signal to the gauge control module in case of a failure of the aut sensor or when the signal sent from the relay control module by B-CAN signal is abnormal.

*1: Without automatic wiper

*2: With automatic wiper

Interior Lights Brightness Change Control

Regardless of the combination light switch in the AUTO position, the body control module *1 or the automatic lighting/rain sensor *2 controls the brightness for daytim brightness. The body control module *1 or the automatic lighting/rain sensor *2 sends the signal to the gauge control module using B-CAN.

*1: Without automatic wiper

*2: With automatic wiper

Sensitivity Adjustment Function (For Some Models)

Sensitivity adjustment of the automatic lighting system can be customized with the gauge control module. You can select the customized timing from 5 types (Min, Lo, sensitivity.

Failsafe Function

Automatic Lighting System

When an automatic lighting sensor failure occurs, the system maintains the state before the failure, and a warning is displayed in the multi-information display (MID).

EXTERIOR LIGHTS SYSTEM DESCRIPTION - COMPONENTS

Headlights

The headlight assembly consists of the headlights (low/high beam lights), front parking lights, daytime running lights and the front turn signal lights.

Front Fog Lights

The front fog lights are installed on the front bumper.

Rear Combination Lights

The taillights consist of the taillights, the brake lights, and the rear turn signal lights. The back-up lights and the inner taillights are built into the inner taillights.

High Mount Brake Light

The high mount brake light is located at the top of the rear window.

Side Turn Signal Lights

The side turn signal light is built into the power mirror.

INPUT TEST

EXTERIOR LIGHTS (BODY CONTROL MODULE AND RELAY CONTROL MODULE) INPUT TEST

NOTE:

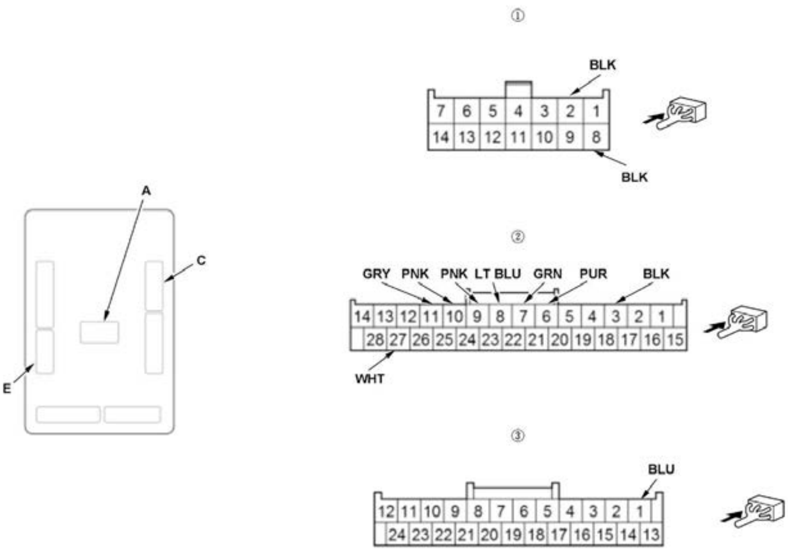
- Make sure the fuses associated with the system is OK.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .

Body Control Module

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect body control module connectors.

Body Control Module Connector A (14P) (female terminals): ① Body Control Module Connector C (28P) (female terminals): ② Body Control Module Connect terminals): ③



Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 4.

Reconnect the connectors to the body control module, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not
C27	WHT	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire

Reconnect the connectors to the relay control module, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 10.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is no
A1	RED	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not
A4	LT GRN	Vehicle ON mode	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
A6	BRN	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G251) • An open or high resistance in the w
C15	BRN	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G251) • An open or high resistance in the g wire
C10	PNK	Combination light switch (headlight) ON	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty combination light switch • An open or high resistance in the g wire
		Combination light switch OFF	Measure the voltage to ground:There should be battery voltage.	• Faulty combination light switch • A short to ground in the wire

10. If multiple failures are found on more than one control unit, **replace the body control module** . If input failures are related to a particular control unit, replace the c

TURN SIGNAL/HAZARD WARNING LIGHTS (BODY CONTROL MODULE) INPUT TEST

NOTE:

- Make sure the fuses associated with the system is OK.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect body control module connectors.

Body Control Module Connector A (14P) (female terminals): ① Body Control Module Connector B (36P) (female terminals): ② Body Control Module Connect

terminals): ③ Body Control Module Connector E (24P) (female terminals): ④

Inspect the connectors and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 4.

Reconnect the connectors to the body control module, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not
A1	RED	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
C27	WHT	Under all conditions	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
E1	BLU	Vehicle ON mode	Measure the voltage to ground:There should be battery voltage.	An open or high resistance in the wire
A2	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the wire
A8	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Poor ground (G401) • An open or high resistance in the wire
C2	GRN	Hazard warning switch pressed	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty hazard warning switch • Poor ground (G402) • An open or high resistance in the wire
		Hazard warning switch released	Measure the voltage to ground:There should be battery voltage.	• Faulty hazard warning switch • A short to ground in the wire
E6*C3	LT GRN*BLK	Turn signal switch in left position	Measure the voltage between terminals E6 and C3:There should be less than 0.2 V.	• Faulty turn signal switch • An open or high resistance in the
		Turn signal switch in right or neutral position	Measure the voltage between terminals E6 and C3:There should be battery voltage.	• Faulty turn signal switch • A short to ground in the wire
E5*C3	RED*BLK	Turn signal switch in right position	Measure the voltage between terminals E5 and C3:There should be less than 0.2 V.	• Faulty turn signal switch

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not
				- An open or high resistance in the wire
		Turn signal switch in left or neutral position	Measure the voltage between terminals E5 and C3:There should be battery voltage.	- Faulty turn signal switch - A short to ground in the wire

5. Turn the vehicle to the OFF (LOCK) mode.Disconnect the connectors to the body control module, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, **replace the body control module** .

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not
B17	LT BLU	Under all conditions	Connect terminal B17 and A1 with a jumper wire:The left rear turn signal light should come on.	- Faulty LED - Poor ground (G505) or an open in wire - An open or high resistance in the w
B18	BLU	Under all conditions	Connect terminal B17 and A1 with a jumper wire:The left front turn signal light and left side turn signal light* should come on.	- Faulty LED - Poor ground (G351, G401*) or an ground wire - An open or high resistance in the w
B34	LT GRN	Under all conditions	Connect terminal B17 and A1 with a jumper wire:The right rear turn signal light should come on.	- Faulty LED - Poor ground (G504) or an open in wire - An open or high resistance in the w
B35	BRN	Under all conditions	Connect terminal B17 and A1 with a jumper wire:The right front turn signal light and right side turn signal light* should come on.	- Faulty LED - Poor ground (G251, G402*) or an ground wire - An open or high resistance in the w

*: With side turn signal light

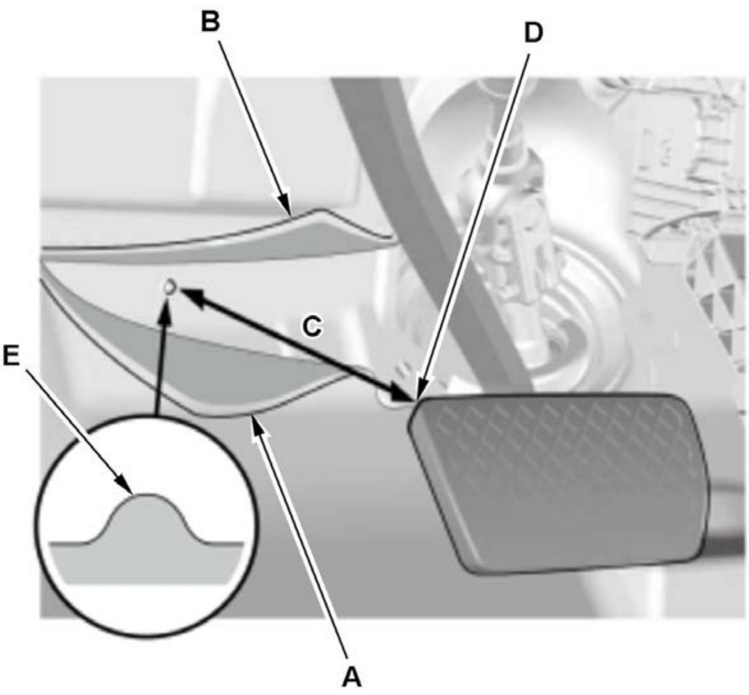
ADJUSTMENT

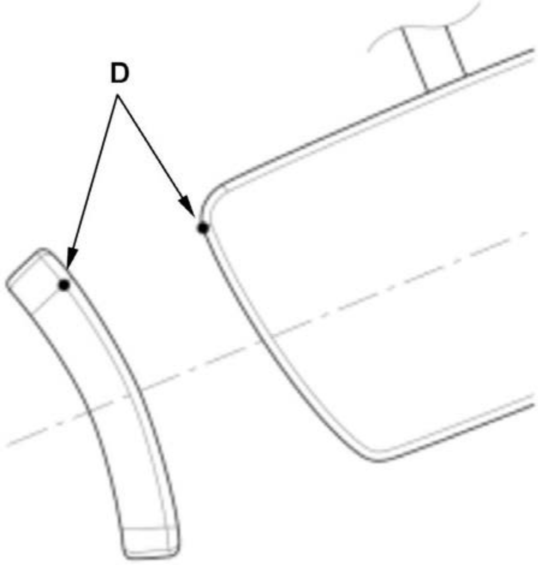
BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT

Adjustment

NOTE: There are two types of electric brake boosters (type A or B) that can be differentiated visually. **Make sure which booster type is equipped before doing any r**

1. **Steering Joint Cover - Remove**
2. Brake Pedal Height - Inspect





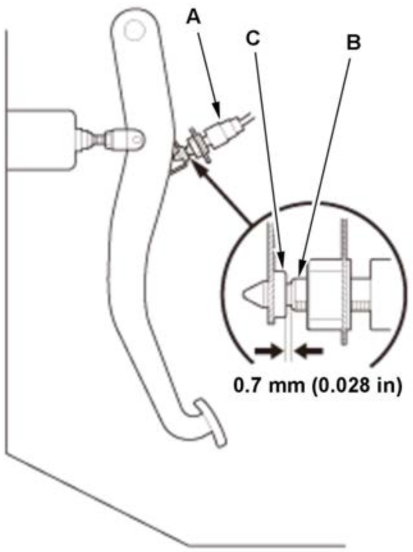
1. Pull back the carpet (A) and the insul

2. Measure the pedal height (C) from th point (D) of the pedal pad to the tab (E) without the insulation.**NOTE:**

If the standard pedal height is out of spe for body damage around the brake peda on the brake pedal assembly.

Standard pedal height:	**215 +/- 5 mm (8.46 +/- 0.20 in)**

3. Brake Pedal Position Switch - Adjust



1. **Remove the brake pedal position switch**

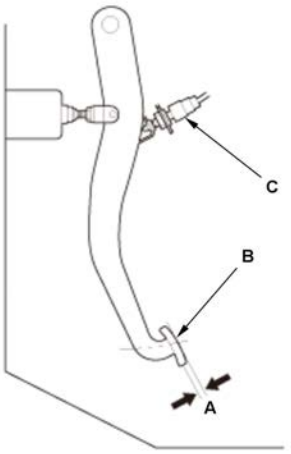
2. Lift up on the brake pedal by hand.

3. Push in the brake pedal position switch (A) until its plunger is fully p
end (B) touching the pad (C) on the pedal arm).

4. Turn the switch 45 deg. clockwise to lock it. The gap between the bra
switch and the pad is automatically adjusted to 0.7 mm (0.028 in) by lo

5. Make sure the brake lights go off when the pedal is released.

4. Brake Pedal Free Play - Check



1. Inspect the free play (A) at the brake pedal pad (B) by pushing the brake pedal by ha
pedal free play is out of specification, adjust the brake pedal position switch (C). If the
play is insufficient, it may result in brake drag.

Free play:	**2.7-8.2 mm (0.106-0.323 in)**

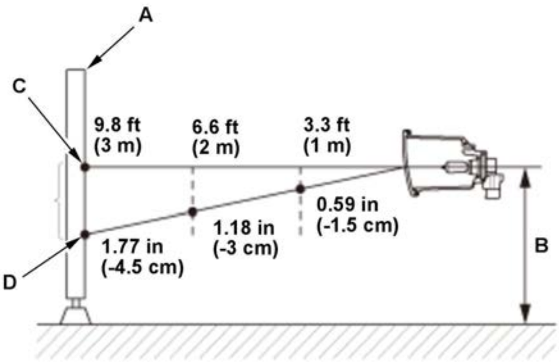
5. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

FRONT FOG LIGHT ADJUSTMENT

Adjustment

1. Front Fog Light - Adjust



Before adjusting the front fog lights:

- Park the vehicle on a level surface.
- Make sure the tire pressures are correct.
- The driver or someone who weighs the same should sit in the driver's
- Unload the vehicle.

The front fog lights should aim down slightly. To check for proper adjustm

1. Park the vehicle in front of a wall or screen (A).

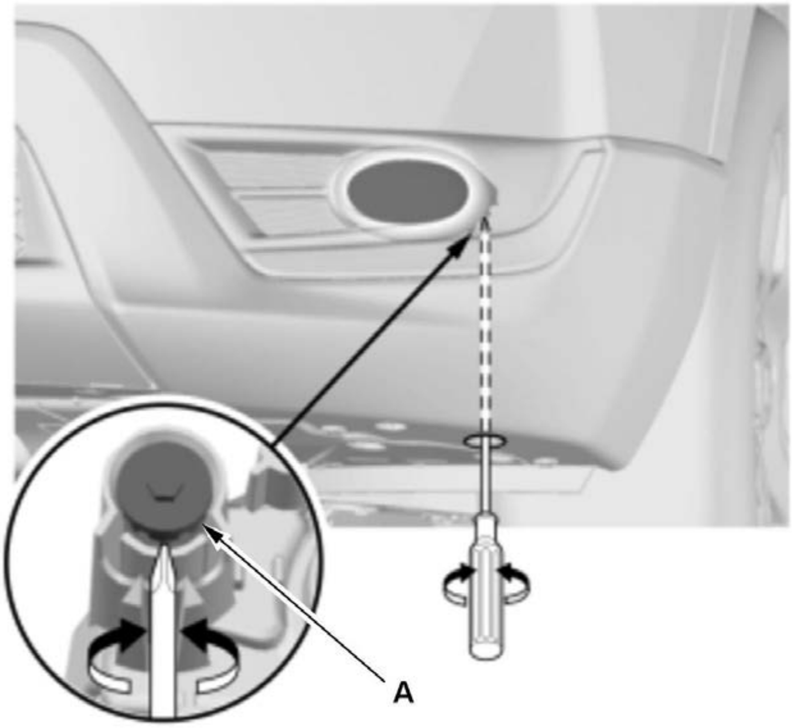
2. Turn the front fog lights on.

3. Determine if the front fog lights are aimed properly:

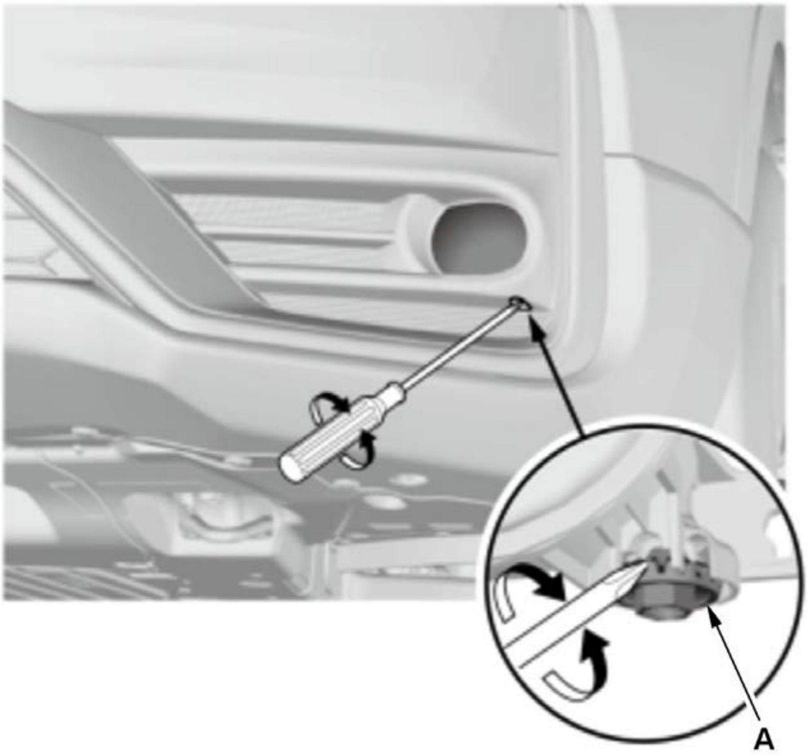
- Measure the height (B) of the front fog lights.
- On the wall or screen, mark the height of the front fog lights with a p
- Check each front fog light beam's height. Adjust them both so they a
  1.77 in (4.5 cm) lower (D) than the height of the front fog lights at a
  m).

For example, if the vehicle is parked 9.8 ft (3 m) from the wall or screen, th
fog light beam should be 1.77 in (4.5 cm) below the tape mark.

With front fog light (non-LED type)

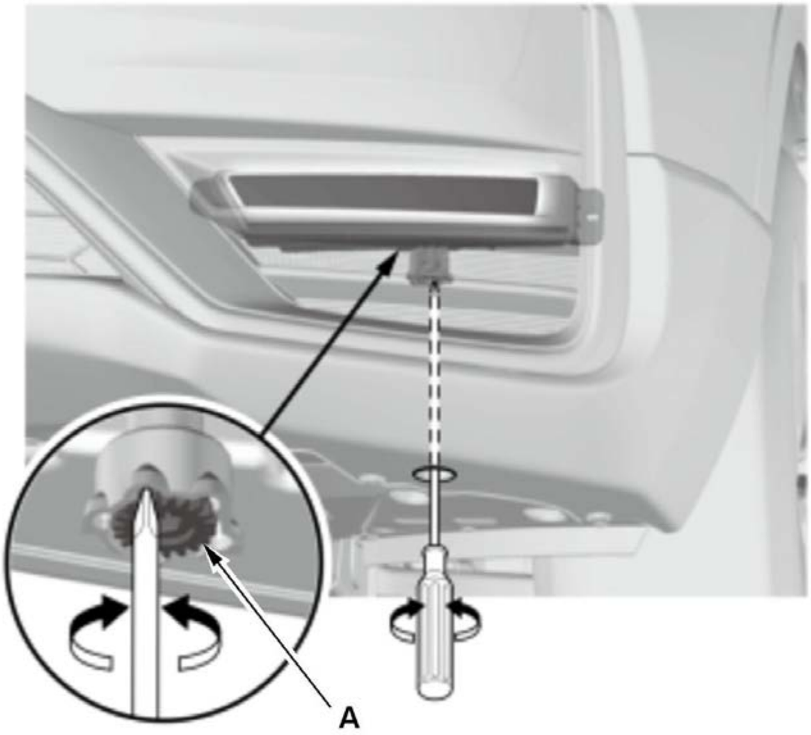


With front fog light (circle LED type)



With front fog light (5-LED type)

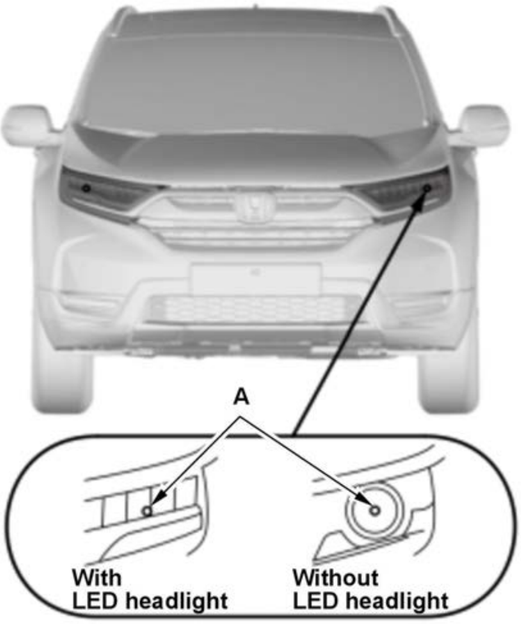
4. If necessary, adjust each front fo specified height by turning the adj



HEADLIGHT ADJUSTMENT

Adjustment

1. Low Beam Headlight - Adjust



Low beam

High beam

WARNING:

Headlights become very hot during use; do not touch them or such items like fender covers immediately after they have bee

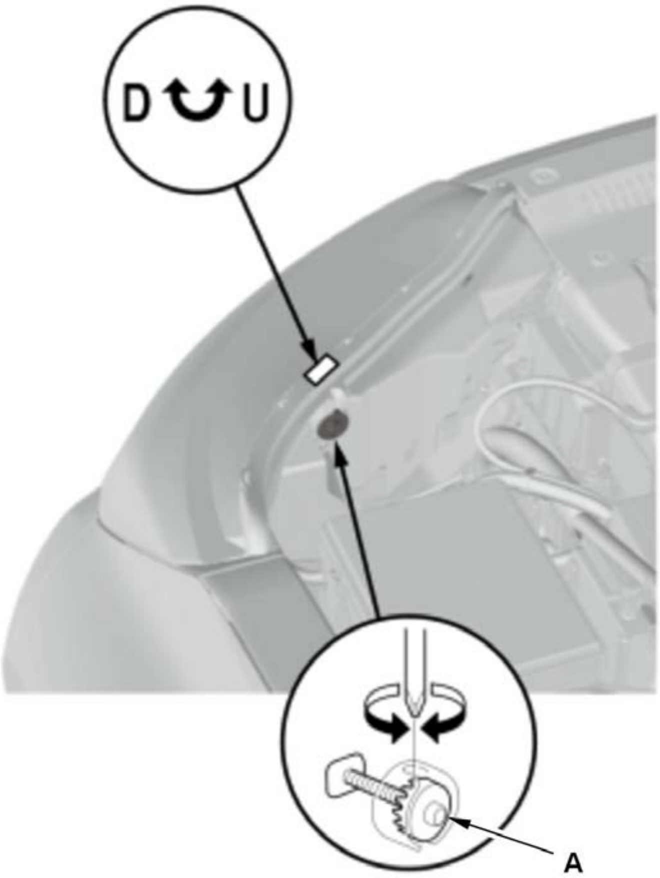
Before adjusting the headlights:

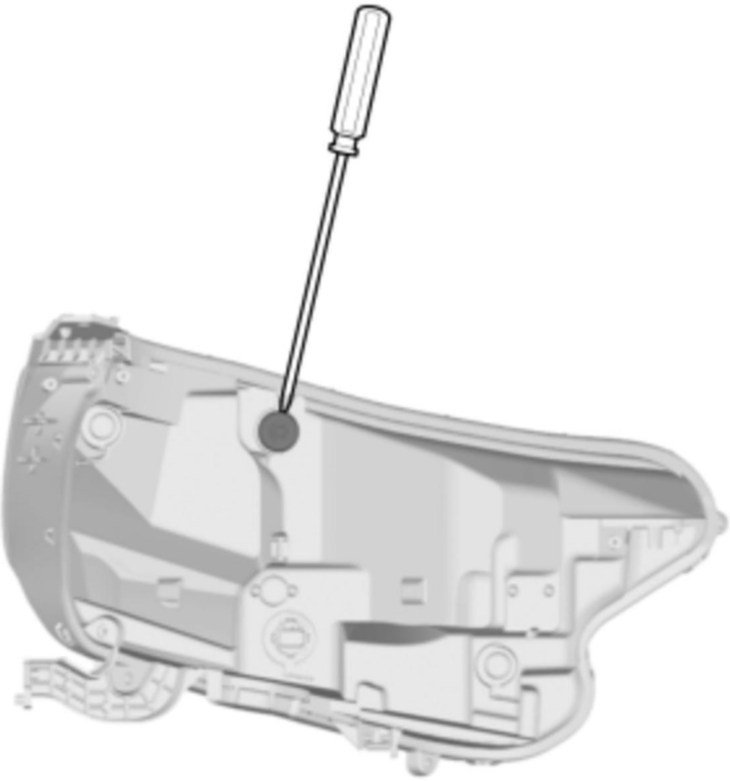
- Park the vehicle on a level surface.
- Make sure the tire pressures are correct.
- The driver or someone who weighs the same should sit (or use an equivalent weight).
- Unload the vehicle.

1. Clean the outer lens so that you can see the center (A) of th

 With LED headlight Without LED headlight	
 B 7.5 m (24.6 ft) A	**Low beam** 2. Park the vehicle so that the center mark of the low is 7.5 m (24.6 ft) away from a wall or screen (B).
	3. Measure the height of the low beam headlight's center mark (A), then (B), mark the same height of the headlights with masking tape in a straig (C).

	4. Turn on the low beam headlights. 5. To see if the headlights are adjusted properly, observe the beams of light pr or screen. The highest edge or "cut line" (A) of the headlights should be equal tape (B). **NOTE:** **To help determine if a headlight is out of adjustment, block one of the beams with a large piece of cardboard or equivalent, and observe the other beam on the wall or screen. Repeat this for the other headlight.**





6. If adjustment is necessary, open the hood headlights to local requirements by turning (A).**NOTE:** The headlights can only be adju

TEST

POWER RELAY TEST

Special Tools Required

Image	Description/Tool Numbe
	Relay Puller 07AAC-000A2A1

Test

1. Power Relay - Test

   Use this chart to identify the types of the relay, then do the test listed for it.

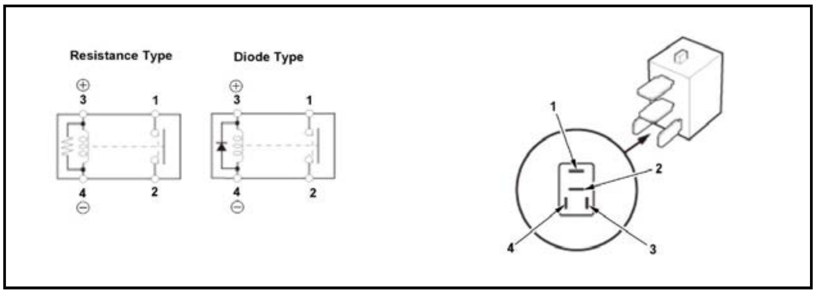
Relay	Test
A/C compressor clutch relay	Normally-open four-terminals type
A/C condenser fan relay	
Auxiliary transmission fluid pump relay	
Cargo area accessory power socket relay	
Console accessory power socket relay	
DC-DC converter ACC relay	
DC-DC converter IG1 relay 1	
DC-DC converter IG1 relay 2	
Front accessory power socket relay	
Front blower motor relay	
Front fog light relay	
Heated steering wheel relay	
Heated windshield wiper area relay	
Horn relay	
Injector relay	
PGM-FI main relay 2	
Power window relay	
Radiator fan relay	
Rear seat heater relay	
Rear window defogger relay	

ACC cut relay	Five-terminal type
Fan control relay	
IG2 cut relay	

Normally-Open Four-Terminal Type

Check for continuity between the terminals:

- There should be continuity between terminals No. 1 and No. 2 when battery power is connected to terminal No. 3, and battery ground is connected to termi
- There should be no continuity between terminals No. 1 and No. 2 when battery power is disconnected.



Five-Terminal Type

Check for continuity between the terminals:

- There should be continuity between terminals No. 1 and No. 2 when battery power is connected to terminal No. 3, and battery ground is connected to termi
- There should be continuity between terminals No. 1 and No. 4 when battery power is disconnected.

SYMPTOM TROUBLESHOOTING

EXTERIOR LIGHTS SYMPTOM TROUBLESHOOTING - LED HEADLIGHT DOES NOT COME ON

LED headlight does not come on

1. DTC check 1

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

   -3. Wait for at least 10 seconds.

   -4. Check for Relay Control Module DTCs with the HDS.

   DTC (Relay Control Module)

DTC Description	DTC
Â	Â

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 2.

2. DTC check 2

   -1. Connect the HDS to the data link connector (DLC) .

   -2. Check for Body Control Module DTCs with the HDS.

DTC Description	DTC
Â	Â

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 3.

3. Combination light switch HEADLIGHT position check

-1. Turn the combination light switch ON.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditio	
	Values	Unit	Values	
Headlight Switch (HEADLIGHT)	ON	Â	Â	Â

Is data list values correct?

YES

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

NO

Go to step 4.

4. Combination light switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the combination light switch test** .

Is the switch OK?

YES

Go to step 5.

NO

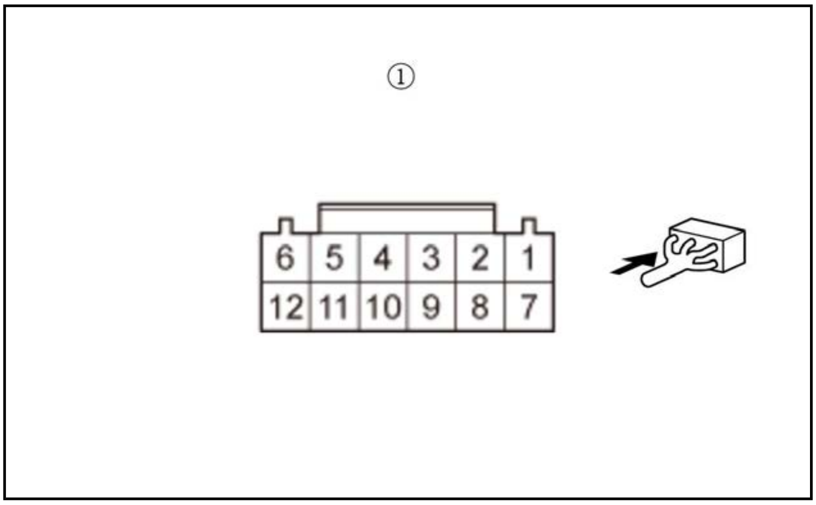
Replace the combination light switch .

5. Open wire check (H/L ON SW line) 1

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeCombination light switch 12P connector: disconnected
Test point 1	Combination light switch 12P connector (female terminals) No. 7: ①

Test point 2	Body ground



Is there battery voltage?

YES

Go to step 6.

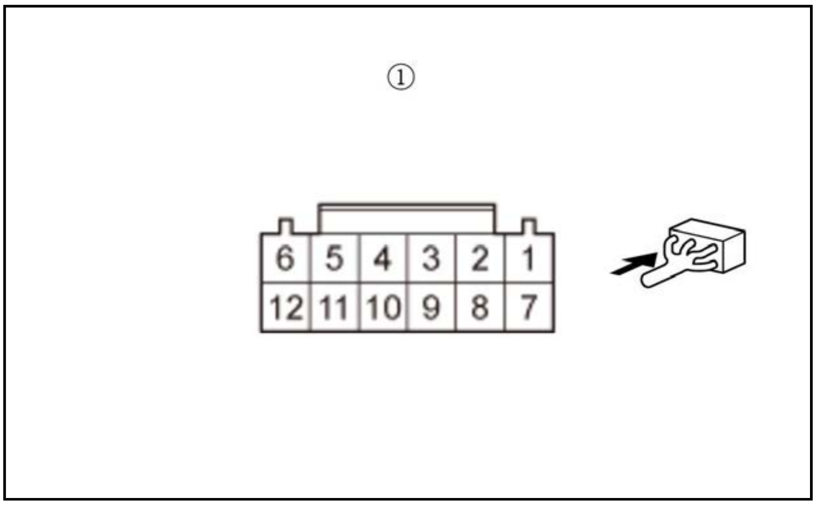
NO

Go to step 7.

6. Open wire check (COMBI SW GND(LT) line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeCombination light switch 12P connector: disconnected
Test point 1	Combination light switch 12P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there continuity?

YES

The COMBI SW GND(LT) wire is OK. Faulty combination light switch; **replace the combination light switch** .

NO

Repair an open or high resistance in the wire.

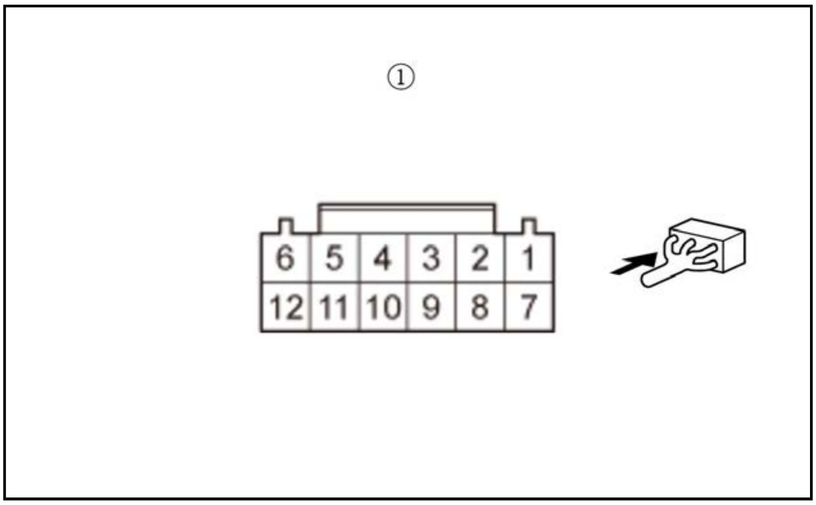
7. Open wire check (H/L ON SW line) 2

   -1. Disconnect the following connector.

Body control module connector C (28P)

   -2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeCombination light switch 12P connector: disconnectedBody control module connector C (28P): disconnected
Test point 1	Combination light switch 12P connector (female terminals) No. 7: ①
Test point 2	**Body control module connector C (28P) No. 9**



Is there continuity?

YES

The H/L ON SW wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

EXTERIOR LIGHTS SYMPTOM TROUBLESHOOTING - LED HEADLIGHT DOES NOT GO OFF

LED headlight does not go off

1. Combination light switch OFF position check

   -1. **Connect the HDS to the data link connector (DLC)** .

   -2. Turn the combination light switch OFF.

   -3. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditio	
	Values	Unit	Values	
Headlight Switch (HEADLIGHT)	OFF	Â	Â	Â

Is data list values correct?

YES

Go to step 4.

NO

Go to step 2.

2. Combination light switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the combination light switch test** .

Is the switch OK?

YES

Go to step 3.

NO

Replace the combination light switch .

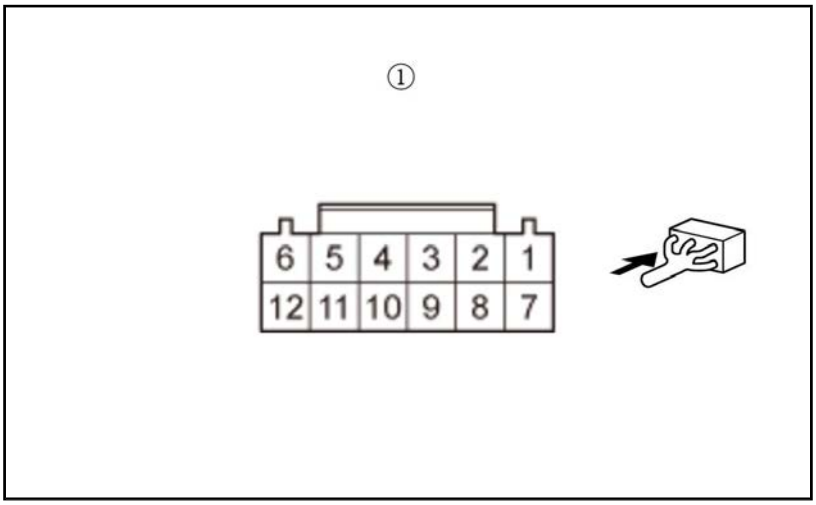
3. Shorted wire check (H/L ON SW line)

-1. Disconnect the following connectors.

Body control module connector C (28P)Automatic lighting/rain sensor 5P connector (with automatic wiper)Automatic lighting control unit-sensor 5P connector (with automatic lighting and without automatic wiper)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeCombination light switch 12P connector: disconnectedBody control module connector C (28P): disconnectedAutomatic lighting/rain sensor 5P connector (with automatic wiper): disconnectedAutomatic lighting control unit-sensor 5P connector (with automatic lighting and without automatic wiper): disconnected
Test point 1	Combination light switch 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the wire.

NO

The H/L ON SW wire is OK. **Replace the body control module** .

4. DTC check

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

-3. Wait for at least 10 seconds.

-4. Check for Relay Control Module DTCs with the HDS.

DTC (Relay Control Module)

DTC Description	DTC
Â	Â

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Repair a short to power in the H/L HI or H/L LO wire.

HOW TO INFORMATION

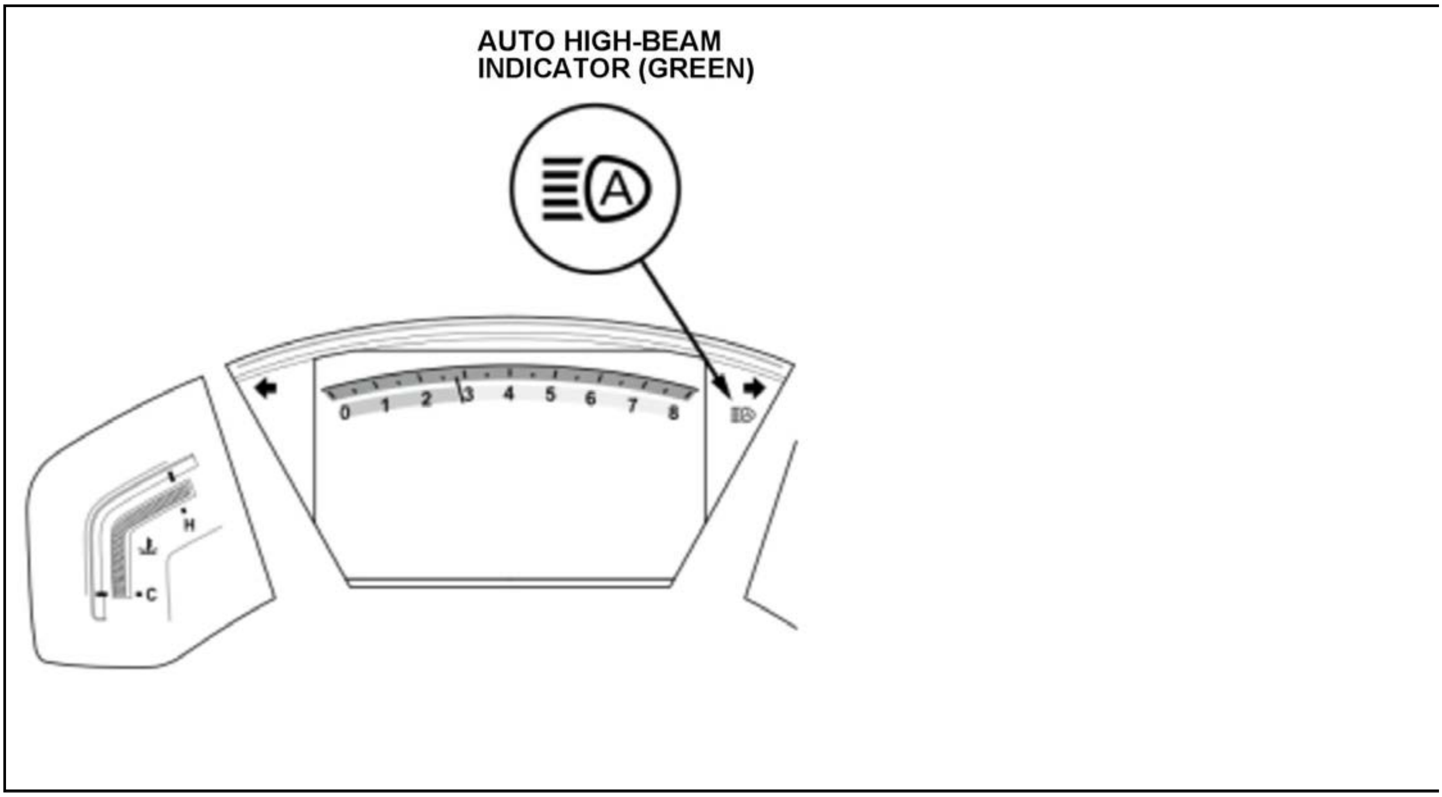
HOW TO TROUBLESHOOT THE AUTO HIGH-BEAM (HIGH-BEAM SUPPORT SYSTEM)

Auto High-Beam Indicator (Green)

When the Auto High-Beam is OK, the Auto High-Beam indicates its operation on the gauge control module as below.

NOTE:

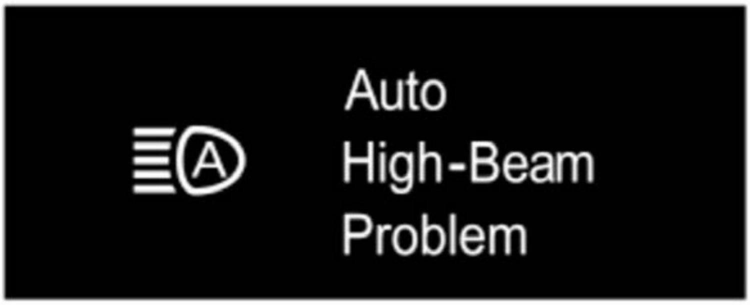
- For Auto High-Beam function, review the Auto High-Beam Description.
- The Auto High-Beam communication with other control units via F-CAN. For Auto High-Beam diagram, review the Auto High-Beam Diagram. If a connected the Auto High-Beam will not operate. In this case, both Auto High-Beam indicator and connected unit indicator come on and stay on (except for the gauge contro



Self-Diagnostic Function

The Auto High-Beam has a self-diagnostic function. If a malfunction of the Auto High-Beam detects a problem while in operation, a warning message is displayed on th display (MID), the Auto High-Beam stops operating, and stores DTCs.

NOTE: The Auto High-Beam operates while maintaining a mutual connection between the multipurpose camera unit at the control origin and the other control units (re body control unit, gauge control module, automatic lighting/rain sensor, etc.). If malfunctions occur in these control unit systems, the Auto High-Beam does not operate warning indicator of the related control unit turn on and a warning message is displayed on the multi-information display (MID).

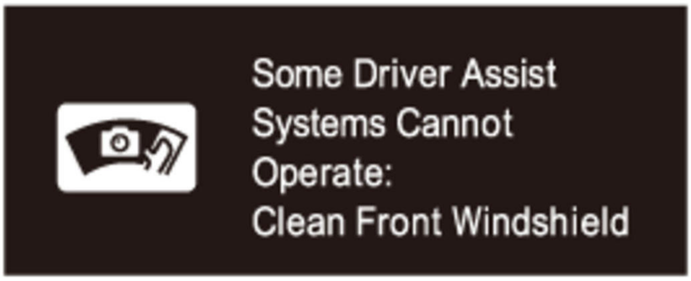


Auto
High-Beam
Problem

Dirt or dust detective function (CLEAN FRONT WINDSHIELD Indication)

If the message appears on the MID, the camera lens or the windshield has enough dirt so that the camera view is obstructed. The Auto High-Beam stops operating.

Clean any dirt or contamination on the camera lens or the windshield. Once the camera's view is unobstructed, the MID turns off and the Auto High-Beam automatically



Some Driver Assist
Systems Cannot
Operate:
Clean Front Windshield

Multipurpose Camera unit

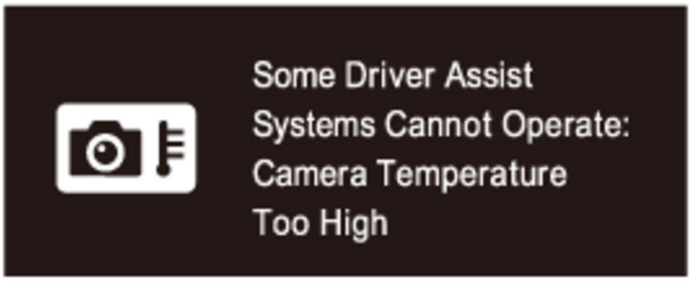
The Auto High-Beam of this vehicle is controlled by the multipurpose camera unit. If an error or malfunction of the multipurpose camera unit occurs, the Auto High-Be
At this time, a warning message is displayed on the multi-information display (MID). The operations of the Auto High-Beam corresponding to the multipurpose camera
can be checked in the **DTC troubleshooting index** .

The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected. The millimeter wave radar re
information from the multipurpose camera unit.

System Protect Function (High temperature) (MULTIPURPOSE CAMERA HOT Indication)

If the message Some Driver Assist Systems Cannot Operate: Camera Temperature Too High appears on the MID, the Auto High-Beam stops operating, and stores a DT

When the multipurpose camera temperature cools down to its proper operating temperature, the indicator on the MID turns off, and the Auto High-Beam automatically



Some Driver Assist
Systems Cannot Operate:
Camera Temperature
Too High

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the Auto High-Beam indic

CAN communication

The Auto High-Beam communicates with other control units via F-CAN. For Auto High-Beam diagram, **review the Auto High-Beam Diagram**.

If the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the Auto High-Beam will not operate even though it is OK. I
Auto High-Beam indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTC
failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check the DTCs with the HDS.

NOTE: For Auto High-Beam DTCs, **refer to the DTC troubleshooting index** .

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the Auto High-Beam indicator does not come on while test-driving, but your troubleshooting was based on the DTC, check f or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure Beam warning message does not come on.
- The Auto High-Beam sometimes stops operating because of the environment (weather, road conditions, driving conditions, etc.). Intermittent failure DTCs may b cases.

How to Retrieve DTCs

NOTE:

- Make sure the 12 volt battery is fully charged before you begin.
- The Auto High-Beam of this vehicle is controlled by the multipurpose camera unit. For this reason, the Auto High-Beam may not operate normally depending on status of the multipurpose camera unit. The operations of the Auto High-Beam related to the multipurpose camera unit malfunctions can be checked in the trouble **DTC for the millimeter wave radar** .

1. **Connect the HDS**

2. Use the HDS to check for Integrated Driver Support System for DTCs.

3. Read and record the DTC:4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. In the DRIVING SUPPORT MENU of the HDS, select Integrated Driver Support System, then choose the clear DTCs icon, and follow the prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS.

DESCRIPTION & OPERATION

AUTO HIGH-BEAM (HIGH-BEAM SUPPORT SYSTEM) DESCRIPTION

Overview

The system operates by switching the high beam and low beam automatically depending on the road condition of vehicles running ahead and opposite vehicles, using th camera unit.

Operating Conditions

- The combination light switch is in the AUTO position.
- The headlight low beam is turned on.
- White and red light sources are not detected ahead.
- 2 or more streetlights have not been detected.
- The vehicle speed is above 25 mph (40 km/h).
- There is no halation state in front of the vehicle.
- There is no manual operation input of the combination light switch.

NOTE: Weather and road conditions (undulation, curve, or environment illuminance etc.) may affect system operation.

Stopping Condition

The system stops operation under the following conditions.

- When the combination light switch is turned to other than the AUTO position.
- When the dimmer switch is operated.
- When the vehicle speed is low:
-
  - -

    Less than 6 mph (10 km/h)
  - -

    Less than 15 mph (24 km/h) condition continues more than four seconds.

Conditions that the System Switches to Low Beam

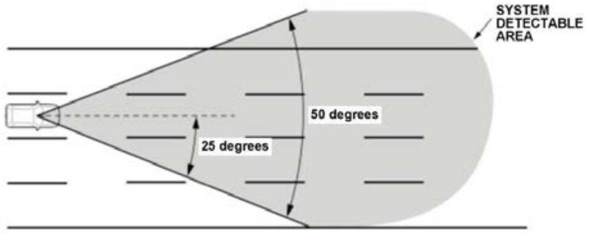
- When there are objects that are emitting lights such as streetlights, house lights, advertising display lighting, signages, vending machines, or other reflecting light.
- When there are objects emitting lights on the road similar to the taillights of vehicles driving ahead or headlights of opposing vehicles.
- When the red lights of the traffic signals are detected.
- When the front wiper motor operates at HIGH for 5 seconds.

Conditions that Switching Timing to Low Beam is Changed

- When the taillights of the vehicle driving ahead are bright or dark.
- When the headlights of the opposite vehicle are bright or dark.
- In rainy, snowy, and foggy weather.

Detection Range and Limits

The multipurpose camera unit recognizes and reacts within the range of 25 degrees horizontally (total 50 degrees).



Auto High-Beam Operation Indicator

When a system malfunction occurs, or when the camera lens or the windshield gets dirty, the warning message is shown on the multi-information display (MID). If the shown, the system stops operating.

 Auto High-Beam Problem	 Some Driver Assis Systems Cannot Operate: Clean Front Winds
NOTE: The actual message may be different depending on your market.	

AUTO HIGH-BEAM (HIGH-BEAM SUPPORT SYSTEM) DESCRIPTION - SYSTEM DIAGRAM

The system diagram of the Auto High-Beam is shown below.

For locations of each component on vehicle, refer to Component Location Index:

- **Multipurpose camera unit**
- **PCM**
- **VSA modulator-control unit**
- **Gauge control module**
- Without automatic wiper: **Automatic lighting control unit-sensor**
- With automatic wiper: **Automatic lighting/rain sensor**
- **Body control module**

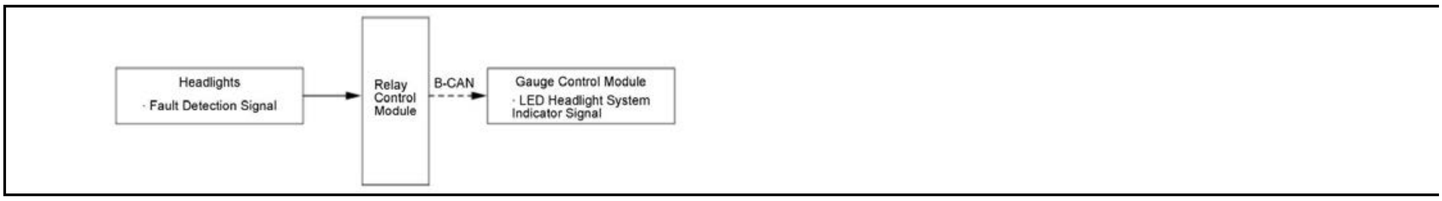
Headlight Fault Detection Function

When a low beam error is detected, the headlights send an error signal to the relay control module. When the relay control module receives the error signal, it sends an I system indicator signal to the gauge control module via B-CAN.



Headlights
· Fault Detection Signal
Relay Control Module

Turn Signal/Hazard Light Function

The turn signal/hazard warning lights are controlled by the body control module, using input from the combination light switch or hazard warning switch signal. When t module receives a left turn or right turn command from the combination light switch, it blinks the front, side*, and rear turn signal lights for the left or right side of the v body control module receives a hazard warning command from the hazard warning switch, it blinks the front and rear turn signal lights for both sides of the vehicle. The includes wire break detection by monitoring the current values using the body control module. An abnormal value is registered as a wire break (open) or faulty LED. W body control module increases the turn signal lighting frequency. If the break detection shows that the current value has returned to the correct value, the body control m normal frequency.

Daytime Running Lights Function

For daytime running light control, the relay control module controls the daytime running light control circuit based on the combination light switch signal, the parking b automatic lighting signal, and then turns on the light. When the combination light switch is in the OFF position or the AUTO position with the vehicle in the ON mode a brake released, the relay control module controls the daytime running light control circuit. When the combination light switch is in the ON position or the AUTO positic output signal from the automatic lighting control unit-sensor or the automatic lighting/rain sensor are inputted to the body control module, daytime running light control

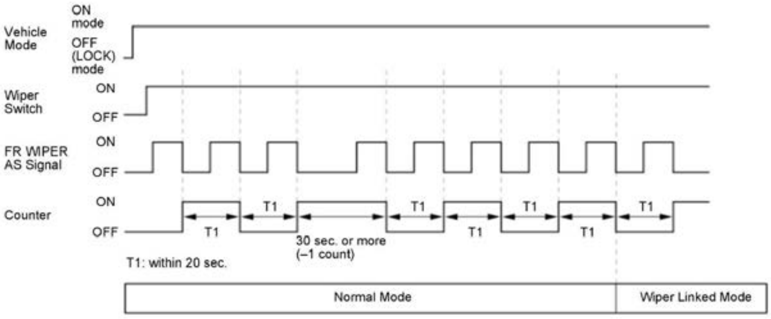
Wiper Linked Mode

When the wiper switch is in a position other than OFF, the automatic lighting control unit-sensor *1 or automatic lighting/rain sensor *2 counts and records the windshi WIPER AS signal (ON to OFF count within 20 seconds) from the body control module via B-CAN. After a total of 5 counts, it switches to wiper linked mode and turns the front parking lights, the taillights, inner taillights, daytime running light, and the side marker lights. The ON/OFF signals at the time of windshield washer operation When a count is not received for 30 seconds or more, the count is reduced by 1, and shifting to normal mode is done when the count reaches 0. The wipers return to nor vehicle is stopped, or when the respective switch is set to OFF.

*1: Without automatic wiper

*2: With automatic wiper



Warning Function

The automatic lighting control unit-sensor *1 or the automatic lighting/rain sensor *2 sends an indicator signal to the gauge control module in case of a failure of the aut sensor or when the signal sent from the relay control module by B-CAN signal is abnormal.

*1: Without automatic wiper

*2: With automatic wiper

Interior Lights Brightness Change Control

Regardless of the combination light switch in the AUTO position, the body control module *1 or the automatic lighting/rain sensor *2 controls the brightness for daytim brightness. The body control module *1 or the automatic lighting/rain sensor *2 sends the signal to the gauge control module using B-CAN.

*1: Without automatic wiper

2: With automatic wiper

Sensitivity Adjustment Function (For Some Models)

Sensitivity adjustment of the automatic lighting system can be customized with the gauge control module. You can select the customized timing from 5 types (Min, Lo, sensitivity.

Failsafe Function

Automatic Lighting System

When an automatic lighting sensor failure occurs, the system maintains the state before the failure, and a warning is displayed in the multi-information display (MID).

EXTERIOR LIGHTS SYSTEM DESCRIPTION - COMPONENTS

Headlights

The headlight assembly consists of the headlights (low/high beam lights), front parking lights, daytime running lights, side marker lights, and the front turn signal lights

Front Fog Lights

The front fog lights are installed on the front bumper.

Taillights/Inner Taillights

The taillights consist of the taillights, the brake lights, and rear side marker lights, and the rear turn signal lights. The back-up lights and the inner taillights are built into

High Mount Brake Light

The high mount brake light is located at the top of the rear window.

Side Turn Signal Lights (With Side Turn Signal Light)

The side turn signal light is built into the power mirror.

SYMPTOM TROUBLESHOOTING

EXTERIOR LIGHTS SYMPTOM TROUBLESHOOTING - LED HEADLIGHT DOES NOT COME ON

1. DTC check 1

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

-3. Wait for at least 10 seconds.

-4. Check for Relay Control Module DTCs with the HDS.

DTC (Relay Control Module)

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 2.

2. DTC check 2

-1. **Connect the HDS to the data link connector (DLC)** .

-2. Check for Body Control Module DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 3.

3. Combination light switch HEADLIGHT position check

-1. Turn the combination light switch ON.

-2. Check the parameter(s) below with the HDS.

Signal	**Threshold**		**Current conditio**	
	Values	**Unit**	**Values**	
Headlight Switch (HEADLIGHT)	ON	B	B	B

Is data list values correct?

YES

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

NO

Go to step 4.

4. Combination light switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the combination light switch test** .

Is the switch OK?

YES

Go to step 5.

NO

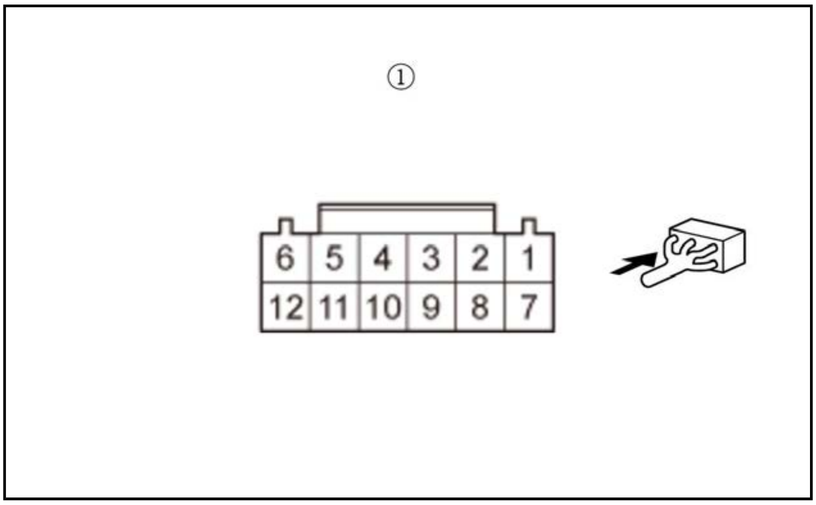
Replace the combination light switch .

5. Open wire check (H/L_ON_SW line) 1

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected
Test point 1	Combination light switch 12P connector (female terminals) No. 7: ①

Test point 2	Body ground



Is there battery voltage?

YES

Go to step 6.

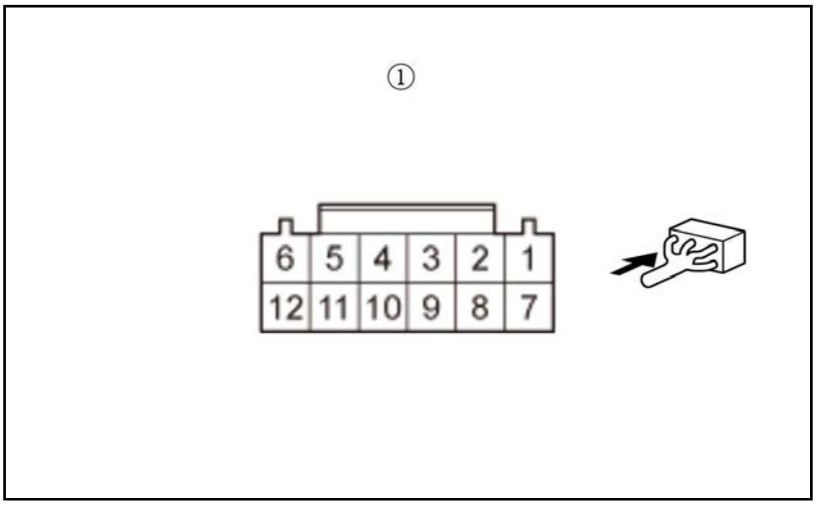
NO

Go to step 7.

6. Open wire check (COMBI_SW_GND(LT) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected
Test point 1	Combination light switch 12P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The COMBI_SW_GND(LT) wire is OK. Faulty combination light switch; **replace the combination light switch** .

NO

Repair an open or high resistance in the wire.

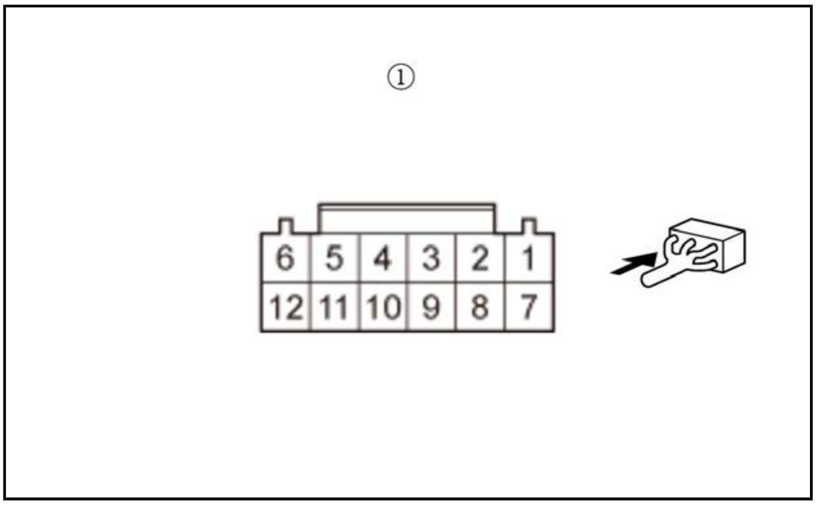
7. Open wire check (H/L_ON_SW line) 2

-1. Disconnect the following connector.

Body control module connector C (28P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected Body control module connector C (28P): disconnected
Test point 1	Combination light switch 12P connector (female terminals) No. 7: ①
Test point 2	**Body control module connector C (28P) No. 9**



Is there 1.0 Ω or less?

YES

The H/L_ON_SW wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

EXTERIOR LIGHTS SYMPTOM TROUBLESHOOTING - LED HEADLIGHT DOES NOT GO OFF

1. Combination light switch OFF position check

-1. **Connect the HDS to the data link connector (DLC)** .

-2. Turn the combination light switch OFF.

-3. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditio	
	Values	Unit	Values	
Headlight Switch (HEADLIGHT)	OFF	B	B	B

Is data list values correct?

YES

Go to step 4.

NO

Go to step 2.

2. Combination light switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Do the combination light switch test** .

   Is the switch OK?

   YES

   Go to step 3.

   NO

   Replace the combination light switch .

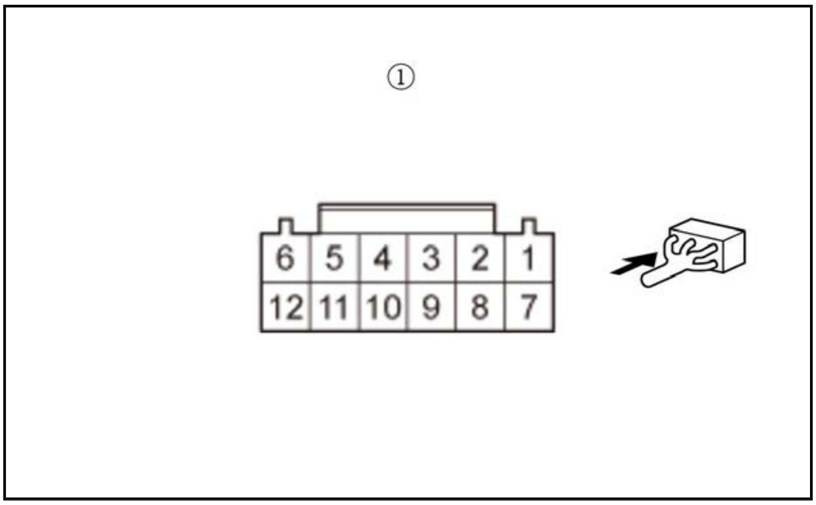
3. Shorted wire check (H/L_ON_SW line)

   -1. Disconnect the following connectors.

Body control module connector C (28P) Automatic lighting/rain sensor 5P connector (with automatic wiper) Automatic lighting control unit-sensor 5P connector (without automatic wiper)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Combination light switch 12P connector: disconnected Body control module connector C (28P): disconnected Automatic lighting/rain sensor 5P connector (with automatic wiper): disconnected Automatic lighting control unit-sensor 5P connector (without automatic wiper): disconnected
Test point 1	Combination light switch 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The H/L_ON_SW wire is OK. **Replace the body control module** .

NO

Repair a short to ground in the wire.

4. DTC check

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

   -3. Wait for at least 10 seconds.

-4. Check for Relay Control Module DTCs with the HDS.

DTC (Relay Control Module)

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting .

NO

Repair a short to power in the H/L HI or H/L LO wire.

HOW TO INFORMATION

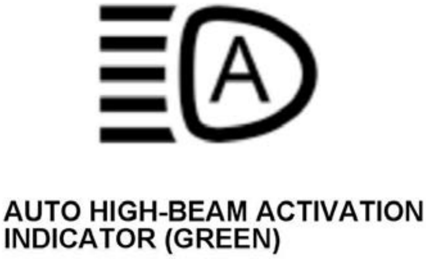
HOW TO TROUBLESHOOT THE AUTO HIGH-BEAM (HIGH-BEAM SUPPORT SYSTEM)

Auto High-Beam Activation Indicator (Green)

If the Auto High-Beam system is normal, the Auto High-Beam activation indicator comes on when the function is on, and goes off when the function is off. If the syster turns off the Auto High-Beam activation indicator, indicates the problem on the multi-information display (MID).

NOTE:

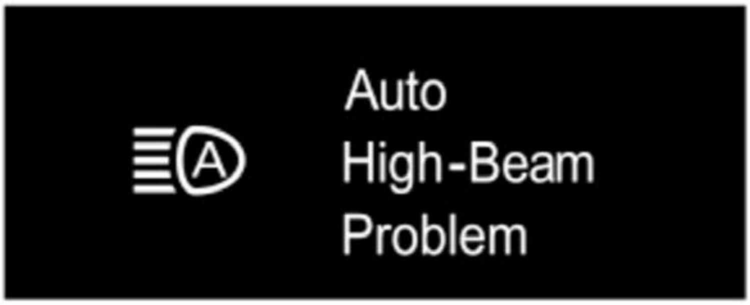
- For locations of the indicator, refer to Gauges Component Location Index .
- For Auto High-Beam function, review the Auto High-Beam Description.
- The Auto High-Beam communicates with other control units via F-CAN. For Auto High-Beam system diagram, review the Auto High-Beam System Diagram.



Self-Diagnostic Function

The Auto High-Beam system has a self-diagnostic function. When a problem is detected by the self-diagnostic function, the Auto High-Beam stops operating, indicates multi-information display (MID), and stores a DTC.

NOTE: The Auto High-Beam operates while maintaining a mutual connection between the multipurpose camera unit at the control origin and the other control units (re body control unit, gauge control module, automatic lighting/rain sensor, etc.). If malfunctions occur in these control unit systems, the Auto High-Beam does not operate warning indicator of the related control unit turn on and a warning message is displayed on the multi-information display (MID).



Dirt or dust detective function (CLEAN FRONT WINDSHIELD Indication)

If the message appears on the MID, the camera lens or the windshield has enough dirt so that the camera view is obstructed. The Auto High-Beam stops operating.

Clean any dirt or contamination on the camera lens or the windshield. Once the camera's view is unobstructed, the MID turns off and the Auto High-Beam automaticall

Multipurpose Camera unit

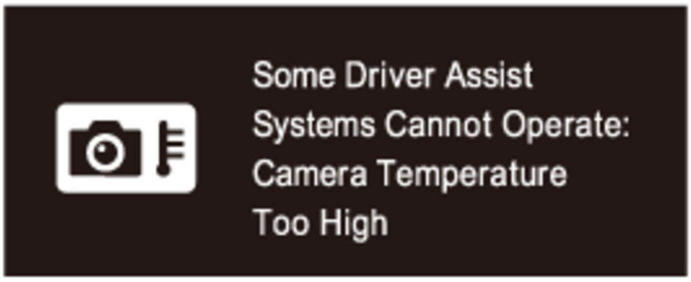
The Auto High-Beam of this vehicle is controlled by the multipurpose camera unit. If an error or malfunction of the multipurpose camera unit occurs, the Auto High-Be
At this time, a warning message is displayed on the multi-information display (MID). The operations of the Auto High-Beam corresponding to the multipurpose camera
can be checked in the DTC troubleshooting index .

The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected. The millimeter wave radar re
information from the multipurpose camera unit.

System Protect Function (High temperature) (MULTIPURPOSE CAMERA HOT Indication)

If the message Some Driver Assist Systems Cannot Operate: Camera Temperature Too High appears on the MID, the Auto High-Beam stops operating, and stores a DT

When the multipurpose camera temperature cools down to its proper operating temperature, the indicator on the MID turns off, and the Auto High-Beam automatically



Some Driver Assist
Systems Cannot Operate:
Camera Temperature
Too High

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the Auto High-Beam indic

CAN communication

The Auto High-Beam communicates with other control units via F-CAN. For Auto High-Beam system diagram, review the Auto High-Beam System Diagram.

If the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the Auto High-Beam will not operate even though it is OK. I
Auto High-Beam indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTC
failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check for DTCs with the HDS, then clear the DTC.

NOTE: For Auto High-Beam DTCs, refer to the DTC troubleshooting index .

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the Auto High-Beam indicator does not come on while test-driving, but your troubleshooting was based on the DTC, check f
or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure
Beam warning message does not come on.
- The Auto High-Beam sometimes stops operating because of the environment (weather, road conditions, driving conditions, etc.). Intermittent failure DTCs may b
cases.

How to Retrieve DTCs

NOTE:

- Make sure the 12 volt battery is fully charged before you begin.
- The Auto High-Beam of this vehicle is controlled by the multipurpose camera unit. For this reason, the Auto High-Beam may not operate normally depending on
status of the multipurpose camera unit. The operations of the Auto High-Beam related to the multipurpose camera unit malfunctions can be checked in the trouble
DTC for the millimeter wave radar .

1. Connect the HDS

2. Use the HDS to check for Integrated Driver Support System for DTCs.

3. Read and record the DTC.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. Connect the HDS

2. In the DRIVING SUPPORT MENU of the HDS, select Integrated Driver Support System, then choose the clear DTCs icon, and follow the prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS.

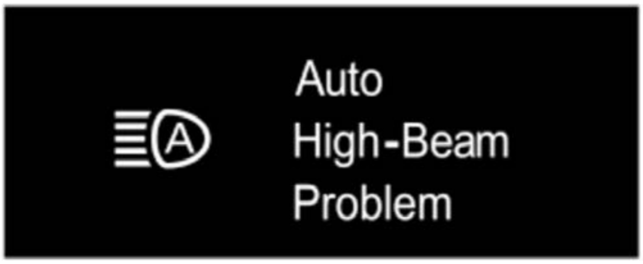
TEST

AUTO HIGH-BEAM (HIGH-BEAM SUPPORT SYSTEM) FUNCTION TEST

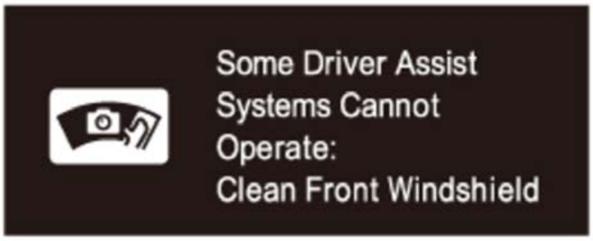
NOTE:

- This test is only used to confirm if the auto high-beam system is operating correctly.
- Certain vehicle and environmental conditions will affect how the auto high-beam system operates. Refer to the owner's manual or Auto High-Beam (High-Beam Description for additional information.

1. Turn the vehicle to the ON mode and confirm there are no auto high-beam messages on the multi-information display (MID). If a message is present, check for DTC' them first before doing this test. Refer to the How to Troubleshoot the Auto High-Beam (High-Beam Support System).



Auto
High-Beam
Problem



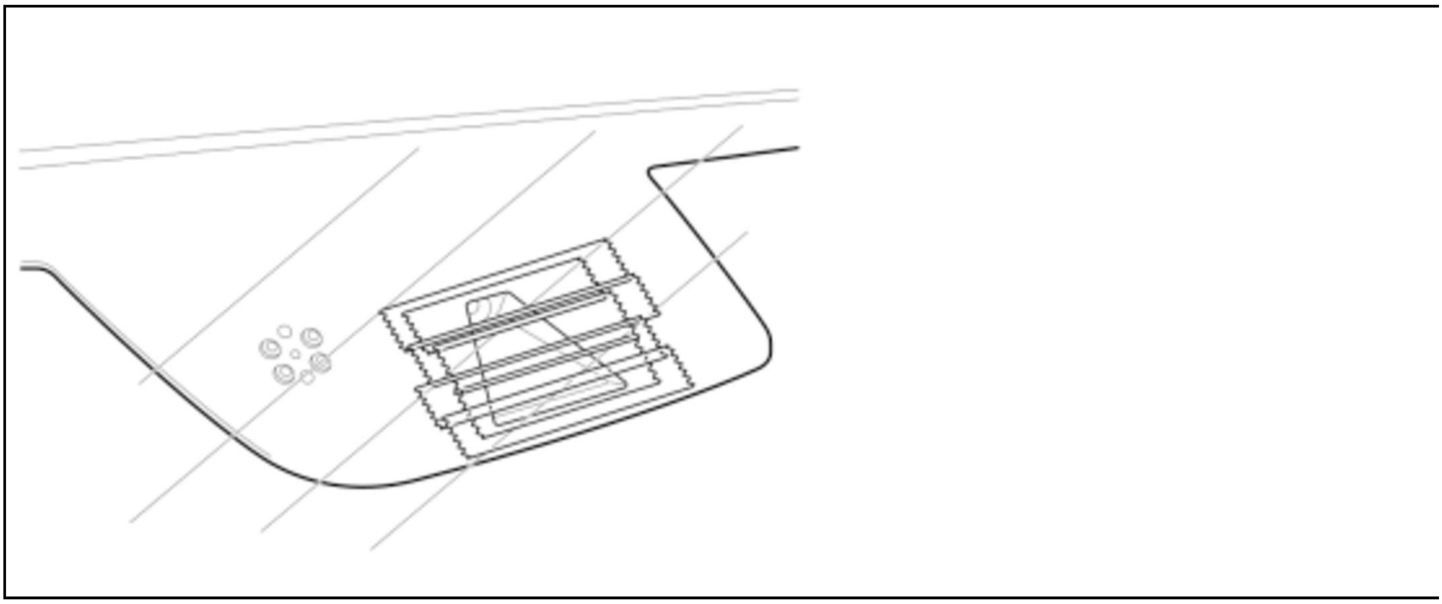
Some Driver Assist
Systems Cannot
Operate:
Clean Front Windshield

Cover the following areas with masking tape:

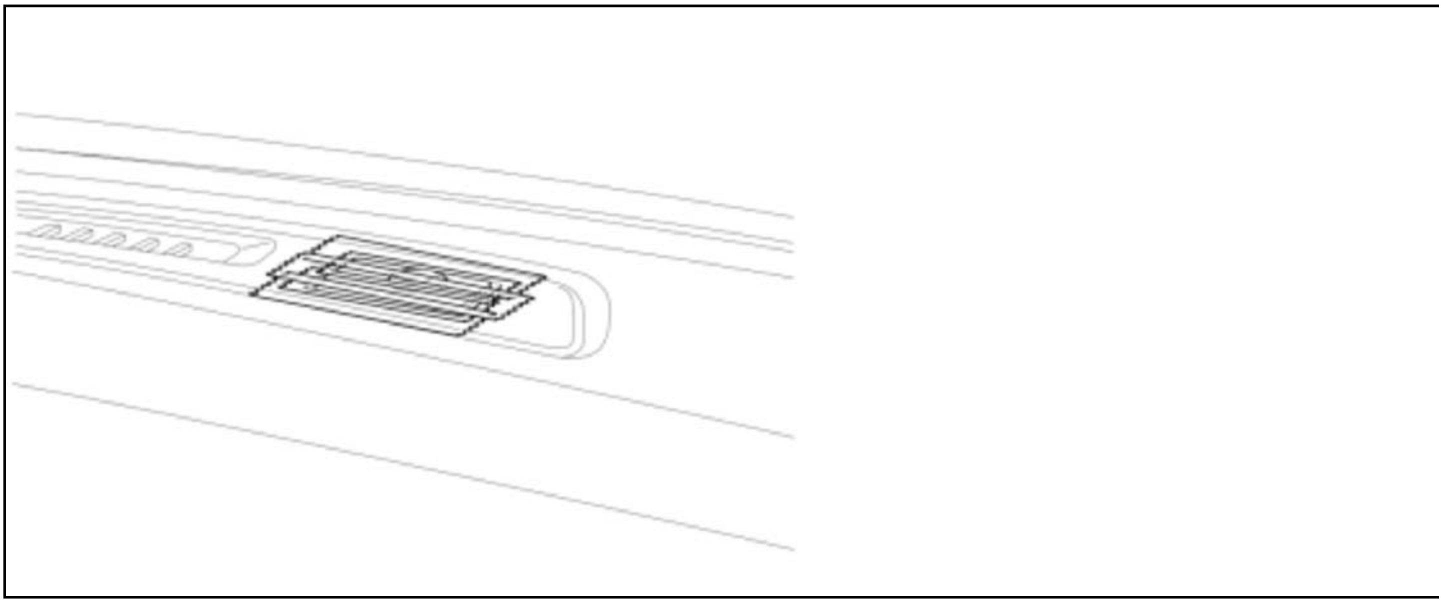
NOTE:

- **The images shown are examples and may not match your vehicle.**
- **Apply two layers of masking tape to insure that the sensor and camera is blocked.**

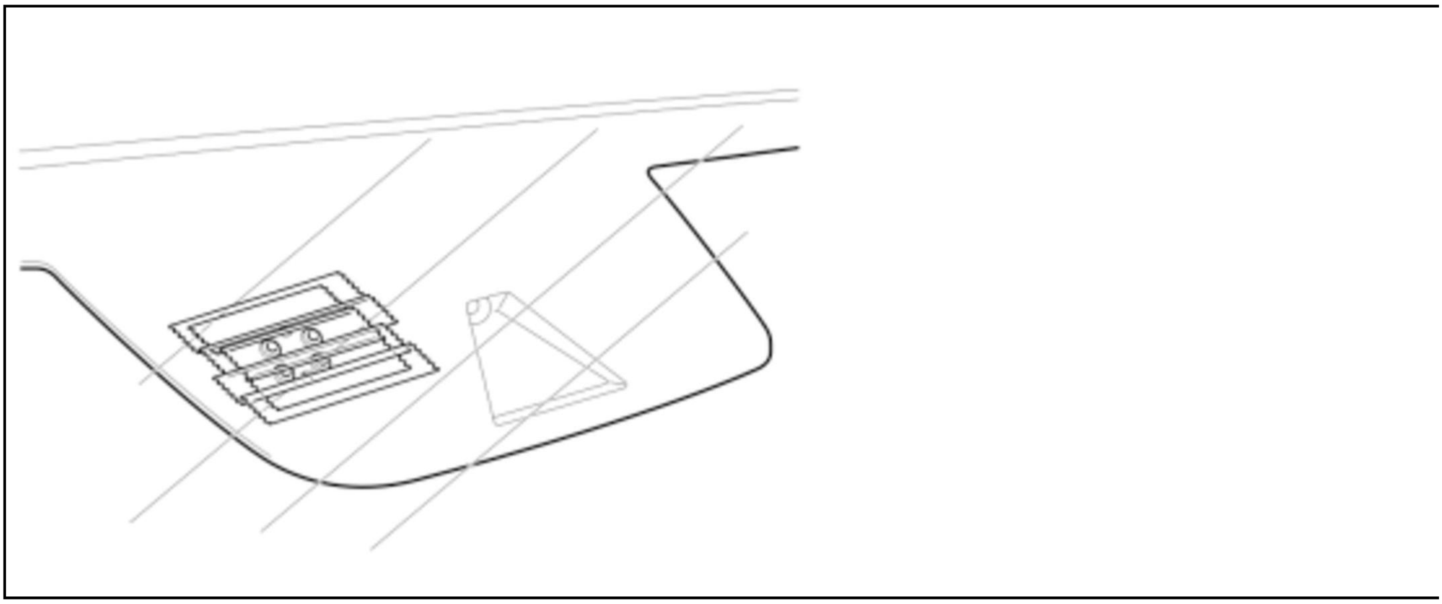
Multipurpose Camera (opening on the front windshield)



Automatic Lighting Control Unit-Sensor / Sunlight Sensor (entire sensor)



Automatic Lighting / Rain Sensor (opening on the front windshield)



3. Set the headlight switch to the low beam and AUTO positions.

4. Start the engine and confirm that the headlight low beam is on. Check the gauge control assembly.

- If the auto high-beam activation indicator is on, the system is normal and the test is complete.

- If the auto high-beam activation indicator is off, pull back the headlight switch lever back for at least 30 seconds until the auto high-beam activation indicator blin repeat steps 1

ADJUSTMENT

BRAKE PEDAL AND BRAKE PEDAL POSITION SWITCH ADJUSTMENT

Adjustment

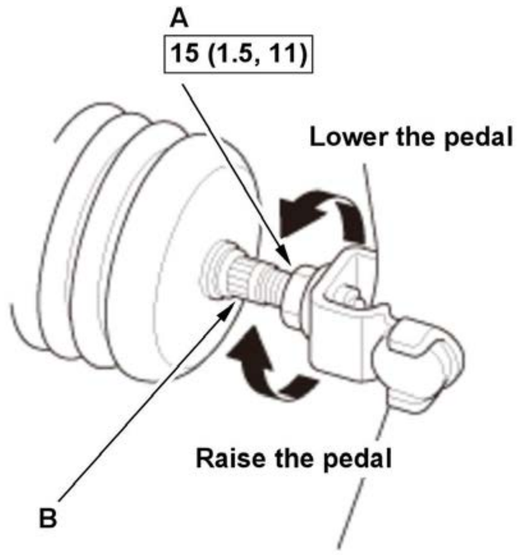
NOTE: How to read the torque specifications .

1. Steering Joint Cover - Remove
2. Brake Pedal Height - Inspect

 	1. Pull back the carpet (A) and t 2. Measure the pedal height (C) upper point (D) of the pedal pac the floor without the insulation.

Standard pedal height:	**215 +/- 5 mm (8.46 +/- 0.20 in)**

3. Brake Pedal - Adjust



1. **Remove the brake pedal position switch** .

NOTE: Do not disconnect the connector.

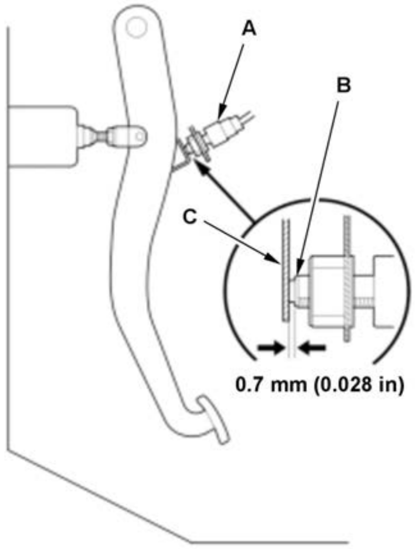
2. Loosen the pushrod locknut (A).

3. Screw the pushrod (B) in or out with pliers
pedal height from the floor is reached.

4. Tighten the locknut firmly.

NOTE: Do not adjust the pedal height with th

4. Brake Pedal Position Switch - Adjust



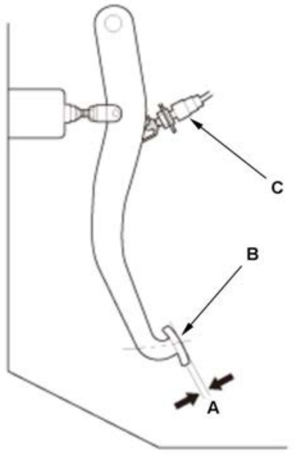
1. Lift up on the brake pedal by hand.

2. Push in the brake pedal position switch (A) until its plunger is fully p
end (B) touching the pedal arm (C)).

3. Turn the switch 45 deg. clockwise to lock it. The gap between the bra
switch and the pad is automatically adjusted to 0.7 mm (0.028 in) by lo

4. Make sure the brake lights go off when the pedal is released.

5. Brake Pedal Free Play - Check



1. Inspect the free play (A) at the brake pedal pad (B) by pushing the brake pedal by ha
pedal free play is out of specification, adjust the brake pedal position switch (C). If the
play is insufficient, it may result in brake drag.

Free play:	**8.1-15.8 mm (0.319-0.622 in)**

6. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

7. **Sensor 0 (Zero) Position - Memorize**

FRONT FOG LIGHT ADJUSTMENT

Adjustment

1. Front Fog Light - Adjust

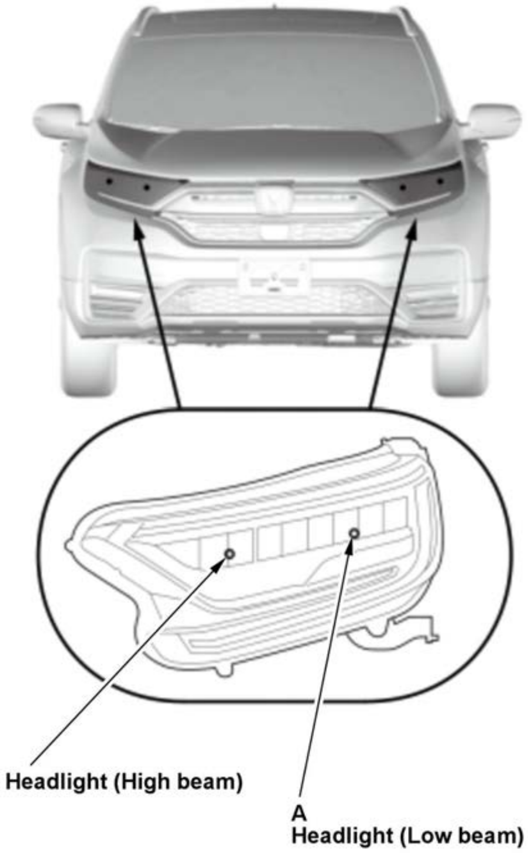
 A C 3 m (9.8 ft) 2 m (6.6 ft) 1 m (3.3 ft) -1.5 cm (0.59 in) -3 cm (1.18 in) -4.5 cm (1.77 in) B D	Before adjusting the front fog lights: - Park the vehicle on a level surface. - Make sure the tire pressures are correct. - The driver or someone who weighs the same should sit in the driver's - Unload the vehicle. The front fog lights should aim down slightly. To check for proper adjustm 1. Park the vehicle in front of a wall or screen (A). 2. Turn the front fog lights on. 3. Determine if the front fog lights are aimed properly: - Measure the height (B) of the front fog lights. - On the wall or screen, mark the height of the front fog lights with a p - Check each front fog light beam's height. Adjust them both so they a cm (1.77 in) lower (D) than the height of the front fog lights at a dist For example, if the vehicle is parked 3 m (9.8 ft) from the wall or screen, th fog light beam should be 4.5 cm (1.77 in) below the tape mark.

	4. If necessary, adjust each front fog light height by turning the adjuster (A).

HEADLIGHT ADJUSTMENT

Adjustment

1. Low Beam Headlight - Adjust



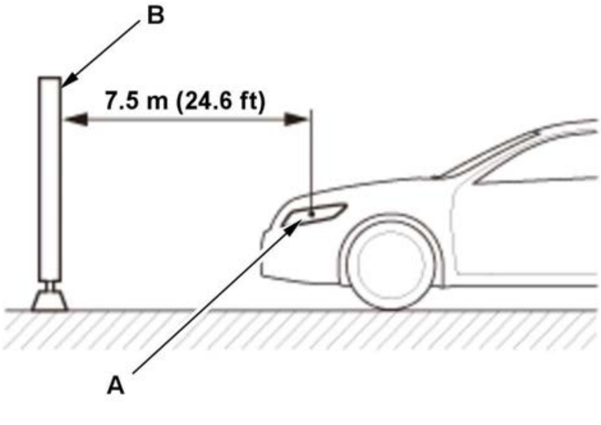
WARNING:

Headlights become very hot during use; do not touch them or cov
items like fender covers immediately after they have been turned

Before adjusting the headlights:

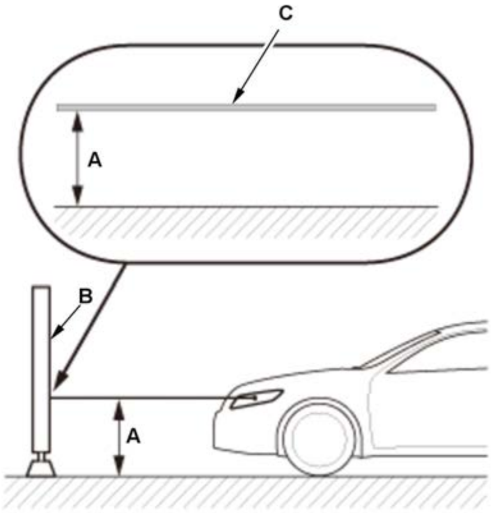
- Park the vehicle on a level surface.
- Make sure the tire pressures are correct.
- The driver or someone who weighs the same should sit in t
  use an equivalent weight).
- Unload the vehicle.

1. Clean the outer lens so that you can see the center (A) of the he



Low beam

2. Park the vehicle so that the center mark of the low
is 7.5 m (24.6 ft) away from a wall or screen (B).



3. Measure the height of the low beam headlight's center mark (A), then
(B), mark the same height of the headlights with masking tape in a straig
(C).
